GLOSSARY OF FREQUENTLY USED TERMS

TERM	DESCRIPTION
Beta Coefficient	A component of the CAPM that measures the risk of a given stock relative to the risk of the overall market.
Bond Yield Plus Risk Premium Approach	A risk premium model used to estimate the Cost of Equity. The Bond Yield Plus Risk Premium approach assumes that investors required a risk premium over the cost of debt as compensation for assuming the greater risk of common equity investment. The model is expressed as a bond yield plus equity risk premium.
Capital Asset Pricing Model (“CAPM”)	A risk premium-based model used to estimate the Cost of Equity, assuming the stock is added to a well-diversified portfolio. The CAPM assumes that investors are compensated for the time value of money (represented by the Risk-Free Rate), and risk (represented by the combination of the Beta Coefficient and the Market Risk Premium).
Constant Growth DCF Model	A form of the DCF model that assumes cash flows will grow at a constant rate, in perpetuity. The model simplifies to a form that expresses the Cost of Equity as the sum of the expected dividend yield and the expected growth rate.
Cost of Equity	The return required by investors to invest in equity securities. The terms “Return on Equity” and “Cost of Equity” are used interchangeably.
Discounted Cash Flow (“DCF”) Model	A model used to estimate the Cost of Equity based on expected cash flows. The Cost of Equity equals the discount rate that sets the current market price equal to the present value of expected cash flows.
Dividend Yield	For a given stock, the current annualized dividend divided by its current market price.
Gross Domestic Product (“GDP”)	The value of all finished goods and services produced within a country during a given period of time (usually measured annually). GDP includes public and private consumption, government expenditures, investments, and net exports (that is, exports minus imports).
Market Return	The expected return on the equity market, taken as a portfolio.
Market Risk Premium	The additional compensation required by investing in the equity market as a portfolio over the Risk-Free rate. The Market Risk Premium is a component of the CAPM.

ROBERT B. HEVERT
SURREBUTTAL TESTIMONY

TERM	DESCRIPTION
Proxy Group	A group of publicly traded companies used as the “proxy” for the subject company (in this case, Liberty-Empire). Proxy companies are sometimes referred to as “Comparable Companies.”
Return on Equity (“ROE”)	The return required by investors to invest in equity securities. The terms “Return on Equity” and “Cost of Equity” are used interchangeably. Please note that the ROE in this context is distinct from the accounting measure sometimes referred to as the “Return on Average Common Equity”.
Risk-Free Rate	The rate of return on an asset with no risk of default.
Risk Premium	The additional compensation required by investors for taking on additional increments of risk. Risk Premium-based approaches are used in addition to the DCF and CAPM to estimate the Cost of Equity.
Treasury Yield	The return on Treasury securities; the yield on long-term Treasury bonds is considered to be a measure of the Risk-Free Rate.

SURREBUTTAL TESTIMONY
OF
ROBERT B. HEVERT
THE EMPIRE DISTRICT ELECTRIC COMPANY
BEFORE THE
MISSOURI PUBLIC SERVICE COMMISSION
CASE NO. ER-2019-0374

1 **I. INTRODUCTION, CAPITAL MARKET UPDATE, AND SUMMARY OF**
2 **RECOMMENDATIONS**

3 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

4 A. My name is Robert B. Hevert and my business address is ScottMadden, Inc., 1900 West
5 Park Drive, Suite 250, Westborough, MA 01581.

6 **Q. ON WHOSE BEHALF ARE YOU SUBMITTING THIS TESTIMONY?**

7 A. I am submitting this surrebuttal testimony (“Surrebuttal Testimony”) before the Missouri
8 Public Service Commission (“Commission”) on behalf of The Empire District Electric
9 Company, a Liberty Utilities company (“Liberty-Empire” or the “Company”).

10 **Q. ARE YOU THE SAME ROBERT B. HEVERT WHO FILED DIRECT AND**
11 **REBUTTAL TESTIMONY IN THIS MATTER ON BEHALF OF LIBERTY-**
12 **EMPIRE?**

13 A. Yes, I am.

14 **Q. WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?**

15 A. My Surrebuttal Testimony responds to the rebuttal testimonies of Peter Chari on behalf of
16 the Commission’s Utility Services Division (“Staff”), and David Murray on behalf of the
17 Office of the Public Counsel (“OPC”) (together, the “Opposing Witnesses”), as they
18 relate to the Company’s Return on Equity (“ROE” or “Cost of Equity”) and capital

1 structure. My analyses and conclusions are supported by the data presented in Schedules
2 RBH-S1 through RBH-S6, which have been prepared by me or under my direction.

3 **Q. HAVE YOU UPDATED YOUR ROE ANALYSES FROM THOSE PRESENTED**
4 **IN YOUR REBUTTAL TESTIMONY?**

5 A. No, I have not. I continue to rely on the analyses provided in my Rebuttal Testimony,
6 which were updated based on market data through January 31, 2020.

7 **Q. PLEASE PROVIDE A SUMMARY OVERVIEW OF YOUR SURREBUTTAL**
8 **TESTIMONY.**

9 A. In my Rebuttal Testimony, I found the Company's Cost of Equity to be 9.95 percent,
10 within a range of 9.80 percent to 10.60 percent. For the reasons discussed throughout my
11 Surrebuttal Testimony, none of the arguments raised in Messrs. Chari or Murray's
12 rebuttal testimonies have caused me to revise my recommendation. That said, the capital
13 markets continue to be extraordinarily volatile. As discussed below, from mid-February
14 through March 20, the utility sector lost about 31.00 percent of its value. During that
15 time, utility dividend yields increased over 100 basis points, and the correlation between
16 utility stocks and the overall market approached 100.00 percent. In short, utilities have
17 not escaped the severe market volatility, and investors have increased the returns they
18 require because of that risk.

19 In my Direct and Rebuttal Testimonies, I recommended an ROE range of 9.80
20 percent to 10.60 percent. Because the capital markets deteriorated so quickly, the models
21 used to estimate the Cost of Equity have not fully reflected those changes. For example,
22 Beta coefficients in the Capital Asset Pricing Model ("CAPM") measure systematic risk
23 over five years; the most recent month or two will not materially affect them. Further,

1 although the significant fall in Treasury yields is a matter of heightened risk, the CAPM
2 would not make a specific adjustment to reflect that effect.

3 Even though financial models may not fully capture the now-elevated risk to
4 utility stocks, there can be no question the risk is higher than it was even two months ago.
5 Giving any weight to that heightened risk indicates an ROE toward the very upper end of
6 my recommended range. That said, I have maintained my 9.95 percent ROE
7 recommendation which, under current conditions, is a conservative estimate of the
8 Company's Cost of Equity.

9 Messrs. Chari's and Murray's ROE recommendations, both 9.25 percent, are
10 unduly low under more "normal" market conditions; they are even more so now. With
11 the ongoing uncertainty in capital markets, now is not the time to add the financial risk
12 created by lower cash flows, and regulatory risk associated with a return that is far
13 removed from those available to investors in other electric utilities. Putting aside the
14 continuing flaws in their approaches, Messrs. Chari's and Murray's recommendations
15 would have the counterproductive effect of increasing risks to investors, and increasing
16 the returns required by them, as well as potentially restricting access to capital.

17 As to the Company's proposed capital structure, nothing in Mr. Murray's rebuttal
18 testimony changes my position that the proper frame of reference is Liberty-Empire's
19 capital structure relative to industry practice. Nor does Mr. Murray's rebuttal testimony
20 change my view that conditions 4 and 5 established in Case No. EM-2016-0213 (referred
21 to herein as "Merger Conditions") are properly assessed by reference to industry practice.
22 As I explain in Section IV, the analyses Mr. Murray "expected" to see in my rebuttal

1 testimony have no bearing on whether Liberty-Empire is properly, or “economically”
2 capitalized.

3 What is relevant is that Mr. Murray’s recommendation would force the Company
4 to take on unnecessary levels of debt just as the capital markets require stronger, not
5 weaker balance sheets. It would compound extraordinarily high levels of market risk
6 with inefficient levels of financing risk. Regardless of its derivation, Mr. Murray’s
7 proposed 46.00 percent equity ratio cannot be seen as the “most economical”.

8 **Q. PLEASE DISCUSS THE CURRENT CAPITAL MARKET CONDITIONS, AND**
9 **THEIR IMPLICATIONS FOR ESTIMATING THE COMPANY’S COST OF**
10 **EQUITY.**

11 A. The recent, dramatic shifts in the capital markets brought about by the COVID-19 virus
12 cannot be overstated. From February 12 to March 20, the S&P 500 lost about 32.00
13 percent of its value, and the utility sector lost about 31.00 percent.¹ During that time the
14 VIX, which measures expected market volatility, increased as high as six-fold.² On
15 March 9, the 30-year Treasury yield fell below 1.00 percent for the first time.

16 Central banks have implemented multiple policies to address the financial market
17 instability. On March 3, 2020 the Federal Reserve reduced the overnight lending rate by
18 50 basis points, to a target range of 1.00 percent to 1.25 percent. It did so in light of the
19 “evolving risks to economic activity” posed by the coronavirus, and despite its view that
20 “[t]he fundamentals of the U.S. economy remain strong.”³ On March 12, 2020, the
21 Federal Reserve Bank of New York (“FRBNY”) released a statement regarding
22 “Treasury Reserve Management Purchases and Repurchase Operations”. In that

¹ Source: S&P Capital IQ. Utility sector measured by the XLU, and Dow Jones Utility Average.

² Source: YahooFinance.

³ Federal Reserve Press Release, March 3, 2020.

1 statement, the FRBNY announced that from March 13 to April 13, 2020 it would
2 repurchase \$60 billion of Treasury securities “across a range of maturities”. The FRBNY
3 also stated it had updated its monthly schedule of repurchase agreement operations to
4 “address temporary disruptions in Treasury financing markets.” Together, the FRBNY’s
5 changes were meant to “address highly unusual disruptions in Treasury financing markets
6 associated with the coronavirus outbreak.”

7 Three days later, on March 15, 2020 the Bank of Canada, the Bank of England,
8 the Bank of Japan, the European Central Bank, the Federal Reserve, and the Swiss
9 National Bank announced “a coordinated action to enhance the provision of liquidity via
10 the standing U.S. dollar liquidity swap line arrangements.”⁴ The same day, the Federal
11 Reserve lowered the Federal Funds rate by an additional 100 basis points, to a target
12 range of 0.00 percent to 0.25 percent, and announced its plan to increase holdings of
13 Treasury securities and agency mortgage-backed securities by a total of \$700 million.⁵

14 Despite those central bank actions, the 30-Year Treasury bond yield has remained
15 highly volatile (see Chart 1 below).

⁴ Federal Reserve Board Press Release, *Coordinated Central Bank Action to Enhance the Provision of Global U.S. Dollar Liquidity*, March 15, 2020.

⁵ Federal Reserve Press Release, March 15, 2020.

1

Chart 1: Coefficient of Variation in 30-Year Treasury Yields⁶

2

3

4

5

6

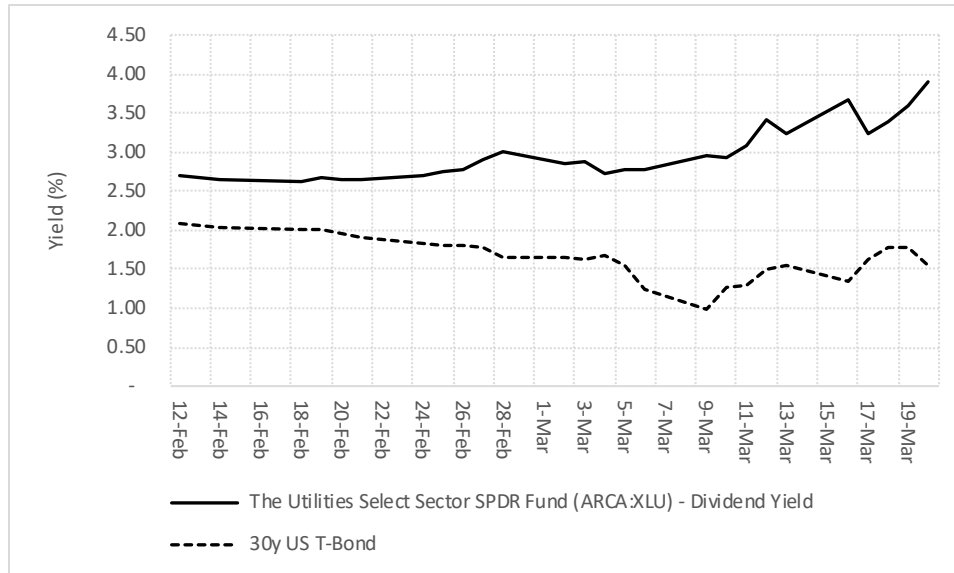

7

That volatility also is reflected in the “yield spread”, or the difference between dividend yields and long-term Government bond yields. Looking to the XLU, an exchange-traded fund of utility companies, the dividend yield increased over 120 basis points from February 12 to March 20, 2020 as the 30-year Treasury yield fell by 54 basis points (see Chart 2, below).

⁶ Source: S&P Global Market Intelligence.

1

Chart 2: Utility Dividend Yields vs. 30-Year Treasury Yields⁷

2

3

4

From a slightly different perspective, from January 1 to February 11, 2020, the correlation between the S&P 500 dividend yield and the utility sector dividend yield was about 18.00 percent. From February 12 to March 20, 2020 it increased to 96.00 percent (see Chart 3, below). That strong correlation is not surprising - as Morningstar recently explained, during volatile markets there often is little distinction in returns across assets or portfolios. That is, “correlations go to 1.”⁸ When that happens, utility stocks lose their “defensive” quality.

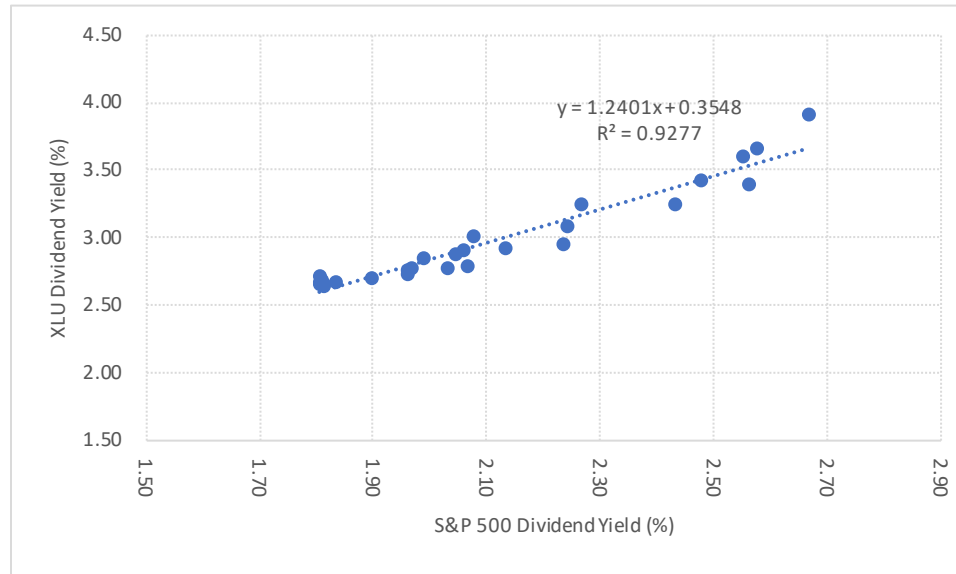

10

⁷ Source: S&P Global Capital IQ.

⁸ Morningstar, *Correlations Going to 1: Amid Market Collapse, U.S. Stock Fund Factors Show Little Differentiation*, March 6, 2020.

1 **Chart 3: Utility Sector Dividend Yield vs. S&P 500 Dividend Yield**

2 **(2/12/2020 – 3/20/2020)⁹**

3
4 The sudden increase in equity market volatility and dividend yields, together with
5 the decrease in Government bond yields reflects the commonly understood safety-seeking
6 behavior on the part of investors (*i.e.*, “flight to safety”). The increase in correlations
7 across asset classes, including utilities, makes clear that utility investors are not exempt
8 from the extraordinary uncertainty pervading the capital markets.

9 **Q. WHAT CONCLUSIONS DO YOU DRAW FROM THOSE ANALYSES?**

10 A. When markets become this uncertain, and this disrupted, we know investors increase
11 their return requirements. As explained in my Direct Testimony, however, “[n]o
12 individual model is more reliable than all others under all market conditions.”¹⁰ In his
13 rebuttal testimony, Mr. Chari explains that Staff relies on only two methods, the

⁹ Utility sector represented by the XLU. Please note, R^2 of 0.9277 indicates a correlation coefficient (R) of 0.9632.

¹⁰ Direct Testimony of Robert B. Hevert, at 15.

1 Discounted Cash Flow (“DCF”) model and CAPM approach.¹¹ As markets become
2 increasingly (historically) volatile, however, it is important to look well beyond two
3 methods to understand how investors view the risks now facing them, and the returns
4 they now require. That is the technical issue.

5 The practical issue is plain: when utility investors are faced with such
6 extraordinary market uncertainty, regulatory consistency and supportiveness become
7 critically important. If the Commission were to adopt the Opposing Witnesses’
8 recommendations, it would convey the opposite; it would suggest a lack of support and
9 an increase in regulatory risk just as that support is most critical. The inevitable result
10 will be diminished access to higher-cost capital, ultimately to the detriment of customers.
11 In my view, the Opposing Witnesses’ recommendations are inadequate under “normal”
12 market conditions. They are even more so now.

13 I appreciate that the Commission has the difficult task of balancing the interests of
14 customers and investors. I also appreciate doing so becomes increasingly difficult under
15 stressed economic and financial conditions. We should not lose sight of the common
16 interest customers and investors have in a financially strong utility. On balance, it
17 remains my opinion that the Company’s Cost of Equity falls in the range of 9.80 percent
18 to 10.60 percent. Current conditions indicate, however, that the investor-required ROE
19 now falls toward the top of that range.

¹¹ Rebuttal Testimony of Peter Chari, at 4.

1 **Q. HOW IS THE BALANCE OF YOUR SURREBUTTAL TESTIMONY**
2 **STRUCTURED?**

3 A. Sections II and III respond to the rebuttal testimonies of Messrs. Chari and Murray,
4 respectively, as they relate to the Company's Cost of Equity. Section IV responds to
5 their rebuttal testimonies regarding the Company's capital structure. Lastly, Section V
6 summarizes and concludes my Surrebuttal Testimony.

7 **II. RESPONSE TO TESTIMONY OF STAFF WITNESS CHARI**

8 **Q. PLEASE BRIEFLY SUMMARIZE MR. CHARI'S CRITICISMS OF YOUR COST**
9 **OF EQUITY ANALYSES.**

10 A. Mr. Chari believes: (1) there is a difference between the Cost of Equity and the
11 authorized return; (2) the growth rates in my Constant Growth DCF model are too high;
12 (3) the Market Risk Premia used in my CAPM analyses are not calculated correctly; (4)
13 my Empirical CAPM ("ECAPM") analysis is not appropriate; (5) the Bond Yield Plus
14 Risk Premium approach should not be relied on; and (6) the small size premium is not
15 appropriate, because Liberty-Empire is not a stand-alone company.

16 **A. Cost of Equity and Authorized Returns on Equity**

17 **Q. PLEASE SUMMARIZE MR. CHARI'S CONCERNS RELATED TO THE**
18 **RELATIONSHIP BETWEEN THE COST OF EQUITY AND AUTHORIZED**
19 **ROE.**

20 A. Mr. Chari states the authorized return is "a Commission-determined return awarded to
21 utility companies affording them the opportunity to earn fair and reasonable
22 compensation for equity capital employed in the provision of utility services."¹² He

¹² *Ibid.*, at 5.

1 further argues that because certain companies do not earn their authorized return, the Cost
2 of Equity and authorized ROE are not equivalent.¹³

3 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI?**

4 A. Mr. Chari's view that the Cost of Equity is disassociated from authorized ROEs is
5 unfounded in theory and practice. In Missouri, the Commission has explained that, "[t]o
6 determine a return on equity, the Commission must consider the expectations and
7 requirements of investors when they choose to invest their money in Ameren Missouri
8 rather than in some other investment opportunity."¹⁴ The Commission further cited the
9 Missouri Court of Appeals:

10 While rate of return is the result of a straight forward mathematic
11 calculation, the inputs, particularly regarding the cost of common equity,
12 are not a matter of 'precise science,' because inferences must be made
13 about the cost of equity, which involves an estimation of investor
14 expectations. In other words, some amount of speculation is inherent in
15 any ratemaking decision to the extent that it is based on capital structure,
16 because such decisions are forward-looking and rely, in part, on the
17 accuracy of financial and market forecasts.¹⁵

18
19 Clearly, the Commission has discussed the Return on Equity it would authorize as
20 the "cost of equity" – the return required by investors. That is, the Commission has
21 explained that its role is to determine the appropriate ROE, which is based on investor
22 expectations and requirements. The fact that the authorized ROE is not guaranteed does
23 not mean investor-required returns are irrelevant to it. Rather, authorized ROEs are
24 based on the same types of models, data, and information at issue in this proceeding.
25 One cannot be dissociated from the other.

¹³ *Ibid.*, at 5-6.

¹⁴ Public Service Commission of the State of Missouri, *In the Matter of Union Electric Company, d/b/a Ameren Missouri's Tariff to Increase Its Revenues for Electric Service*, ER-2014-0258, April 29, 2015, at 61.

¹⁵ *Ibid.*, at 68, citing *State ex rel. Missouri Gas Energy v. Public Service Commission*, 186 S.W.3d 376, 383 (Mo App. W.D. 2005).

1 If Mr. Chari’s concern is that the authorized ROE, or Cost of Equity, may not be
2 the same as the eventual earned Return on Average Common Equity, I addressed that
3 point in my Direct Testimony; the *Glossary of Frequently Used Terms* describes the
4 Return on Equity (“ROE”) as:

5 The return required by investors to invest in equity securities. The terms
6 “Return on Equity” and “Cost of Equity” are used interchangeably. Please
7 note that the ROE in this context is distinct from the accounting measure
8 sometimes referred to as the “Return on Average Common Equity”.

9
10 It seems, then, that Mr. Chari’s concern is that authorized ROEs do not reflect the
11 Cost of Equity. As explained above, the Commission has stated otherwise.

12 **Q. IS MR. CHARI’S ASSERTION THAT THE COST OF EQUITY DOES NOT**
13 **EQUAL THE AUTHORIZED ROE CONSISTENT WITH THE APPROACH**
14 **TAKEN BY OTHER REGULATORY COMMISSIONS?**

15 A. No, it is not. Mr. Chari’s position that the Cost of Equity and the authorized return on
16 equity are two separate and incompatible concepts is inconsistent with industry practice.
17 For example, in a recent rate case order in Docket No. D.P.U. 17-05, the Massachusetts
18 Department of Public Utilities noted, “[t]he terms ROE and cost of equity are used
19 interchangeably herein.”¹⁶ Similarly, the Public Service Commission of the District of
20 Columbia uses the terms “return on equity” and “Cost of Equity” interchangeably, as
21 does the Illinois Commerce Commission, the Public Service Commission of South
22 Carolina, and the Virginia State Corporation Commission.¹⁷

¹⁶ Massachusetts Department of Public Utilities, *Petition of NSTAR Electric Company and Western Massachusetts Electric Company, each doing business as Eversource Energy, Pursuant to G.L. c. 164, § 94 and 220 CMR 5.00 et seq., for Approval of General Increases in Base Distribution Rates for Electric Service and a Performance Based Ratemaking Mechanism*, D.P.U. 17-05, November 30, 2017, at 642.

¹⁷ See, for example, Public Service Commission of the District of Columbia, *In the Matter of the Application of Washington Gas Light Company for Authority to Increase Existing Rates and Charges for Gas Service*, Formal Case No. 1137, Order No. 18712, at 28; Illinois Commerce Commission, *Liberty Utilities*

1 Further, in my experience regulatory commissions generally consider model
2 results (as well as other analyses and qualitative information) presented by witnesses to
3 determine the appropriate ROE for the subject company. That is, the model results are
4 used as a direct measure to inform the authorized ROE. Under Mr. Chari's construct,
5 over many years and across many jurisdictions, substantially all regulatory commissions
6 in the U.S., including this Commission, have been inappropriately considering those
7 models, and improperly estimating the authorized ROE.

8 **Q. DO YOU HAVE ANY OBSERVATIONS REGARDING THE EARNED**
9 **RETURNS PRESENTED ON PAGE 5 OF MR. CHARI'S REBUTTAL**
10 **TESTIMONY?**

11 A. Yes, I do. I agree with Mr. Chari that the companies he reports with relatively low
12 earned returns had seen increases in their stock price. However, as shown in Chart 4,
13 below, companies that earned comparatively high returns saw greater increases in their
14 stock prices. Because Mr. Chari focuses on the companies that have relatively low
15 earned returns, I averaged the change in stock price for the companies presented on page
16 5 of Mr. Chari's rebuttal testimony since the beginning of 2013, consistent with Mr.
17 Chari's analytical period.¹⁸ I then calculated the average stock price change since the
18 beginning of 2013 for the companies with the highest earned returns.¹⁹

(Midstates Natural Gas) Corp. d/b/a Liberty Utilities Proposed General Increase in Natural Gas Rates, Docket No. 14-0371, February 11, 2015, at 65-67; Public Service Commission of South Carolina, Application of Duke Energy Progress, LLC for Adjustments in Electric Rate Schedules and Tariffs, Docket No. 2018-318-E, Order No. 2019-341, May 21, 2019, at 24; and Virginia State Corporation Commission, Application of Appalachian Power Company For a 2014 Biennial Review of the Rates, Terms and Conditions for the Provision of Generation, Distribution and Transmission Services Pursuant to § 56-585.1 A of the Code of Virginia, Case No. PUE-2014-00026, at 26-29.

¹⁸ I did not include Avangrid, Inc. ("Avangrid") in my analysis, because it was not publicly traded for the entirety of the analytical period.

¹⁹ I included the six companies with the highest earned returns, consistent with the six lowest in Mr. Chari's table on page 5 of his rebuttal testimony (excluding Avangrid).

1 As shown in Chart 4, companies with the lowest earned returns experienced an
2 average stock price increase of approximately 46.00 percent since January 1, 2013,
3 whereas the companies with the highest earned returns have experienced a stock price
4 increase of approximately 115.00 percent.²⁰ Mr. Chari's conclusion that because
5 companies with relatively low earned returns experienced increases in stock prices proves
6 that the Cost of Equity and authorized ROE are not equivalent,²¹ is a partial analysis that
7 does not support his conclusion.

8 **Chart 4: Average Stock Price Change by**
9 **Companies with Highest and Lowest Earned Returns²²**

10
11 Lastly, Chart 4 also shows that utility companies saw significant declines in their
12 stock prices regardless of their past earnings growth. That finding goes back to a point
13 made earlier: in volatile markets, stocks tend to trade together (i.e., correlations go to 1).

²⁰ On February 18, 2020 the companies with this highest and lowest earned returns reached their highest average stock price increases of approximately 173.00 percent and 112.00 percent, respectively.

²¹ Rebuttal Testimony of Peter Chari, at 6.

²² Source: S&P Global Market Intelligence, as of March 16, 2020.

1 That is, in highly volatile markets, such as the current environment, stocks across all
2 sectors exhibit return patterns.

3 **Q. WHAT ARE MR. CHARI'S OBSERVATIONS RELATED TO RECENTLY**
4 **AUTHORIZED RETURNS?**

5 A. Mr. Chari argues there were only six fully litigated authorized returns for vertically
6 integrated authorized returns in 2019, with an average of 9.36 percent.²³ He suggests one
7 of those six, DTE Electric Co. ("DTE Electric"), is an outlier because its authorized
8 equity ratio was "far lower" than those authorized in the remaining five rate cases. Mr.
9 Chari concludes my recommended ROE therefore is "implausible".²⁴

10 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI?**

11 A. Although Mr. Chari states there were only six fully litigated returns for vertically
12 integrated electric utilities in 2019, there were ten. The four returns Mr. Chari excludes
13 were authorized in December 2019, and ranged from 10.20 percent to 10.50 percent.
14 Including all fully litigated authorized returns for vertically integrated electric utilities in
15 2019 results in an average return of 9.74 percent.²⁵

16 Mr. Chari's concern appears to be that my recommended ROE is removed from
17 the national average authorized ROE. When all fully litigated cases for vertically
18 integrated electric utilities in 2019 are considered, however, my recommended return is
19 fewer than 20 basis points removed from the national average; the low end of my range is

²³ Rebuttal Testimony of Peter Chari, at page 6-7.

²⁴ *Ibid.*, at page 7.

²⁵ Schedule RBH-S1.

1 only six basis points from the average. Mr. Chari’s recommendation, on the other hand,
2 is approximately 50 basis points below.²⁶

3 As to Mr. Chari’s suggestion that the DTE Electric authorized return of 10.00
4 percent in Michigan is an outlier due to its relatively low equity ratio of 37.94 percent, I
5 disagree. The Michigan Public Service Commission (“MPSC”) includes additional items
6 in the ratemaking capital structure beyond common equity and long-term debt. As shown
7 in the final order in Case No. U-20162 (reproduced in Table 1, below), the reported
8 capital structure includes additional components, such as preferred stock, short-term debt,
9 investment tax credits, and deferred income taxes.

Table 1: DTE Electric Authorized Capital Structure²⁷

Capital Structure Component	Ratio
Long-Term Debt	37.94%
Preferred Stock	0.00%
Common Shareholders’ Equity	37.94%
Short-Term Debt	0.66%
Investment Tax Credit (ITC) – Debt	0.06%
Investment Tax Credit (ITC) – Equity	0.06%
Deferred Income Taxes (Net)	23.33%
Total	100.00%

11 The MPSC noted in its order in the DTE Electric rate case that it “adopts a 50/50
12 debt to equity capital structure.”²⁸ That is, considering only long-term debt and common
13 equity results in a capital structure of 50.00 percent for each component. A 50.00 percent
14 equity ratio is within the range of authorized equity ratios reported by Mr. Chari on page
15 7 of his rebuttal testimony. As such, I disagree that DTE Electric’s 10.00 percent ROE
16 should be viewed as an outlier.

²⁶ As discussed in my Rebuttal Testimony at pages 28 through 31, I do not agree with Mr. Chari that a simple review of a small number of authorized returns in fully litigated cases is an appropriate benchmark.

²⁷ Michigan Public Service Commission, *In the matter of the application of DTE Electric Company for authority to increase its rates, amend its rate schedules and rules governing the distribution and supply of electric energy, and for miscellaneous accounting authority*, Case No. U-20162, at 70.

²⁸ *Ibid.*

1 **Q. DO YOU HAVE ANY OTHER OBSERVATIONS RELATED TO RECENTLY**
2 **AUTHORIZED RETURNS?**

3 A. As discussed in my Rebuttal Testimony, when individual authorized returns are
4 considered, there has been no obvious trend in authorized returns since 2015.²⁹ However,
5 looking at 2018 and 2019, authorized returns for vertically integrated electric utilities
6 were 9.68 percent and 9.73 percent, respectively.³⁰ Since the beginning of 2019 (through
7 February 28, 2020) the average authorized return for vertically integrated electric utilities
8 was 9.74 percent, only six basis points below my recommended range.³¹

9 **B. Constant Growth DCF Model**

10 **Q. PLEASE SUMMARIZE MR. CHARI'S CONCERNS WITH YOUR**
11 **APPLICATION OF THE CONSTANT GROWTH DCF MODEL.**

12 A. Mr. Chari believes the growth rates in my Constant Growth DCF model are too high
13 relative to expected GDP growth.³²

14 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI ON THOSE POINTS?**

15 A. Although Mr. Chari does not specifically note in his rebuttal testimony his source for
16 expected GDP growth rate, he appears to believe any growth rate above 4.10 percent is
17 improper.³³ In Staff's Cost of Service Report, however, Mr. Chari assumed a growth rate
18 range of 4.20 percent to 5.00 percent in his Constant Growth DCF analysis.³⁴
19 Consequently, the highest growth rate Mr. Chari finds reasonable is below the low end of
20 the growth rate range in his Constant Growth DCF analysis. It appears Mr. Chari's own

²⁹ Rebuttal Testimony of Robert B. Hevert, at 30-31.

³⁰ S&P Global Market Intelligence, *RRA Regulatory Focus Major Rate Case Decisions – January-December 2019*, January 31, 2020, at 1.

³¹ Source: S&P Global Market Intelligence.

³² Rebuttal Testimony of Peter Chari, at 7-8.

³³ *Ibid.*, at 7. Mr. Chari states that he believes the long-term GDP growth rate is “about 4.1%” in footnote 7 of his rebuttal testimony.

³⁴ Staff Cost of Service Report, at 16.

1 analysis contradicts his argument that 4.10 percent is a reasonable limit on growth rates
2 in the Constant Growth DCF model.

3 **Q. ARE THE GROWTH RATES USED IN YOUR CONSTANT GROWTH DCF**
4 **ANALYSIS TOO HIGH?**

5 A. No, they are not. Mr. Chari's construct assumes all firms would converge to the rate of
6 GDP growth over time. Under the Constant Growth DCF model's fundamental
7 assumptions, the expected earnings growth rate equals the expected rate of capital
8 appreciation (because it also assumes a constant Price/Earnings ("P/E") ratio). Mr.
9 Chari's method, therefore, assumes capital appreciation will not exceed GDP growth.
10 Market-wide capital appreciation rates of 5.80 percent (the average growth rate in the
11 Constant Growth DCF analysis in my Direct Testimony) and higher have occurred quite
12 often (*see* Chart 5 below, which provides the frequency with which historical
13 observations have fallen in certain ranges).³⁵ By historical standards, the growth rates
14 Mr. Chari considers too high represent approximately the 42nd percentile of the actual
15 capital appreciation rates observed from 1926 to 2018. That is, over the 1926 to 2018
16 period, more than half (*i.e.*, 58.00 percent) of the annual capital appreciation returns were
17 greater than 5.80 percent.

³⁵ Under the Constant Growth DCF model's assumptions, the growth rate equals the rate of capital appreciation.

1 **Chart 5: Frequency Distribution of Capital Appreciation Returns,**
 2 **1926-2018³⁶**

3
 4 **Q. DOES MR. CHARI CONSIDER WHETHER OR HOW HIS DCF MODEL**
 5 **RESULTS REFLECT COMMONLY CONSIDERED MEASURES OF RISK?**

6 A. No, he does not. In addressing that issue, it is helpful to recall the Constant Growth DCF
 7 model’s fundamental structure. As explained in my Direct Testimony³⁷, the DCF model
 8 noted by the equation $k = \frac{D(1+g)}{P_0} + g$ is derived from the longer-form present value
 9 formula:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_\infty}{(1+k)^\infty} [1]$$

10
 11 The model fundamentally assumes investors use the present value structure alone to find
 12 the intrinsic value of common stock, and intrinsic value always equals market value. But
 13 it has long been understood the two are not necessarily the same. The DCF model

³⁶ Duff & Phelps, 2019 SBBI Yearbook, at A-3.

³⁷ Direct Testimony of Robert B. Hevert, at 47.

1 therefore will not produce accurate estimates of the market-required ROE if the market
2 price diverges from the present value-based estimate of intrinsic value.

3 In discussing the “Relationship between Intrinsic Value and Market Price”,
4 Graham and Dodd stated:

5 ...the influence of what we call analytical factors over the market price is
6 both *partial* and *indirect* – partial, because it frequently competes with
7 purely speculative factors which influence the price in the opposite
8 direction; and indirect, because it acts through the intermediary of
9 people’s sentiments and decisions. In other words, the market is not a
10 weighing machine, on which the value of each issue is recorded by an
11 exact and impersonal mechanism, in accordance with its specific qualities.
12 Rather should we say that the market is a voting machine, whereon
13 countless individuals register choices which are the product partly of
14 reason and partly of emotion.³⁸

15 As Graham and Dodd explained, differences between market prices and intrinsic value
16 may arise for many reasons. In recent markets, those reasons may include taking short-
17 term trading positions to hedge risk (*e.g.*, a “flight to safety”), to speculating (*e.g.*,
18 momentum trades), or taking positions to increase current income (*i.e.*, a “reach for
19 yield”).³⁹

20 As my Direct Testimony explained, the “reach for yield” has a limit; investors
21 will not accept the incremental risk of capital losses when valuation multiples continually
22 expand. Charts 9 and 10 to my Direct Testimony, which provided the variation in P/E
23 ratios over time suggested much the same. That is, valuations do not strictly follow
24 interest rates. The incremental risk of capital losses as valuations expand may be seen in
25 the DCF model, and its derivative measure of “equity duration”.

³⁸ Benjamin Graham and David L. Dodd, Security Analysis, McGraw Hill Book Company, Inc., 1934, facsimile edition, copyright 2005, at 28.

³⁹ Some investors may select relatively high dividend yield companies as a “reach for yield” in response to the shortage of investment alternatives that provide adequate yield in today’s capital market, rather than investing in stocks based on their long-term return potential.

1 **Q. PLEASE EXPLAIN THE CONCEPT OF “EQUITY DURATION”, AND HOW IT**
2 **MAY BE APPLIED IN THIS CIRCUMSTANCE.**

3 A. In general, “duration” measures the security’s price sensitivity to changes in the
4 underlying discount rate. For bonds, duration measures the percent change in price
5 relative to the percent change in the yield to maturity.⁴⁰ The same concept may be
6 applied to equity investments, where equity duration measures the sensitivity of equity
7 prices to changes in the Cost of Equity. In each case (that is, for both stocks and bonds),
8 duration represents the weighted average time (in years) over which cash flows are
9 received. Because it measures the sensitivity of prices to changes in yields, duration is an
10 important measure of risk to investors.

11 **Q. PLEASE GENERALLY DESCRIBE HOW DURATION IS CALCULATED.**

12 A. Consistent with the Constant Growth DCF model, equity duration recognizes that equity
13 cash flows (dividends) continue in perpetuity. Based on the Constant Growth DCF
14 model’s structure, duration may be defined as $d = \frac{1}{k - g}$ [2], where d is the duration, k is
15 the Cost of Equity, and g is the assumed growth rate.⁴¹ Because the DCF model assumes
16 the Cost of Equity is the sum of the dividend yield and the growth rate, the denominator
17 equals the assumed dividend yield. Modified duration (d_m), sometimes considered a
18 more precise measure, adjusts Equation [2] by the discount rate:

19
$$d_m = \frac{d}{1 + k} \text{ [3]}$$

20 The percent change in stock prices (“P”) brought about by a change in the Cost of Equity
21 is calculated as:

⁴⁰ <https://www.investopedia.com/terms/d/duration.asp>

⁴¹ James L. Farrell, Jr., *The Dividend Discount Model: A Primer*, Financial Analysts Journal, November/December 1985, at 23.

$$\frac{\Delta P}{P} = -d_m \times \Delta k \quad [4]$$

Two points bear particular attention. First, duration will increase as the difference between k and g decreases. Assuming that difference equals the expected dividend yield, lower-yielding stocks will tend to have higher durations and, therefore, are more sensitive to changes in the Cost of Equity. The second, and related point, is that as k decreases, duration increases (assuming no change in expected growth). An increase in duration therefore indicates an increase in the market risks to which equity investors are exposed.

Here, Mr. Chari presents the DCF analysis Staff applied to its natural gas proxy group, in this proceeding, and in the Spire Missouri case.⁴² In the Spire Missouri case, Staff presented an average dividend yield of 2.71 percent, and a midpoint “Indicated Cost of Common Equity” of 7.31 percent. The implied modified duration based on those inputs is 34.39.⁴³ Mr. Chari’s current formulation for his natural gas proxy group includes a dividend yield of 2.45 percent, with a midpoint Cost of Equity estimate of 7.05 percent. The implied modified duration based on those estimates is 38.13⁴⁴, a 10.88 percent increase over Staff’s assumptions in the Spire Missouri case. Because it implies higher modified duration, Mr. Chari’s analysis implies considerably higher risk for investors, even since the Spire Missouri proceeding.

Q. WHAT CONCLUSIONS DO YOU DRAW FROM THOSE ANALYSES?

A. Mr. Chari’s assessments and recommendations do not consider the risks implied by them. Even if we assume investors rely principally on the DCF method, and market prices always equal the estimate of intrinsic value produced by that method, we should not lose

⁴² See, Schedules PC-10-2, PC-10-3.

⁴³ $34.39 = \left(\frac{1}{.0271}\right) \times \left(\frac{1}{1.0731}\right)$. See, Schedule PC-10-3.

⁴⁴ $38.13 = \left(\frac{1}{.0245}\right) \times \left(\frac{1}{1.0705}\right)$. See, Schedule PC-10-2.

1 sight of the risk implied by the extended equity duration. As noted earlier, valuation
2 metrics such as P/E ratios tend to vary over time, consistent with the observation that
3 higher valuations imply higher levels of duration risk. That being the case, we should be
4 very cautious about drawing inferences regarding investor motivations and perpetual
5 return requirements from the DCF approach.

6 **C. Capital Asset Pricing Model**

7 **Q. PLEASE SUMMARIZE MR. CHARI'S CONCERNS WITH YOUR CAPM**
8 **ANALYSIS.**

9 A. Mr. Chari believes my estimate of the Market Risk Premium ("MRP") is too high,
10 because I include non-dividend paying companies in the calculation.⁴⁵

11 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI'S CONCERN THAT YOUR**
12 **ESTIMATES OF THE MRP ARE TOO HIGH?**

13 A. I disagree. As discussed in my Direct Testimony, I gathered the annual Market Risk
14 Premia reported by Duff & Phelps and produced a histogram of the observations. The
15 results of that analysis, which are presented in Chart 12 in my Direct Testimony,
16 demonstrate Market Risk Premia of at least 11.52 percent (the average of the Market Risk
17 Premium estimates in my Direct Testimony) occurred quite frequently.⁴⁶

18 **Q. DO YOU HAVE ANY CONCERNS WITH MR. CHARI'S "CORRECTION" TO**
19 **YOUR *EX-ANTE* MARKET RISK PREMIUM?**

20 A. Yes, I do. Mr. Chari appears to have incorrectly updated my *ex-ante* Market Risk
21 Premium analysis when he excluded non-dividend paying companies. As noted on page
22 56 of my Direct Testimony, to estimate the *ex-ante* Market Risk Premium I calculated the

⁴⁵ Rebuttal Testimony of Peter Chari, at 9.

⁴⁶ Direct Testimony of Robert B. Hevert, at 53.

1 market capitalization weighted average DCF result for each company in the S&P 500
2 (where data was available). To develop the weights for each company, I divided the
3 market capitalization for each company by the total market capitalization for all the
4 companies in the S&P 500 (where data was available). However, after removing the non-
5 dividend paying companies, Mr. Chari did not update the calculation of the total market
6 capitalization of the S&P 500. That is, Mr. Chari divided the market capitalization for
7 each company in his analysis by the total market capitalization for all the companies in
8 the S&P 500, *including* non-dividend paying companies, which he removed from the
9 analysis. Doing so results in a scenario in which the weights for each company do not
10 sum to 100.00 percent, artificially suppressing the results of his “corrected” Market Risk
11 Premium estimates.

12 Had Mr. Chari correctly calculated his “corrected” version of my *ex-ante* MRP
13 analysis, the MRPs based on Bloomberg and Value Line data would be 229 and 201 basis
14 points higher, respectively. Similarly, the CAPM results increase approximately 115
15 basis points and the ECAPM results increase approximately 140 basis points. Although
16 those results are significantly higher than the incorrectly calculated results presented by
17 Mr. Chari, as discussed in detail below, I do not agree that it is appropriate to exclude
18 non-dividend paying companies from the calculation of the MRP.

1 **Q. WHAT IS YOUR CONCERN WITH EXCLUDING NON-DIVIDEND PAYING**
2 **COMPANIES FROM THE CALCULATION OF THE MARKET RETURN**
3 **WHEN CALCULATING THE MARKET RISK PREMIUM COMPONENT OF**
4 **THE CAPM?**

5 A. First, the expected market return is meant to reflect just that – all companies in the
6 market. Investors recognize the investible equity market includes both dividend and non-
7 dividend paying companies. Some of the largest companies, based on market
8 capitalization, would be excluded from the calculation if non-dividend paying companies
9 were excluded. For example, Alphabet Inc., Amazon.com Inc., and Facebook Inc., do
10 not pay dividends. Based on the data presented in my Rebuttal Testimony, the combined
11 market capitalization of those three companies is over \$2.56 trillion, which is
12 approximately 9.00 percent of the entire S&P 500.⁴⁷ Excluding those companies alone
13 could have a significant effect on the calculated expected market return and, therefore the
14 Market Risk Premium. Equally important, the result would not measure the expected
15 return on the investible market.

16 Beyond that, my methodological concern is with internal consistency in the
17 model's application. A fundamental assumption of the CAPM is that the required return
18 is proportional to the risk of the investment. Under the CAPM, the Beta coefficient is the
19 measure of risk, and is calculated by comparing the subject security's returns to the
20 overall market returns. Because the Beta coefficient is calculated relative to the overall
21 market, which includes both dividend paying and non-dividend paying companies, it is
22 important that the expected market return also reflect the overall market. As such, I do

⁴⁷ Schedule RBH-R2. Based on data from Bloomberg Professional. As a point of reference, utilities as a sector represent only about 3.60 percent of the S&P 500. Source: <https://my.spindices.com/indices/equity/sp-500>

1 not believe it is appropriate to combine Beta coefficients calculated relative to the entire
2 market with a Market Risk Premium calculated using only a subset of the market (*i.e.*,
3 dividend paying companies).

4 If Mr. Chari chooses to remove non-dividend paying companies from the
5 expected market return, he likewise should remove them from the index used to calculate
6 the Beta coefficient. Because Beta coefficients are a positive function of the correlation
7 of returns between the subject company and the index, removing non-dividend paying
8 companies may increase the correlation, thereby increasing the Beta coefficient.⁴⁸

9 In addition, dividend paying companies may have lower volatility than non-
10 dividend paying companies. Because the Beta coefficient also reflects relative volatility
11 (*i.e.*, subject company relative to the index), if the volatility of the index falls, the relative
12 volatility will increase, again increasing the Beta coefficient.⁴⁹ Mr. Chari's position
13 inherently assumes the proxy companies' correlation coefficients and relative volatility
14 would remain constant, and their Beta coefficients would remain unchanged if non-
15 dividend paying companies are removed from the market index. But he has not shown
16 that to be the case.

⁴⁸ As noted in my Direct Testimony, the Beta coefficient is defined as: $\beta_j = \frac{\sigma_j}{\sigma_m} \times \rho_{j,m}$ where σ_j is the standard deviation of returns for company "*j*," σ_m is the standard deviation of returns for the broad market, and $\rho_{j,m}$ is the correlation of returns in between company *j* and the broad market. The Beta coefficient therefore represents both relative volatility (*i.e.*, the standard deviation) of returns, and the correlation in returns between the subject company and the overall market. Direct Testimony of Robert B. Hevert at 54.

⁴⁹ Direct Testimony of Robert B. Hevert at 54.

1 **Q. ARE THERE OTHER FUNDAMENTAL REASONS WHY IT IS APPROPRIATE**
2 **TO INCLUDE NON-DIVIDEND PAYING COMPANIES IN THE MARKET**
3 **INDEX?**

4 A. Yes. As noted in my Direct Testimony, the Constant Growth DCF model relies on
5 several fundamental assumptions. Among those assumptions are that earnings and
6 dividends will grow at the same, constant rate in perpetuity (that is, the payout ratio will
7 remain constant), and the P/E ratio will remain constant, also in perpetuity. Under those
8 assumptions, the DCF result is the same, regardless of whether “cash flows” are
9 dividends paid in perpetuity, or the proceeds of selling the stock at any time in the future.
10 In that case, when the dividend yield is zero, the standard DCF model indicates the Cost
11 of Equity equals the expected growth rate.⁵⁰ To summarize, the DCF structure focuses
12 on cash flows, regardless of whether they are dividends, or stock sale proceeds.

13 Schedule RBH-S2 demonstrates that principle. Intuitively, if the P/E ratio
14 remains constant, the stock price will grow at the expected earnings growth rate. The
15 discount rate that sets the future stock price equal to the initial stock price (that is, the
16 DCF estimate) therefore equals the growth rate. Consequently, I do not agree the
17 expected market return should exclude non-dividend paying companies.

18 **D. Empirical Capital Asset Pricing Model**

19 **Q. PLEASE SUMMARIZE MR. CHARI’S CONCERNS WITH YOUR ECAPM.**

20 A. Mr. Chari argues that my application of the ECAPM is not appropriate because there was
21 a range of alpha returns cited by Dr. Morin. As such, he believes that relying on the
22 calculation reported by Dr. Morin is unreliable.

⁵⁰ $ROE = \frac{D}{P} + g$; $ROE = \frac{0}{P} + g$; $ROE = g$.

1 **Q. HAVE YOU UNDERTAKEN ANY INDEPENDENT ANALYSES TO**
2 **DETERMINE WHETHER THERE IS A RELATIONSHIP BETWEEN BETA**
3 **COEFFICIENTS AND EXCESS RETURNS PRODUCED BY THE CAPM AND**
4 **ECAPM?**

5 A. Yes, I performed an analysis of excess returns produced by the CAPM, by Beta
6 coefficient decile, over the ten years ended 2019. The analysis compared the observed
7 returns of the companies in the S&P 500 Index to expected returns based on the CAPM.
8 Observed returns were calculated as the total return for each company from the first day
9 of a given year to the end of that year. The expected return for each company was
10 calculated using the CAPM as applied to the following annual data: (1) a risk-free rate
11 equal to the average 30-year Treasury yield for that year; (2) an adjusted Beta coefficient
12 as of the beginning of the year using Bloomberg's standard calculation method (two
13 years of weekly return data, using the S&P 500 Index as the comparison benchmark); and
14 (3) a market return equal to the S&P 500 Index total return for that year. The companies
15 were grouped into deciles each year based on their Beta coefficients, and the median
16 excess return (or return deficiency) was calculated for each decile group. Excess returns
17 were calculated as the observed return less the return implied by the CAPM. Chart 6
18 (below) summarizes those results.

1

Chart 6: Excess Returns Under CAPM⁵¹

2

3

4

5

6

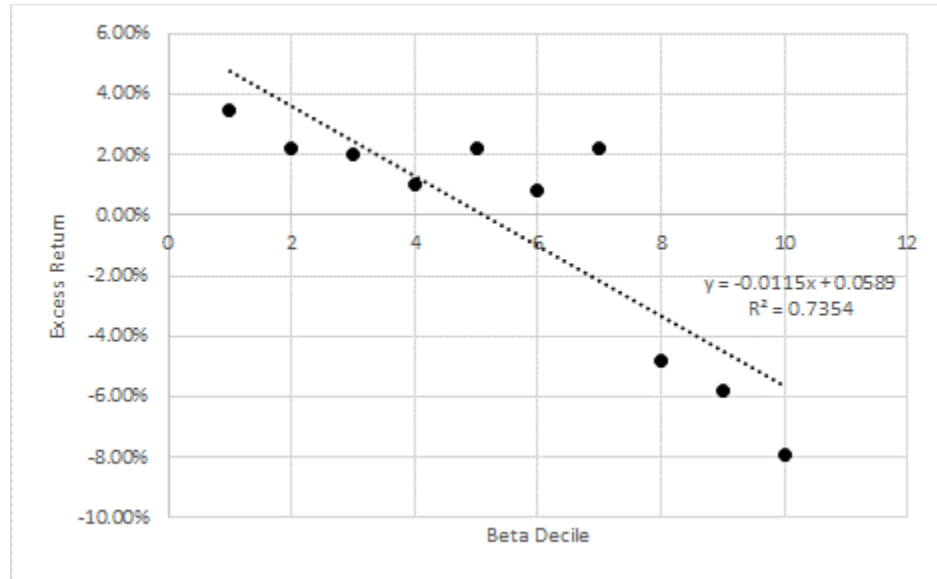

7

As Chart 6 demonstrates, the relationship between Excess Return and Beta coefficient deciles is strong, with deciles explaining approximately 80.00 percent of the Excess Return. Using the same data and calculating the Excess Return by reference to the ECAPM (as defined by Equation [8] in my Direct Testimony), produces the same downward sloping relationship, but not to the same degree (*see* Chart 7, below).

⁵¹ Source: Bloomberg Professional Services.

1

Chart 7: Excess Returns Under ECAPM⁵²

2

3

4

5

6

7

8

9

10

There are two principal observations to be drawn from Charts 6 and 7. First, under the ECAPM the slope coefficient falls somewhat (relative to the CAPM), suggesting a flatter relationship between Beta coefficient deciles and the excess return. The flatter slope moves closer to the point at which the excess return is zero across all deciles. Second, the excess returns are somewhat moderated under the ECAPM; the high excess returns are lower, and the low excess returns are higher than under the CAPM. Again, that finding suggests the ECAPM mitigates, but does not solve the issue of the CAPM underestimating returns for low-Beta coefficient firms.

11

12

13

14

In summary, Charts 6 and 7 support the position that the CAPM tends to underestimate returns for low-Beta coefficient firms. The ECAPM moderates that effect to some extent, but does not eliminate it. Because the ECAPM mitigates the drift in Beta coefficients, I believe it is a reasonable method.

⁵² Source: Bloomberg Professional Services.

1 **Q. DO YOU HAVE ANY OTHER OBSERVATIONS RELATED TO THE USE OF**
2 **THE ECAPM?**

3 A. As noted in my Direct Testimony, Fama and French described the empirical issue
4 addressed by the ECAPM, noting that “[t]he returns on the low beta portfolios are too
5 high, and the returns on the high beta portfolios are too low.”⁵³ Similarly, Dr. Roger
6 Morin observes that “[w]ith few exceptions, the empirical studies agree that ... low-beta
7 securities earn returns somewhat higher than the CAPM would predict, and high-beta
8 securities earn less than predicted.”⁵⁴ As Dr. Morin also explains, the ECAPM “makes
9 use” of those findings, and estimates the Cost of Equity based on the following
10 equation:⁵⁵

$$k_e = R_f + \alpha + \beta(\text{MRP} - \alpha) \quad [5]$$

11 where α , or “alpha”, is an adjustment to the risk/return line, and “MRP” is the Market
12 Risk Premium. Summarizing empirical evidence regarding the range of estimates for
13 alpha, Dr. Morin explains that the model “reduces to the following more pragmatic
14 form:”⁵⁶

$$k_e = R_f + 0.25(R_m - R_f) + 0.75\beta(R_m - R_f) \quad [6]$$

15 where:

16 k_e = the investor-required ROE;

17 R_f = the risk-free rate of return;

⁵³ Eugene F. Fama and Kenneth R. French, *The Capital Asset Pricing Model: Theory and Evidence*, Journal of Economic Perspectives, Vol. 18, No. 3, Summer 2004, at 33. *See*, Direct Testimony of Robert B. Hevert, at 56.

⁵⁴ Roger A. Morin, New Regulatory Finance (Public Utility Reports, Inc., 2006), at 175.

⁵⁵ *Ibid.*, at 189.

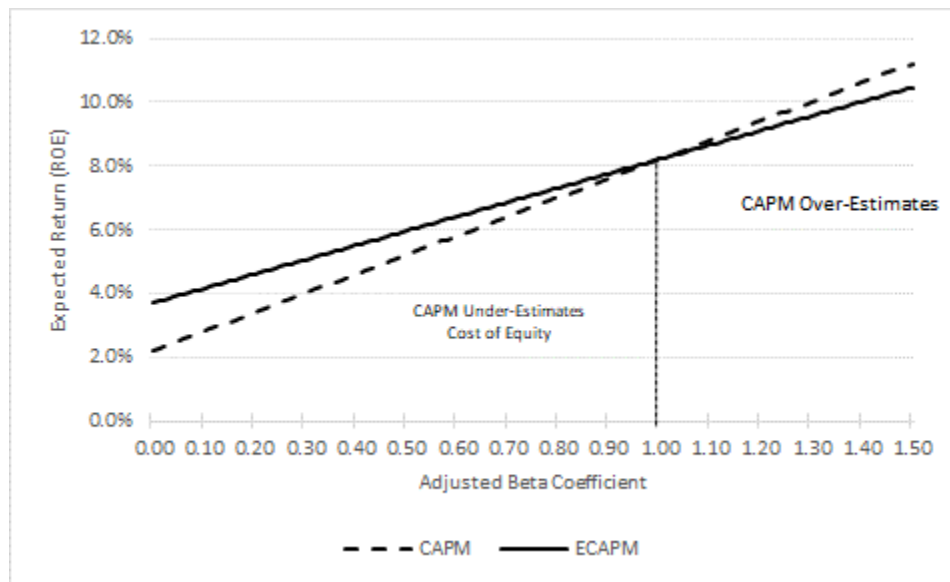

⁵⁶ *Ibid.*, at 190. Equations [5] and [6] tend to produce similar results when “alpha” is in the range of 1.00 percent to 2.00 percent. *See*, Schedule RBH-S3. As Dr. Morin explains, alpha coefficients in that range are highly consistent with those identified in prior published research.

1 β = the adjusted Beta coefficient of an individual security; and

2 R_m = the required return on the market.

3 The relationship between expected returns from the CAPM and ECAPM can be
4 seen in Chart 8, below. Chart 8, which reflects Mr. Chari's risk-free rate and MRP,
5 illustrates the extent to which the CAPM under-states the expected return relative to the
6 ECAPM when Beta coefficients – whether adjusted or unadjusted – are less than 1.00.

7 **Chart 8: CAPM and ECAPM Expected Returns⁵⁷**

8
9 **Q. HAVE OTHER REGULATORY COMMISSIONS ACCEPTED THE USE OF**
10 **THE ECAPM?**

11 A. Yes, they have. In my experience the ECAPM has been accepted in past regulatory
12 proceedings by commissions in Alaska, Maryland, Mississippi, and New York.⁵⁸

⁵⁷ Schedule RBH-S3. Source: Staff Cost of Service Report, Schedule PC-11-1. The finding that the ECAPM is not an adjustment to the Beta coefficient also is clear in Equation [5] ($k_e = R_f + \alpha + \beta(MRP - \alpha)$), in which the alpha coefficient increases the intercept (the expected return when the Beta coefficient equals zero), and reduces the Market Risk Premium. Assumes Mr. Chari's 6.00 percent MRP and 2.21 percent risk-free rate. Please note that the use of Mr. Chari's CAPM estimates in Chart 8 is for illustrative purposes only.

⁵⁸ The ECAPM is also referred to as the "zero-beta" CAPM approach. See, Regulatory Commission of Alaska, Docket No. P-97-4 (Order No. 151) / Docket No. P-97-7 (Order No. 110), November 27, 2002;

1 Regulatory commission staff in Nevada, and the Department of Commerce in Minnesota,
2 have presented the ECAPM approach in prior proceedings.⁵⁹ The application of the
3 ECAPM by the witnesses in those rate proceedings is consistent with my application of
4 the ECAPM in this proceeding.

5 **Q. LASTLY, DOES THE CAPM ADDRESS, AT LEAST TO SOME EXTENT,**
6 **CONCERNS WITH THE UNUSUALLY LOW LEVEL OF LONG-TERM**
7 **TREASURY YIELDS?**

8 A. Yes, it does. As Chart 8 (above) indicates, beyond flattening the SML's slope, the
9 ECAPM shifts the SML upward, so the intercept is above the risk-free rate. By doing so,
10 the ECAPM does mitigate, at least to some degree, the currently low Treasury yields
11 brought about by investors' safety-seeking behavior.

12 **E. Bond Yield Plus Risk Premium**

13 **Q. PLEASE SUMMARIZE MR. CHARI'S CONCERNS WITH YOUR BOND YIELD**
14 **PLUS RISK PREMIUM APPROACH.**

15 A. Mr. Chari believes the Bond Yield Plus Risk Premium approach is circular, because it
16 relies on authorized returns. He also states FERC rejected the use of the Bond Yield Plus
17 Risk Premium approach in Opinion 569.⁶⁰

Public Service Commission of Maryland, Case No. 9311, Order No. 85724, July 12, 2013; Public Service Commission of Mississippi, Docket No. 01-UN-0548, Final Order, December 3, 2001; and New York Public Service Commission Case No. 16-G-0257, Order Establishing Rates for Gas Service, April 20, 2017.

⁵⁹ Direct Testimony and Attachments of Craig M. Addonizio, Minnesota Public Utilities Commission Docket No. G008/Gr-15-424, November 24, 2015; Prepared Direct Testimony of Yasuji Otsuka, Ph.D., Public Utilities Commission of Nevada; Docket No. 12-02019 & 12-04005, August 17, 2012.

⁶⁰ Rebuttal Testimony of Peter Chari, at 11-12.

1 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI'S CONCERN THAT YOUR**
2 **BOND YIELD PLUS RISK PREMIUM APPROACH IS CIRCULAR?**

3 A. The cases considered in my Bond Yield Plus Risk Premium approach, and their
4 associated decisions, reflect the same type of market-based analyses at issue in this
5 proceeding. Because authorized returns are publicly available (the proxy companies
6 disclose authorized returns, by jurisdiction, in their 2019 SEC Forms 10-K),⁶¹ it is
7 reasonable to conclude that data is reflected, at least to some degree, in investors' return
8 expectations and requirements.

9 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI REGARDING FERC'S**
10 **DETERMINATION RELATED TO THE BOND YIELD PLUS RISK PREMIUM**
11 **IN OPINION NO. 569?**

12 A. A meaningful difference between the method I have applied in this case and the method
13 considered by FERC is that my method looks to authorized returns across all
14 jurisdictions, whereas the risk premium method considered by FERC is based on FERC-
15 authorized returns, which may have included ROE incentive adders, or were approving a
16 preexisting ROE.⁶² Those points are not at issue under my method.

17 The revised approach under Opinion No. 569 is not settled policy. As FERC has
18 acknowledged, there are multiple requests for rehearing of Opinion No. 569 currently
19 pending.⁶³ Further, FERC recently has established a paper hearing to address the

⁶¹ See, for example, American Electric Power Company, Inc., SEC Form 10-K for the year ended December 31, 2019, at 4; ALLETE Inc., SEC Form 10-K for the year ended December 31, 2019, at 14-15; Duke Energy Corporation, SEC Form 10-K for the year ended December 31, 2019, at 16; WEC Energy Group, Inc., SEC Form 10-K for the year ended December 31, 2018, at 130.

⁶² See, 169 FERC ¶ 61,129, Docket Nos. EL14-12-003, EL15-45-000 Opinion No. 569, Nov. 21, 2019, para. 342.

⁶³ See, Potomac-Appalachian Transmission Highline, LLC, Opinion No. 554-A, 170 FERC ¶ 61,050 (2020), Order on Rehearing, Directing Briefs, and Accepting in Part and Rejecting in Part Compliance Filings, at para. 5.

1 methods proposed in its prior Coakley Briefing Order, and MISO Briefing Order, the
2 same Briefing Orders that proposed the DCF, CAPM, Risk Premium, and Expected
3 Earnings approaches.⁶⁴ That process is ongoing, with no current resolution.
4 Consequently, Opinion No. 569 should not be seen as invalidating the Bond Yield Plus
5 Risk Premium approach.

6 **F. Small Size Premium**

7 **Q. WHAT ARE MR. CHARI'S CONCERNS WITH YOUR SMALL SIZE PREMIUM**
8 **ANALYSIS?**

9 A. Mr. Chari does not believe a small size premium is appropriate risk because Liberty-
10 Empire is not a stand-alone company.⁶⁵

11 **Q. WHAT IS YOUR RESPONSE TO MR. CHARI'S CONCERN?**

12 A. Mr. Chari's position runs counter to the widely accepted "stand-alone" regulatory
13 principle, which treats each utility subsidiary as its own company. Parent entities, like
14 other investors, have capital constraints and must look at the attractiveness of the
15 expected risk-adjusted return of each investment alternative in their capital budgeting
16 process. The opportunity cost concept applies regardless of the source of the funding.
17 When funding is provided by a parent entity, the return still must be sufficient to provide
18 an incentive to allocate equity capital to the subsidiary or business unit rather than other
19 internal or external investment opportunities. That is, the regulated subsidiary must
20 compete for capital with all the parent company's affiliates, and with other, similarly
21 situated utility companies. In that regard, investors value corporate entities on a sum-of-
22 the-parts basis and expect each division within the parent company to provide an

⁶⁴ *Ibid.*

⁶⁵ Rebuttal Testimony of Peter Chari, at 12.

1 appropriate risk-adjusted return. It therefore is important that the authorized ROE
2 reflects the risks and prospects of the utility's operations and supports the utility's
3 financial integrity from a stand-alone perspective.

4 **III. RESPONSE TO TESTIMONY OF OPC WITNESS MURRAY**

5 **A. Utility Sector Performance**

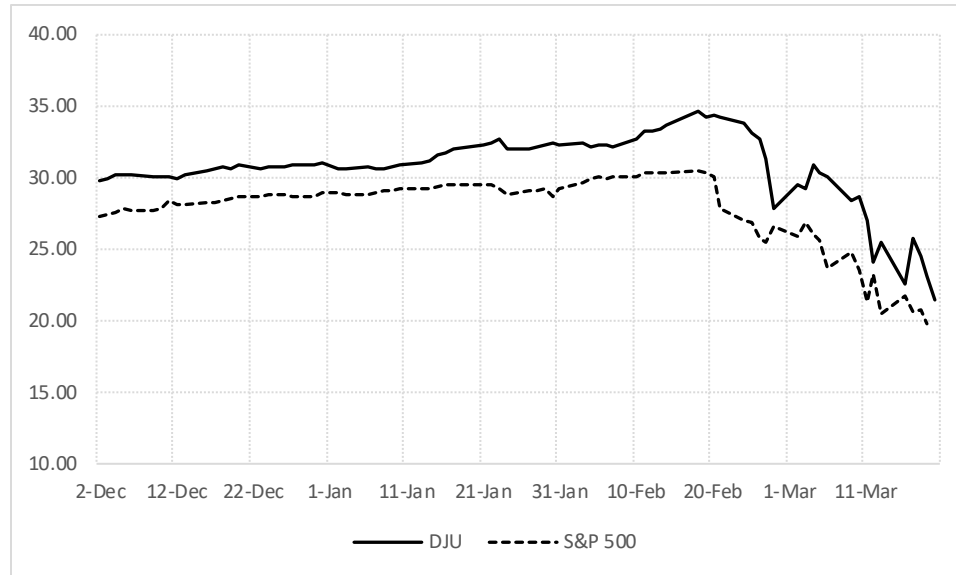

6 **Q. AT PAGE 3 OF HIS REBUTTAL TESTIMONY, MR. MURRAY OBSERVES**
7 **UTILITY P/E RATIOS PEAKED ON OR AROUND FEBRUARY 21, 2020, AND**
8 **UTILITIES' COSTS OF CAPITAL ARE AT RECORD LOWS. WHAT IS YOUR**
9 **RESPONSE TO MR. MURRAY REGARDING THOSE POINTS?**

10 **A** Although valuations for utilities and the broad market peaked during mid-February, as
11 discussed in Section I, they have fallen considerably since then; the utility sector and the
12 broad market lost over 30.00 percent of their value. Utility dividend yields, measured by
13 the XLU, increased by about 120 basis points. As to P/E ratios, the Dow Jones Utility
14 ("DJU") Index ratio fell from 34.26 on February 21 to 21.43 on March 20, a decline of
15 about 37.50 percent. At the same time, the market P/E ratio (measured by the S&P 500)
16 fell by about 34.00 percent (see Chart 9, below).⁶⁶

⁶⁶ Interestingly, the DJU Index P/E ratio corresponds quite closely to the data Mr. Murray reports: On December 2, 2019 Mr. Murray's electric proxy group average P/E ratio was 29.48 relative to the DJU P/E ratio of 29.78; on February 11 the two were 32.72 and 33.27, respectively. Sources: Rebuttal Testimony of David Murray, at 19, S&P Capital IQ.

1

Chart 9: Price/Earnings Ratios Over Time⁶⁷

2

3

4

5

6

7

8

9

Because Mr. Murray’s analysis ends about the time valuations peaked, he comes to the misplaced conclusion that the cost of capital “has declined significantly”.⁶⁸ With the significant change in market conditions since February 21, that clearly has not been the case. Rather, the extreme volatility and loss in value has increased the Cost of Equity. I appreciate that Mr. Murray intends to update his assessment in his surrebuttal testimony⁶⁹; I expect he will see the same market reactions.

10

11

B. Constant Growth DCF Model

Q. PLEASE SUMMARIZE MR. MURRAY’S CONCERNS WITH YOUR CONSTANT GROWTH DCF ANALYSIS.

12

13

A. Mr. Murray does not agree with my use of consensus analyst expected EPS growth rates in the Constant Growth DCF model. He also believes they are too high.⁷⁰

⁶⁷ Source: S&P Capital IQ.
⁶⁸ Rebuttal Testimony of David Murray, at 33.
⁶⁹ *Ibid.*, at 3.
⁷⁰ *Ibid.*, at 11-12.

1 **Q. WHAT IS YOUR RESPONSE TO MR. MURRAY?**

2 A. First, as discussed in response to Mr. Chari, the growth rates provided in my Constant
3 Growth DCF analysis are reasonable when considered relative to historical capital
4 appreciation rates. In addition, as discussed in my Direct and Rebuttal Testimonies, the
5 relationship between various growth rates and stock valuation metrics has been the
6 subject of much academic research, including published articles that support the use of
7 analysts' earnings growth projections in the DCF model.⁷¹ That research, together with
8 my own analyses, fully support the use of analyst earnings growth rate projections.

9 Lastly, the Constant Growth DCF model requires several assumptions, including
10 that the dividend yield and P/E ratio will remain constant in perpetuity.⁷² As Charts 2
11 and 9 (above) demonstrate, both have been extremely unstable, with significantly
12 decreased P/E ratios and increased dividend yields. Under those circumstances, the
13 Constant Growth DCF model results should be considered with considerable caution.

14 **Q. AT PAGES 13 AND 14 OF HIS TESTIMONY, MR. MURRAY SEEMS TO**
15 **ARGUE THAT THE PROPER USE OF ANALYSTS FORECASTS IS IN THE**
16 **CONTEXT OF THEIR "DIVIDEND DISCOUNT MODELS". WHAT IS YOUR**
17 **RESPONSE TO MR. MURRAY ON THAT POINT?**

18 A I disagree. In this proceeding, we are focused on estimating the return investors require
19 to invest in utilities such as Liberty-Empire. We do so based on observed market data –
20 including market prices – applied to financial models. The Dividend Discount Models
21 Mr. Murray references, on the other hand, are used by equity analysts to develop

⁷¹ Direct Testimony of Robert B. Hevert, at 49-51; Rebuttal Testimony of Robert B. Hevert, at 21.

⁷² Direct Testimony of Robert B. Hevert, at 47.

1 recommendations, or to determine whether, in their view, stocks are under or over-
2 valued. As Evercore ISI explained:

3 We performed a dividend discount analysis across most of the utilities
4 within our coverage universe. Key findings: (1) utilities appear materially
5 undervalued relative to long-term interest rates, (2) growth matters and the
6 extent and durability of the group's long-term EPS and DPS growth
7 prospects are arguably underappreciated by investors, and (3) the
8 widening P/E multiple spreads within the sector are, in many cases,
9 justifiable. We intended this exercise to be illustrative and the company-
10 specific results are not necessarily indicative of our ratings and price
11 targets. However, many of the findings support the underlying thought
12 processes that drive our recommendations and help explain why we
13 remain unapologetically bullish on names with excellent financial track
14 records and highly visible long-term growth outlooks (i.e., ATO, CMS,
15 NEE, WEC and XEL – all Outperform rated).⁷³

16 Setting a price target or recommendation based on an assumed discount rate (*i.e.*,
17 the Cost of Equity) is an altogether different analysis than determining the discount rate
18 based on market prices. Our testimony focuses on the latter, not the former. Mr.
19 Murray's Schedule DM-R-3 C 3/16 is a good example of the difference between the two
20 analyses. There (Part 1), Evercore ISI analysts provide the "P/E Implied by [Dividend
21 Discount Model] Results" relative to the actual P/E ratio. For all 26 companies reviewed,
22 the implied P/E ratio is higher than the "current" P/E ratio. Put another way, the
23 Dividend Discount Model is not used to determine the cost of capital based on current
24 prices, it is used to determine implied prices based on an assumed cost of capital.

⁷³ Schedule DM-R-3 C 1/16.

1 **C. Capital Asset Pricing Model**

2 **Q. PLEASE SUMMARIZE MR. MURRAY’S CONCERNS WITH YOUR CAPM**
3 **ANALYSIS.**

4 A. Mr. Murray’s concerns with my CAPM analysis lie primarily with my Market Risk
5 Premium estimates.⁷⁴ In particular, Mr. Murray argues that projected returns on the
6 market are too high.⁷⁵ Along those lines, Mr. Murray also does not agree with the use of
7 the Constant Growth DCF model to estimate the market return.⁷⁶

8 **Q. WHAT IS YOUR RESPONSE TO MR. MURRAY?**

9 A. As noted in my response to Mr. Chari and discussed in my Direct Testimony, Chart 12 in
10 my Direct Testimony demonstrates Market Risk Premia of at least 11.52 percent (the
11 average of the Market Risk Premium estimates in my Direct Testimony) occurred quite
12 frequently.⁷⁷

13 I have prepared a similar analysis considering how often various ranges of market
14 returns have been observed over the 1926 to 2018 period. To perform that analysis, I
15 gathered the annual market returns reported by Duff & Phelps and produced a histogram
16 of those observations. The results of that analysis, which are presented in Chart 10,
17 demonstrate that market returns of 14.83 percent (the average of my market return
18 estimates in my Direct Testimony) and higher occurred quite often.

⁷⁴ Rebuttal Testimony of David Murray, at 17-19.

⁷⁵ *Ibid.*, at 17.

⁷⁶ *Ibid.*, at 17-18.

⁷⁷ Direct Testimony of Robert B. Hevert, at 53.

1

Chart 10: Frequency Distribution of Market Returns, 1926 -2018⁷⁸

2

3 **Q. DOES MR. MURRAY CORRECTLY CHARACTERIZE HOW YOU**
4 **CALCULATE YOUR *EX-ANTE* MRP?**

5 A. No, he does not. First, Mr. Murray suggests my estimates of the market return are 14.78
6 percent to 14.95 percent.⁷⁹ However, as shown in Schedule RBH-D2, pages 1 and 7, the
7 estimated market returns in my Direct Testimony were 14.78 percent and 14.88 percent.
8 Mr. Murray further states that I assume “market risk premiums of 12.15% and 12.25%”⁸⁰
9 to which I add “a current and projected risk-free rate of 2.63% and 2.70%, respectively,
10 to arrive at these expected market returns.”⁸¹ His description is inaccurate.

11 As described in my Direct Testimony, I did not assume an estimate of the MRP.
12 Rather, for each company in the S&P 500 I calculated the market capitalization weighted
13 average Constant Growth DCF result based on data from Bloomberg and Value Line. I
14 then summed the market capitalization weighted average Constant Growth DCF result for

⁷⁸ Source: Duff & Phelps, 2019 SBBI, Appendix A-1, A-7. Schedule RBH-S4.

⁷⁹ Rebuttal Testimony of David Murray, at 17.

⁸⁰ *Ibid.*, at 16.

⁸¹ *Ibid.*, at 17.

1 each company to arrive at my estimate of the market return. After estimating the market
2 return I then subtracted the current 30-year Treasury yield from that amount to arrive at
3 the market DCF-derived *ex-ante* MRP estimate.⁸² That is, contrary to Mr. Murray's
4 discussion, I did not "assume" an MRP and then add the risk-free rate to estimate the
5 market return to it. Rather, I estimated the market return and subtracted the risk-free rate
6 to arrive at the MRP.

7 **Q. TURNING TO MR. MURRAY'S POSITION THAT THE EPS GROWTH RATES**
8 **USED TO DEVELOP YOUR ESTIMATED MARKET RETURN ARE TOO**
9 **HIGH,⁸³ DID YOU CONSIDER WHERE YOUR ESTIMATE FALLS WITHIN**
10 **THE RANGE OF HISTORICAL OBSERVATIONS?**

11 A. Yes. I gathered the annual capital appreciation return on Large Company Stocks reported
12 by Morningstar for the years 1926 through 2018, produced a histogram of those
13 observations (*see* Chart 5, in my response to Mr. Chari), and calculated the probability
14 that a given capital appreciation return estimate would be observed. That analysis
15 demonstrates capital appreciation rates of 12.60 percent and 12.90 percent (as Mr.
16 Murray calculates)⁸⁴ and higher actually occurred quite often,⁸⁵ representing
17 approximately the 57th and 58th percentiles, respectively.

⁸² Direct Testimony of Robert B. Hevert, at 56.

⁸³ Rebuttal Testimony of David Murray, at 18-19.

⁸⁴ *Ibid.*, at 18.

⁸⁵ Under the Constant Growth DCF model's assumptions, the growth rate equals the rate of capital appreciation.

1 **Q. IS THERE SUPPORT FOR THE USE OF THE DCF MODEL TO CALCULATE**
2 **THE MARKET RETURN?**

3 A. Yes, the approach described on page 56 of my Direct Testimony is consistent with
4 academic literature and published texts.⁸⁶

5 **D. Bond Yield Plus Risk Premium**

6 **Q. PLEASE SUMMARIZE MR. MURRAY’S CONCERNS WITH YOUR BOND**
7 **YIELD PLUS RISK PREMIUM APPROACH.**

8 A. Mr. Murray states that the Bond Yield Plus Risk Premium approach “is a regression
9 analysis of allowed ROEs to interest rates.”⁸⁷ Mr. Murray’s concern with my Bond Yield
10 Plus Risk Premium approach is his view that it “does not allow sufficient compression of
11 allowed ROEs versus the utility industry’s COE” and “[i]t only serves to support the
12 premium at which utilities trade to the S&P 500.”⁸⁸ Mr. Murray further suggests the
13 Bond Yield Plus Risk Premium approach applies an adjustment to the relationship
14 between authorized ROEs and interest rates.⁸⁹

15 **Q. IS THE BOND YIELD PLUS RISK PREMIUM APPROACH “A REGRESSION**
16 **ANALYSIS OF ALLOWED ROES TO INTEREST RATES” AS MR. MURRAY**
17 **SUGGESTS?**

18 A. No, it is not. As discussed in my Direct Testimony, the Bond Yield Plus Risk Premium
19 approach recognizes the well-documented inverse relationship between the Equity Risk
20 Premium and interest rates. As noted on page 63 of my Direct Testimony, “[t]he basic

⁸⁶ See, *Estimating Shareholder Risk Premia Using Analysts’ Growth Forecasts* by Robert S. Harris and Felicia C. Marston, Financial Management, Summer 1992; and Roger A. Morin, Ph.D., New Regulatory Finance (2006), at 118-119.

⁸⁷ Rebuttal Testimony of David Murray, at 31.

⁸⁸ *Ibid.*, at 32.

⁸⁹ *Ibid.*, at 31.

1 method used was regression analysis, in which the observed Equity Risk Premium is the
2 dependent variable, and the average 30-year Treasury yield is the independent variable.”
3 The current, and near-term and long-term projected 30-year Treasury yields were then
4 input into the resulting regression equation to estimate the Equity Risk Premium. Then
5 the current, and near-term and long-term projected 30-year Treasury yields were added to
6 the estimated Equity Risk Premium to arrive at the results of the analysis.

7 My analysis is not based on a simple regression analysis using authorized returns
8 as the dependent variable and interest rates as the independent variable as Mr. Murray
9 suggests. Again, Mr. Murray has mischaracterized my analysis.

10 **Q. WHAT IS YOUR RESPONSE TO MR. MURRAY’S CONCERN THAT THE**
11 **BOND YIELD PLUS RISK PREMIUM APPROACH PERPETUATES WHAT HE**
12 **VIEWS AS HIGH ROES?**

13 A. As discussed in my response to Mr. Chari, the cases considered in my Bond Yield Plus
14 Risk Premium approach, and their associated decisions, reflect the same type of market-
15 based analyses at issue in this proceeding. And for the reasons discussed in my response
16 to Mr. Chari, I disagree with Mr. Murray’s view that the Cost of Equity and authorized
17 ROE are distinct concepts. In summary, Mr. Murray’s position that the Bond Yield Plus
18 Risk Premium approach perpetuates relatively high ROEs is entirely unfounded.

19 **Q. DID YOU MAKE AN “ADJUSTMENT” TO YOUR RISK PREMIUM RESULTS,**
20 **AS MR. MURRAY SUGGESTS?**

21 A. No, I did not. As discussed above and in my Direct Testimony, my Equity Risk Premium
22 estimate is based on a regression analysis, which shows a significant inverse relationship

1 between the Equity Risk Premium and Treasury bond yields.⁹⁰ Because interest rates
2 remain low relative to historical levels, the calculated Equity Risk Premium is
3 significantly above the historical average. As discussed in both my Direct and Rebuttal
4 Testimonies, the inverse relationship between interest rates and the Equity Risk Premium
5 is supported by the findings in my Bond Yield Plus Risk Premium approach and is
6 consistent with published research.⁹¹ As such, I disagree with Mr. Murray's
7 characterization of my approach as being an "adjustment". It simply reflects the
8 important and long-recognized relationship between interest rates and the Equity Risk
9 Premium.

10 **Q. HAVE YOU PERFORMED AN ANALYSIS TO DEMONSTRATE THE**
11 **RELATIVE ACCURACY OF AN AVERAGE EQUITY RISK PREMIUM,**
12 **COMPARED TO A RISK PREMIUM THAT REFLECTS THE INVERSE**
13 **RELATIONSHIP BETWEEN BOND YIELDS AND THE EQUITY RISK**
14 **PREMIUM?**

15 A. Yes, I have. I first calculated the ROE that the average 4.68 percent "static" risk
16 premium would predict using 2000-2019 annual average 30-year Treasury yields, and the
17 error between the predicted ROE and the actual observed average ROE. I then calculated
18 the ROE predicted in each year using my methodology, which accounts for the log
19 normal relationship discussed in my Direct Testimony, and the error between the actual
20 and predicted observations.

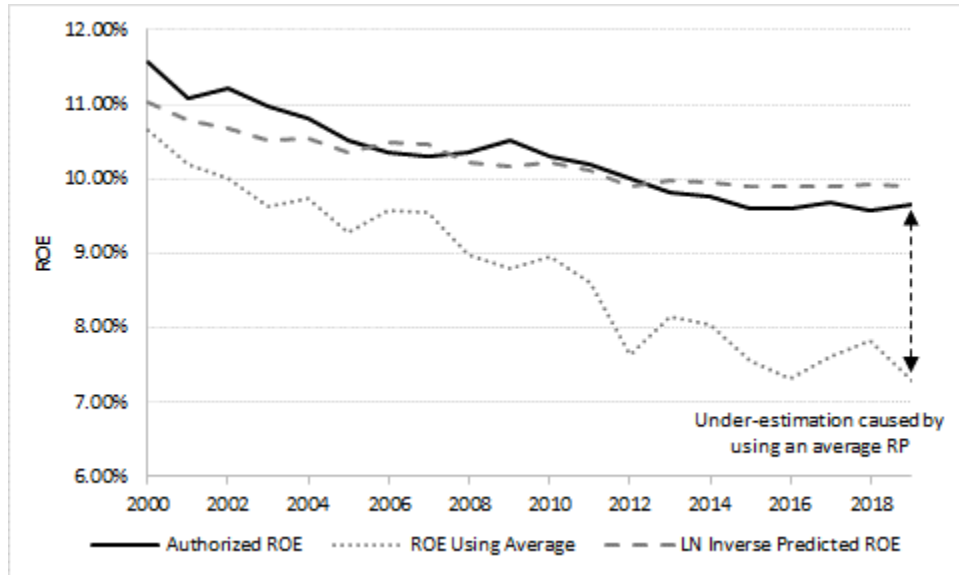

21 As shown in Schedule RBH-S5, using the average Equity Risk Premium,
22 produces estimates that are as much as 238 basis points removed from the actual

⁹⁰ Direct Testimony of Robert B. Hevert, at 62-63.

⁹¹ *Ibid.*; and Rebuttal Testimony of Robert B. Hevert, at 47-48.

1 authorized ROE. Using a Risk Premium approach to reflect the inverse relationship
2 between bond yields and the Equity Risk Premium, however, reduces the largest
3 prediction error to 56 basis points. Chart 11 (*see*, also Schedule RBH-S5) demonstrates
4 that applying a Risk Premium model that reflects the inverse relationship produces
5 generally accurate estimates of observed average authorized ROEs. The use of a static
6 Equity Risk Premium, however, produces significant errors, particularly in relatively low
7 (or high) interest rate environments.

8 **Chart 11: Accuracy of Risk Premium ROE Estimates**

9
10 **IV. CAPITAL STRUCTURE**

11 **Q. PLEASE SUMMARIZE MR. MURRAY’S REBUTTAL TESTIMONY AS IT**
12 **RELATES TO THE COMPANY’S CAPITAL STRUCTURE.**

13 **A.** Mr. Murray makes several arguments to support his view that the “economical” capital
14 should contain only 46.00 percent common equity, and should reflect the “adjusted”

1 capital structure of Liberty Utilities Co. (“LUCo”).⁹² Principally, he argues “LUCo’s
2 capital structure, as adjusted, represents the balance of capital APUC’s officers consider
3 reasonable for purposes of financing its North America regulated utility assets, including
4 those of Empire.”⁹³ I assume the adjustments he notes in his rebuttal testimony are those
5 Mr. Murray discussed in his direct testimony, and which Mr. Chari discusses in his
6 rebuttal testimony. Mr. Murray also argues it is improper to consider the Company’s
7 capital structure related to its electric utility operations, “deconsolidated” from its gas
8 utility operations.⁹⁴

9 Although Mr. Murray concedes the Company’s equity ratio “is somewhat close
10 to that which Empire had when it was an independent publicly-traded company with a
11 3rd party investable capital structure”, he alleges it “no longer [is] a function of balancing
12 business and financial risk for purposes of capital access.”⁹⁵ Rather, he argues “[i]t now
13 targets a common equity ratio for purposes of justifying its revenue requirement.”⁹⁶ Mr.
14 Murray then notes he will “compare and contrast” the Company’s capital structure
15 through March 27, 2020, suggesting changes in capital structures over time are important
16 considerations.

17 As to the merger conditions approved in Case No. EM-2016-0213, Mr. Murray
18 observes neither I “nor any other Empire witness compared any of Empire’s previous

⁹² Mr. Murray drops his proposed equity ratio to 45.00 percent if the Commission were to adopt the Company’s proposed “revenue normalized rate design”. *See*, Rebuttal Testimony of David Murray, at 35.

⁹³ Rebuttal Testimony of David Murray, at 8.

⁹⁴ *Ibid.*, at 7-8.

⁹⁵ *Ibid.*, at 8.

⁹⁶ *Ibid.*

1 capital structure requests to its current request.”⁹⁷ He expected “a more detailed
2 comparison of LUCo’s capital structure to that of Empire.”⁹⁸

3 **Q. PLEASE NOW SUMMARIZE MR. CHARI’S REBUTTAL TESTIMONY**
4 **REGARDING THE COMPANY’S CAPITAL STRUCTURE.**

5 A. Mr. Chari disagrees with Mr. Murray’s position that LUCo’s capital structure, rather than
6 Liberty-Empire’s is proper. As Mr. Chari points out, “[t]he correct capital structure for
7 setting Empire’s ROR is Empire’s book capital structure as presented on September 30,
8 2019.”⁹⁹ Mr. Chari finds that capital structure to include 52.90 percent common equity,
9 and 47.10 percent long-term debt.¹⁰⁰

10 Regarding the merger conditions specified in Case No. EM-2016-0213, Mr. Chari
11 argues LUCo’s capital structure includes 53.00 percent common equity, somewhat more
12 than Liberty-Empire’s 52.90 percent common equity ratio. He argues “[t]he higher the
13 equity ratio, the less economical the capital structure is, all being equal”¹⁰¹, because
14 “equity costs more than the other portions (debt and preferred stock) of the capital
15 structure.”¹⁰² Mr. Chari also disagrees with Mr. Murray’s proposed adjustment to
16 LUCo’s capital structure, which is to add \$395 million of LUCo-guaranteed debt to its
17 long-term debt balance, while removing the same amount from its equity balance. Mr.
18 Chari observes the basis of Mr. Murray’s proposed adjustment, LUCo’s guarantee, is
19 misplaced in that not all the debt supports LUCo’s regulated operations.¹⁰³ He finds

⁹⁷ *Ibid.*, at 5.

⁹⁸ *Ibid.*

⁹⁹ Rebuttal Testimony of Peter Chari, at 13.

¹⁰⁰ *Ibid.*

¹⁰¹ *Ibid.*, at 14.

¹⁰² *Ibid.*

¹⁰³ *Ibid.*, at 15.

1 including that debt “would be unfair for both LUCo and Empire to use a capital structure
2 that is not representative of the capital they use in their operations.”¹⁰⁴

3 **Q. TURNING FIRST TO MR. CHARI’S DISCUSSION OF MR. MURRAY’S**
4 **PROPOSED ADJUSTMENT TO LUCO’S CAPITAL STRUCTURE, WHY DID**
5 **YOU NOT ADDRESS THAT POINT IN YOUR REBUTTAL TESTIMONY?**

6 A. It is not relevant to the central issue of whether Liberty-Empire’s capital structure is “the
7 most economical”. As Mr. Chari points out, Merger Condition 5 states:

8 If Empire’s per books capital structure is different from that of the entity
9 or entities in which Empire relies for its financing needs, Empire shall be
10 required to provide evidence in subsequent rate cases as to why Empire’s
11 per book capital structure is the most economical for purposes of
12 determining a fair and reasonable allowed rate of return for purposes of
13 determining Empire’s revenue requirement.¹⁰⁵

14 My plain reading of Merger Condition 5 is straightforward: if Liberty-Empire’s “book
15 capital structure” differs from LUCo’s, the Company must demonstrate its capital
16 structure is “the most economical”.¹⁰⁶ As Mr. Chari points out, the difference in book
17 capital structures between the two is minimal; 53.00 percent common equity at LUCo
18 relative to 52.90 percent equity at Liberty-Empire.¹⁰⁷ I do not see a need to reconcile that
19 modest difference, as Mr. Murray appears to have expected.¹⁰⁸

20 Assuming the ten-basis point difference between the two rises to the threshold of
21 a difference for the purpose of Merger Condition 5, the central issue is whether Liberty-
22 Empire’s capital structure is the most economical. As discussed in my Rebuttal

¹⁰⁴ *Ibid.*

¹⁰⁵ *Ibid.*, at 14.

¹⁰⁶ I am not qualified to offer a legal opinion, nor I am offering one.

¹⁰⁷ Rebuttal Testimony of Peter Chari, at 14.

¹⁰⁸ Rebuttal Testimony of David Murray, at 5.

1 Testimony¹⁰⁹, and as I explain below (in response to Mr. Chari’s rebuttal testimony),
2 determining whether a given capital structure is “economical” is a complicated
3 assessment.

4 **Q. AT PAGES 15 AND 16 OF HIS REBUTTAL TESTIMONY, MR. CHARI**
5 **DISCUSSES MR. MURRAY’S PROPOSED ADJUSTMENT TO LUCO’S**
6 **CAPITAL STRUCTURE. WHAT IS YOUR RESPONSE TO MR. CHARI ON**
7 **THAT POINT?**

8 A. As Mr. Chari points out, Mr. Murray’s proposed adjustment relates to \$395 million of
9 debt issued by Liberty Utilities Financing GP1 (“LUF”), the entity responsible for raising
10 debt “for distribution to APUC and LUCo subsidiaries.” Mr. Murray’s proposed
11 adjustment, which is to increase LUCo’s debt balance by \$395 million and decrease its
12 equity balance by the same amount, hinges on LUCo’s guarantee of LUF’s debt. That
13 adjustment produces Mr. Murray’s 46.00 percent equity ratio.¹¹⁰

14 Mr. Chari appears to argue Mr. Murray’s proposed adjustment is improper in part
15 because LUCo guarantees debt issued by LUF for APUC’s regulated and unregulated
16 operations. He suggests “[i]ncluding the \$395 million in LUCo’s capital structure
17 incorrectly allocates the debt burden of the entirety of APUC’s entities to LUCo’s
18 regulated utilities, including Empire”. He then concludes “[t]he debt should not be
19 included in a capital structure to be used for the purpose of ratemaking because it would
20 be unfair for both LUCo and Empire to use a capital structure that is not representative of
21 the capital they use in their operations.”¹¹¹

¹⁰⁹ Rebuttal Testimony of Robert B. Hevert, at 56-68.

¹¹⁰ Rebuttal Testimony of Peter Chari, at 15.

¹¹¹ *Ibid.*, at 16.

1 In my opinion, the question of whether the LUF debt guaranteed by LUCo applies
2 to regulated or unregulated operations has no bearing on the “most economical” capital
3 structure standard established in Merger Condition 5. As Mr. Chari points out, Liberty-
4 Empire’s book capital structure does not equal LUCo’s capital structure whether Mr.
5 Murray’s proposed adjustment is applied, or not. That being the case, the question under
6 Merger Condition 5 is not whether Liberty-Empire’s capital structure is the same as
7 LUCo’s. Rather, it is whether Liberty-Empire’s capital structure is the most economical.

8 **Q. DO YOU AGREE WITH MR. CHARI’S POSITION THAT LIBERTY-EMPIRE’S**
9 **CAPITAL STRUCTURE IS THE MOST ECONOMICAL BECAUSE IT**
10 **CONTAINS SLIGHTLY LESS EQUITY THAN LUCO’S (UNADJUSTED)**
11 **CAPITAL STRUCTURE?**

12 A. No, I do not. First, it is important to define “most economical” in this context. As I
13 explained in my Rebuttal Testimony, capital structures must be set and managed to
14 achieve multiple objectives, subject to multiple constraints. It is a matter of optimization.
15 Yes, it is important to ensure the lowest reasonable cost to ratepayers. It also is important
16 to ensure the financial wherewithal to efficiently access both long-term capital and short-
17 term liquidity, regardless of market conditions.

18 Further, the costs of capital (both debt and equity) are inextricably linked to the
19 capital structure. We cannot change one without considering changes in the other. Mr.
20 Chari’s argument implies determining whether one capital structure is more economical
21 than another largely is an algebraic exercise, in which the capital structure may change
22 without affecting the costs of capital. As he puts it, “[t]he higher the equity ratio, the less
23 economical the capital structure is, all being equal.” Mr. Chari argues that is the case

1 because “equity costs more than the other portions (debt and preferred stock) of the
2 capital structure.”¹¹²

3 As a practical matter, however, all does not remain equal. As explained in my
4 Rebuttal Testimony, increasing the proportion of debt in the capital structure magnifies
5 risks to investors.¹¹³ That is, as the proportion of debt increases, the costs of both debt
6 and equity increase – they are inextricably related. Consequently, there is a point at
7 which the additional financial risk associated with higher proportions of debt outweigh
8 the benefit of its lower cost relative to equity. The relationships among financial leverage
9 and risk have been formalized by Modigliani and Miller¹¹⁴ who showed that the Cost of
10 Equity may be expressed as:

$$k_{e,L} = k_{e,U} + (k_{e,U} - k_d)(1 - T) \left(\frac{D}{E} \right) \text{ Equation [7]}$$

11 where

12		
13	$k_{e,U}$	= Cost of Equity for an unlevered firm
14	$k_{e,L}$	= Cost of Equity for a levered firm
15	k_d	= Cost of Debt (interest rate)
16	D	= Level of debt
17	E	= Level of equity
18	T	= Tax rate
19		

20 Equation [7] expresses the Cost of Equity for a levered firm as the Cost of Equity for an
21 unlevered firm, which reflects business risk only, plus a premium for financial risk.

22 Using the Modigliani-Miller equation (and estimating the effect of increased
23 leverage on the Cost of Debt by looking at credit spreads), we can estimate the effect of
24 leverage on the weighted average cost of capital (“WACC”) using the following formula:

¹¹² Rebuttal Testimony of Peter Chari, at 14.

¹¹³ Rebuttal Testimony of Robert B. Hevert, at 67.

¹¹⁴ F. Modigliani and M. Miller, *The Cost of Capital, Corporation Finance, and the Theory of Investment*, The American Economic Review 48 No. 3, June 1958, at 261-297; F. Modigliani and M. Miller, *Corporate Income Taxes and the Cost of Capital: A Correction*, The American Economic Review 53 No. 3, June 1963, at 433-443.

1
$$WACC = \frac{D}{TC}k_d(1 - T) + \frac{E}{TC}k_{e,L} \quad \text{Equation [8]}$$

2 where “TC” is Total Capital, the sum of debt (“D”) and equity (“E”). Applying that
3 approach, it becomes apparent there is point at which the WACC is minimized (*see* Chart
4 12, below).

5 **Chart 12: Illustrative WACC at Varying Equity Ratios¹¹⁵**

6
7 As Chart 12 illustrates, as equity is added (moving from left to right on Chart 12),
8 the WACC falls, owing to the lower costs of debt and equity brought about by less
9 financial risk. At equity ratios of about 60.00 percent to 65.00 percent, the WACC is
10 minimized; it increases from there. Although directionally proper, changes in the WACC
11 are imprecise due to the complex and the dynamic nature of the relationship between
12 leverage and the costs of capital. As explained above, any measure of an “optimal”
13 capital structure must consider numerous objectives and constraints. Nonetheless, the
14 relationship is consistent with the proposition that increasing financial leverage increases
15 the Cost of Equity; it does not remain equal.

¹¹⁵ Schedule RBH-S6.

1 **Q. IN SECTION II, YOU DISCUSSED THE PRINCIPLE OF “EQUITY**
2 **DURATION”. IS EQUITY DURATION REFLECTED IN MR. CHARI’S**
3 **ASSESSMENT?**

4 A. No, it is not. In my Rebuttal Testimony, I explained that a common financing principle is
5 “maturity matching”.¹¹⁶ I noted that the perpetual nature of common stock extends the
6 weighted average life of the capital structure to more closely align that of the rate base.
7 In Section II (above), I found the average Modified Duration of the companies included
8 in Mr. Chari’s analyses to be about 38 years. In my practical experience, examining the
9 weighted average duration of the capital structure is a fundamental component of
10 determining an “optimal”, or “economical” capital structure. Again, that is an important
11 factor Mr. Chari does not consider.

12 **Q. WHAT ARE YOUR CONCLUSIONS REGARDING MR. CHARI’S CAPITAL**
13 **STRUCTURE RECOMMENDATION?**

14 A. I agree with Mr. Chari’s conclusion that Liberty-Empire’s capital structure should be
15 used for ratemaking purposes, although for different reasons than he provides. In my
16 opinion, the question of what constitutes an “economical” capital structure properly is
17 viewed in the context of capital structure optimization. That is, an “economical” capital
18 structure is one that looks to optimize the proportions of equity and debt, based on
19 multiple factors. Because utilities have similar financing objectives and face common
20 constraints, the practice of capital structure optimization is best viewed in the capital
21 structures in place among utility operating companies. Doing so fully supports the

¹¹⁶ Rebuttal Testimony of Robert B. Hevert, at 58-59.

1 Company's proposed capital structure as the "most economical," to the extent such a
2 showing is required.

3 **Q. TURNING NOW TO MR. MURRAY'S REBUTTAL TESTIMONY, WHAT IS**
4 **YOUR RESPONSE TO HIS STATEMENT THAT HE "EXPECTED A MORE**
5 **DETAILED COMPARISON OF LUCO'S CAPITAL STRUCTURE TO THAT OF**
6 **EMPIRE"**¹¹⁷?

7 A. Mr. Murray's expectation seems to be based on his view that Merger Condition 5
8 requires a reconciliation between LUCo's capital structure on the one hand, and Liberty-
9 Empire's on the other. As Mr. Chari's testimony notes, with or without Mr. Murray's
10 proposed adjustment, LUCo's book capital structure does not equal Liberty-Empire's
11 book capital structure. Given that difference, the relevant analytical issue is whether
12 Liberty-Empire's capital structure is the "most economical". As between Liberty-
13 Empire's 52.90 percent equity ratio and LUCo's 53.00 percent equity ratio¹¹⁸, there is no
14 meaningful difference and one cannot be said to be the "most economical" relative to the
15 other.

16 That is not the case, however, with Mr. Murray's proposed 46.00 percent equity
17 ratio. As explained in my response to Mr. Chari, because capital structure optimization is
18 complex, it is best observed in the capital structures in place among operating utilities.
19 Schedule RBH-R7 to my Rebuttal Testimony demonstrated the average equity ratio
20 among the utility my proxy companies was 53.59 percent. Mr. Murray's 46.00 percent
21 recommended equity ratio falls over two standard deviations below that average.¹¹⁹

¹¹⁷ Rebuttal Testimony of David Murray at 5.

¹¹⁸ Rebuttal Testimony of Peter Chari at 14.

¹¹⁹ The standard deviation is 3.70 percent. $(0.5359 - 0.4600)/0.0370 = 2.05$.

1 From a slightly different perspective, his recommendation falls in the bottom 3rd
2 percentile of the proxy company equity ratios.¹²⁰

3 As discussed earlier, the Cost of Equity is inextricably linked to debt leverage.
4 Mr. Murray's recommendation is so heavily leveraged relative to industry practice that it
5 certainly would increase risks to debt and equity investors, increasing the returns required
6 by them (*see*, Equations [7] and [8], above). In short, regardless of how he arrived at it,
7 Mr. Murray's 46.00 percent equity ratio cannot be seen as the "most economical".

8 **Q. AT PAGE 9 OF HIS REBUTTAL TESTIMONY, MR. MURRAY INDICATES HE**
9 **INTENDS TO VIEW CHANGES IN THE COMPANY'S CAPITAL STRUCTURE**
10 **OVER TIME. IN YOUR VIEW, HAS THE COMPANY'S CAPITAL**
11 **STRUCTURE MATERIALLY CHANGED SINCE 2016?**

12 A. No, it has not. Since September 2016, the Company's year-end equity ratio has remained
13 in the range of 50.00 percent to 51.00 percent.¹²¹ During that time, there has been no
14 recapitalization of which I am aware, and the Company's credit ratings have remained
15 constant.

16 **Q. HAVE AUTHORIZED EQUITY RATIOS CHANGED OVER TIME?**

17 A. Yes, they generally have increased. Excluding capital structures authorized in
18 jurisdictions that include non-investor supplied sources of capital (principally,
19 Accumulated Deferred Income Taxes), authorized equity ratios have increased over time
20 (*see*, Chart 13, below).

¹²⁰ That is, 97.00 percent of the observed equity ratios were higher than 46.00 percent.

¹²¹ *See*, The Empire District Electric Company SEC Form 10-Q For the quarterly period ended September 30, 2016, at 9; Schedule DM-4, pages 1 and 3.

9

10

The upward trend in equity ratios since 2005, in particular since 2008/2009, makes sense as the financial crisis focused attention on balance sheet strength and capital access. Now, as the capital markets undergo another severe dislocation, the balance sheet strength built over time has become extremely important. Mr. Murray’s recommendation not only would undo the financial strength needed during volatile capital markets, it would indicate a degree of regulatory risk that would further diminish the Company’s financial profile, just as that profile is most needed. From that perspective as well, Mr. Murray’s proposed capital structure cannot be seen as the “most economical”.

¹²² Source: S&P Global Market Intelligence. Excludes equity ratios authorized in AR, FL, IN, and MI.

1 Q. AT PAGES 35 AND 36 OF HIS REBUTTAL TESTIMONY, MR. MURRAY
2 NOTES HIS RECOMMENDATIONS WOULD REDUCE THE COMPANY'S
3 *PRO FORMA* RATIO OF CFO PRE-WC/DEBT,¹²³ BUT HE IS NOT
4 CONCERNED DOING SO WOULD AFFECT THE COMPANY'S CREDIT
5 PROFILE. WHAT IS YOUR RESPONSE TO MR. MURRAY ON THAT POINT?

6 A. First, as Chart 10 to my Rebuttal Testimony indicates, Moody's rating process places
7 only 15.00 percent weight to that ratio. In contrast, the "Regulatory Framework" receives
8 25.00 percent weight, and the "Sufficiency of Rates and Returns" is given 12.50 percent
9 weight. As my Rebuttal Testimony explained, *pro forma* metrics are only one of a broad
10 range of factors considered in the ratings process. The distance between Mr. Murray's
11 recommendations and both industry and regulatory practice would be reflected in factors
12 such as Moody's "Regulatory Framework" and the "Sufficiency of Rates and Returns".
13 Mr. Murray's partial assessment does not address those important considerations.

14 Second, a wide range of CFO Pre-WC/Debt ratios fall within the Baa to A ratings
15 categories; ratios as low as 11.00 percent and as high as 27.00 percent do so.¹²⁴ Even if
16 Mr. Murray's recommendations produce *pro forma* ratios within that range, it does not
17 follow that the Company's credit profile would be unaffected. As noted above,
18 qualitative assessments of the regulatory environment weigh far more in the ratings
19 process. Consequently, Mr. Murray's *pro forma* analyses do not demonstrate his 46.00
20 percent equity ratio recommendation is the "most economical".

¹²³ Cash Flow From Operations pre-Working Capital adjustments/Debt

¹²⁴ Moody's Investors Service, *Rating Methodology, Electric and Gas Utilities*, June 2017, at 34. Ratios based on the "Low Business Risk Grid".

1 **Q. DOES THE CURRENT CAPITAL MARKET DISLOCATION AFFECT THE**
2 **DETERMINATION OF AN “ECONOMICAL” CAPITAL STRUCTURE?**

3 A. Yes, it does. As discussed in Section I, capital markets now are experiencing
4 extraordinary levels of volatility. All industry sectors, including utilities, have been
5 affected. My Rebuttal Testimony explained that capital structures are set not only to
6 ensure efficient capital access during accommodating markets, but also during
7 constrained markets. Given their obligation to serve, and that operation cash flows rarely
8 are sufficient to fund capital investments over long periods, that efficient market access is
9 imperative.¹²⁵ Companies with stronger balance sheets are better positioned to efficiently
10 – and economically – access that capital during constrained capital markets. That point
11 cannot reasonably be in dispute.

12 Mr. Murray’s focus on his proposed \$395 million adjustment misses that
13 fundamental point. There simply is no basis to conclude that a capital structure
14 containing considerably more financial risk than seen in regulatory or industry practice is
15 the “most economical”. To the contrary, Mr. Murray’s approach would add financial risk
16 to market risk, compounding the adverse effect on investors, and increasing the returns
17 they require. That is especially true now, in this market.

18 The Company’s proposed capital structure, on the other hand, is consistent with
19 industry practice, reflects the many factors that must be considered in developing an
20 optimal - or economical - capital structure, and recognizes the importance of balance
21 sheet strength, especially during volatile capital markets. Regardless of how Mr. Murray

¹²⁵ As Mr. Murray notes on page 38 of his rebuttal testimony, Liberty-Empire’s commercial paper program remains in place. It now is rated A2/P2 by Standard & Poor’s and Moody’s, respectively. See, Algonquin Power & Utilities, Corp., February 27, 2020, at 24.

1 developed his proposed 46.00 percent equity ratio, it cannot be seen as the “most
2 economical”.

3 **Q. WHAT CAPITAL STRUCTURE DOES THE COMPANY NOW PROPOSE FOR**
4 **RATEMAKING PURPOSES?**

5 A. As Ms. Richard notes in her True-up Direct Testimony, the Company proposes a capital
6 structure of 53.07 percent Common Equity, and 46.93 percent Long-Term Debt. I
7 understand that capital structure includes the Company’s actual balances as of January
8 31, 2020, excluding short-term debt.

9 **Q. ARE COMMON EQUITY AND LONG-TERM DEBT THE TWO SOURCES OF**
10 **CAPITAL COMMONLY CONSIDERED IN ESTABLISHING A UTILITY’S**
11 **RATEMAKING CAPITAL STRUCTURE?**

12 A. Yes, they are.

13 **Q. WHY IS THAT THE CASE?**

14 A. The principal reason is that the assets included in rate base are long-lived, and are
15 financed with correspondingly long-lived securities. As discussed in my Direct
16 Testimony¹²⁶ (and further, below), utilities generally follow the financing practice
17 commonly referred to as “maturity matching,” which matches the lives of assets being
18 financed with the maturity of the securities issued to finance those assets. Under that
19 practice, the overall term structure of the utility’s long-term liabilities—including both
20 debt and equity—correspond to the life of its long-term assets.

21 Whereas short-term debt has a maturity of one year or less, long-term debt may
22 have maturities of 30 years or longer. Although there are practical financing constraints,

¹²⁶ See, Direct Testimony of Robert B. Hevert, at 39-41.

1 such as the need to “stagger” long-term debt maturities, the general objective is to extend
2 the average life of long-term debt. Still, long-term debt has a finite life, which is likely to
3 be less than the life of the assets included in rate base. Common equity, on the other
4 hand, is perpetual—its life is indefinite.

5 **Q. PLEASE EXPLAIN WHY, IN YOUR VIEW, SHORT-TERM DEBT SHOULD BE**
6 **EXCLUDED FROM THE RATEMAKING CAPITAL STRUCTURE.**

7 A. In my opinion, there are two fundamental reasons why short-term debt should be
8 excluded. First, short-term debt generally is used to fund working capital requirements.
9 Those requirements often are seasonal and variable; they are not permanent as are the
10 assets included in rate base. Because short-term debt funds short-term variable working
11 capital needs, it should not be included in the ratemaking capital structure.

12 Second, prudent financing practice calls for long-term assets (such as rate base
13 items) to be financed with long-term securities. Doing otherwise would expose the
14 Company’s ratepayers to both refinancing risk (that is, the risk of not being able to roll-
15 over short-term debt as it comes due), and interest rate risk (incurring higher interest
16 costs as maturing short-term debt is refinanced). Although short-term debt may be used
17 as an interim source of financing (that is, until a sufficiently large balance has been
18 accumulated to be efficiently financed by long-term securities), it should not be seen as a
19 permanent source of capital.

20 **Q. HAS THE COMPANY’S SHORT-TERM DEBT BALANCE VARIED OVER**
21 **TIME?**

22 A. Yes, it has. I understand the Company’s quarter-end short-term debt balance fell to zero
23 in two of the five quarterly reporting periods from December 2018 through December

1 2019.¹²⁷ As of January 31, 2020, the short-term debt balance was **_____**. ¹²⁸

2 That pattern is consistent with the point made earlier, that short-term debt tends to vary
3 over time, and is not used as a permanent source of capital. I therefore agree with Ms.
4 Richard's conclusion that short-term debt should be excluded from the ratemaking capital
5 structure.

6 **V. CONCLUSIONS AND RECOMMENDATIONS**

7 **Q. WHAT ARE YOUR OVERALL CONCLUSIONS AND RECOMMENDATIONS?**

8 A. None of Messrs. Chari's or Murray's rebuttal testimonies have caused me to change the
9 conclusions and recommendations presented in my Direct and Rebuttal Testimonies. I
10 continue to believe my models are correctly specified and support my recommended
11 ROE of 9.95 percent, within a range of 9.80 percent through 10.60 percent.

12 Regarding Liberty-Empire's capital structure, I agree with Mr. Chari's conclusion
13 that the Company's proposal is appropriate, although for different reasons. I strongly
14 disagree with Mr. Murray's position that an equity ratio of 46.00 percent is "most
15 economical". Even under less volatile market conditions, Mr. Murray's proposal is far
16 afield from industry practice. Now, when balance sheet strength is so important to capital
17 access, and when investors already are facing extraordinarily high levels of market risk,
18 Mr. Murray's proposal simply adds unnecessary risk. In my opinion, his proposal is
19 counterproductive, and should be given no weight.

20 **Q. DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?**

21 A. Yes, it does.

¹²⁷ OPC Data Request - 3006 – Supplemental; CONFIDENTIAL.
¹²⁸ MPSC Data Request - 0186 – Supplemental CONFIDENTIAL.

VERIFICATION OF ROBERT B. HEVERT

Robert B. Hevert, under penalty of perjury, declares that the foregoing surrebuttal testimony is true and correct to the best of her/his knowledge, information, and belief.

Present Value Factor calculated based upon the current period and the Constant ROE	Present Value Factor		0.9091	0.8264	0.7513	0.6830	0.6209	0.5645	0.5132	0.4665	0.4241	0.3855	0.00

CASE 1	DIVIDENDS IN PERPETUITY												
Present value of Div/S obtained by multiplying nominal Div/S by the Present Value Factor for the period	Present Value Dividend	1.2720	1.2257	1.1812	1.1382	1.0968	1.0569	1.0185	0.9815	0.9458	0.9114		0.00
Total Value of investment sum of all Present Value Dividends in perpetuity (250 instances for demonstration purposes)	Value of Investment	\$ 34.98											

CASE 2		10-YEAR HOLDING PERIOD										
Present value of Div/S obtained by multiplying nominal Div/S by the Present Value Factor for the period	Present Value of Dividend	\$ 1.27	\$ 1.23	\$ 1.18	\$ 1.14	\$ 1.10	\$ 1.06	\$ 1.02	\$ 0.98	\$ 0.95	\$ 0.91	
Present value of Stock Price obtained by multiplying nominal Stock Price by the Present Value Factor for the 10th Period (Terminal Value)	Present Value of Stock Price	--	--	--	--	--	--	--	--	--	--	24.15
Value of dividends = sum of all Present Value Dividends for periods 1-10	Value of Dividends	\$ 10.83										
Present value of Stock Price obtained by multiplying nominal Stock Price by the Present Value Factor for the 10th Period (Terminal Value)	Value of Stock Price	\$ 24.15										
Total Value of investment sum of all Present Value Dividends for periods 1-10 and Present Value of Stock in period 10 (Terminal Value)	Value of Investment	\$ 34.98										

CASE 3		5-YEAR HOLDING PERIOD				
Present value of Div/S obtained by multiplying nominal Div/S by the Present Value Factor for the period	Present Value of Dividend	\$ 1.27	\$ 1.23	\$ 1.18	\$ 1.14	\$ 1.10
Present value of Stock Price obtained by multiplying nominal Stock Price by the Present Value Factor for the 5th Period (Terminal Value)	Present Value of Stock Price	--	--	--	--	29.07
Value of dividends = sum of all Present Value Dividends for periods 1-5	Value of Dividends	\$ 5.91				
Present value of Stock Price obtained by multiplying nominal Stock Price by the Present Value Factor for the 5th Period (Terminal Value)	Value of Stock Price	\$ 29.07				
Total Value of investment sum of all Present Value Dividends for periods 1-5 and Present Value of Stock in period 5 (Terminal Value)	Value of Investment	\$ 34.98

Effects of Leverage on the Company's Return on Equity

Notes:

Under Modigliani-Miller Proposition:

$$R_e = R_a + \frac{D}{E} (R_a - R_d) \times (1 - T)$$

or, rearranged:

$$R_a = \frac{(R_e + \frac{D}{E} \times R_d \times (1 - T))}{(1 + \frac{D}{E} \times (1 - T))}$$

R_a	= Unlevered Return on Equity
R_e	= Levered Return on Equity
R_d	= Cost of Debt
T	= Tax Rate
D/E	= Debt/Equity Ratio
