

Dear commissioner

Enclosed is DVD That Contains footage of two meters with automatic reading devices on them at two different locations. Please pay attention to the two bottom dials that keeps track of the gas you use. Both of these meters have an 80.000 BTU furnace that is running at full capacity

These two bottom test hands are used by service men when they turn gas on at a customer's house. If these hands are moving erratically there is no way to determine by spotting the gas meter if a customer has any leaks on there fuel runs. This could cerate an unsafe situation for the customer. (Me)

How anybody can depend on a product that does not operate properly is beyond me.

Somebody has to correct this problem before someone gets hurt, maimed, or possibly a life. Don't have that on your conscious.

Thank you,
Someone who cares.
