COUNTY OF ST. LOUIS)

Affidavit of Brian C. Collins

Brian C. Collins, being first duly sworn, on his oath states:

1. My name is Brian C. Collins. I am a consultant with Brubaker & Associates, Inc., having its principal place of business at 16690 Swingley Ridge Road, Suite 140, Chesterfield, Missouri 63017. We have been retained by the Missouri Industrial Energy Consumers and Vicinity Energy Kansas City, Inc. in this proceeding on their behalf.
2. Attached hereto and made a part hereof for all purposes are my direct testimony and schedule which were prepared in written form for introduction into evidence in Missouri Public Service Commission Case No. GR-2021-0108.
3. I hereby swear and affirm that the testimony and schedule are true and correct and that they show the matters and things that they purport to show.

Brian C. Collins

Subscribed and sworn to before me this 26th day of May, 2021.

Direct Testimony of Brian C. Collins

I. Introduction

Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A Brian C. Collins. My business address is 16690 Swingley Ridge Road, Suite 140,
Chesterfield, MO 63017.

Q WHAT IS YOUR OCCUPATION?

A I am a consultant in the field of public utility regulation and a Principal with the firm of
Brubaker & Associates, Inc., energy, economic and regulatory consultants.

Q PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A This information is included in Appendix A to this testimony.

Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?

A This testimony is presented on behalf of the Missouri Industrial Energy Consumers
("MIEC") and Vicinity Energy Kansas City, Inc. ("Vicinity"). The MIEC is a non-profit
corporation that represents the interests of industrial customers in matters involving
utility issues. Those interests include the interests of large industrial consumers of

**Brian C. Collins
Page 1**

1 Spire Missouri Inc. (“Spire” or “Company”). Vicinity is a “heating company” and a
2 “public utility” as those terms are defined in Sections 386.020(20) and 386.020(43).
3 Vicinity, therefore, is not only a customer of Spire, but also a competitor with Spire.
4 Vicinity is one of the largest users and transporters of natural gas on the Spire system.

5 **Q WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?**

6 A My testimony addresses the Company's class cost of service (“CCOS”) study, the
7 allocation of any allowed gas distribution rate increase, and the Transportation class
8 rate design. I have examined the testimony and schedules presented by the Company
9 in this proceeding with respect to class cost of service, class revenue allocation, and
10 rate design, and will comment on the propriety of its proposals and make certain
11 recommendations.

12 My silence on any aspect of the Company's filing should not be construed as
13 an endorsement of, or agreement with, the Company's position.

14 **Q PLEASE PROVIDE A BRIEF SUMMARY OF YOUR CONCLUSIONS AND**
15 **RECOMMENDATIONS IN THIS PROCEEDING.**

16 A My conclusions and recommendations are as follows:

17 1. The CCOS study filed by the Company in this proceeding is generally based
18 on fundamentally sound principles. For example, the CCOS study allocates
19 the fixed costs of distribution mains to customer classes on the basis of a
20 demand component and a customer component. However, Spire has filed
21 a CCOS study only for its combined system and not individually for the Spire
22 East and Spire West Systems.¹

23 2. Though the CCOS study filed by Spire shows that the Transportation
24 customers in Spire East and Spire West on average should receive a
25 non-gas rate **decrease** of approximately 18.6%, Spire proposes to
26 **increase** the non-gas rates of the Transportation class by 23.5% on

¹Spire East refers to the service territory previously called Laclede Gas Company. Spire West refers to the service territory previously called Missouri Gas Energy (“MGE”).

- 1 average. As a result of its class revenue allocation proposal, Spire moves
2 the Transportation class's rates even further away from cost of service than
3 they are now.
- 4 3. With regard to rate design in the Transportation rate schedule, Spire has
5 made a movement to a single rate design for Transportation customers
6 across its combined service territories without adequate cost support. Spire
7 has eliminated the two-block volumetric rate design for Transportation
8 customers in both Spire East and Spire West. As a result, some
9 Transportation customers will see dramatic increases at proposed rates, in
10 excess of 80%, even though its CCOS study indicates Transportation
11 customers' rates should be decreased on average. In particular, Vicinity
12 would see an increase of over 85% in its non-gas costs.
- 13 4. Spire has not justified the above average increases for Transportation
14 customers or its flattening of the Transportation rates, which results in
15 disproportionately above average increases to larger customers.
- 16 5. As a result, I recommend that the respective existing rate designs for
17 Transportation customers in Spire West and Spire East be maintained.
- 18 6. Because the single CCOS study indicates that existing Transportation rates
19 should be reduced, I recommend that the existing rates of Transportation
20 customers in Spire West and Spire East be reduced by approximately
21 18.6%. Because the Company unilaterally chose to file its CCOS study on
22 only a consolidated or combined basis, sufficient data does not currently
23 exist to enable different Transportation rate adjustments to be proposed for
24 Spire West and Spire East.
- 25 7. Because the Company's CCOS study indicates that all classes but the
26 Residential class should receive a rate decrease, the difference in revenues
27 resulting from my proposed revenue allocation should be collected from the
28 Residential class.
- 29 8. I recommend that in future rate cases, the Missouri Public Service
30 Commission ("Commission") require Spire to file a CCOS study or studies
31 consistent with the Commission order in this case. For example, to the
32 extent the Commission finds that separate rates for Spire East and Spire
33 West should continue, the Company should file separate CCOS studies for
34 Spire East and Spire West in the next rate case. This will allow parties to
35 measure the adequacy of the rates for each class in both service areas and
36 evaluate the reasonableness of any rate consolidation proposals – an
37 undertaking that could not be conducted in this proceeding due to the lack
38 of documentation filed by Spire in support of its movement toward
39 consolidated rates. Such an approach was ordered by the Commission in
40 the recently completed Missouri-American Water Company rate case.

1 **II. Class Cost of Service and Rate Design Principles**

2 **Q** **COULD YOU PLEASE EXPLAIN THE RATEMAKING PROCESS AND THE DESIGN**
3 **OF RATES?**

4 **A** The ratemaking process has three steps. First, we must determine the utility's total
5 revenue requirement and the extent to which an increase or decrease in revenues is
6 necessary. Second, we must determine how any increase or decrease in revenues is
7 to be distributed among the various customer classes. A determination of how many
8 dollars of revenue should be produced by each class is essential for obtaining the
9 appropriate level of rates. Third, individual tariffs must be designed to produce the
10 required amount of revenues for each class of service and to reflect the cost of serving
11 customers within the class.

12 The guiding principle at each step should be cost of service. In the first step,
13 determining revenue requirements, it is universally agreed that the utility is entitled to
14 a revenue increase only to the extent that its actual cost of service has increased. If
15 current rate levels exceed the utility's revenue requirement, a rate reduction is required.
16 In short, rate revenues should equal actual cost of service. The same principle should
17 apply in the second and third steps. Each customer class should, to the extent
18 practicable, produce revenues equal to the cost of serving that particular class, no more
19 and no less. This may require a rate increase for some classes and a rate decrease
20 for other classes. The standard tool for performing this exercise is a CCOS study that
21 shows the cost to serve each class, as well as the rates of return for each class of
22 service. The goal is to modify rate levels so that each class of service provides
23 approximately the same rate of return. Finally, in designing tariffs for individual classes,
24 the goal also should be to align the rate design with the cost of service so that each

1 customer class's rate tracks, to the extent practicable, the utility's cost of providing
2 service to that customer class.

3 **Q WHY IS IT IMPORTANT TO ADHERE TO BASIC COST OF SERVICE PRINCIPLES**
4 **IN THE RATEMAKING PROCESS?**

5 A The basic reasons for using cost of service as the primary factor in the ratemaking
6 process are equity and stability.

7 **Q PLEASE DISCUSS THE EQUITY CONSIDERATION.**

8 A When rates are based on cost of service, each customer class pays what it costs the
9 utility to serve that customer class, no more and no less. But when rates are not based
10 on cost of service, then some classes are required to contribute disproportionately to
11 the utility's revenues by subsidizing the service provided to other customer classes.
12 This is inherently inequitable.

13 **Q PLEASE DISCUSS THE STABILITY CONSIDERATION.**

14 A When rates are closely tied to costs, the earnings impact on the utility associated with
15 changes in numbers of customers and their usage patterns will be minimized as a result
16 of rates being designed in the first instance to track changes in the level of costs. Thus,
17 cost-based rates provide an important enhancement to a utility's earnings stability,
18 thereby reducing the utility's need to file for future rate increases.

19 From the perspective of the customer, cost-based rates provide a more reliable
20 means of determining future levels of costs. If rates are based on factors other than
21 costs, it becomes much more difficult for customers to translate expected utility-wide
22 cost changes (*i.e.*, expected increases in overall revenue requirements) into changes

1 in the rates charged to particular customer classes (and to customers within the class).
2 From the customer's perspective, this situation reduces the attractiveness of
3 expansion, as well as continued operations, because of the lessened ability to plan.
4 Cost-based rates provide accurate price signals that provide customers with important
5 information necessary to make expansion decisions as well as decisions regarding
6 continued operations, thus improving their ability to plan.

7 **Q WHEN YOU SAY "COST," TO WHAT TYPE OF COST ARE YOU REFERRING?**

8 A I am referring to the utility's "embedded" or actual accounting costs of rendering service;
9 that is, those costs that are used by the Commission in establishing the utility's overall
10 revenue requirement.

11 **Q WHAT IS THE BASIC PURPOSE OF A CCOS STUDY?**

12 A The basic purpose of a CCOS study is to determine the costs that a utility incurs to
13 provide service to different classes of customers. After the utility's overall cost of
14 service (or revenue requirement) is determined, a CCOS study is used, first, to allocate
15 the cost of service between the utility's jurisdictional and non-jurisdictional (if any)
16 businesses and between service territories. Then, second, to allocate the jurisdictional
17 cost of service among the utility's customer classes.

18 A CCOS study shows the extent to which each customer class contributes to
19 the total cost of the system. For example, when a class produces the same rate of
20 return as the total system, it returns to the utility just enough revenues to cover the
21 costs incurred in serving that class (including a reasonable authorized return on
22 investment). If a class produces a rate of return below the system average, the
23 revenues it provides to the utility are insufficient to cover all relevant costs. If, on the

1 other hand, a class produces a rate of return above the average, then that class pays
2 revenues sufficient to cover the costs attributable to it, and it also pays for part of the
3 costs attributable to other classes that produce below-average rates of return. The
4 CCOS study therefore is an important tool, because it shows the revenue requirement
5 for each class along with the rate of return under current rates and any proposed rates.

6 Reliance on a properly prepared CCOS study in designing or consolidating
7 rates serves to minimize improper price signals and cross-subsidization issues
8 between rate classes and customers within a rate class. All rate design proposals
9 should not be adopted when the CCOS study supports a class or classes' rate
10 reduction but the filed tariff change results in a significant overall increase to the class
11 or classes and disproportionate increases to certain customers within that class or
12 classes.

13 **Q WHAT ARE THE MAIN ELEMENTS OF A CCOS STUDY?**

14 **A** Cost of service is a basic and fundamental ingredient to proper ratemaking. In all
15 CCOS studies, certain fundamental concepts should be recognized. Of primary
16 importance among these concepts are the functionalization, classification, and
17 allocation of costs.

18 Functionalization is the determination and arrangement of costs according to
19 major functions, such as production, storage, transmission and distribution.

20 Classification involves identifying the nature of these costs according to whether
21 the costs vary with the demand placed upon the system, the quantity of gas consumed,
22 or the number of customers being served.

23 After the assignment of costs to demand, commodity and customer categories,
24 each cost category must be allocated to classes. Fixed costs are those costs that tend

1 to remain constant over the short run irrespective of changes in output, and are
2 generally considered to be demand-related. Fixed costs include those costs that are a
3 function of the size of the utility's investment in facilities, and those costs that are
4 necessary to keep the facilities "on line." Variable costs, on the other hand, are
5 basically those costs that tend to vary with throughput (or usage), and are generally
6 considered to be commodity-related. Customer-related costs are those costs that are
7 most closely related to the number of customers served, rather than the demands
8 placed upon the system or the quantity of gas consumed.

9 **III. The Company's CCOS Study**

10 **Q HAVE YOU REVIEWED THE CCOS STUDY FILED BY THE COMPANY IN THIS**
11 **PROCEEDING USED TO ESTABLISH RATES?**

12 A Yes. I reviewed the Company's CCOS study sponsored by Mr. Wesley E. Selinger.

13 **Q WHAT ARE THE RESULTS OF THE COMPANY'S CCOS STUDY?**

14 A Based on the information provided by the Company, I have summarized the results of
15 the CCOS study in Table 1 below. Table 1 shows the increases necessary to bring
16 classes' rates to cost of service for Spire on a combined Spire East and Spire West
17 basis. It should be noted that the increases shown in the table are calculated with
18 respect to current revenues, which only includes current base rate revenues and
19 excludes Infrastructure System Replacement Surcharge ("ISRS") revenues.

TABLE 1

**Spire CCOS Study Results
At Equal Percent Rate of Return**

<u>Line</u>	<u>Rate Class</u>	<u>Current Revenues (without ISRS)¹</u> <u>(1)</u>	<u>CCOS Revenues²</u> <u>(2)</u>	<u>CCOS Increase/ (Decrease) \$</u> <u>(3)</u>	<u>Increase/ (Decrease) %</u> <u>(4)</u>

Source:

¹ Schedule WES-2, page 1 of 66.

1 **Q CAN YOU EXPLAIN THIS TABLE?**

2 A This table shows that Spire is seeking an increase of approximately \$111.5 million
3 above the amount of revenues produced by current base rates. The current revenues
4 in the above table do not reflect the approximately \$47.3 million that would be
5 recovered on an annualized basis through the current ISRS surcharge. The table also
6 shows that, in order to reach cost of service, Residential rates need to be increased by
7 \$138.7 million while the other classes should receive a combined decrease of
8 \$27.2 million.

1 **Q HOW WAS THE COMPANY'S CCOS STUDY PERFORMED?**

2 A The Company's CCOS study was performed on a combined basis for Spire East and
3 Spire West. Separate CCOS studies were not performed for Spire East and Spire
4 West.

5 **Q WHY ARE SEPARATE CCOS STUDIES IMPORTANT?**

6 A It is important because it would allow parties to measure – and the Commission to
7 understand – how all customer classes' existing rates in both Spire East and Spire
8 West are performing in terms of collecting their cost of service.

9 **Q SHOULD RATES IN SPIRE EAST AND SPIRE WEST BE DESIGNED ON THEIR
10 RESPECTIVE CLASS COST OF SERVICE?**

11 A Yes. The Spire West and Spire East systems were separately planned, designed, and
12 constructed. As a result, their rates have historically been based on separate cost of
13 service. Furthermore, it is likely that the customers in each system have different usage
14 characteristics which would drive different rates. For instance, customers of one
15 system may have a higher load factor (i.e., the customers have higher usage for each
16 unit of demand). Therefore, rates should continue to be based on each service
17 territory's cost of service. This will properly reflect cost causation.

18 **Q WHEN SELECTING A CLASS COST OF SERVICE METHODOLOGY, SHOULD THE
19 METHODOLOGY APPROPRIATELY REFLECT COST CAUSATION?**

20 A Yes. In selecting a particular class cost of service study methodology, the fundamental
21 question is whether that methodology properly reflects cost causation. In other words,
22 costs should be allocated to the utility's customer classes based on how the costs are

1 incurred. The *Gas Distribution Rate Design Manual* published by the National
2 Association of Regulatory Utility Commissioners (“NARUC”) describes this principle as
3 follows:

4 *Historic or embedded cost of service studies attempt to apportion total*
5 *costs to the various customer classes in a manner consistent with the*
6 *incurrence of those costs.* This apportionment must be based on the
7 fashion in which the utility’s system, facilities and personnel operate to
8 provide the service.²

9 **Q WHAT IS YOUR CONCLUSION WITH RESPECT TO THE COMPANY’S CCOS**
10 **STUDY?**

11 A Based on my review of the CCOS study, I conclude that the CCOS study incorporates
12 generally accepted cost of service principles but should not have been prepared solely
13 on a consolidated basis. Specifically, the Company’s CCOS study appropriately
14 allocates the costs of distribution mains to the Company’s customer classes based on
15 both (1) the contribution of each class to the system design day demand (the Coincident
16 Demand method) and (2) the number of customers served within each class. The
17 Company’s largest investment in terms of cost is distribution mains,³ thus it is especially
18 important that the allocation of these costs follow class cost causation.

²NARUC *Gas Distribution Rate Design Manual* at 20 (emphasis added).

³According to Mr. Selinger’s Appendix C of his testimony, distribution mains represent 45% of utility plant investment for Spire.

1 Q SETTING ASIDE THE ISSUE OF SEPARATE STUDIES FOR SPIRE EAST AND
2 SPIRE WEST, PLEASE EXPLAIN WHY THE COMPANY'S CCOS STUDY
3 PROPERLY REFLECTS CLASS COST CAUSATION WITH RESPECT TO
4 DISTRIBUTION MAINS.

5 A When a gas distribution utility installs distribution mains to establish/expand the
6 capacity of its system, there are two factors that it must consider. First, the utility must
7 design its system to ensure that it will be capable of meeting customers' demand on
8 the system peak day (or "design day"). The expected demand on the system peak day
9 is the key consideration. It dictates the proper size (in diameter) of the distribution
10 mains to be installed to provide reliable service—and that, in turn, dictates the costs
11 that the utility must incur. Thus, the costs incurred by the utility are a function of design
12 day demand, because when the distribution system is designed to meet the coincident
13 design day demand of the utility's rate classes, the utility is able to meet its firm
14 customers' demands each and every day of the year.

15 Second, the utility must also design its system in such a way that all customers
16 are physically connected to the system. While the diameter of the mains installed
17 depends upon design day demand, the total length of the mains depends upon the
18 number of customers being served. To illustrate, a much greater level of investment in
19 distribution main is needed to serve 10,000 customers with individual coincident peak
20 demands of 1 Mcf located at various geographical locations than what is needed to
21 serve one customer with a demand of 10,000 Mcf at a single geographic location. Thus,
22 the costs that a gas distribution utility incurs to provide service are driven by both design
23 day demand (diameter of the main) and the number of customers connected to the
24 system (length of the main).

1 Consistent with this, the Company's CCOS study allocates the costs of
2 distribution mains to customer classes on the basis of both (1) each class's contribution
3 to the total design peak day demand of the system (the Coincident Demand method)
4 and (2) the number of customers within each class. The CCOS study therefore
5 allocates costs based on how they are incurred, consistent with cost-causation
6 principles, and are reasonable for the purpose of setting rates in this proceeding.

7 **Q WHY DOES PARTIALLY ALLOCATING DISTRIBUTION MAIN COSTS ON A**
8 **DESIGN DAY DEMAND BASIS REFLECT SOUND COST OF SERVICE**
9 **PRINCIPLES?**

10 A As explained above, when a gas distribution utility designs its system, the key
11 consideration is the expected demands of the customer classes on the design day.
12 The expected demands on the design day dictate both the proper size of the mains,
13 and that in turn directly impacts the total cost of the system. The cost of the system is
14 therefore a function of the design day demand, and that cost is *the same* regardless of
15 how much gas customers are expected to use throughout the year. The cost of serving
16 the peak is the same regardless of whether customers are expected to use gas
17 consistently throughout the entire year, or during only part of the year (e.g., the winter
18 months).

19 **Q WHY DOES ALLOCATING DISTRIBUTION MAIN COSTS PARTIALLY ON A**
20 **CUSTOMER BASIS REFLECT SOUND COST OF SERVICE PRINCIPLES?**

21 A Classifying a portion of main costs as customer-related recognizes that a portion of
22 main costs is incurred to connect customers to the system and is related to the length
23 of mains necessary to connect those customers rather than the demand of those

1 customers. Classifying a portion of main costs as customer related and allocating those
2 costs on a customer basis appropriately reflects cost of service. Spire has classified a
3 portion of distribution mains as customer related using the zero-inch analysis. The
4 zero-inch approach calculates a hypothetical zero or minimum size main necessary to
5 connect customers to the system and thus affords customers the opportunity to take
6 gas delivery service as desired. The results of Spire's zero-inch analysis determined
7 that approximately 34.1% of the investment in mains is customer related for Spire.
8 Therefore, the demand related portion of mains investment is 65.90%.

9 **Q IS ANNUAL USAGE A DESIGN CRITERION FOR A TYPICAL GAS DISTRIBUTION**
10 **COMPANY FACILITY?**

11 A No, it is not. To be sure, annual usage is certainly a factor that should be and is
12 considered in allocating the variable cost of operating the gas system. However,
13 annual usage does not determine the amount of system capacity that is necessary to
14 provide firm (*i.e.*, non-interruptible) service to every customer every day of the year.
15 Rather, the actual physical size of the distribution mains, compressors, and related
16 equipment is based on customers' contributions to the system design day demand.

17 The system's capacity to serve customer classes must be sized for design day
18 demand, so that all firm customers can utilize that capacity to receive a firm,
19 uninterrupted supply of gas on the day of the system peak demand. Only if the system
20 is designed to meet the design day demand of all the Company's rate classes will the
21 Company be able to deliver gas each and every day of the year to meet its customers'
22 demands. If the distribution mains were not designed to meet the design day demand
23 of classes but were instead designed to meet the average demand of classes, there

1 would be times when firm customers would not receive service due to inadequate main
2 capacity.

3 **Q BUT DOESN'T THE COMPANY'S DISTRIBUTION SYSTEM ALLOW CUSTOMERS**
4 **TO RECEIVE VOLUMES OF GAS THROUGHOUT THE YEAR?**

5 A Yes. After the distribution system is designed and constructed to meet design day
6 demand, the capacity is adequate to serve the demands of customers on all other days.

7 It is the design day demand which drives the capacity-related cost incurred in
8 order to design, construct, implement and maintain a distribution system that is
9 adequate to provide firm service throughout the year, including the system peak design
10 day, to all customers that want firm service. Distribution systems are sized based on
11 design day demands which will ensure that firm gas supply can actually be delivered
12 every single day of the year. Because cost causation is driven by design day demand,
13 distribution-related demand or capacity-related costs should be allocated based on
14 design day demand.

15 If the distribution system can meet the design day demand of its customers, it
16 can meet the demand of its customers on every other day of the year. Daily needs
17 must be met, but the only way to ensure that will happen is through a system that is
18 designed to meet the design day demand. A system designed to simply meet average
19 demand would fail to serve customers on many cold days.

20 **Q DOES SPIRE'S CCOS STUDY ALSO PROPERLY ALLOCATE THE COSTS OF**
21 **STORAGE TO CLASSES?**

22 A Yes. Transportation customers on the Spire system manage their own gas supply and
23 are not allowed to use Spire's gas storage assets for injecting or withdrawing their own

1 gas supply. As a result, the costs of underground storage are not allocated by Spire to
 2 the Transportation class customers.

3 Spire's costs of its own underground storage, both capital and expenses, are
 4 incurred for the construction and operation of assets designed to store natural gas used
 5 to meet the demands of its sales customers who purchase both gas supply and delivery
 6 service from Spire. These costs are not incurred by Spire to provide delivery service
 7 to Transportation customers. As a result, Spire's allocation of underground storage in
 8 its CCOS study best reflects cost causation because Spire does not incur the cost of
 9 underground storage in providing distribution delivery service to Transportation
 10 customers.

11 **IV. Class Revenue Allocation**

12 **Q HAVE YOU REVIEWED SPIRE'S PROPOSED CLASS REVENUE ALLOCATION?**

13 **A** Yes. Spire's proposed class revenue allocation is shown below in Table 2.

TABLE 2					
<u>Spire's Class Revenue Allocation</u>					
<u>Line</u>	<u>Rate Class</u> (1)	<u>Current Revenues (without ISRS)¹</u> (2)	<u>CCOS Revenues²</u> (3)	<u>Company Proposed Revenues³</u> (4)	<u>Increase/ (Decrease) %</u> (5) = [(4) - (2)] / (2)
1	Residential	\$450,417,204	\$589,116,333	\$533,636,681	18.48%
2	SGS	\$46,392,223	\$44,131,017	\$57,305,034	23.52%
3	LGS	\$43,710,934	\$24,344,961	\$53,993,027	23.52%
4	Transportation	<u>\$30,017,548</u>	<u>\$24,420,986</u>	<u>\$37,078,555</u>	<u>23.52%</u>
5	Total	\$570,537,909	\$682,013,298	\$682,013,297	19.53%

Page 16

1 Q DO YOU AGREE WITH LACLEDE'S PROPOSED CLASS REVENUE
2 ALLOCATION?

3 A No, I do not. As shown in Table 1, Spire's CCOS study clearly shows that all rate
4 classes except the Residential class require rate decreases to bring their rates to their
5 respective class cost of service. Instead of moving the SGS, LGS, and Transportation
6 classes closer to cost of service, Spire moves these classes away from cost of service
7 under its proposed rates. Specifically, Spire proposes to increase rates for these
8 classes by a higher percentage than it proposes for the Residential class. Thus, these
9 classes provide even higher rates of return at proposed rates than they do at current
10 rates. Furthermore, even though these classes should receive a rate decrease, Spire
11 has proposed a higher percentage increase in rates for these classes than for the
12 Residential class, as shown in Table 2.

13 This movement away from cost of service in terms of rate of return is shown in
14 Table 3 below. Class rates of return at current rate revenues, cost of service revenues,
15 and proposed Spire rate revenues are compared in the table.

TABLE 3
Spire Class Rates of Return

<u>Line</u>	<u>Rate Class</u>	<u>Current Revenues (without ISRS)</u>	<u>CCOS Revenues</u>	<u>Company Proposed Revenues</u>
		<u>ROR</u>	<u>ROR</u>	<u>ROR</u>
1	Residential	2.60%	7.23%	5.52%
2	SGS	8.09%	7.23%	11.97%
3	LGS	16.63%	7.23%	20.46%
4	Transportation	<u>10.12%</u>	<u>7.23%</u>	<u>13.17%</u>
5	Total	4.18%	7.23%	7.23%

Brian C. Collins
Page 17

1 With respect to the Transportation class, its rate of return would increase to 13.2%,
 2 which is higher than its rate of return at current rates of 10.1%, and nearly double that
 3 of the proposed system average rate of return of 7.23%.

4 When a class produces a rate of return higher than the system average, it is
 5 subsidizing another class or classes. Under Spire’s proposed class revenue allocation,
 6 the SGS, LGS, and Transportation classes will subsidize the Residential class by
 7 approximately \$55.5 million annually and pay more than their respective class cost of
 8 service under proposed rates.

9 **Q WHAT IS YOUR PROPOSED CLASS REVENUE ALLOCATION?**

10 A Table 4 below shows my recommended class revenue allocation for Spire. I propose
 11 to move all classes to cost of service. As a result, all classes would produce a rate of
 12 return of 7.23% at proposed rates.

TABLE 4
MIEC/Vicinity Proposed Class Revenue Allocation for Spire

<u>Line</u>	<u>Rate Class</u> (1)	<u>Current Revenues (without ISRS)¹</u> (2)	<u>CCOS Revenues²</u> (3)	<u>MIEC/Vicinity Proposed Revenues</u> (4)	<u>Increase/ (Decrease) %</u> (5) = [(4) – (2)] / (2)
1	Residential	\$450,417,204	\$589,116,333	\$589,116,333	30.8%
2	SGS	\$46,392,223	\$44,131,017	\$44,131,017	-4.9%
3	LGS	\$43,710,934	\$24,344,961	\$24,344,961	-44.3%
4	Transportation	\$30,017,548	\$24,420,986	\$24,420,986	-18.6%
5	Total	\$570,537,909	\$682,013,298	\$682,013,298	19.5%

Sources:

^{1,2} Schedule WES-2, page 1 of 66.

1 Q PLEASE EXPLAIN WHY YOUR PROPOSED CLASS REVENUE ALLOCATION FOR
2 SPIRE IS REASONABLE.

3 A My proposal for class revenue allocation is reasonable because it moves all classes to
4 their respective cost of service in the combined service territories. This is based on the
5 single class cost of service study. Specifically for the Transportation class, because
6 the Company has only provided a single class cost of service study, I recommend that
7 each volumetric block charge under the existing rates for Transportation customers be
8 decreased by an equal percent so that the Transportation class receives an 18.6%
9 decrease.

10 Q SHOULD SEPARATE CLASS COST OF SERVICE STUDIES BE PERFORMED IN
11 THE NEXT RATE CASE FOR BOTH SPIRE EAST AND SPIRE WEST IN ORDER TO
12 GUIDE THE CLASS REVENUE ALLOCATION?

13 A Yes. This will allow the rates in each service territory to be compared to each territory's
14 respective class cost of service. A similar provision was recently ordered by the
15 Commission in the Missouri-American Water Company rate case (WR-2020-0344).

16 **VI. Proposed Transportation Rate Design for Spire**

17 Q PLEASE DESCRIBE THE CURRENT RATE DESIGN FOR THE SPIRE WEST AND
18 SPIRE EAST TRANSPORTATION CLASS?

19 A The current Spire West Transportation tariff (the Large Volume or LV tariff) provides for
20 a customer charge with all other costs recovered through a seasonal two-block
21 volumetric consumption charge. The first block applies to the first 30,000 Ccf of
22 customer monthly usage and is equal to 3.441¢/Ccf during the summer and 5.512¢/Ccf

1 during the winter. For all usage in excess of 30,000 Ccf/month, the customer is charged
2 2.280¢/Ccf during the summer and 4.300¢/Ccf during the winter.

3 The current Spire East Transportation tariff is similar. The Spire East tariff has
4 a customer charge, a reservation charge per billing demand therm, and a two-block
5 volumetric consumption charge. Specifically, the first block of 2.509¢/therm applies to
6 the first 36,000 therms of customer monthly usage. The second block of 1.050¢/therm
7 applies to all usage in excess of 36,000 therms.⁴

8 **Q DO YOU BELIEVE THAT THE CURRENT TWO-BLOCK TRANSPORTATION RATE**
9 **STRUCTURE IS REASONABLE?**

10 A Yes. Current Transportation rates collect a significant level of fixed costs through the
11 volumetric consumption charges. One major problem with the collection of fixed costs
12 through a variable charge is that customers with a larger amount of usage will likely
13 end up paying for more than their share of fixed costs. Conversely, those
14 Transportation customers with a smaller level of usage will likely end up paying less
15 than the amount of fixed costs incurred to provide them service, so that large customers
16 will be subsidizing the smaller customers in the Transportation rate class. The reduced
17 second block in Spire's existing rate design attempts to reflect this fact by reducing the
18 volumetric consumption charge for the higher usage customers after they exceed the
19 second block usage threshold.

⁴Notice that the current Spire East tariff measures usage in therms. In contrast, the Spire West tariff measures usage in Ccf. Spire proposes to convert the Spire East tariff so that it is also measured in Ccf. I do not have any objection to this change such that usage is measured in consistent units in both Spire East and Spire West.

1 **Q HAVE YOU REVIEWED THE COMPANY'S PROPOSED RATE DESIGNS FOR THE**
2 **TRANSPORTATION CLASS IN SPIRE EAST AND SPIRE WEST?**

3 A Yes, I have reviewed the Company's proposed rate designs for the Transportation
4 class and disagree with the Company's proposed approach. The Company has not
5 justified its proposed rate designs nor has it demonstrated that its rate design proposal
6 properly reflects class cost of service for the Transportation class.

7 **Q DOES THE COMPANY PROPOSE TO MOVE TOWARD A SINGLE VOLUMETRIC**
8 **RATE FOR TRANSPORTATION CUSTOMERS?**

9 A Yes. Spire's existing rate design for Spire West and Spire East Transportation
10 customers includes a two-block volumetric rate. Based on its proposal in this rate case,
11 Spire proposes to eliminate the two volumetric blocks and include only a single block
12 rate in its rate design proposal for the Transportation class.

13 **Q WHY IS A SINGLE VOLUMETRIC RATE FOR THE TRANSPORTATION**
14 **CUSTOMERS NOT APPROPRIATE?**

15 A Single volumetric rates tend to over-collect fixed costs from large users of natural gas.
16 This creates subsidies between large users and small users in the class as shown in
17 Schedule BCC-1. Schedule BCC-1 shows that large usage Transportation customers
18 receive much larger increases than smaller usage Transportation customers in both
19 Spire East and Spire West under the Company's proposed rate design that contains a
20 single volumetric block. As a result, large users such as Vicinity will face increased
21 costs that are not based on cost of service. In addition, a single block rate will adversely
22 affect Vicinity's ability to maintain its competitiveness. This is particularly troublesome

1 because Spire is a direct competitor with Vicinity in regard to Vicinity's steam heating
2 service.

3 **Q DOES SPIRE ALSO PROPOSE TO ELIMINATE THE EXISTING SEASONAL**
4 **BLOCK RATES FOR SPIRE WEST TRANSPORTATION CUSTOMERS?**

5 A Yes. I oppose the Company's proposal to eliminate the seasonal block charges in
6 Spire West for Transportation customers absent any justification and impact analysis
7 for the Transportation class.

8 **Q HAS THE COMPANY JUSTIFIED ITS TRANSPORTATION RATE DESIGN**
9 **PROPOSAL?**

10 A No. Spire filed a single CCOS study. As a result, it is impossible to determine how
11 close the current revenues collected under Spire's existing rates are to actual cost of
12 service for Transportation customers in both Spire East and Spire West. Spire has also
13 failed to offer a reasonable basis for or demonstrate an immediate need to collapse the
14 Transportation rate from a two-block rate structure to a single block.

15 **Q DID THE COMPANY EXAMINE THE IMPACT OF ITS TRANSPORTATION RATE**
16 **DESIGN PROPOSAL ON TRANSPORTATION CUSTOMERS IN SPIRE EAST AND**
17 **SPIRE WEST?**

18 A No. Responses to data requests make it clear that the Company did not examine the
19 impacts of its rate design proposal on Transportation customers at all. For example,
20 when asked in Vicinity Data Request 1e to describe all analyses of the non-gas rate
21 impacts to existing Transportation customers of Spire's proposal to change the rate

1 design from a two-block structure to a single block, the Company responded with the
2 following:

3 **Response:** The Company's goal was to simplify the tariffs under one
4 Spire Missouri, and the Company did not perform any analysis that is
5 responsive to this request.

6 **Q HOW DO YOU RESPOND?**

7 A For Spire to dramatically change the existing Transportation rate design structures
8 without understanding the impacts to its largest customers for the sake of simplifying
9 its tariffs is not a good business practice nor is it reflective of proper customer relations.
10 To not perform such analysis results in an unawareness on Spire's behalf of the
11 impacts of these significant changes on the costs that would be imposed on its largest
12 customers. As a result, Spire has neither determined nor proven in this case that its
13 proposed rate design structure is reflective of cost of service for its Transportation
14 customers.

15 **Q WILL SPIRE'S TRANSPORTATION RATE DESIGN PROPOSAL RESULT IN
16 SIGNIFICANT IMPACTS TO TRANSPORTATION CUSTOMERS?**

17 A Yes. Based on the Company's rate design proposal, some customers will see
18 increases in excess of 80%. This is because the proposed rate design coupled with
19 the Company's proposed class revenue allocation collects revenues drastically in
20 excess of class cost of service. In addition as previously discussed, if Spire's rate
21 design proposal were to be adopted, a competitive advantage would be transferred to
22 Spire by imposing significantly higher costs on and causing Vicinity to face even greater
23 pricing competition for its existing steam customers.

1 In its application to intervene⁵ at 4, Vicinity discussed the severe impact of
2 Spire's proposed rate increase and rate design recommendation, as follows:

3 5. And that impact is huge. As noted above, Vicinity is currently billed
4 through a two-block rate. Because it is such a large customer, almost all
5 of its volumes are billed at the lower second-block rate. That second-block
6 rate is now \$0.0430 per Ccf in the winter and \$0.0228 per Ccf in the
7 summer. In this case, Spire proposes to collapse the two blocks into one,
8 eliminate the summer/winter differential, and charge all volumes at \$0.0604
9 per Ccf. Without divulging customer-specific usage data in this public filing,
10 the impact of such a proposed rate structure change on a customer like
11 Vicinity that takes the vast majority of its volumes at the second-block rate
12 of going from an unweighted average second block rate of \$0.03290
13 ($(\$0.0430 + \$0.0228)/2 = \$0.03290$) to a rate of \$0.0604 would be
14 devastating. **Preliminary calculations show that the increase to**
15 **Vicinity will be greater than 85%.** This 85% or greater increase would
16 generally flow to Vicinity's customers, which are already likely to be
17 struggling with the impacts on their businesses from Covid 19. [Original
18 Emphasis]

19 **Q IS THE ABOVE ESTIMATED IMPACT TO VICINITY CONSISTING OF AN 85% OR**
20 **GREATER INCREASE STILL VALID?**

21 A Yes.

22 **Q WOULD THE 85% OR GREATER INCREASE ESTIMATED FOR VICINITY BE**
23 **ABSORBED BY VICINITY AS AN OPERATING COST?**

24 A No. These costs must be passed onto Vicinity's customers dollar for dollar, thus
25 supporting the concern about the competitive disadvantage Vicinity faces from this rate
26 case. Because these costs are passed onto Vicinity customers, Spire has essentially
27 proposed that Vicinity's individual customers should receive an 85% increase. This is
28 hardly fair when compared with other Spire customers. By adopting my recommended

⁵Application to Intervene Out of Time of Vicinity Energy Kansas City, Inc., filed February 16, 2021. The results of these unweighted "preliminary calculations" have not been revised, in part to protect the confidential nature of Vicinity's Transportation volumes.

1 rate design proposal, the impact to Vicinity and the individual customers served by
2 Vicinity will be limited to a more reasonable impact.

3 **Q ARE YOUR CONCERNS LIMITED SOLELY TO VICINITY?**

4 A No. The Spire proposal to collapse the current two-block Transportation rate design
5 into a single rate block will be acutely felt by all Transportation customers that currently
6 have usage priced in the lower rate second block.

7 **Q WHAT IS YOUR RECOMMENDATION REGARDING THE TRANSPORTATION**
8 **CLASS RATE DESIGN?**

9 A Spire clearly has not justified its proposed changes to the existing structures of the
10 Transportation rates. In addition, Spire East and Spire West are completely separate
11 service territories. The Spire East and Spire West systems were separately planned,
12 designed, and constructed. As a result, their rates have historically been based on
13 separate cost of service. Rates should continue to be based on each service territory's
14 cost of service. This will properly reflect cost causation.

15 I recommend the existing separate Transportation rate designs be maintained
16 in both Spire East and Spire West and that each volumetric block charge under the
17 existing rates for Transportation customers be decreased by an equal percent so that
18 the Transportation class receives an 18.6% decrease as shown in the Company's
19 single class cost of service study. Even if the Commission does not agree with my
20 proposal to reduce rates for Transportation customers to align those rates with the cost
21 of service, it should still reject the Company's unsupported proposal to eliminate the
22 second volumetric block rate.

Brian C. Collins
Page 25

1 Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

2 A Yes, it does.

Qualifications of Brian C. Collins

1 **Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A Brian C. Collins. My business address is 16690 Swingley Ridge Road, Suite 140,
3 Chesterfield, MO 63017.

4 **Q WHAT IS YOUR OCCUPATION AND BY WHOM ARE YOU EMPLOYED?**

5 A I am a consultant in the field of public utility regulation and a Principal with the firm of
6 Brubaker & Associates, Inc. ("BAI"), energy, economic and regulatory consultants.

7 **Q PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND WORK
8 EXPERIENCE.**

9 A I graduated from Southern Illinois University Carbondale with a Bachelor of Science
10 degree in Electrical Engineering. I also graduated from the University of Illinois at
11 Springfield with a Master of Business Administration degree. Prior to joining BAI, I was
12 employed by the Illinois Commerce Commission and City Water Light & Power
13 ("CWLP") in Springfield, Illinois.

14 My responsibilities at the Illinois Commerce Commission included the review of
15 the prudence of utilities' fuel costs in fuel adjustment reconciliation cases before the
16 Commission as well as the review of utilities' requests for certificates of public
17 convenience and necessity for new electric transmission lines. My responsibilities at
18 CWLP included generation and transmission system planning. While at CWLP, I
19 completed several thermal and voltage studies in support of CWLP's operating and
20 planning decisions. I also performed duties for CWLP's Operations Department,
21 including calculating CWLP's monthly cost of production. I also determined CWLP's

Brian C. Collins
Appendix A
Page 1

1 allocation of wholesale purchased power costs to retail and wholesale customers for
2 use in the monthly fuel adjustment.

3 In June 2001, I joined BAI as a Consultant. Since that time, I have participated
4 in the analysis of various utility rate and other matters in several states and before the
5 Federal Energy Regulatory Commission (“FERC”). I have filed or presented testimony
6 before the Arkansas Public Service Commission, the California Public Utilities
7 Commission, the Delaware Public Service Commission, the Public Service
8 Commission of the District of Columbia, the Florida Public Service Commission, the
9 Georgia Public Service Commission, the Idaho Public Utilities Commission, the Illinois
10 Commerce Commission, the Indiana Utility Regulatory Commission, the Kentucky
11 Public Service Commission, the Public Utilities Board of Manitoba, the Minnesota
12 Public Utilities Commission, the Mississippi Public Service Commission, the Missouri
13 Public Service Commission, the Montana Public Service Commission, the North
14 Dakota Public Service Commission, the Public Utilities Commission of Ohio, the
15 Oregon Public Utility Commission, the Rhode Island Public Utilities Commission, the
16 Public Service Commission of Utah, the Virginia State Corporation Commission, the
17 Public Service Commission of Wisconsin, the Washington Utilities and Transportation
18 Commission, and the Wyoming Public Service Commission. I have also assisted in
19 the analysis of transmission line routes proposed in certificate of convenience and
20 necessity proceedings before the Public Utility Commission of Texas.

21 In 2009, I completed the University of Wisconsin – Madison High Voltage Direct
22 Current (“HVDC”) Transmission Course for Planners that was sponsored by the
23 Midwest Independent Transmission System Operator, Inc. (“MISO”).

24 BAI was formed in April 1995. BAI and its predecessor firm has participated in
25 more than 700 regulatory proceedings in forty states and Canada.

Brian C. Collins
Appendix A
Page 2

1 BAI provides consulting services in the economic, technical, accounting, and
2 financial aspects of public utility rates and in the acquisition of utility and energy
3 services through RFPs and negotiations, in both regulated and unregulated markets.
4 Our clients include large industrial and institutional customers, some utilities and, on
5 occasion, state regulatory agencies. We also prepare special studies and reports,
6 forecasts, surveys and siting studies, and present seminars on utility-related issues.

7 In general, we are engaged in energy and regulatory consulting, economic
8 analysis and contract negotiation. In addition to our main office in St. Louis, the firm
9 also has branch offices in Phoenix, Arizona and Corpus Christi, Texas.
