MPS/L&P REGIONAL SPOT-MARKET POWER PRICE MODELING.....	3
---	----------

Direct Testimony:
James W. Okenfuss, P.E.

**BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MISSOURI
DIRECT TESTIMONY OF JAMES W. OKENFUSS, P.E.
ON BEHALF OF AQUILA, INC.
D/B/A AQUILA NETWORKS-MPS AND AQUILA NETWORKS-L&P
CASE NO. ER-_____**

1 Q. Please state your name and business address.

2 A. My name is James W. Okenfuss. My business address is 10750 East 350
3 Highway, Kansas City, Missouri 64138.

4 Q. By whom are you employed and in what capacity?

5 A. I am employed by Aquila, Inc. ("Aquila" or "Company") in the position of
6 Electric Systems Analyst.

7 Q. Please briefly describe your education and work experience.

8 A. I graduated from the University of Missouri - Columbia in 1987 with a
9 bachelor's degree in electrical engineering. My employment with Missouri
10 Public Service ("MPS") began in 1988 as Marketing Engineer and later as
11 Associate Engineer - Instruments and Controls at the Sibley Generating
12 Station. In 1995, I left MPS to work as a consultant for Black & Veatch
13 ("B&V") and Shafer, Kline and Warren ("SKW"). In 1997, I completed a
14 masters of business administration at Rockhurst University. In 2000, I
15 became, and still remain, a member of the adjunct faculty of Avila University,
16 teaching economics and statistics courses in the Undergraduate Business and
17 MBA programs. In 2001, I accepted employment with Aquila Merchant
18 Services as Senior Fundamentals Analyst. In 2002, I was transferred from the

1 deregulated Aquila Merchant Services Group to the regulated Aquila
2 Networks Group in my current capacity. In 2003, I completed a masters in
3 economics at the University of Missouri – Kansas City. I am a Missouri
4 licensed professional engineer; E-27080.

5 Q. Briefly describe your current duties at Aquila.

6 A. I currently analyze the state of the market for electricity in the various regions
7 that Aquila Networks serves, primarily the North American Reliability
8 Council (“NERC”) regions designated as the Western Electric Coordinating
9 Council (“WECC”) and the Southwest Power Pool (“SPP”). Part of my
10 analysis includes providing models of spot market prices for the Eastern
11 Interconnect, an electrical grid that extends from the Atlantic to the Rockies.

12 Q. Have you previously filed testimony before the Missouri Public Service
13 Commission (“Commission”)?

14 A. Yes. I filed rebuttal testimony in Case Nos. ER-2004-0034 and HR-2004-
15 0024 (Consolidated) concerning issues involving the determination of natural
16 gas and power prices to be used in those electric and steam rate cases, for the
17 purpose of setting rates.

18 Q. What is the purpose of your direct testimony?

19 A. The purpose of this testimony is to present and support Aquila’s position in
20 this case regarding spot market power prices used in determining fuel and
21 purchased power expense for the Aquila Networks-MPS (“MPS”) and Aquila
22 Networks-L&P (“L&P”) operating divisions of Aquila.

23 Q. Are you sponsoring any schedules?

1 A. Yes. I am sponsoring Schedule JWO-1, which summarizes the price of spot
2 market power used in determining fuel and purchased power expense for the
3 Aquila Networks-MPS ("MPS") and Aquila Networks-L&P ("L&P")
4 operating divisions of Aquila. This schedule details the on-peak power prices
5 estimated for the Southwest Power Pool, Northern Subregion (SPPN).

6 **MPS /L&P REGIONAL SPOT-MARKET POWER PRICE MODELING**

7 Q. In developing the annualized purchased energy expense in this case, did
8 Aquila adjust the price paid for spot-market energy from what was actually
9 paid during the test year?

10 A. Yes, the adjustment was made to improve the accuracy of the model in
11 response to current fuel prices and economic conditions.

12 Q. Please describe the market drivers used in your development of power market
13 price estimates.

14 A. Aquila assumes that the power market price is roughly determined by the
15 impact of several factors operating at the same time. Principal drivers of the
16 price for power are: existing and proposed generation, current load profiles
17 and load growth, and the current level of fuel costs with fuel price
18 movements. Technological advancements to the production of power can
19 have an impact over time, but have a minimal impact in the test year power
20 price estimates. Therefore those advances are left out of the price
21 determination model.

22 Q. Please describe Aquila's sources for existing and future generation resources.

1 A. Aquila utilizes a national database of power production from Global Energy
2 Decisions (GED) that is specially formatted for use in GED's MIDAS Gold
3 ™ analysis package. The MIDAS Gold ™ database has as its source the
4 current GED Energy Velocity ™ database.
5 The MIDAS Gold ™ database contains unit specific operating data on every
6 operating plant within NERC. This operating data includes unit capacity, heat
7 rate, fuel type, variable O&M costs, fixed plant costs, etc. GED compiles
8 much of this data from published resources such as FERC Form 1 submissions
9 and quarterly CEMS data compiled by the EPA.

10 Q. Please summarize Aquila's assumptions concerning regional and national
11 loads.

12 A. Regional loads are included in the MIDAS Gold ™ dataset. Regional loads
13 and 10-year forecasts are reported by NERC region in the EIA-411. GED
14 collects this information and breaks down present load and growth by market
15 area. The MIDAS Gold ™ data set uses this information to simulate the load
16 growth of all regions and market areas in NERC. Aquila does not modify this
17 information in the production of the spot market price curve for power. So,
18 for the test year 2004 neighboring systems load profiles were modeled from
19 the 2004 forecast information each neighboring utility and region submitted to
20 NERC.

21 Q. Please explain which fuel costs are used in power price determination.

22 A. The power market price estimating methods used by Aquila, are concerned
23 with only a few types of primary energy source costs. Nuclear fuel, coal,

1 hydro, natural gas and fuel oil are the fuels that have a material impact on the
2 ultimate market price for power. The impact of wind, solar, biomass and
3 other renewable resources appear to be minimal, and therefore are not used as
4 a driver for market power prices.

5 Q. Please describe the method of estimated primary fuel source forward prices.

6 A. Fuel costs assumptions vary by the fuel being considered. The methods used
7 for determining the cost of each primary energy source is considered
8 separately.

9 Q. Describe the method used to forecast nuclear, coal and hydro fuel costs.

10 A. The majority of the energy produced in the country is generated by base
11 loaded plants most of which use nuclear, coal or hydro fuel (stable cost) as
12 their primary energy source. The costs of these sources have two features in
13 common. First, the cost is heavily dependent upon the individual plant. The
14 costs for fuel at these plants vary due to a large number of factors, including
15 refueling schedules, coal and delivery contracts, water usage constraints, etc.
16 The second feature these fuel costs have in common is that they are relatively
17 stable and do not fluctuate over time. Therefore, the fuel cost estimate for
18 actual fuel purchased costs contained in GED's Energy Velocity™ database
19 for each individual plant is likely to hold throughout the timeframe of the test
20 year. Therefore, for Aquila's test year estimating purposes, GED's actual
21 costs for these fuels are held constant for the study period.

22 Q. Please explain how natural gas and fuel oil prices are estimated.

- 1 A. Due to the volatile nature of the price of natural gas and the increasing
2 percentage of time that natural gas fired generating units are the marginal
3 price unit, the need for a natural gas forecast that considers the seasonal fuel
4 price fluctuations is essential to an accurate power market price estimate.
5 Regional natural gas prices were developed using the method sponsored in
6 Aquila witness Jerry G. Boehm's testimony. Natural gas basis for the
7 individual plants are assumed to be relatively constant across a NERC region
8 or sub-region. Average historical basis are calculated for each region and
9 applied to the Henry Hub forecast to provide a delivered cost for natural gas in
10 each of the NERC regions or sub-regions. It is assumed that the natural gas
11 basis will not vary over time.
- 12 Fuel oil appears to drive power prices for certain months of the years in
13 certain areas of the country, primarily Florida and the Northeast. However,
14 the impact of fuel oil price movements to the power market prices in the
15 Midwest is insignificant. For modeling purposes, the futures prices of New
16 York Harbor delivered #2 and #6 Fuel oil is used as an input to the model.
- 17 Q. Please describe the method by which power prices are developed.
- 18 A. Power market prices are developed using the MIDAS Gold TM analysis
19 software from GED. The MIDAS Gold TM software can be used in a variety
20 of ways. When used for price forecasting, the model is being used in the
21 "multi-area" mode.
- 22 Q. What is the MIDAS Gold TM "multi-area" mode of analysis?

- 1 A. The multi-area mode of analysis is basically an application of a transportation
2 linear programming model. All regions of the country are condensed into
3 market areas, each with a load profile and a set of generation resources.
4 Within each market area, loads and resources are matched 8760 hourly
5 periods per year.
- 6 The market areas are connected in the model by a series of transmission lines,
7 each subject to a transmission constraint. Price differences in market areas
8 connect with an unconstrained transmission path and will cause the model to
9 assume a power flow between the two areas, the effect of which will be to
10 lower the cost in the high price area and increase the cost in the low cost area.
- 11 This assumed power flow increases until the two market prices have
12 equilibrated at an identical level or the transmission line has reached its limit.
- 13 Q. Are prices only developed for the Southwest Power Pool (SPP) NERC region?
- 14 A. No. Market prices are simultaneously determined for all regions within the
15 model study. The Midwest model produces power market forward prices for
16 market areas in the SPP, Mid-Continent Area Power Pool (MAPP), Mid-
17 American Interconnected Network (MAIN), and the Southeastern Electric
18 Reliability Council (SERC) NERC regions.
- 19 Q. Does this conclude your testimony at this time?
- 20 A. Yes.

Direct Testimony:
James W. Okenfuss, P.E.

Schedule JWO-1: Average Spot Market Power Prices - SPPN

SPPN Average Spot Power Prices - \$/MWh		
Month	Peak	Off-Peak
JAN	68.538	39.542
FEB	68.321	43.635
MAR	56.981	36.390
APR	53.867	35.595
MAY	46.434	26.478
JUN	58.503	27.158
JUL	72.409	39.238
AUG	75.120	37.034
SEP	48.871	25.834
OCT	41.979	22.577
NOV	46.078	25.022
DEC	60.327	37.380

In the matter of Aquila, Inc. d/b/a Aquila Networks-MPS and Aquila Networks-L&P; for authority to file tariffs increasing electric rates for the service provided to customers in the Aquila Networks-MPS and Aquila Networks-L&P area

County of Jackson)

State of Missouri) **ss**

James W. Okenfuss, being first duly sworn, deposes and says that he is the witness who sponsors the accompanying testimony entitled "Direct Testimony of James W. Okenfuss;" that said testimony was prepared by him and under his direction and supervision; that if inquiries were made as to the facts in said testimony and schedules, he would respond as therein set forth; and that the aforesaid testimony and schedules are true and correct to the best of his knowledge, information, and belief.

James W. Okenfuss

Subscribed and sworn to before me this 24th day of May, 2005.
