Pursuant To 4 CSR 240-2.135.**

**DIRECT TESTIMONY**

**OF**

**SAMUEL C. HADAWAY**

**Case No. ER-2012-0175**

1           **I.       INTRODUCTION AND SUMMARY OF RECOMMENDATIONS**

2   **Q.       Please state your name and business address.**

3   A.       My name is Samuel C. Hadaway and my business address is FINANCO, Inc., 3520  
4           Executive Center Drive, Suite 124, Austin, Texas 78731.

5   **Q.       On whose behalf are you testifying?**

6   A.       I am testifying on behalf of KCP&L Greater Missouri Operations Company ("GMO" or  
7           the "Company").

8   **Q.       Please state your educational background and describe your professional training  
9           and experience.**

10   A.       I have a bachelor's degree in economics from Southern Methodist University, as well as  
11           M.B.A. and Ph.D. degrees with concentrations in finance and economics from the  
12           University of Texas at Austin ("UT Austin"). I am an owner and full-time employee of  
13           FINANCO, Inc. ("FINANCO"). FINANCO provides financial research concerning the  
14           cost of capital and financial condition for regulated companies as well as financial  
15           modeling and other economic studies in litigation support. In addition to my work at  
16           FINANCO, I have served as an adjunct professor in the McCombs School of Business at  
17           UT Austin and in what is now the McCoy College of Business at Texas State University.  
18           In my prior academic work, I taught economics and finance courses and I conducted  
19           research and directed graduate students in the areas of investments and capital market  
20           research. I was previously Director of the Economic Research Division at the Public

1 Utility Commission of Texas ("Texas Commission") where I supervised the Texas  
2 Commission's finance, economics, and accounting staff, and served as the Texas  
3 Commission's chief financial witness in electric and telephone rate cases. I have taught  
4 courses at various utility conferences on cost of capital, capital structure, utility financial  
5 condition, and cost allocation and rate design issues. I have made presentations before  
6 the New York Society of Security Analysts, the National Rate of Return Analysts Forum,  
7 and various other professional and legislative groups. I have served as a vice president  
8 and on the board of directors of the Financial Management Association.

9 A list of my publications and testimony I have given before various regulatory  
10 bodies and in state and federal courts is contained in my resume, which is included as  
11 Appendix A.

12 **Q. Have you previously testified before the Missouri Public Service Commission**  
13 **("MPSC" or "Commission") or other utility regulatory agencies?**

14 A. Yes. I have testified before the MPSC and numerous other regulatory commissions on  
15 cost of capital and related financial issues.

16 **Q. What is the purpose of your testimony?**

17 A. The purpose of my testimony is to estimate GMO's required rate of return on equity  
18 ("ROE") and to support the Company's requested capital structure and overall rate of  
19 return.

20 **Q. Please outline and describe the testimony you will present.**

21 A. My testimony is divided into five additional sections. Following this introduction, in  
22 Section II, I discuss the impact on ROE of GMO's fuel adjustment clause ("FAC"). In  
23 Section III, I present and explain the Company's requested capital structure and overall

1 cost of capital. In Section IV, I review general capital market costs and conditions, and  
2 discuss recent developments in the electric utility industry that affect the cost of capital.  
3 In Section V, I review various methods for estimating the cost of equity. In this section, I  
4 discuss the discounted cash flow ("DCF") model, as well as risk premium methods and  
5 other approaches that are often used to estimate the cost of capital. In Section VI, I  
6 discuss the details of my cost of equity studies and provide a summary table of my ROE  
7 results.

8 **Q. Please describe the general approach you use in your cost of equity studies.**

9 A. First, my recommendation is premised upon the fair rate of return principles established  
10 by the U.S. Supreme Court in *Federal Power Comm'n v. Hope Natural Gas Co.*, 320 U.S.  
11 591, 603 (1944) ("*Hope*") and *Bluefield Water Works & Improvements Co. v. Public*  
12 *Service Comm'n*, 262 U.S. 679, 693 (1923) ("*Bluefield*"). That is to say, a utility's return  
13 authorized by a regulatory body, such as the MPSC, should be commensurate with  
14 returns on investments in other enterprises having corresponding risks. The return should  
15 also be sufficient to assure confidence in the financial integrity of the utility so as to  
16 maintain its credit, and to attract capital so that it is able to properly discharge its public  
17 duties. Given these legal principles, I have reviewed several methods to determine an  
18 appropriate ROE and overall rate of return for GMO. These methods and the underlying  
19 economic models are applied to an investment grade company reference group of other  
20 electric utilities generally similar to GMO.

21 **Q. Please explain your analysis in arriving at a recommended ROE for GMO.**

22 A. My ROE estimate is based on alternative versions of the constant growth and multistage  
23 growth DCF model. I also provide a bond-yield-plus-equity risk premium analysis and I

1 review economic conditions and interest rates that are expected to prevail during the  
2 coming year. Because GMO is a wholly-owned subsidiary of Great Plains Energy  
3 Incorporated ("GPE") and does not have publicly traded common stock or other  
4 independent market data, its cost of equity cannot be estimated directly. For this reason,  
5 I apply the DCF model to a large reference group of investment grade electric utilities  
6 selected from the *Value Line Investment Survey* ("*Value Line*"). *Value Line* is a widely-  
7 followed, reputable source of financial data often used by professional economists to  
8 estimate ROE. To be included in my group, the reference companies must have at least a  
9 triple-B (investment grade) bond rating; they must derive at least 70 percent of revenues  
10 from regulated utility sales; they must have consistent financial records not affected by  
11 recent mergers or restructuring; and they must have a consistent dividend record with no  
12 dividend cuts within the past two years. The fundamental characteristics of the  
13 companies in my comparable group are summarized in Schedule SCH-1, page 1.

14 I also conducted a risk premium analysis based on ROEs allowed by state  
15 regulators relative to Moody's average utility debt costs. In this analysis, I considered  
16 both current utility bond yields and the higher interest rates that Standard and Poor's  
17 ("S&P") is forecasting for the coming year. S&P forecasts that long-term government  
18 and corporate interest rates will increase from current levels during 2012. The data  
19 sources and the details of my cost of equity studies are contained in my Schedules SCH-1  
20 through SCH-6.

21 **Q. Please state your ROE recommendation and summarize the results of your cost of**  
22 **equity studies.**

1 A. I support an ROE of 10.4 percent. I apply alternative versions of the DCF model and I  
2 provide a risk premium analysis and a review of forecasted economic conditions for the  
3 coming year. The DCF analysis indicates a reasonable range of 10.0 percent to 10.4  
4 percent. My risk premium analysis indicates an ROE range of 9.97 percent to 10.12  
5 percent. As I will discuss later in this testimony, the government's continuing  
6 intervention in the debt markets has created artificially low long-term interest rates and  
7 the recent sharp decline in interest rates has created risk premium ROE estimates that are  
8 not consistent with observed equity market turmoil. The continuing volatility and  
9 heightened investor risk aversion in the equity markets indicates that the cost of equity  
10 has not declined as much as interest rates. Based on these factors, a requested ROE at the  
11 top of my DCF range at 10.4 percent is reasonable.

12 **II. IMPACT OF GMO'S FUEL ADJUSTMENT CLAUSE ON ROE**

13 **Q. Have you considered the effect of GMO'S FAC on the Company's business risk**  
14 **profile and its required ROE?**

15 A. Yes. I have considered the effect of GMO's FAC from several perspectives, and I have  
16 concluded from my analysis that no adjustment to ROE should be made. Most important,  
17 the continuation of GMO's FAC makes GMO's business risk profile more similar to the  
18 risk profiles of the comparable companies that I used to estimate ROE.

19 All of the companies in my 22-company comparable group have fuel and  
20 purchased power adjustment mechanisms. Schedule SCH-1, page 2 lists the companies  
21 and shows their cost recovery mechanisms at the operating company level. From this  
22 perspective, no adjustment to the base ROE obtained from the comparable company

1 group should be applied to GMO. In fact, without the FAC, GMO's business risk profile  
2 would be higher than that of the average comparable company.

3 **III. GMO CAPITAL STRUCTURE AND OVERALL RATE OF RETURN**

4 **Q. Please summarize the Company's requested capital structure and overall rate of**  
5 **return.**

6 A. The requested capital structure components and the resulting overall rate of return are  
7 presented in Table 1 below:

8 **Table 1**  
9 **Requested Capital Structure**

<u>Capital Components</u>	<u>Ratio</u>	<u>Cost</u>	<u>Weighted Cost</u>
Debt	46.918%	5.733%	2.690%
Preferred stock	0.607%	4.291%	0.026%
<u>Common equity</u>	<u>52.475%</u>	<u>10.400%</u>	<u>5.457%</u>
TOTAL	100.000%		<u>8.173%</u>

15 **Q. What is the basis for the Company's requested capital structure and overall rate of**  
16 **return?**

17 A. The requested capital structure, as well as the costs for debt and preferred stock, are  
18 consistent with GPE's projected capital structure at August 31, 2012. These data are  
19 presented in more detail in Schedule SCH-2, with the August 31, 2012 summary shown  
20 on page 10 of that schedule. Using the parent company's consolidated capital structure is  
21 consistent with GMO's approach in its prior rate cases.

1 **Q. What are the key differences between GPE's actual capital structure as of**  
2 **September 30, 2011 and the requested capital structure, projected as of August 31,**  
3 **2012?**

4 A. The actual GPE capital structure as of September 30, 2011, is shown on page 2 of  
5 Schedule SCH-2. The key differences between the actual capital structure and the  
6 requested capital structure, projected as of August 30, 2012, are as follows:

7 Long-Term Debt

8 Net Long-Term Debt is projected to decrease by \$376 million due to \$663 million of  
9 long-term debt maturities partially offset by \$287 million of new long-term debt from the  
10 remarketing of the debt component of the equity units as senior notes.

11 Equity

12 Equity is projected to increase by \*\*■■■■\*\* million, which is driven primarily by the  
13 \$287 million issuance of common stock from the settlement of the equity units stock  
14 purchase contract, a projected \*\*■■■■\*\* million increase in retained earnings and a small  
15 amount of equity issued by GPE through the dividend reinvestment and direct stock  
16 purchase plan and company benefit plans.

17 Equity-linked Convertible Debt

18 The \$287 million equity-linked convertible debt component of the capital structure as of  
19 September 30, 2011 is not part of the August 31, 2012 projected capital structure. Prior  
20 to August 31, 2012, the subordinated notes component of the Equity Units will be  
21 remarketed as Senior Notes which have been included in the long-term debt component  
22 of the projected capital structure. On June 15, 2012, the purchase contract component of

1 the Equity Units will be settled with the issuance of common stock which has been  
2 included in the equity component of the projected capital structure.

3 **IV. FUNDAMENTAL FACTORS THAT AFFECT THE COST OF EQUITY**

4 **Q. What is the purpose of this section of your testimony?**

5 A. In this section, I review recent capital market conditions and industry and company-specific  
6 factors that should be reflected in a cost of capital estimate.

7 **Q. What is the current outlook for the U.S. economy?**

8 A. Growth for the U.S. economy is expected to remain slow in the near term. While most  
9 economists expect real growth to remain positive, in the 1.5 percent range,  
10 unemployment is also expected to remain stubbornly high in the 8 percent to 9 percent  
11 range. Forecasts for 2012 indicate continuing, but slow recovery with new job creation a  
12 fundamental concern. Equity markets have continued to be extremely volatile and only  
13 recently have utility stocks had favorable performance relative to the general market  
14 recovery. As I will explain later in this testimony, the recent positive utility stock  
15 performance is not necessarily a reflection of improving economic conditions. Rather it  
16 very likely reflects a search for yield by investors discouraged by the persistent  
17 intervention of the federal government in the fixed income market and its stated intention  
18 of maintaining low bond yields. On top of these market dislocations, investors are also  
19 concerned about the European sovereign debt crisis. All of these factors point to elevated  
20 risk aversion, a fundamental lack of equilibrium conditions in the financial markets, and a  
21 continuing relatively high cost for equity capital.

1 **Q. What has been the experience in the U.S. capital markets over the past several**  
2 **years?**

3 A. In Schedule SCH-3, page 1, I provide a 10-year review of annual interest rates and rates  
4 of inflation. During the time period, interest rates and inflation generally have been  
5 lower than in the previous decade. Inflation, as measured by the Consumer Price Index,  
6 has fluctuated between a low of zero percent (in 2008) and a high of 4.1 percent (caused  
7 by the spike in energy costs that occurred in 2007). The decade's average annual  
8 inflation rate (2.4 percent) was approximately 100 basis points lower than the longer-  
9 term average rate of the past 60 years (see Schedule SCH-4). Interest rates declined  
10 steadily over most of the period, with the 2011 average utility interest rate at its lowest  
11 level for more than 30 years (see Schedule SCH-6, page 1).

12 **Q. What has been the more recent trend in utility borrowing costs?**

13 A. In Schedule SCH-3, page 2, I provide the month-by-month interest rate data since the  
14 beginning of 2009. Those data are summarized below in Table 2 below.

**Table 2**  
**Long-Term Interest Rate Trends**

Month	Triple-B Utility Rate	30-Year Treasury Rate	Triple-B Utility Spread
Jan-09	7.90	3.13	4.77
Feb-09	7.74	3.59	4.15
Mar-09	8.00	3.64	4.36
Apr-09	8.03	3.76	4.27
May-09	7.76	4.23	3.53
Jun-09	7.31	4.52	2.79
Jul-09	6.87	4.41	2.46
Aug-09	6.36	4.37	1.99
Sep-09	6.12	4.19	1.93
Oct-09	6.14	4.19	1.95
Nov-09	6.18	4.31	1.87
Dec-09	6.26	4.49	1.77
Jan-10	6.16	4.60	1.56
Feb-10	6.25	4.62	1.63
Mar-10	6.22	4.64	1.58
Apr-10	6.19	4.69	1.50
May-10	5.97	4.29	1.68
Jun-10	6.18	4.13	2.05
Jul-10	5.98	3.99	1.99
Aug-10	5.55	3.80	1.75
Sep-10	5.53	3.77	1.76
Oct-10	5.62	3.87	1.75
Nov-10	5.85	4.19	1.66
Dec-10	6.04	4.42	1.62
Jan-11	6.06	4.52	1.54
Feb-11	6.10	4.65	1.45
Mar-11	5.97	4.51	1.46
Apr-11	5.98	4.50	1.48
May-11	5.74	4.29	1.45
Jun-11	5.67	4.23	1.44
Jul-11	5.70	4.27	1.43
Aug-11	5.22	3.65	1.57
Sep-11	5.11	3.18	1.93
Oct-11	5.24	3.13	2.11
Nov-11	4.93	3.02	1.91
Dec-11	5.07	2.98	2.09
3-Mo Avg	<b>5.08</b>	<b>3.04</b>	<b>2.04</b>
12-Mo Avg	<b>5.57</b>	<b>3.91</b>	<b>1.66</b>

Sources: Mergent Bond Record (Utility Rates); www.federalreserve.gov (Treasury Rates).

Three month average is for October 2011-December 2011.

Twelve month average is for January 2011-December 2011.

1 The data in Table 2 track the steady decline in corporate interest rates that has occurred  
2 since early 2009 and the market turmoil that has existed during this time period. The  
3 Federal Reserve's continuing intervention in the financial markets and its efforts to keep  
4 short-term rates near zero and longer-term U.S. Treasury rates at historically low levels  
5 are now affecting yields on high quality corporate debt as well. While the effects of these  
6 monetary policy efforts are not easily captured in rate of return estimation models, equity  
7 market turbulence and the resulting elevated level of risk aversion indicate that the  
8 decline in ROE has been less than the decline in corporate borrowing costs.

9 **Q. Do the smaller spreads between yields on triple-b utility bonds and U.S. treasury**  
10 **bonds mean that the markets have fully recovered from the economic turmoil that**  
11 **resulted from the financial crisis?**

12 A. No. While markets have stabilized considerably from the conditions that existed in 2008  
13 and early 2009, investors remain concerned about high unemployment, large federal  
14 deficits, turmoil in the Mideast, the sovereign debt crisis in Europe as well as other  
15 domestic economic issues. These factors combined with sluggish growth in gross  
16 domestic product ("GDP") continue to raise substantial equity market concerns and  
17 contribute to heightened investor risk aversion.

18 **Q. What do forecasts for the economy and interest rates show for the coming year?**

19 A. During 2012, interest rates are expected to rise only slightly from currently low levels. In  
20 Schedule SCH-3, page 3, I provide S&P's most recent interest rate forecast from its  
21 *Trends & Projections* publication for November 2011. Table 3 below summarizes the  
22 interest rate forecasts:

**Table 3**  
**Standard & Poor's Interest Rate Forecast**

	Dec. 2011 Average	Average 2011 Est.	Average 2012 Est.
Treasury Bills	0.1%	0.1%	0.0%
10-Yr. T-Bonds	2.0%	2.8%	2.3%
30-Yr. T-Bonds	3.0%	3.9%	3.3%
Aaa Corporate Bonds	3.9%	4.6%	4.2%

Sources: [www.federalreserve.gov](http://www.federalreserve.gov), (Current Rates). Standard & Poor's *Trends & Projections*, Nov. 2011, p. 8 (Projected Rates).

These data show that, during 2012, average long-term Treasury interest rates are expected to increase by 30 basis points relative to the low levels in December 2011. Yields on the other bonds shown in the table are also expected to increase slightly. The small interest rate increases projected by S&P are consistent with a sluggishly improving economy and the government's announced intention to maintain low interest rates.

**Q. How have utility stocks performed during the past several years?**

A. Utility stock prices have been more volatile in recent years as compared to their traditional performance. The wider fluctuations in more recent years are vividly illustrated in the following Graph 1, which depicts Dow Jones Utility Average ("DJUA") prices over the past 25 years.

1        Until the late 1990s, utility stocks were viewed as relatively stable investments. Over the  
 2        past decade, however, utility stock prices have fluctuated much more widely. In this  
 3        environment, investors' return expectations and requirements for providing capital to the  
 4        utility industry are high relative to the longer-term, traditional view of the industry.

5        **Q.    How have utility stocks performed since the market low point reached in March**  
 6        **2009?**

7        A.    Prior to the last several months (since May 2011), utility stock prices had lagged well  
 8        behind the general market recovery. Since May, however, fears of potential sovereign  
 9        defaults as well as domestic financial problems have increased equity market risk  
 10        aversion. This situation has made dividend oriented stocks, like utilities, relatively more  
 11        attractive for all income-oriented investors. For the May-December time period, the

1 DJUA rose over 6 percent (6.5%), while the S&P 500 dropped by over 7 percent (-7.5%).  
2 The relatively better performance for utilities has produced lower dividend yields in the  
3 DCF model; *i.e.*, the DCF model results, with respect to dividend yields, do not reflect  
4 the overall market's volatility and heightened risk aversion. This anomaly makes it more  
5 difficult to interpret current DCF cost of equity estimates for utility companies.

6 **Q. How has the "flight to quality" in the traditional fixed income (bond) markets**  
7 **affected dividend oriented stocks?**

8 A. As bond yields have fallen (as a result of the government's ongoing policies in the  
9 financial markets), investors have looked for income from dividend paying stocks.  
10 Consequently, utility stocks have experienced favorable performance as investors in  
11 search of yield have substituted utility common stocks for low-yielding bonds.

12 **Q. Does this imply that the cost of equity capital for utilities has declined as much as**  
13 **interest rates have dropped?**

14 A. No. Equity market risk aversion has increased, not decreased. The domestic economy  
15 faces severe challenges—growth in GDP has slowed, unemployment remains stubbornly  
16 high, and job creation is weak. The federal government is responding to this economic  
17 distress by artificially depressing interest rates through its ongoing purchases of Treasury  
18 bonds and other securities. While this government policy pumps liquidity into the  
19 financial markets, it also removes yield opportunities for traditional investors in safe,  
20 fixed income investments. Thus, investors are trying to react rationally to a market  
21 environment that has many risks but few income opportunities. Such circumstances  
22 reduce ROE estimates from traditional rate of return estimation methods, but these lower

1 estimates do not reflect ongoing market volatility and increased equity market risk  
2 aversion that continues to exist.

3 **Q. Has equity market volatility been recognized as a cause for reduced equity capital**  
4 **availability in the U.S.?**

5 A. Yes. A recent Associated Press article describes this problem in some detail. In that  
6 article the author notes that since August, market swings have been particularly  
7 troublesome:

8 In market-speak, it's called volatility: Large jumps followed by deep dives,  
9 within the course of a week or sometimes the same day. The surge in  
10 volatility since early August has been blamed for preventing companies  
11 from going public and scaring people out of stocks. Some think that even  
12 if Europe resolves its debt crisis, large price swings are here to stay.

13 The long-term trend is toward more volatility. Judging by the number of  
14 times in a year the S&P 500 swung 2 percent or more in a single day,  
15 markets are much more likely to have large leaps up or dives down,  
16 according to S&P's equity research group. Swings of 2 percent occurred  
17 an average of five times a year from 1950 to 1999. It's already happened  
18 20 times this year, with three months left to go. (Matthew Craft,  
19 Associated Press/Yahoo Finance, Oct. 2, 2011).

20 **Q. What is the utility industry's current fundamental position?**

21 A. The industry has seen significant volatility both in terms of fundamental operating  
22 characteristics and the effects of the economy. Slow economic growth has reduced sales  
23 volumes. Moreover, there is great uncertainty regarding environmental rules proposed  
24 by the U.S. Environmental Protection Agency ("EPA"). Both of these factors have  
25 increased the difficulty of planning for future load requirements. This Commission  
26 recognized these concerns when it opened a docket on August 30, 2011 entitled "In the  
27 Matter of an Investigation of the Cost to Missouri Electric Utilities Resulting from  
28 Compliance with Federal Environmental Regulations," Case No. EW-2012-0065. One of

1 the investigation's purposes is to examine "the potential impact" of "current and future  
2 EPA rules under the Clean Air and Clean Water Acts" "to determine [their] potential  
3 impact on reliability and costs" for the state's electric utilities. In the equity markets,  
4 ongoing turmoil has increased investors' preferences for safer, dividend paying  
5 companies. Value Line discusses this phenomenon and provides a warning of possible  
6 overvaluation in its recent Electric Utility update.

### 7 **Value Line Investor Survey**

8 With most of 2011 completed, it seems almost certain that electric utility  
9 stocks will have outperformed the broader market averages when the year  
10 is over. As of mid-December, the Value Line Utility Average is up  
11 slightly, while the Value Line Geometric Average is down about 14%.  
12 Electric utility stocks have long been viewed as a safe haven in volatile  
13 markets, due in large part to their generous dividend yields. However,  
14 many of these issues are now trading within their 2014-2016 Target Price  
15 Ranges. This is often an indication that they have become expensively  
16 priced. (*Value Line Investor Survey*, Dec. 23, 2011, p. 901).

17 In the summary in its recent assessment of the Electric Utility Industry, S&P  
18 provides perspective for investors' concerns for 2012:

### 19 **Standard & Poor's**

20 Regulated U.S. electric utility companies will begin implementing  
21 Environmental Protection Agency (EPA) rules concerning carbon and  
22 other pollutants in 2012. Other challenges included the continued need for  
23 substantial capital spending, the potential for rate pressure in a slow  
24 growth period, and the changing global capital markets. ("The Top 10  
25 Investor Questions For U.S. Regulated Electric Utilities In 2012,"  
26 Standard & Poor's RatingsDirect, Jan. 3, 2012, p. 2).

27 Credit market gyrations and the volatility of utility shares demonstrate the increased  
28 uncertainties that utility investors face. These uncertainties translate into a higher cost of  
29 equity capital.

1 **Q. Do utilities continue to face the operating and financial risks that existed prior to**  
2 **the recent financial crisis?**

3 A. Yes. Prior to the recent financial crisis, the most significant risk factor for utility  
4 investors was the industry's continuing transition to more open market conditions and  
5 competition. With the passage of the Energy Policy Act ("EPACT") in 1992 and the  
6 Federal Energy Regulatory Commission's ("FERC") Order No. 888 in 1996, the stage  
7 was set for vastly increased competition in the electric utility industry. The EPACT's  
8 mandate for open access to the transmission grid and the FERC's implementation through  
9 Order No. 888 effectively opened the market for wholesale electricity to competition.  
10 Previously protected utility service territory and lack of wholesale transmission access in  
11 some parts of the country had limited the availability of competitive bulk power prices.  
12 The EPACT and Order No. 888 have essentially eliminated such constraints and allowed  
13 most utilities to seek alternative wholesale suppliers for their incremental power needs.

14 In addition to wholesale issues at the federal level, in states that have  
15 implemented retail access, even retail markets have opened to competition. Concerns  
16 about these issues and additional efforts for dealing with larger construction programs  
17 and power cost recovery mechanisms have developed as well. As expected, the opening  
18 of previously protected utility markets to competition, the uncertainty created by the  
19 removal of regulatory protection, and continuing fuel price volatility have raised the level  
20 of uncertainty about investment returns across the entire industry.

1 **Q. Is GMO affected by these same market uncertainties and increasing utility capital**  
2 **costs?**

3 A. Yes. To some extent all electric utilities are being affected by the industry's transition to  
4 competition. GMO's power costs and other operating activities have been significantly  
5 affected by transition and restructuring events around the country. In fact, the  
6 uncertainty associated with the changes that are transforming the utility industry as a  
7 whole, as viewed from the perspective of the investor, remain a factor in assessing any  
8 utility's required ROE, including the ROE from GMO's operations in Missouri. This is  
9 true even though Missouri has not adopted retail choice or other major forms of  
10 restructuring.

11 **Q. Are there other specific risks that GMO must address?**

12 A. Yes. The above-mentioned climate change initiatives create fairly significant risk for the  
13 Company going forward. Approximately 80 percent of the Company's fuel mix based on  
14 actual generation is coal. The Company discussed the potential impact of climate change  
15 risk in its most recent Form 10-K:

16 The Companies are subject to extensive federal, state and local  
17 environmental laws, regulations and permit requirements relating to air  
18 and water quality, waste management and disposal, natural resources and  
19 health and safety. In addition to imposing continuing compliance  
20 obligations and remediation costs for historical and pre-existing  
21 conditions, these laws and regulations authorize the imposition of  
22 substantial penalties for noncompliance, including fines, injunctive relief  
23 and other sanctions. There is also a risk that new environmental laws and  
24 regulations, new judicial interpretations of environmental laws and  
25 regulations, or the requirements in new or renewed environmental permits  
26 could adversely affect the Companies' operations. In addition, there is  
27 also a risk of lawsuits brought by third parties alleging violations of  
28 environmental commitments or requirements, creation of a public  
29 nuisance or other matters, and seeking injunctions or monetary or other  
30 damages and certain federal courts have held that state and local

1 governments and private parties have standing to bring climate change tort  
2 suits seeking company-specific emission reductions and damages.

3 The Environmental Protection Agency (EPA) has enacted various  
4 regulations regarding the reporting and permitting of greenhouse gases,  
5 and has proposed other permitting regulations, under the existing Clean  
6 Air Act. These existing and proposed rules establish new thresholds for  
7 greenhouse gas emissions, defining when Clean Air Act permits under the  
8 New Source Performance Standards, New Source Review and Title V  
9 operating permits programs would be required for new or existing  
10 industrial facilities and when the installation of best available control  
11 technology would be required. Most of the Companies' generating  
12 facilities would be affected by these existing and proposed rules.  
13 Additional federal and/or state legislation or regulation respecting  
14 greenhouse gas emissions may be proposed or enacted in the near future.  
15 Further, pursuant to the Collaboration Agreement, KCP&L agreed to  
16 pursue a set of initiatives including energy efficiency, additional wind  
17 generation, lower emission permit levels at its Iatan and LaCygne stations  
18 and other initiatives designed to offset CO2 emissions. Requirements to  
19 reduce greenhouse gas emissions may cause the Companies to incur  
20 significant costs relating to their ongoing operations (through additional  
21 environmental control equipment, retiring and replacing existing  
22 generation, or selecting more costly generation alternatives), to procure  
23 emission allowance credits, or due to the imposition of taxes, fees or other  
24 governmental charges as a result of such emissions.

25 Due to all of the above, the Companies' projected capital and other  
26 expenditures for environmental compliance are subject to significant  
27 uncertainties, including the timing of implementation of any new or  
28 modified environmental requirements, the emissions limits imposed by  
29 such requirements and the types and costs of the compliance alternatives  
30 selected by the Companies. As a result, costs to comply with  
31 environmental requirements cannot be estimated with certainty, and actual  
32 costs could be significantly higher than projections. Other new  
33 environmental laws and regulations affecting the operations of the  
34 Companies may be adopted, and new interpretations of existing laws and  
35 regulations could be adopted or become applicable to the Companies or  
36 their facilities, any of which may materially adversely affect the  
37 Companies' business, adversely affect the Companies' ability to continue  
38 operating its power plants as currently done and substantially increase  
39 their environmental expenditures or liabilities in the future. (2010 GPE  
40 and KCP&L SEC Joint Form 10-K, pp. 13-16.)

1 **Q. How do capital market participants respond to these financial risk perceptions and**  
2 **concerns?**

3 A. As I discussed previously, equity investors respond to changing assessments of risk and  
4 financial prospects by changing the price they are willing to pay for a given security.  
5 When the risk perceptions increase or financial prospects decline, investors refuse to pay  
6 the previously existing market price for a company's securities, and market supply and  
7 demand forces then establish a new lower price. The lower market price typically  
8 translates into a higher cost of capital through a higher dividend yield requirement, as  
9 well as the potential for increased capital gains if prospects improve. In addition to  
10 market losses for prior shareholders, the higher cost of capital is transmitted directly to  
11 the company by the need to issue more shares to raise any given amount of capital for  
12 future investment. The additional shares also impose additional future dividend  
13 requirements and reduce future earnings per share growth prospects.

14 **Q. How have regulatory commissions responded to these changing market and**  
15 **industry conditions?**

16 A. Over the past five years, quarterly allowed ROEs have averaged about 10.4 percent. For  
17 integrated electrics, like GMO, the average allowed rate for 2010 was 10.38 percent and  
18 for 2011, it was 10.24 percent.<sup>1</sup> Table 4 below summarizes the quarterly ROE data for  
19 all types of electric utilities which are published by SNL's Regulatory Research  
20 Associates, an authoritative source for this information which is regularly relied upon by

12 Debt Cost	6.11%	6.65%	6.28%	5.55%	5.17%
13 Indicated Average					
14 Risk Premium	4.25%	3.81%	4.20%	4.79%	5.05%

15  
16 Source: Regulatory Focus, SNL Regulatory Research Associates, Major Rate Case  
17 Decisions, Jan. 10, 2012. Utility debt costs are the "average" public utility bond yields as  
18 reported by Moody's.

19 Based on these data, over the past five years, the allowed equity risk premium for electric  
20 utilities has ranged between 3.81 percent and 5.05 percent.

21 **V. ESTIMATING THE COST OF EQUITY CAPITAL**

22 **Q. What is the purpose of this section of your testimony?**

23 A. The purpose of this section of my testimony is to present a general definition of the cost  
24 of equity and to compare the strengths and weaknesses of several of the most widely used  
25 methods for estimating the cost of equity. Estimating the cost of equity is fundamentally  
26 a matter of informed judgment. The various models provide a concrete link to actual  
27 capital market data and assist with defining the various relationships that underlie the  
28 ROE estimation process.

29 **Q. Please define the term "cost of equity capital" and provide an overview of the cost**  
30 **estimation process.**

1 A. The cost of equity capital is the profit or rate of return that equity investors expect to  
2 receive. In concept it is no different than the cost of debt or the cost of preferred stock.  
3 The cost of equity is the rate of return that common stockholders expect, just as interest  
4 on bonds and dividends on preferred stock are the returns that investors in those  
5 securities expect. Equity investors expect a return on their capital commensurate with the  
6 risks they take, consistent with returns that are available from other similar investments.  
7 Unlike returns from debt and preferred stocks, however, the equity return is not directly  
8 observable in advance and, therefore, it must be estimated or inferred from capital market  
9 data and trading activity.

10 An example helps to illustrate the cost of equity concept. Assume that an investor  
11 buys a share of common stock for \$20 per share. If the stock's expected dividend is  
12 \$1.00, the expected dividend yield is 5.0 percent ( $\$1.00 / \$20 = 5.0$  percent). If the stock  
13 price is also expected to increase to \$21.20 after one year, this \$1.20 expected gain adds  
14 an additional 6.0 percent to the expected total rate of return ( $\$1.20 / \$20 = 6.0$  percent).  
15 Therefore, when buying the stock at \$20 per share, the investor expects a total return of  
16 11.0 percent: 5.0 percent dividend yield, plus 6.0 percent price appreciation. In this  
17 example, the total expected rate of return at 11.0 percent is the appropriate measure of the  
18 cost of equity capital, because it is this rate of return that caused the investor to commit  
19 the \$20 of equity capital in the first place. If the stock were riskier, or if expected returns  
20 from other investments were higher, investors would require a higher rate of return from  
21 the stock, which would result in a lower initial purchase price in market trading.

22 Each day market rates of return and prices change to reflect new investor  
23 expectations and requirements. For example, when interest rates on bonds and savings

1 accounts rise, utility stock prices usually fall. This is true, at least in part, because higher  
2 interest rates on these alternative investments make utility stocks relatively less  
3 attractive, which causes utility stock prices to decline in market trading. This  
4 competitive market adjustment process is quick and continuous, so that market prices  
5 generally reflect investor expectations and the relative attractiveness of one investment  
6 versus another. In this context, to estimate the cost of equity one must apply informed  
7 judgment about the relative risk of the company in question and knowledge about the risk  
8 and expected rate of return characteristics of other available investments as well.

9 **Q. How does the market account for risk differences among the various investments?**

10 A. Risk-return tradeoffs among capital market investments have been the subject of  
11 extensive financial research. Literally dozens of textbooks and hundreds of academic  
12 articles have addressed the issue. Generally, such research confirms the common sense  
13 conclusion that investors will take additional risks only if they expect to receive a higher  
14 rate of return. Empirical tests consistently show that returns from low risk securities,  
15 such as U.S. Treasury bills, are the lowest; that returns from longer-term Treasury bonds  
16 and corporate bonds are increasingly higher as risks increase; and, generally, returns from  
17 common stocks and other more risky investments are even higher. These observations  
18 provide a sound theoretical foundation for both the DCF and risk premium methods for  
19 estimating the cost of equity capital. These methods attempt to capture the well founded  
20 risk-return principle and explicitly measure investors' rate of return requirements.

21 **Q. Can you illustrate the capital market risk-return principle that you just described?**

22 A. Yes. The following graph depicts the risk-return relationship that has become widely  
23 known as the Capital Market Line ("CML"). The CML offers a graphical representation

1 of the capital market risk-return principle. The graph is not meant to illustrate the actual  
2 expected rate of return for any particular investment, but merely to illustrate in a general  
3 way the risk-return relationship.

## Risk-Return Tradeoffs

4 As a continuum, the CML can be viewed as an available opportunity set for investors.  
5 Those investors with low risk tolerance or investment objectives that mandate a low risk  
6 profile should invest in assets depicted in the lower left-hand portion of the graph.  
7 Investments in this area, such as Treasury bills and short-maturity, high quality corporate  
8 commercial paper, offer a high degree of investor certainty. In nominal terms (before  
9 considering the potential effects of inflation), such assets are virtually risk-free.

1 Investment risks increase as one moves up and to the right along the CML. A  
2 higher degree of uncertainty exists about the level of investment value at any point in  
3 time and about the level of income payments that may be received. Among these  
4 investments are long-term bonds and preferred stocks, which offer priority claims to  
5 assets and income payments. They are relatively low risk, but they are not risk-free. The  
6 market value of long-term bonds, even those issued by the U.S. Treasury, often fluctuates  
7 widely when government policies or other factors cause interest rates to change.

8 Farther up the CML continuum, common stocks are exposed to even more risk,  
9 depending on the nature of the underlying business and the financial strength of the  
10 issuing corporation. Common stock risks include market-wide factors, such as general  
11 changes in capital costs, as well as industry and company specific elements that may add  
12 further to the volatility of a given company's performance. As I will illustrate in my risk  
13 premium analysis, common stocks typically are more volatile and have higher risk than  
14 high quality bond investments and, therefore, they reside above and to the right of bonds  
15 on the CML graph. Other more speculative investments, such as stock options and  
16 commodity futures contracts, offer even higher risks (and higher potential returns). The  
17 CML's depiction of the risk-return tradeoffs available in the capital markets provides a  
18 useful perspective for estimating investors' required rates of return.

19 **Q. How is the fair rate of return in the regulatory process related to the estimated cost**  
20 **of equity capital?**

21 A. The regulatory process is guided by fair rate of return principles established in the U.S.  
22 Supreme Court cases, *Bluefield* and *Hope*:

23 A public utility is entitled to such rates as will permit it to earn a return on  
24 the value of the property which it employs for the convenience of the

1 public equal to that generally being made at the same time and in the same  
2 general part of the country on investments in other business undertakings  
3 which are attended by corresponding risks and uncertainties; but it has no  
4 constitutional right to profits such as are realized or anticipated in highly  
5 profitable enterprises or speculative ventures. *Bluefield Water Works &*  
6 *Improvement Co. v. Public Service Comm'n of West Virginia*, 262 U.S.  
7 679, 692-693 (1923).

8 From the investor or company point of view, it is important that there be  
9 enough revenue not only for operating expenses, but also for the capital  
10 costs of the business. These include service on the debt and dividends on  
11 the stock. By that standard the return to the equity owner should be  
12 commensurate with returns on investments in other enterprises having  
13 corresponding risks. That return, moreover, should be sufficient to assure  
14 confidence in the financial integrity of the enterprise, so as to maintain its  
15 credit and to attract capital. *Federal Power Comm'n v. Hope Natural Gas*  
16 *Co.*, 320 U.S. 591, 603 (1944).

17 Based on these principles, the fair rate of return should closely parallel investor  
18 opportunity costs as discussed above. If a utility earns its market cost of equity, neither  
19 its stockholders nor its customers should be disadvantaged.

20 **Q. What specific methods and capital market data are used to evaluate the cost of**  
21 **equity?**

22 A. Techniques for estimating the cost of equity normally fall into three groups: comparable  
23 earnings methods, risk premium methods, and DCF methods.

24 **Q. Please describe the first set of estimation techniques, the comparable earnings**  
25 **methods.**

26 A. The comparable earnings methods have evolved over time. The original comparable  
27 earnings methods were based on book accounting returns. This approach developed ROE  
28 estimates by reviewing accounting returns for unregulated companies thought to have  
29 risks similar to those of the regulated company in question. These methods have  
30 generally been rejected because they assume that the unregulated group is earning its

1 actual cost of capital, and that its equity book value is the same as its market value. In  
2 most situations these assumptions are not valid, and, therefore, accounting-based  
3 methods do not generally provide reliable cost of equity estimates.

4 More recent comparable earnings methods are based on historical stock market  
5 returns rather than book accounting returns. While this approach has some merit, it too  
6 has been criticized because there can be no assurance that historical returns actually  
7 reflect current or future market requirements. Also, in practical application, earned  
8 market returns tend to fluctuate widely from year to year. For these reasons, a current  
9 cost of equity estimate (based on the DCF model or a risk premium analysis) is usually  
10 required.

11 **Q. Please describe the second set of estimation techniques, the risk premium methods.**

12 A The risk premium methods begin with currently observable market returns, such as yields  
13 on government or corporate bonds, and add an increment to account for the additional  
14 equity risk. The capital asset pricing model ("CAPM") and arbitrage pricing theory  
15 ("APT") model are more sophisticated risk premium approaches. The CAPM and APT  
16 methods estimate the cost of equity directly by combining the "risk-free" government  
17 bond rate with explicit risk measures to determine the risk premium required by the  
18 market. Although these methods are widely used in academic cost of capital research,  
19 their additional data requirements and their potentially questionable underlying  
20 assumptions have detracted from their use in most regulatory jurisdictions. The basic  
21 risk premium methods provide a useful parallel approach with the DCF model and assure  
22 consistency with other capital market data consistency in the cost of equity cost  
23 estimation process.

1 **Q. Please describe the third set of estimation techniques, based on the DCF model.**

2 A. The DCF model is the most widely used regulatory cost of equity estimation method.  
3 Like the risk premium approach, the DCF model has a sound basis in theory, and many  
4 argue that it has the additional advantage of simplicity. I will describe the DCF model in  
5 detail below, but in essence its estimate of ROE is simply the sum of the expected  
6 dividend yield and the expected long-term dividend (or price) growth rate. While  
7 dividend yields are easy to obtain, estimating long-term growth is more difficult.  
8 Because the constant growth DCF model also requires very long-term growth estimates  
9 (technically to infinity), some argue that its application is too speculative to provide  
10 reliable results, resulting in the preference for the multistage growth DCF analysis.

11 **Q. Of the three estimation methods, which do you believe provides the most reliable**  
12 **results?**

13 A. From my experience, a combination of DCF and risk premium methods provides the  
14 most reliable approach. While the caveat about estimating long-term growth must be  
15 observed, the DCF model's other inputs are readily obtainable, and the model's results  
16 typically are consistent with capital market behavior. The risk premium methods provide  
17 a good parallel approach to the DCF model and further ensure that current market  
18 conditions are accurately reflected in the cost of equity estimate.

19 **Q. Please explain the DCF model.**

20 A. The DCF model is predicated on the concept that stock prices represent the present value  
21 or discounted value of all future dividends that investors expect to receive. In the most  
22 general form, the DCF model is expressed in the following formula:

23 
$$P_0 = D_1/(1+k) + D_2/(1+k)^2 + \dots + D_\infty/(1+k)^\infty \quad (1)$$

1 where  $P_0$  is today's stock price;  $D_1, D_2,$  etc. are all future dividends and  $k$  is the discount  
2 rate, or the investor's required rate of return on equity. Equation (1) is a routine present  
3 value calculation based on the assumption that the stock's price is the present value of all  
4 dividends expected to be paid in the future.

5 Under the additional assumption that dividends are expected to grow at a constant  
6 rate "g" and that  $k$  is strictly greater than  $g$ , equation (1) can be solved for  $k$  and  
7 rearranged into the simple form:

$$8 \quad k = D_1/P_0 + g \quad (2)$$

9 Equation (2) is the familiar constant growth DCF model for cost of equity estimation,  
10 where  $D_1/P_0$  is the expected dividend yield and  $g$  is the long-term expected dividend  
11 growth rate.

12 **Q. Are there circumstances where the constant growth model may not give reliable**  
13 **results?**

14 A. Yes. Under circumstances when growth rates are expected to fluctuate or when future  
15 growth rates are highly uncertain, the constant growth model may not give reliable  
16 results. Although the DCF model itself is still valid, i.e., equation (1) is mathematically  
17 correct, under such circumstances the simplified form of the model must be modified to  
18 capture market expectations accurately.

19 Recent events and current market conditions in the electric utility industry as  
20 discussed later appear to challenge the constant growth assumption of the traditional DCF  
21 model. Since the mid-1980s, dividend growth expectations for many electric utilities  
22 have fluctuated widely. In fact, over one-third of the electric utilities in the U.S. have  
23 reduced or eliminated their common dividends over this time period. Some of these

1 companies have re-established their dividends, producing exceptionally high growth  
2 rates. Under these circumstances, long-term growth rate estimates may be highly  
3 uncertain, and estimating a reliable "constant" growth rate for many companies is often  
4 difficult.

5 **Q. Can the DCF model be applied when the constant growth assumption is violated?**

6 A. Yes. When growth expectations are uncertain, the more general version of the model  
7 represented in equation (1) should be solved explicitly over a finite "transition" period  
8 while uncertainty prevails. The constant growth version of the model can then be applied  
9 after the transition period, under the assumption that more stable conditions will prevail  
10 in the future. There are two alternatives for dealing with the nonconstant growth  
11 transition period.

12 Under the "terminal price" nonconstant growth approach, equation (1) is written  
13 in a slightly different form:

$$14 \quad P_0 = D_1/(1+k) + D_2/(1+k)^2 + \dots + P_T/(1+k)^T \quad (3)$$

15 where the variables are the same as in equation (1) except that  $P_T$  is the estimated stock  
16 price at the end of the transition period  $T$ . Under the assumption that normal growth  
17 resumes after the transition period, the price  $P_T$  is then expected to be based on constant  
18 growth assumptions. With the terminal price approach, the estimated cost of equity,  $k$ , is  
19 just the rate of return that investors would expect to earn if they bought the stock at  
20 today's market price, held it and received dividends through the transition period (until  
21 period  $T$ ), and then sold it for price  $P_T$ . In this approach, the analyst's task is to estimate  
22 the rate of return that investors expect to receive given the current level of market prices  
23 they are willing to pay.

1 **Q. What is the other alternative for dealing with the nonconstant growth transition**  
2 **period?**

3 A. Under the "multistage" nonconstant growth approach, equation (1) is simply expanded to  
4 incorporate two or more growth rate periods, with the assumption that a permanent  
5 constant growth rate can be estimated for some point in the future:

$$6 \quad P_0 = D_0(1+g_1)/(1+k) + \dots + D_2(1+g_2)^n/(1+k)^n + \\ 7 \quad \dots + [D_T(1+g_T)^{(T+1)}/(k-g_T)]/(1+k)^T \quad (4)$$

8 where the variables are the same as in equation (1), but  $g_1$  represents the growth rate for  
9 the first period;  $D_2$  is the dividend at the beginning of the second period and  $g_2$  is the  
10 growth rate for the second period; and  $D_T$  is the dividend at the beginning of the third  
11 period and  $g_T$  is the growth rate for the period from year T (the end of the transition  
12 period) to infinity. The first two growth rates are simply estimates for fluctuating growth  
13 over "n" years (typically 5 or 10 years) and  $g_T$  is a constant growth rate assumed to  
14 prevail forever after year T. The difficult task for analysts in the multistage approach is  
15 determining the various growth rates for each period.

16 Although less convenient for exposition purposes, the nonconstant growth models  
17 are based on the same valid capital market assumptions as the constant growth version.  
18 The nonconstant growth approach simply requires more explicit data inputs and more  
19 work to solve for the discount rate, k. Fortunately, the required data are available from  
20 investment and economic forecasting services, and computer algorithms can easily  
21 produce the required solutions. Both constant and nonconstant growth DCF analyses are  
22 presented in the following section.

1 **Q. Please explain the risk premium methodology.**

2 A. Risk premium methods are based on the assumption that equity securities are riskier than  
3 debt and, therefore, that equity investors require a higher rate of return. This basic  
4 premise is well supported by legal and economic distinctions between debt and equity  
5 securities, and it is widely accepted as a fundamental capital market principle. For  
6 example, debt holders' claims to the earnings and assets of the borrower have priority  
7 over all claims of equity investors. The contractual interest on mortgage debt must be  
8 paid in full before any dividends can be paid to shareholders, and secured mortgage  
9 claims must be fully satisfied before any assets can be distributed to shareholders in  
10 bankruptcy. Also, the guaranteed, fixed-income nature of interest payments makes year-  
11 to-year returns from bonds typically more stable than capital gains and dividend  
12 payments on stocks. All these factors demonstrate the more risky position of  
13 stockholders and support the equity risk premium concept.

14 **Q. Are risk premium estimates of the cost of equity typically consistent with other  
15 current capital market costs?**

16 A. Generally so, but as noted previously, the recent sharp decline in interest rates and  
17 continuing government intervention in the credit markets raise questions about the  
18 accuracy of current risk premium estimates of ROE. The risk premium approach is  
19 generally useful because it is founded on current market interest rates, which are directly  
20 observable.

21 **Q. Is there consensus about how risk premium data should be employed?**

22 A. No. In regulatory practice, there is often considerable debate about how risk premium  
23 data should be interpreted and used. Since the analyst's basic task is to gauge investors'

1 required returns on long-term investments, some argue that the estimated equity spread  
2 should be based on the longest possible time period. Others argue that market  
3 relationships between debt and equity from several decades ago are irrelevant and that  
4 only recent debt-equity observations should be given any weight in estimating investor  
5 requirements. There is no consensus on this issue. Since analysts cannot observe or  
6 measure investors' expectations directly, it is not possible to know exactly how such  
7 expectations are formed or, therefore, to know exactly what time period is most  
8 appropriate in a risk premium analysis.

9 The important point is to answer the following question: "What rate of return  
10 should equity investors reasonably expect relative to returns that are currently available  
11 from long-term bonds?" The risk premium studies and analyses I discuss later address  
12 this question. My risk premium analysis is based on an intermediate position that avoids  
13 some of the problems and concerns that have been expressed about both very long and  
14 very short periods of analysis with the risk premium model.

15 **Q. Please summarize your discussion of cost of equity estimation techniques.**

16 A. Estimating the cost of equity is one of the most controversial issues in utility ratemaking.  
17 Because actual investor requirements are not directly observable, several methods have  
18 been developed to assist in the estimation process. The comparable earnings method is  
19 the oldest but perhaps least reliable. Its use of accounting rates of return, or even  
20 historical market returns, may or may not reflect current investor requirements.  
21 Differences in accounting methods among companies and issues of comparability also  
22 detract from this approach.

1           The DCF and risk premium methods have become the most widely accepted in  
2 regulatory practice. Under normal market conditions, a combination of the DCF model  
3 and a review of risk premium data provides the most reliable cost of equity estimate.  
4 While the DCF model does require judgment about future growth rates, the dividend  
5 yield is straightforward, and the model's results are generally consistent with actual  
6 capital market behavior. Given current market conditions, I will rely on the DCF model  
7 estimates from the cost of equity studies that follow.

8 **Q. Please explain why you have not provided ROE estimates based on the CAPM.**

9 A. I have not included a CAPM estimate in his case because, under current market  
10 conditions, the CAPM does not provide reliable estimates of the cost of equity. This  
11 situation is caused by the government's continuing intervention in the credit markets and  
12 the resulting artificially low U.S. Treasury bond interest rates that have resulted, as well  
13 as the recent market turmoil's effects on the CAPM's other required inputs.

14 The CAPM is based on three principal inputs:

- 15 1) the risk-free interest rate ( $R_f$ );
- 16 2) the expected market risk premium for stocks relative to the risk-free rate  $E(R_m) -$   
17  $R_f$ ; and
- 18 3) a measure of market-related, or nondiversifiable, risk ( $\beta$  or beta).

19 The CAPM estimate of ROE is then calculated as:

$$20 \text{ ROE} = R_f + \beta[E(R_m) - R_f]$$

21 The market data discussed previously in Section IV of this testimony show that, under  
22 present market conditions, potentially all three of the CAPM's principal inputs tend to  
23 understate ROE. The risk-free rate,  $R_f$ , is understated because, due to governmental

1 credit market policies and investors' increased risk aversion, the U.S. Treasury rates used  
2 for  $R_f$  are artificially low. The second input, the expected market risk premium [ $E(R_m) -$   
3  $R_f$ ], when based on historical data, may also be understated because such data cannot  
4 reflect the heightened investor risk aversion that has resulted from the financial crisis.  
5 Finally, utility beta coefficients may have declined because utility stocks moved in the  
6 opposite direction of the overall market on recent occasions. All these factors cause  
7 CAPM estimates of ROE for utilities to be understated. For this reason, in the present  
8 case, I rely on the DCF and other risk premium models to estimate the cost of equity for  
9 GMO.

## 10 VI. COST OF EQUITY CAPITAL FOR GMO

11 **Q. What is the purpose of this section of your testimony?**

12 A. In this section I present my quantitative studies of the cost of equity capital for GMO and  
13 discuss the details of my analysis.

14 **Q. How are your studies organized?**

15 A. In the first part of my analysis, I apply three versions of the DCF model to the 22-  
16 company group of electric utilities based on the selection criteria discussed previously.  
17 In the second part of this section, I describe my risk premium analysis and review  
18 projected economic conditions and projected capital costs for the coming year.

19 My DCF analysis is based on three versions of the DCF model. In the first  
20 version, I use the constant growth format with long-term expected growth based on  
21 analysts' growth rate projections. In the second version of the DCF model, for the  
22 estimated growth rate, I use the estimated long-term GDP growth rate. In the third  
23 version of the DCF model, I use a two-stage growth approach, with stage one based on

1 Value Line's three-to-five-year dividend growth projections and stage two based on long-  
2 term projected growth in GDP. The dividend yields in all three of the DCF models are  
3 from Value Line's projections of dividends for the coming year and stock prices are from  
4 the three-month average for the months that correspond to the Value Line editions from  
5 which the underlying financial data are taken.

6 **Q. The DCF model requires an estimate of investors' long-term growth rate**  
7 **expectations. Why do you believe your forecast of GDP growth based on long-term**  
8 **historical data is appropriate?**

9 A. There are at least three reasons. First, most econometric forecasts are derived from the  
10 trending of historical data or the use of weighted averages. This is the approach I have  
11 taken in Schedule SCH-4. The long-run historical average GDP growth rate is 6.7  
12 percent, but my estimate of long-term expected growth is 5.8 percent. My forecast is  
13 lower because my forecasting method gives much more weight to the more recent 10-  
14 and 20-year periods.

15 Second, some currently lower GDP growth forecasts likely understate very long  
16 growth rate expectations that are required in the DCF model. Many of those forecasts are  
17 currently low because they are based on the assumption of permanently low inflation  
18 rates, in the range of 2 percent. As shown in my Schedule SCH-4 the average long-term  
19 inflation rate has been over 3 percent in all but the most recent 10- and 20- year periods.

20 Finally, the current economic turmoil makes it even more important to consider  
21 longer-term economic data in the growth rate estimate. As discussed in the previous  
22 section, current near-term forecasts for both real GDP and inflation are severely  
23 depressed. To the extent that even the longer-term outlooks of professional economists

1 are also depressed, their forecasts will be low. Under these circumstances, a longer-term  
2 balance is even more important. For all these reasons, while I am also presenting other  
3 growth rate approaches based on analysts' estimates in this testimony, I believe it is  
4 appropriate also to consider long-term GDP growth in estimating the DCF growth rate.

5 **Q. Does independent academic research support using GDP growth in the DCF model?**

6 A. Yes. Growth in nominal GDP (*i.e.*, real GDP plus inflation) is the most general measure  
7 of economic growth in the U.S. economy. For long time periods, such as those used in  
8 the Morningstar/Ibbotson Associates rate of return data, GDP growth has averaged  
9 between 5 percent and 8 percent per year. From this observation, Professors Brigham  
10 and Houston offer the following observation concerning the appropriate long-term  
11 growth rate in the DCF Model:

12 Expected growth rates vary somewhat among companies, but dividends  
13 for mature firms are often expected to grow in the future at about the same  
14 rate as nominal gross domestic product (real GDP plus inflation). On this  
15 basis, one might expect the dividend of an average, or "normal," company  
16 to grow at a rate of 5 to 8 percent a year. (Eugene F. Brigham and Joel F.  
17 Houston, *Fundamentals of Financial Management*, 11th Ed. 2007, p.  
18 298.).

19 Other academic research on corporate growth rates offers similar conclusions about GDP  
20 growth as well as concerns about the long-term adequacy of analysts' forecasts:

21 Our estimated median growth rate is reasonable when compared to the  
22 overall economy's growth rate. On average over the sample period, the  
23 median growth rate over 10 years for income before extraordinary items is  
24 about 10 percent for all firms. ... After deducting the dividend yield (the  
25 median yield is 2.5 percent per year), as well as inflation (which averages  
26 4 percent per year over the sample period), the growth in real income  
27 before extraordinary items is roughly 3.5 percent per year. This is  
28 consistent with the historical growth rate in real gross domestic product,  
29 which has averaged about 3.4 percent per year over the period 1950-1998.  
30 (Louis K. C. Chan, Jason Karceski, and Josef Lakonishok, "The Level and  
31 Persistence of Growth Rates," *The Journal of Finance*, Apr. 2003, p. 649).

1 IBES long-term growth estimates are associated with realized growth in  
2 the immediate short-term future. Over long horizons, however, there is  
3 little forecastability in earnings, and analysts' estimates tend to be overly  
4 optimistic. ... On the whole, the absence of predictability in growth fits in  
5 with the economic intuition that competitive pressures ultimately work to  
6 correct excessively high or excessively low profitability growth. (*Ibid.*, p.  
7 683).

8 These findings support the notion that long-term growth expectations are more closely  
9 predicted by broader measures of economic growth than by near-term analysts' estimates.  
10 Especially for the very long-term growth rate requirements of the DCF model, the growth  
11 in nominal GDP should be considered an important input.

12 **Q. How did you estimate the expected long-run GDP growth rate?**

13 A. I developed my long-term GDP growth forecast from nominal GDP data contained in the  
14 St. Louis Federal Reserve Bank data base. That data for the period 1950 through 2011 is  
15 summarized in my Schedule SCH-4. As shown at the bottom of that schedule, the overall  
16 average for the period was 6.7 percent. The data also show, however, that in the more  
17 recent years since 1980, lower inflation has resulted in lower overall GDP growth. For  
18 this reason I gave more weight to the more recent years in my GDP forecast. This  
19 approach is consistent with the concept that more recent data should have a greater effect  
20 on expectations and with generally lower near- and intermediate-term growth rate  
21 forecasts that presently exist. Based on this approach, my overall forecast for long-term  
22 GDP growth is 5.8 percent.

23 **Q. Please summarize the results of your DCF analyses.**

24 A. The DCF results for my comparable company group are presented in Schedule SCH-5.  
25 As shown in the first column of page 1 of that schedule, the traditional constant growth  
26 model produces an ROE of 10.0 percent. In the second column of page 1, I recalculate

1 the constant growth results with the growth rate based on long-term forecasted growth in  
2 GDP. With the GDP growth rate, the constant growth model indicates an ROE range of  
3 10.2 percent to 10.4 percent. Finally, in the third column of page 1, I present the results  
4 from the multistage DCF model. The multistage model indicates an ROE range of 10.0  
5 percent to 10.1 percent. The overall results from the DCF model indicate an ROE range  
6 of 10.0 percent to 10.4 percent.

7 **Q. What are the results of your risk premium studies?**

8 A. The details and results of my risk premium studies are shown in Schedule SCH-6. These  
9 studies indicate an ROE range of 9.97 percent to 10.12 percent, based on both projected  
10 and currently low Baa interest rates. The Federal Reserve System's continuing "easy  
11 money" policies have provided renewed liquidity in the credit markets that is reflected in  
12 these lower yields. These results are not consistent with DCF results, which reflect at  
13 least a portion of the increased equity market risk aversion as shown in continuing the  
14 volatility in stock prices for utility shares. These circumstances indicate that the cost of  
15 equity capital for utilities has not declined to the same extent as interest rates on utility  
16 debt.

17 **Q. How are your risk premium studies structured?**

18 A. My equity risk premium studies are divided into two parts. First, I compare electric  
19 utility authorized ROEs for the period 1980-2011 to contemporaneous long-term utility  
20 interest rates. The differences between the average authorized ROEs and the average  
21 interest rate for the year is the indicated equity risk premium. I then add the indicated  
22 equity risk premium to the forecasted and current triple-B utility bond interest rate to  
23 estimate ROE. Because there is a strong inverse relationship between equity risk

1 premiums and interest rates (when interest rates are high, risk premiums are low and vice  
2 versa), further analysis is required to estimate the current equity risk premium level.

3 The inverse relationship between equity risk premiums and interest rate levels is  
4 well documented in numerous, well-respected academic studies. These studies typically  
5 use regression analysis or other statistical methods to predict or measure the equity risk  
6 premium relationship under varying interest rate conditions. On page 3 of Schedule  
7 SCH-6, I provide regression analyses of the allowed annual equity risk premiums relative  
8 to interest rate levels. The negative and statistically significant regression coefficients  
9 confirm the inverse relationship between equity risk premiums and interest rates. This  
10 means that when interest rates rise by one percentage point, the cost of equity increases,  
11 but by a smaller amount. Similarly, when interest rates decline by one percentage point,  
12 the cost of equity declines by less than one percentage point. I use this negative interest  
13 rate change coefficient in conjunction with current interest rates to establish the  
14 appropriate current equity risk premium.

15 **Q. Can you illustrate the inverse relationship between equity risk premiums and**  
16 **interest rates without using the statistical analysis described above?**

17 A. Yes. Statistical analysis is often used, especially in academic research, to substantiate  
18 certain economic and financial relationships. For equity risk premium analysis, however,  
19 the fundamental issue can be observed by simply averaging the data for various time  
20 periods without further statistical analysis. The data in Table 5 below show average  
21 utility bond yields and equity risk premiums for each non-overlapping, five-year period  
22 between 1980 and 2011.

**Table 5**  
**Average Five-Year Utility Bond Yields and Equity Risk**  
**Premiums**  
**(1980-2011)**

Period	Average Utility Bond Interest Rate	Average Equity Risk Premium
1980-1986	13.31%	1.69%
1987-1991	9.81%	2.99%
1992-1996	8.02%	3.54%
1997-2001	7.61%	3.66%
2002-2006	6.42%	4.34%
2007-2011	5.95%	4.42%

Source: Schedule SCH-6, p. 1.

1           These data show that equity risk premiums have consistently increased as interest rates  
2           have declined, and that they were lower when interest rates were high. This result is a  
3           market-based reflection, which shows that required rates of return in the stock market do  
4           not move in lockstep with changes in interest rates. Because utilities must compete with  
5           other types of equity investments for capital, the ROE for utilities does not change by as  
6           much as the observed changes in interest rates. Arguments that unadjusted, long-term  
7           average risk premiums can be used with current, historically low interest rates to estimate  
8           ROE are mistaken. That approach to equity risk premium analysis will consistently  
9           understate the required rate of return.

10   **Q.   Please summarize the results of your cost of equity analysis.**

11   A.   My quantitative results are summarized in Table 6 below:

**Table 6**  
**Summary of Cost of Equity Estimates**

<u>DCF Analysis</u>	<u>Indicated Cost</u>
Constant Growth (Traditional Growth)	10.0%
Constant Growth (GDP Growth)	10.2%-10.4%
Multistage Growth Model	10.0%-10.1%
DCF Range	<u>10.0%-10.4%</u>
<u>Risk Premium Analysis</u>	<u>Indicated Cost</u>
Projected Utility Interest Rate + Risk Premium	
Risk Premium (5.34% + 4.78%)	10.12%
Current Utility Interest Rate + Risk Premium	
Risk Premium (5.08% + 4.89%)	9.97%
GMO ROE	<u>10.4%</u>

17 **Q. How should these results be interpreted by the Commission in setting the fair cost of**  
18 **equity for GMO?**

19 A. The midpoint DCF estimate my for comparable group is 10.2 percent. Given current  
20 market conditions, I support an ROE at the top of my DCF range at 10.4 percent. Such  
21 conditions make it difficult to strictly interpret quantitative model estimates for the cost  
22 of equity. The government's continuing intervention in the credit markets and the  
23 continuing turmoil that exists in the equity markets support the higher estimate. Under  
24 these circumstances, use of a lower DCF range or equity risk premium estimates based  
25 strictly on historical risk premium relationships would likely understate the cost of  
26 equity.

27 **Q. Does this conclude your testimony?**

28 A. Yes, it does.

**BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI**

In the Matter of KCP&L Greater Missouri )  
Operations Company's Request for Authority to ) Case No. ER-2012-0175  
Implement General Rate Increase for Electric Service )

**AFFIDAVIT OF SAMUEL C. HADAWAY**

STATE OF TEXAS            )  
  ) ss  
COUNTY OF TRAVIS        )

Samuel C. Hadaway, being first duly sworn on his oath, states:

1. My name is Samuel C. Hadaway. I am employed by FINANCO, Inc. in Austin, Texas. I have been retained by Great Plains Energy, Inc., the parent company of KCP&L Greater Missouri Operations Company, to serve as an expert witness to provide cost of capital testimony on behalf of KCP&L Greater Missouri Operations Company.

2. Attached hereto and made a part hereof for all purposes is my Direct Testimony on behalf of KC&PL Greater Missouri Operations Company consisting of forty-two (42) pages, having been prepared in written form for introduction into evidence in the above-captioned docket.

3. I have knowledge of the matters set forth therein. I hereby swear and affirm that my answers contained in the attached testimony to the questions therein propounded, including any attachments thereto, are true and accurate to the best of my knowledge, information and belief.

Samuel C. Hadaway  
Samuel C. Hadaway

Subscribed and sworn before me this 15<sup>th</sup> day of February, 2012.

James Miller  
Notary Public

My commission expires: 11-09-13

**SAMUEL C. HADAWAY**

**FINANCO, Inc.  
Financial Analysis Consultants**

**3520 Executive Center Drive, Suite 124  
Austin, Texas 78731  
(512) 346-9317**

**SUMMARY OF QUALIFICATIONS**

- Principal, Financial Analysis Consultants (FINANCO, Inc.).
- Ph.D. in Finance and Economics.
- Extensive expert witness testimony in court and before regulatory agencies.
- Management of professional research staff in academic and regulatory organizations.
- Professional presentations before executive development groups, the National Rate of Return Analysts' Forum, and the New York Society of Security Analysts.
- Financial Management Association, previously Vice President for Practitioner Services.

**EDUCATION**

**The University of Texas at Austin  
Ph.D., Finance and Econometrics  
January 1975**

*Dissertation: An Evaluation of the  
Original and Recent Variants of the  
Capital Asset Pricing Model.*

**The University of Texas at Austin  
MBA, Finance  
June 1973**

*Thesis: The Pricing of Risk on the  
New York Stock Exchange.*

**Southern Methodist University  
BA, Economics  
June 1969**

Honors program. Departmental  
distinction.

**OTHER EXPERIENCE**

**University of Texas at Austin  
Adjunct Associate Professor  
1985-1988, 2004-Present**

Corporate Financial Management,  
Investments, and Integrative Finance  
Cases.

**Texas State University San Marcos  
Associate Professor of Finance  
1983-1984, 2003-2004**

Graduate and undergraduate courses  
in Financial Management, Managerial  
Economics, and Investment Analysis.

**Public Utility Commission of Texas  
Chief Economist and Director of  
Economic Research Division  
August 1980-August 1983**

Lead financial witness. Supervised  
Commission staff in research and  
testimony on rate of return, financial  
condition, and economic analysis.

**Assistant Professor of Finance  
Texas Tech University  
July 1978-July 1980  
University of Alabama  
January 1975-June 1978**

Member of graduate faculty. Conducted  
Ph.D. seminars and directed doctoral  
dissertations in capital market theory.  
Served as consultant to industry,  
church and governmental organizations.

- General Telephone Company of the Southwest, Dkt. No. 3690, April 1981.
- Mid-South Electric Cooperative, Dkt. No. 3656, March 1981.
- West Texas Utilities Company, Dkt. No. 3473, December 1980.
- Houston Lighting & Power Company, Dkt. No. 3320, September 1980.

**ECONOMIC ANALYSIS AND TESTIMONY**

**Antitrust Litigation:**

- Marginal Cost Analysis of Concrete Production/Predatory Pricing (Stiles)
- Analysis of Lost Business Opportunity due to denial of Waste Disposal Site Permit (Browning-Ferris Industries, Inc.).
- Analysis of Electric Power Transmission Costs in Purchased Power Dispute, 1995, (City of College Station, Texas).

**Contract Litigation:**

- Analysis of Cogeneration Contract/Economic Viability Issues(Texas-New Mexico Power Company)
- Definition of Electric Sales/Franchise Fee Contract Dispute (Reliant Energy HL&P)
- Analysis of Purchased Power Agreement/Breach of Contract (Texas-New Mexico Power Company)
- Regulatory Commission Provisions in Franchise Fee Ordinance Dispute (Central Power & Light Company)
- Analysis of Economic Damages resulting from attempted Acquisition of Highway Construction Company (Dillingham Construction Corporation).
- Analysis of Economic Damages due to Contract Interference in Acquisition of Electric Utility Cooperative (PacifiCorp).
- Analysis of Economic Damages due to Patent Infringement of Boiler Cleaning Process (Dowell-Schlumberger/The Dow Chemical Company).

- Analysis of Lost Profits in Highway Construction Dispute, Jones Bros., Plaintiff, v. Flour Daniel, Balfour Beatty, Lambrecht, and Lone Star Infrastructure, LLC, Defendants, 53rd Judicial District Court of Travis County, Texas, Cause No. GN204386, 2005, (Flour, et al)
- Analysis of Lost Profits in Insurance Dispute, Nickelson v. International Shipbreaking Ltd., LLC, et al, 332<sup>nd</sup> District Court, Hidalgo County, Texas, Cause No. C-482-01-F, 2005, (Great American Insurance Company).
- Analysis of Lost Profits and Other Economic Damages due to Patent Infringement, Climb Tech, Guthrie, & Schwartz Design, Plaintiffs, v. Verble, Hagler, Reeves, Valcor Industries, Inc., Defendants, U.S. District Court, Western District, Austin, Texas, Civil Action No. 1:05-cv-864-LY, 2008, (Verble, Hagler, et al).

**Lender Liability/Securities Litigation:**

- ERISA Valuation of Retail Drug Store Chain (Sommers Drug Stores Company).
- Analysis of Lost Business Opportunities in Failed Businesses where Lenders Refused to Extend or Foreclosed Loans (FirstCity Bank Texas, McAllen State Bank, General Electric Credit Corporation).
- Usury and Punitive Damages Analysis based on Property Valuation in Failed Real Estate Venture, 1995, (Tomen America, Inc.).

**Personal Injury/Wrongful Death/Lost Earnings Capacity Litigation:**

- Analysis of Lost Earnings Capacity and Punitive Damages due to Industrial Accident (Worsham, Forsythe and Wooldridge).
- Analysis of Lost Earnings Capacity due to Improper Termination (Lloyd Gosselink, Ryan & Fowler).
- Present Value Analysis of Lost Earnings and Future Medical Costs due to Medical Malpractice (Sierra Medical Center).
- Present Value Analysis of Life Care Plan, U.S. District Court, Eastern District of Texas, Texarkana Division, Chisum v. Ford Motor Company, Civil Action No. 5:05-cv-0045, 2005, (Ford Motor Company).
- Analysis of Lost Earnings Capacity due to Industrial Accident, 122<sup>nd</sup> District Court, Galveston County, Texas, Trevino v. BP Products North America, Inc., Cause No. 05-cv-0341, 2006, (BP Products North America, Inc).

**Product Warranty/Liability Litigation:**

- Analysis of Lost Profits due to Equipment Failure in Cogeneration Facility (WF Energy/Travelers Insurance Company).
- Analysis of Economic Damages due to Grain Elevator Explosion (Degesch Chemical Company).
- Analysis of Economic Damages due to failure of Plastic Pipe Water Lines (Western Plastics, Inc.)
- Analysis of Rail Car Repair and Maintenance Costs in Product Warranty Dispute (Youngstown Steel Door Company).
- Analysis of Lost Profits due to Equipment Failure in Electric Power Plant, Houston Casualty Co., Comision Federal de Electricidad, and Seguros Comercial America S.A. de C.V. (Plaintiffs) v. Siemens Power Corporation, et al, District Court of Dallas County Texas, Cause No. DV-99-02749, 2005, (Siemens).
- Analysis of Lost Profits due to Manufacturing Parts Failure, Sanijet Corp. (Plaintiff) v. Lexor International, Inc., U.S. District Court, Northern Division of Texas, Dallas, Texas, Case No. 3:06-cv-1258-B ECF (Lexor International)

**Property Tax Litigation:**

- Evaluation of Electric Utility Distribution System (Jasper-Newton Electric Cooperative).
- Evaluations of Electric Utility Generating Plants (West Texas Utilities Company).

**Valuations of Closely Held Businesses in Litigation Support and Federal Estate Tax Planning.**
