ROE UPDATE

### BEFORE THE PUBLIC SERVICE COMMISSION OF THE STATE OF MISSOURI REBUTTAL TESTIMONY OF SAMUEL C. HADAWAY ON BEHALF OF AQUILA, INC. D/B/A AQUILA NETWORKS-L&P CASE NO. HR-2005-0450

A. M

1

- Q. Please state your name and business address.
- A. My name is Samuel C. Hadaway. My business address is FINANCO, Inc., 3520
   Executive Center Drive, Austin, Texas 78731.
- 4 Q. What is the purpose of your rebuttal testimony?
- 5 A. The purpose of my rebuttal testimony is to respond to the return on equity 6 ("ROE") and capital structure recommendations of Commission Staff witness 7 David Murray, Office of Public Counsel ("OPC") witness Ben Johnson, and 8 Federal Executive Agencies/Sedalia Industrial Energy Users' Association/St. Joe 9 Industrial Group ("FEA") witness Michael Gorman. I also update my equity cost 10 estimates.
- 11 Q. Please describe the L&P steam operations.

A. The steam operations of L&P flow steam generated as a by-product from L&P's power production plants to steam customers through a system built specifically to handle its distribution. Since electric power and steam are produced simultaneously by L&P's power generating facilities, there should be no differentiation in the cost of capital or capital structure between Aquila's electric business and its steam business. Q. Is your rebuttal testimony for L&P's steam operations essentially the same as
 your rebuttal testimony for Aquila's MPS and L&P electric utility
 operations?

4 A. Yes, it is. Because the products of steam and electricity for L&P are sourced 5 from the same investment in electrical generation made by the Company, I 6 recommended the same allowed return and capital structure for both in my direct 7 testimony and I am offering the same rebuttal testimony for both. In support of my rebuttal testimony for the steam operations, I am adopting the same analysis, 8 9 conclusions and testimony as I filed in my rebuttal testimony for the L&P electric 10 operations. My Rebuttal Schedule SCH-2A has been included to illustrate the "stand-alone" credit metrics for the L&P steam operations with the same 11 12 sensitivities to Staff ROE and capital structure as illustrated in Rebuttal Schedule SCH-2 of my electric rebuttal testimony. Neither Dr. Johnson nor Mr. Gorman 13 14 offer separate stand alone ROE and capital structure recommendations for the 15 steam operations.

16

7

ſ

#### **RECOMMENDATIONS OF THE PARTIES**

Q. What are the ROE recommendations of the various parties in this case?
A. The Company is requesting an ROE of 11.5 percent. Staff witness Murray offers
an ROE range of 8.5 percent to 9.5 percent. OPC witness Johnson recommends
an ROE of 9.95 percent. FEA witness Gorman recommends an ROE of 9.8
percent.

22 Q. What are the capital structure recommendations of the parties?

1	A.	The Company is requesting a capital structure that consists of 51.8 percent debt
2		and 48.2 percent equity. The requested capital structure is based on the average
3		capital structure percentage for the reference company group used to estimate
4		ROE. Staff witness Murray recommends a capital structure consisting of 57.53
5		percent debt and 42.47 percent equity. Mr. Murray's recommended capital
6		structure is based on the Company's actual June 30, 2005 updated capital
7		structure percentages. <sup>1</sup> OPC witness Johnson recommends a capital structure
8		consisting of 67.3 percent debt and 32.7 percent equity, which was the
9	·	consolidated capital structure for Aquila at December 31, 2004. FEA witness
10		Gorman recommends a capital structure consisting of 55 percent debt and 45
11		percent equity, based on his comparable group average capital structure taken
12		from the September 2005 C.A. Turner Utility Report (now AUS Utility Reports).
13		Although we use the same proxy groups to estimate capital structure and ROE,
14		Mr. Gorman's capital structure differs from mine because the C.A. Turner
15		publication that he relied on includes short-term debt in its capital structure
16		amounts, while my source for the same data, Value Line, does not. I will explain
17		why Mr. Gorman's use of the C.A. Turner data is incorrect later in this testimony.
18	Q.	How do Mr. Murray's. Dr. Johnson's, and Mr. Gorman's ROE
19		recommendations compare with the appropriate returns for electric utilities
20		being determined throughout the United States?

ĩ

<sup>&</sup>lt;sup>1</sup> Mr. Murray's capital structure percentages as stated in his direct testimony were 63.84 percent debt and 36.16 percent equity. Based on his further evaluation of the Company's actual June 30, 2005 data, I understand that Mr. Murray will recommend a 42.47 percent equity ratio in his rebuttal testimony.

1	A.	I have prepared as Rebuttal Schedule SCH-1 a summary of electric utility ROEs
2		allowed by state commissions during the past two years. The average allowed
3		ROE in during 2004 was 10.73 percent. For the first three quarters of 2005, the
4		average ROE was 10.41 percent. For the third quarter of 2005, the average
5	• .	allowed ROE was 10.84 percent. These results show that the ROEs
6		recommended by Mr. Murray, Dr. Johnson, and Mr. Gorman are well below the
7		mainstream of recent ROEs allowed by other regulatory commissions around the
8		country.
9	Q.	How has this Commission stated that it would use evidence of the ROEs
10		allowed by other state regulators in determining authorized ROEs for
11		Missouri electric utilities?
12	A.	The Commission has indicated generally that, while it will not set ROEs in
13		Missouri based on returns authorized by other commissions, it will consider the
14		reasonableness of an ROE recommendation in light of the findings and decisions
15		of other regulators. In this regard, it is my understanding that the Commission has
16		also said that the national average ROE is an indicator of the capital market in
17		which Missouri utilities will have to compete for necessary capital. The
18		Commission noted in the recent Empire District Electric Company rate case (Case
19		No. ER-2004-0570) that the 11.0 percent ROE authorized for Empire District was
20		in the mainstream of national ROE decisions for that same period. As indicated
21		above, the national average electric utility ROE granted in 2004 leading up to the
22		Empire District decision was 10.73 percent. Such a reasonableness check in this
23		proceeding is particularly important, given the very low ROE recommendations

ì.

.

ĩ

l

ł

of the other parties and the extensive upcoming capital requirements faced by
 MPS/L&P. MPS/L&P will need to compete against other electric utilities to raise
 the capital needed to meet these capital requirements.

Q. Did other parties give any weight to such comparisons to modify their low
ROE recommendations?

6 A. No. Although Mr. Murray discusses the returns allowed by other commissions on 7 pages 39 and 40 of his testimony, and he admits that the top end of his 8 recommended range in the Empire District case was 170 basis points below the ROE ultimately set by the Commission after it gave consideration to those 9 10 returns, he continues to give no consideration to the large differences between his 11 current ROE recommendation and the returns recently granted by other 12 commissions. Dr. Johnson gives no consideration to contemporaneous returns 13 allowed by other commissions at all in any of his ROE analyses. Mr. Gorman 14 includes state commission "authorized electric returns" in his equity risk premium 15 analysis, but his use of the data is not complete, as I will discuss later in this 16 testimony.

17 STANDARDS FOR JUDGING THE ADEQUACY OF EQUITY RETURNS

- 18 Q. What standards do you propose to apply in determining which ROE
- 19

### recommendations to accept?

A. I would turn back to the standards from the *Hope* and *Bluefield* decisions that I
cited in my direct testimony. Looking to those standards, I ask (1) whether the
returns to MPS/L&P would be commensurate with returns on investments in other
enterprises having corresponding risks and (2) whether the returns to MPS/L&P

would be sufficient to ensure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. I would not consider an ROE or overall rate of return recommendation to be adequate unless it met both of those standards.

**Q.** How have the other parties addressed these two standards?

1

2

3

4

5

Α. All three witnesses have presented analyses that they claim respond to the first 6 standard – whether their recommended ROE would be commensurate with returns 7 on investments in other enterprises having corresponding risks. As to whether the 8 9 second required standard is met----that is, whether their recommended ROEs 10 would be sufficient to ensure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital-only Mr. Gorman 11 attempted to address this issue. As I will point out, had the other parties 12 13 performed a financial integrity analysis, they would have found that their 14 recommendations are inadequate.

15 Particularly the results from Dr. Johnson's recommendations, based on the parent company's historical capital structure, fall well below the financial metrics 16 17 required for an investment grade bond rating. Similarly, even with an updated 18 capital structure containing 42.47 percent equity, Mr. Murray's extremely low 19 ROE range would barely touch the low end of the financial metrics required for 20 triple-B in two categories and would fail to meet requirements altogether for a 21 third. Mr. Gorman's analysis shows mostly weak triple-B indicators, with one 22 metric in the double-B range for L&P. In this light, the parties' ROE

1		recommendations plainly are not consistent with and in fact are too low for
2		MPS/L&P to attain a strong investment grade bond rating.
3		THE COMPARABLE RETURN STANDARD
4	Q.	The first standard you cite is whether the recommended ROE would be
5		commensurate with returns on investments in other enterprises having
6		corresponding risks. Why are the conclusions of the witnesses so far apart
7		with respect to this standard?
8	A.	The main disagreements relate to (1) the growth rates in our respective discounted
9		cash flow ("DCF") models and (2) the role that higher projected interest rates
10		should play in estimating ROE. In their DCF models, the other witnesses use
1 <b>1</b>		growth rates that produce unreasonably low DCF estimates. They respectively
12		rely on analysts' low near-term forecasts (Murray, Gorman) or on historical
13		growth rates that have been diminished by the electric industry's recent turmoil
14		and restructuring (Johnson), which likely bear no relationship to investors long-
15		term expectations for the future.
16	Q.	Please continue.
17	А.	My higher DCF estimates result from more reasonable estimates of investors'
18		expected long-term growth. In my initial testimony, I supported a DCF range for
19		my reference group of 10.6 percent to 11.1 percent. I also included forecasted
20		interest rates from Standard & Poor's ("S&P") and provided a bond-yield-plus-
21		risk premium analysis based on those interest rates, which confirmed my DCF
22		results. My risk premium analysis indicated an ROE of 11.0 percent, with the

ĥ

÷

(

1

i

23

: . . ./

I

results from other more aggressive risk premium methods ranging from 11.2

percent to 11.8 percent. As I will demonstrate in more detail below, had the other witnesses more reasonably considered longer-term growth rates and had they considered consensus forecasts for much higher interest rates during the coming year, they would have seen that their ROE estimates are too low.

5

1

2

3

4

### Q. Why are the parties' growth rate estimates so far apart?

A. 6 Our growth rates are far apart because Mr. Murray, Dr. Johnson, and Mr. Gorman 7 gave no weight to overall economic growth or to any other long-term growth rate forecasts. This oversight is particularly problematic since their DCF analyses are 8 9 based strictly on the constant growth version of the DCF model. In that model a basic assumption is that the growth term "g" must equal investors' expectations 10 11 for the very long-term future. Rather than attempt to meet this requirement, however, Mr. Murray and Mr. Gorman use only 3-to-5-year analysts' earnings 12 13 projections and, worse, Dr. Johnson relies entirely on historical growth rates that 14 are negatively influenced by electric utility industry events. Under current market 15 conditions, these methods produce incorrect estimates of long-term growth.

16 The other parties low growth rates also stem, in part, from recent market 17 conditions that typically have had a large negative effect on utility industry. 18 Expected rising interest rates and recently high utility stock prices have caused 19 utility analysts to become extremely pessimistic. As I will demonstrate later, 20 analysts' 3-to-5-year growth forecasts are now 150 to 200 basis points (1.5% to 21 2.0%) lower than they were five years ago. While it is true that recent inflation 22 and interest rates have been historically low, these near-term market conditions

- should not be extrapolated to long-term utility growth rates as Mr. Murray, Dr.
   Johnson, and Mr. Gorman have done.
- 3 Q. Are the DCF growth rate estimates usually this far apart?

4 No. Although it is typical for ROE witnesses to argue about DCF growth rates, I A. 5 think the other witnesses are missing a key point: long-term growth expectations 6 as required in the DCF model should not change greatly from year to year. Short 7 of a fundamental change in the nature of utility services, there is no reason to 8 believe that average utility growth rates expected into perpetuity will fluctuate 9 widely in projections obtained on a year-to-year basis. The other witnesses seem 10 to have missed this point because they have imputed data from the recent low 11 inflation environment and the very large drop in analysts' three-to-five-year growth estimates directly into their longer-term DCF perpetual growth rates. 12

13 If they employed a more reasonable assumption that long-term growth 14 rates will be more stable than the short-term growth projections, they would 15 derive a significantly higher ROE than they have recommended. The stability of 16 long-term growth rates recognizes that absent major structural changes in the 17 electric utility industry, major changes in long-term (as opposed to short-term) 18 electric utility growth rates should not be expected.

- 19
- 20

## THE ATTRACTION OF CAPITAL AND MAINTENANCE

OF CREDIT STANDARD

Q. The second required standard you cite is whether the recommended ROE
would be sufficient to ensure confidence in the financial integrity of the
enterprise, so as to maintain its credit and to attract capital. How does this

1		standard apply to the ROE recommendations of Mr. Murray, Dr, Johnson,
2		and Mr. Gorman?
3	А.	Regardless of the technical merits of the various ROE analyses, Mr. Murray's 8.5
4		percent to 9.5 percent ROE range, Dr. Johnson's 9.95 percent ROE, and Mr.
5	-	Gorman's 9.8 percent ROE, if adopted, would weaken rather than support the
6		financial condition of Aquila's MPS and L&P operating divisions. Such adverse
7		consequences would be particularly inappropriate given the Company's efforts to
8		pay down debt and restore its' financial condition. Sound financial condition is
9		essential if Aquila is to finance its large construction commitments on reasonable
10		financial terms.
11	Q.	Has the Commission dealt with the maintenance of financial integrity recently
12		in another case?
13	A.	Yes. It is my understanding that in the Stipulation and Agreement entered into
14		among Kansas City Power & Light Company ("KCPL") and the intervening
15	•	parties regarding KCPL's "Experimental Regulatory Plan" (Case No. EO-2005-
16		0329), the Commission approved the collection of an "additional amortization
17		amount" by KCPL as necessary to preserve two out of three S&P credit ratios at a
18		level no lower than the "lower level of the top third" of the BBB targets as set by
19		S&P. This was done in recognition of KCPL's commitment to a heavy
20		construction program over the course of the upcoming five year period.
21		Clearly, with MPS/L&P also committed to a heavy construction program
22		over the next five years, as expressed in Mr. Empson's direct testimony, allowing
23		for the attainment of credit metrics at least in the mid-BBB range is of paramount

- importance for Aquila to be able to raise capital on terms comparable to that of its
   peer companies.
- 3 Q. If the financial ratios stated by Standard & Poor's are calculated with Mr.
  4 Murray's 8.5 percent to 9.5 percent ROEs, would that analysis demonstrate
- 5 results consistent with the stated metrics for a "BBB" rating?
- 6 A. No. In the following table (and in Rebuttal Schedule SCH-2A), I set forth the
- 7 stated metrics for a "BBB" rating, along with the metrics for the steam operations
- 8 produced by the upper end of Mr. Murray's recommended 8.5 percent to 9.5
- 9 percent ROE range.

10 Financial Metrics (Steam) Resulting from Mr. Murray's Recommendations

Business	Requirement	9.5% ROE	
Position 6	for BBB	42.47% Equity	Target Met
FFO/Interest:	3.0x - 4.2x	3.3x	BBB-
FFO/Total Debt:	18% - 28%	16.5%	BB+
Debt/Capitalization:	48% - 58%	57.5%	BBB-

As this table shows, with Mr. Murray's proposed capital structure and even the
upper end of his ROE range, only two of the required financial metrics can barely
be met. Such results are not adequate to demonstrate that there is reasonable

19 support for the financial integrity of L&P's Missouri steam operations.

- 20 **REBUTTAL TO THE ANALYSIS AND RECOMMENDATIONS OF**
- 21

## STAFF WITNESS DAVID MURRAY

22 Q. Please begin by briefly summarizing Mr. Murray's analysis and

### 23 recommendations.

A. Mr. Murray presents his final recommendations in a table on page 46 of his
testimony. In that table his DCF range is between 8.5 percent and 9.5 percent.

1		His table also shows "historical" CAPM results of 6.18 percent to 9.41 percent
2	,	and "forward-looking" CAPM results of 6.31 percent to 7.45 percent. Based on
3		these results he recommends that an ROE range of 8.5 percent to 9.5 percent
4		should be applied to Aquila's June 30, 2005 consolidated capital structure
5		containing an equity ratio of only 36.16 percent. Given the similarity of the
6		ranges, it appears that Mr. Murray's ROE recommendation is based solely on his
7		constant growth DCF results.
8	Q.	How is Mr. Murray's DCF analysis structured?
9	A.	He applies the single-stage, constant growth DCF model to a sample of six
10		integrated electric utilities, which he apparently deems to be comparable to
11		MPS/L&P. His selection criteria are summarized in his Schedule 11. To be
12	· ••	included in Mr. Murray's group, companies were required to be part of the S&P
13		vertically integrated electric utility group and to be publicly traded with at least
14		ten years of available data published in the Value Line Investment Survey.
15		Companies were also required to have at least an investment grade credit rating
16		(bond rating of BBB minus or higher) and to have projected growth rates
17		published by at least two sources. The final six-company sample is listed in
18		Schedule 12. It seems highly questionable that Mr. Murray began his analysis
19		with a universe of only the eleven electric utilities contained in the S&P industry
20		group. There are at least 59 investment grade electric utilities that would have
21		been available for filtering and analysis had he simply begun with all the major
22		electric utilities followed by the Value Line Investment Survey.
23	Q.	How does Mr. Murray estimate the DCF model growth rate "g"?

î

1

ł

1	A.	He reviews several growth rate indications for his six-company sample. In the
2		three pages of Schedule 13, he summarizes historical 5- and 10-year compound
3		average growth rates for per share dividends ("DPS"), earnings ("EPS"), and book
4		value ("BVPS"). His averages generally range between -2.92 percent for 5-year
5		EPS growth to a maximum of +2.33 percent for 10-year DPS growth. Although
6		the difference is immaterial in the present case, Mr. Murray's compound
7		averaging approach is incorrect because it systematically understates the expected
8		value of data and, therefore, further understates expected future growth rates. At
9		page 27, Mr. Murray says that he then averages the historical growth rates
10		(virtually zero) with an average projected growth rate of 4.16 percent to produce a
11		combined average of historical and projected growth of 2.29 percent. He also
12		says, however, that "[a]ll the growth rates were then analyzed to arrive at a
13		growth rate range for the comparables of 3.90 percent to 4.90 percent." (Murray at
14		27, lines 12-13.)
15	<b>Q.</b> -	What is the source of Mr. Murray's 3.90 percent to 4.90 percent growth rate
16		range?
17	A.	In Schedule 14, Mr. Murray summarizes 3-to-5-year projected EPS growth
18		estimates from IBES, S&P, and Value Line. The averages of those estimates for
19		Mr. Murray's six-company sample range from 3.73 percent for IBES to 4.92
20		percent for Value Line. From these data, it appears that Mr. Murray's 3.90
21		percent to 4.90 percent growth rate range is based on his subjective rounding of
22		the projected 3-to-5-year EPS growth rate range.

ŝ

Ĺ

1	Q.	Does Mr. Murray give any consideration to other more broadly based
2		sources for estimating investors' long-term growth rate expectations?
3	A.	No.
4	Q.	Does Mr. Murray provide any analysis to show whether analysts' growth
5		rate projections for EPS are stable over time or that such growth rate
6		projections are indicative of investors' very long-term expectations as
7		required in the constant growth DCF model?
8	A.	No.
9	Q.	Does Mr. Murray offer any alternative versions of the DCF model, such as
10		those that apply a multi-stage growth approach to capture the possibility of
11		higher expected growth rates further into the future?
12	· A.	No.
		How do you characterize Mr. Murray's sole reliance on the constant growth
13	Q.	now do you characterize wir. Murray's sole renance on the constant growth
13	Q.	version of the DCF model with growth rates based only on 3-to-5-year
	<b>Q.</b>	
14	<b>Q.</b>	version of the DCF model with growth rates based only on 3-to-5-year

1

( ;

1	Q.	Please describe the academic research that you are referring to.
2	A.	For long time periods, such as those required in the constant growth DCF model,
3		the general growth rate in the U.S. economy as measure by nominal growth in
4		gross domestic product ("GDP") has averaged between 6 percent and 8 percent
5		per year. From this observation, Professors Brigham, Gapenski, and Ehrhardt
6		offer the following observation concerning the appropriate long-term growth rate
7		in the DCF Model:
8 9 10 11 12 13 14 15		Expected growth rates vary from company to company, but dividend growth on average is expected to continue in the foreseeable future at about the same rate as that of the nominal gross domestic product (real GDP plus inflation). On this basis, one might expect the dividend of an average, or "normal," company to grow at a rate of 6 to 8 percent a year. (Brigham, Gapenski, and Ehrhardt, Financial Management, 9th Ed., page 335.)
16		Other academic research on corporate growth rates offers similar conclusions
17		about GDP growth as well as concerns about the long-term adequacy of analysts'
18		forecasts:
19 20 21 22 23 24 25 26 27 28 29 30 31		Our estimated median growth rate is reasonable when compared to the overall economy's growth rate. On average over the sample period, the median growth rate over 10 years for income before extraordinary items is about 10 percent for all firms After deducting the dividend yield (the median yield is 2.5 percent per year), as well as inflation (which averages 4 percent per year over the sample period), the growth in real income before extraordinary items is roughly 3.5 percent per year. This is consistent with the historical growth rate in real gross domestic product, which has averaged about 3.4 percent per year over the period 1950-1998. (Louis K. C. Chan, Jason Karceski, and Josef Lakonishok, "The Level and Persistence of Growth Rates," <i>The Journal of Finance</i> , April 2003, p. 649)
32 33 34 35		IBES long-term growth estimates are associated with realized growth in the immediate short-term future. Over long horizons, however, there is little forecastablility in earnings, and analysts' estimates tend to be overly optimistic On the whole, the

',

1

ι

1

ł

absence of predictability in growth fits in with the economic 1 2 intuition that competitive pressures ultimately work to correct 3 excessively high or excessively low profitability growth. (Ibid, 4 page 683) 5 These findings support the notion that long-term growth expectations are more 6 closely predicted by broader measures of economic growth than by near-term analysts' estimates. Especially for the very long-term growth rate requirements of 7 8 the DCF model, the growth in nominal GDP should be considered an important 9 input. 10 How have analysts' three-to-five year growth projections changed in recent Q. 11 vears? 12 Current analysts' growth projections are much lower than they were just four Α. years ago. In Rebuttal Schedule SCH-4, I compare analysts' current growth 13 14 projections for the 27-companies in my updated comparable group to growth rates 15 that were projected for those same companies in 2001. In its editions covering electric utilities during 2001, Value Line projected three-to-five year earnings per 16 17 share growth of 6.8 percent per year. In the 2005 editions, Value Line projects 18 three-to-five year earnings growth of only 4.3 percent per year. Results are 19 similar for the sustainable growth "b" times "r" estimation method where the 20 average growth rate in 2001 was 5.6 percent as compared to 3.7 percent in 2005. 21 Such dramatic changes in growth rates seem unlikely in estimates that might be 22 used to measure the long-term growth rate as required in the DCF model. These 23 results strongly support using more general long-term economic growth rates, 24 such as GDP, in the DCF model.

Q. Would it have been difficult for Mr. Murray to consider a broader based 1 2 estimate of longer-term investor growth rate expectations? 3 No. Long-term growth rate data are readily available as I pointed out in my direct A. 4 testimony. 5 **Q**. How did you estimate the expected long-run GDP growth rate? 6 I developed my long-term GDP growth forecast from nominal GDP data A. 7 contained in the St. Louis Federal Reserve Bank data base. That data for the 8 period 1947 through 2004 is summarized in my Rebuttal Schedule SCH-5. As 9 shown at the bottom of that exhibit, the average growth rate for the entire period 10 was 7.1 percent. The data also show, however, that in the more recent years since 1980, lower inflation has resulted in lower overall GDP growth. For this reason I 11 gave more weight to the more recent years in my GDP forecast. This approach is 12 13 consistent with the concept that more recent data should have a greater effect on 14 expectations and with generally lower near- and intermediate-term growth rate 15 forecasts that presently exist. Based on this approach, my overall forecast for 16 long-term GDP growth is 6.6 percent. 17 If Mr. Murray had used a 6.6 percent growth rate in his DCF analysis, what Q. would his results have been? 18 In Rebuttal Schedule SCH-6, I have reproduced Mr. Murray's summary DCF 19 A. 20 exhibit (Murray Schedule 16) with the 6.6 percent growth rate substituted for his 21 growth rate range. With an average dividend yield of 4.6 percent for Mr. 22 Murray's comparable group, the estimated ROE is 11.2 percent (4.6% dividend yield plus 6.6% growth = 11.2% ROE). 23

### REBUTTAL TO THE ANALYSIS AND RECOMMENDATIONS OF OPC WITNESS BEN JOHNSON

- 3 Q. Please summarize the ROE and capital structure recommendations of Dr.
  4 Johnson.
- 5 Dr. Johnson recommends using the Aquila consolidated capital structure at A. 6 December 31, 2004 which consists of 67.3 percent debt and 32.7 percent equity. 7 He accepts the debt cost rates as proposed by the Company. He performs two 8 ROE analyses: The first is a Comparable Earnings Analysis which produces a 9 recommended ROE range of 10.0 percent to 11.5; the second is a Market 10 Approach which yields a recommended ROE range of 8.4 percent to 9.9 percent. 11 He averages the two midpoints from these ranges, 10.75 percent and 9.15 percent. 12 to arrive at his final ROE recommendation of 9.95 percent.

13 Q. What comments do you have concerning the capital structure

14

1 2

recommendation of Dr. Johnson?

I disagree with Dr. Johnson's capital structure recommendation for a number of 15 A. 16 reasons. First, his capital structure recommendation effectively ignores all of the 17 progress that the Company has made to improve its equity ratio in 2005. His recommended capital structure based on Aquila consolidated data from December 18 19 31, 2004 includes only 32.7% equity. This contrasts sharply with the direction 20 that the Company has taken in the recent months to improve its equity position. It has sold assets and used the proceeds to retire debt. At June 30, 2005, the actual 21 Aquila consolidated capital structure consisted of 42.47 percent equity. At 22 23 September 30, 2005, the equity ratio was 42.03 percent. As provided in its 24 response to Data Request No. MPSC-0449, the Company is projecting a capital

- structure at year end 2006 with 50.3 percent equity. Dr. Johnson's
- 2 3

1

recommendation is not reasonable given this tangible improvement that the Company has made in shoring up its financial condition.

4 Furthermore, his capital structure recommendation is not consistent with 5 his ROE analysis. In his Market Analysis ROE approach, he used the same 6 comparable group of electric utilities that I used. The average equity ratio for this 7 group is 48.2% for year-end 2004 and 52.8% when projected for the next three to five years by Value Line. By using an ROE from his comparable group, but then 8 recommending an equity ratio which is dramatically below the group's average, 9 10 he has created a mismatch which further reduces the credibility of his 11 recommendation. The capital structure recommendation must be consistent with 12 the comparable group ROE analysis or a risk adjustment is necessary. That is, if 13 the recommended equity level is drastically below that of the proxy group, the 14 ROE from the group must be adjusted upward to account for this additional 15 financial risk. Since Dr. Johnson did not make such a risk adjustment, his 16 analysis understates the cost of capital.

17 **Q**. What comments do you have concerning Dr. Johnson's ROE

18

### recommendation?

While I generally do not support the comparable earnings approach as a primary 19 A.

- 20 ROE estimation method, the result of Dr. Johnson's Comparable Earnings
- 21 Analysis, an ROE range of 10.0 percent to 11.5 percent, is not entirely
- unreasonable. Comparable earnings methodologies are suspect because there is 22
- 23 no guarantee that book returns equal market required returns and book returns are

1 very sensitive to accounting adjustments. Furthermore, the approach taken by Dr. 2 Johnson borders on the arbitrary and subjective. First, he studied the return on average common equity earned by unregulated firms. Specifically, he analyzed 3 4 the earned returns for the Federal Trade Commission's "All Manufacturers" group 5 and for a range of industries (over 900 firms) monitored by Business Week. From 6 this data, he comes up with an ROE range of 11.5 percent to 13.0 percent for a 7 typical unregulated firm. From this, he jumps to the conclusion that the typical 8 electric utility has an ROE in the range of 9.75 percent to 10.75 percent and then 9 makes another leap to the conclusion that the appropriate ROE for Aquila's MPS 10 and L&P operating divisions is 10.0 percent to 11.5 percent. All of these 11 presumptions are based primarily on subjective and non-quantified risk factors. 12 The final result ends up based mostly Dr. Johnson's opinion and judgment with 13 little numeric support.

14 Dr. Johnson's other ROE methodology, the Market Analysis approach, 15 produces results which are below the range of reasonableness. Technically, his 16 Market Analysis consists of two parts: 1) an observation of historical market 17 returns earned by equity investors and 2) a DCF analysis. He goes to great 18 lengths to analyze historic market returns from data provided by Ibbotson Associates and does ultimately conclude that, over long periods of time, equity 19 20 investors in the average large unregulated company require a return in the 21 neighborhood of 12.5 percent. However, this data point is only used by Dr. 22 Johnson to somewhat arbitrarily expand his much lower DCF results from a range

of 8.0 percent to 9.0 percent to a range of 8.0 percent to 9.5 percent with no further discussion.

For the most part, Dr. Johnson's Market Analysis consists of his DCF analysis. Here he develops a dividend yield range of 5.0 percent to 5.5 percent and adds growth of 3.0 percent to 3.5 percent to generate an ROE range of 8.0 percent to 9.0 percent. After consideration of the Ibbotson data discussed earlier and a flotation cost factor of 0.4 percent, Dr. Johnson's final DCF range for ROE is 8.4 percent to 9.9 percent.

9 Q. Are there deficiencies in Dr. Johnson's DCF analysis?

1

2

10 Yes. Dr. Johnson's DCF analysis is deficient in a number of important areas. A. First, he considers only historical growth rates in his DCF analysis. While he 11 12 readily admits that "it is investor expectations about the future, not past results, that are most relevant in developing a DCF analysis" (Johnson at 35), he relies 13 14 exclusively on past results in deriving his DCF growth rates. The historical time period that he relies on in his analysis, 1995-2004, is a period beset by gigantic 15 upheaval in the electric utility industry. Unprecedented turmoil caused by 16 17 deregulation, restructuring, and enhanced competition has negatively impacted the 18 growth rates during the very time periods used by Dr. Johnson. It is not 19 appropriate for him to extrapolate growth rates derived from this period into perpetuity, as required by the DCF model. 20 If Dr. Johnson had used your GDP-based growth forecast of 6.6 percent

Q. If Dr. Johnson had used your GDP-based growth forecast of 6.6 percent
growth rate in his DCF analysis, what would his results have been?

1	А.	In Rebuttal Schedule SCH-7, I have reproduced Dr. Johnson's summary DCF
2		results with the 6.6 percent growth rate substituted for his growth rate range.
3		With an average dividend yield range of 5.0 percent to 5.5 percent for Dr.
4		Johnson's comparable group, the estimated midpoint DCF ROE is 11.85 percent
5		(5.25% midpoint dividend yield plus 6.6% growth = $11.85\%$ ROE). As my
6		rebuttal schedule shows, when this DCF result is combined with his Comparable
7		Earnings results (10.75% midpoint ROE), the overall midpoint ROE for the
8		revised analysis is 11.30 percent.
9	<b>Q</b> .	What effect would Dr. Johnson's capital structure and ROE
10		recommendations have on the financial condition of the Company?
11	A.	As shown in Rebuttal Schedule SCH-3, his recommendations would produce sub-
12		investment grade metrics.
13	Q.	On page 38, Dr. Johnson suggests that you should have used "real" growth
14		in GDP rather than "nominal" growth in your DCF analysis. Do you agree
15		with this suggestion?
16	А.	Absolutely not. The ROE that all witnesses in this case are determining for
17		Aquila is a "nominal" rate, that is, it includes an inflationary component. For this
18		reason, the growth term used in the DCF formula must be a "nominal" rate. For
19		Dr. Johnson to suggest otherwise is extremely misleading. This issue is nothing
20		more than a "red herring" created by Dr. Johnson to confuse and potentially
21		mislead the Commission.
22		REBUTTAL TO THE ANALYSIS AND RECOMMENDATIONS OF FEA
23		WITNESS MICHAEL GORMAN

i

Q. Please summarize the ROE and capital structure recommendations of Mr.
 Gorman.

A. Mr. Gorman recommends a capital structure for Aquila that consists of 45 percent
 equity and 55 percent debt. He proposes an ROE of 9.8 percent for the Company.

5 Q. Is anything wrong with Mr. Gorman's capital structure recommendation?

6 A. Yes. Mr. Gorman and I take similar approaches in our capital structure analysis 7 in that we derive our capital structure recommendation from the same comparable 8 group that we use to determine ROE. As Mr. Gorman states, this ensures the 9 "proxy group's capital structure is consistent with the financial and operating risk 10 reflected in my return on equity for Aquila and applied to that same capital 11 structure" (Gorman at 15). As discussed earlier, Mr. Murray, and especially Dr. 12 Johnson, miss this point that there must be a match between the capital structure 13 and ROE.

14 The problem with Mr. Gorman's analysis, however, is that he overstates 15 the debt portion of the capital structure by including short-term debt. Short-term 16 debt is not part of Aquila's permanent capital base and should not be reflected in 17 its capital structure percentages for ratemaking purposes. By improperly 18 including short-term debt, Mr. Gorman's approach unfairly shifts lower short-term 19 debt costs to capital which rightfully should be allowed to earn the cost of equity, 20 and virtually guarantees that the Company will not be able to earn its authorized 21 rate of return. If short-term debt is removed from his data, his capital structure recommendation would be the same as mine. 22

Q. Mr. Gorman implies that his capital structure will better match Aquila's
 capital structure during the time that rates from this case will be in effect.
 Do you agree?

No. Mr. Gorman states (at page 12) that his "proposed capital structure is a better 4 A. 5 projection of Aquila's actual capital structure during the period rates determined in this proceeding will be in effect." He goes on to say (at page 13) that his 6 7 "proposed capital structure is more in line with Value Line's projected capital 8 structure for Aquila during the next three to five years." I dispute these 9 statements for two reasons. One, according to the Company's response to Data 10 Request No. MPSC-0449, by year-end 2006 which falls directly during the time 11 that rates from this case will be in effect, the Company's consolidated capital 12 structure will consist of 50.3 percent equity and 49.7 percent debt. Second, Value 13 Line's proposed capital structure for Aquila during the next three to five years 14 includes 49.5 percent equity and 50.5 percent debt. Mr. Gorman's recommended 15 capital structure includes only 45 percent equity. Clearly, my proposal which 16 reflects 48.2 percent equity, is much more in line with the Company's capital 17 structure as it will exist during the time that rates from this proceeding are in 18 place.

19

20

# Q. Do you have disagreements with Mr. Gorman's ROE analysis and recommendation?

A. Yes. First, I find it interesting that Mr. Gorman's ROE recommendation in this
case, at 9.8 percent, is exactly the same recommendation that he is making for
PacifiCorp's Washington utility in testimony he filed recently before the

1		Washington Utilities and Transportation Commission in Docket Nos. UE-
2		050684/UE-050412. PacifiCorp is essentially a single-A rated utility while
3		Aquila is a single-B rated utility, although its credit standing is improving and
4		rates are being set for its regulated operations using a triple-B target.
5		Nonetheless, it seems that Mr. Gorman should have recognized some level of
6		ROE differential between these two cases, but for some reason, he did not.
7		Mr. Gorman performs three underlying analyses before reaching his final
8		ROE recommendation. From his constant growth DCF analysis, he derives an 8.6
9	×	percent ROE. On its face, this result is below the range of reasonableness. With
10		triple-B interest rates expected to reach 6.65 percent over the next year, his
11		constant growth result implies an equity risk premium of only 1.95 percent (8.6%-
12		6.65%=1.95%). This result is below any reasonable equity risk premium level. I
13		believe he should have rejected such low constant growth results out of hand.
14	Q.	Why are his DCF results so low?
15	A.	The primary reason that Mr. Gorman achieved such low DCF results can be
16		traced to his sole reliance on analysts' estimates in determining the growth rate
17		component of the DCF model. He gave no weight to overall economic growth or
18		to any other long-term growth rate forecasts. As I stated earlier, this oversight is
19		particularly problematic since his DCF analyses is entirely restricted to the
20		constant growth version of the DCF model. In that model a basic assumption is
21		that the growth term "g" must equal investors' expectations for the very long-term
22		future. Rather than attempt to meet this requirement, however, Mr. Gorman uses
23		only 3-to-5-year analysts' earnings projections. Under current market conditions,

1

Ţ

1

f

1		these methods produce incorrect estimates of long-term growth. Again, as stated
2		previously, rising interest rates and recently high utility stock prices have caused
3		utility analysts to become extremely pessimistic. These near-term market
4		conditions should not be extrapolated to long-term utility growth rates as Mr.
5		Gorman has done.
6	Q.	If Mr. Gorman had used your GDP-based growth forecast of 6.6 percent
7		growth rate in his DCF analysis, what would his results have been?
8	А.	In Rebuttal Schedule SCH-8, I have reproduced Mr. Gorman's summary DCF
9		exhibit (Schedule MPG-5) with the 6.6 percent growth rate substituted for his
10		growth rate range. With an average dividend yield of 4.6 percent for Mr.
11		Gorman's comparable group, the estimated ROE is 11.2 percent (4.56% dividend
12		yield plus $6.6\%$ growth = $11.16\%$ ROE).
13	Q.	Please comment on Mr. Gorman's risk premium ROE analysis.
14	A. '	His risk premium analysis contains serious inconsistencies that, when corrected,
15		produces higher results.
16	Q.	Please elaborate.
17	Α.	Mr. Gorman's risk premium analysis consists of two parts. In one approach he
18		adds an equity risk premium range of 4.4 percent to 5.7 percent to a projected 20-
19		year Treasury bond yield of 5.2%. This results in a risk premium estimate of 9.6
20		percent to 10.9 percent, with a midpoint estimate at 10.3 percent. In his second
21		approach, he adds a risk premium range of 3.0 percent to 4.0 percent to a current
22		single-A utility bond yield of 5.79 percent. This produces an equity return
23		estimate in the range of 8.8 percent to 9.8 percent, with a midpoint of 9.3 percent.

ł

1		The first inconsistency in Mr. Gorman's risk premium analysis is obvious.		
2		He uses projected rates in one part, and current rates in the other. That his 20-		
3	year Treasury bond yield of 5.2 percent is relatively close to his single-A utility			
4	bond yield of 5.79 percent, when the spread between very low risk Treasury			
5		bonds and higher risk utility bonds is typically at least 1.0 percent, highlights the		
6		mismatch in his analysis. In addition, he should have used triple-B utility bonds		
7		as his starting point, rather than single-A, to better match Aquila's specific		
8		circumstance. Finally, he does not explain why his spread over utility bond rates		
9		is now 3.0 percent to 4.0 percent when in the PacifiCorp Washington case		
10		mentioned earlier he used a range of 3.0 percent to 4.5 percent.		
11	Q.	What results do you obtain when you correct the inconsistencies in Mr.		
12		Gorman's risk premium analysis?		
13	A.	To match his projected Treasury bond rate, I have redone his risk premium		
14		analysis using projected utility bond rates. In my risk premium analysis, I used		
15		projected triple-B utility bond rates of 6.65 percent. Combining this rate with his		
16		PacifiCorp Washington risk premium of 3.0 percent to 4.5 percent yields a cost of		
17		equity range of 9.65 percent to 11.15 percent, with a midpoint of 10.4 percent.		
18		His overall range now becomes 10.4 percent to 10.3 percent (from the Treasury		
19		bond risk premium analysis discussed above), with a midpoint ROE of 10.35		
20		percent.		
21	Q.	In his risk premium analysis, Mr. Gorman fails to make an adjustment to		
22		account for the inverse relationship between equity risk premiums and		
23		interest rate levels. How do you respond?		

I

1	A.	I am surprised that Mr. Gorman's did not make this adjustment because he has
2		recognized the validity of such an adjustment in previous cases in which he has
3		testified. On page 15, lines 10-13 of Public Utility of Commission of Texas
4		Docket No. 14965 Mr. Gorman states:
5 6 7 8		The results of my study indicate an inverse relationship between a bond's real return and the equity risk premium. This result is consistent with the findings of published studies which indicate equity risk premiums move inversely with interest rates.
9		Had Mr. Gorman made a similar adjustment in this case, his risk premium results
10		would have indicated much higher ROEs than what he obtained.
11	Q.	Mr. Gorman criticizes you for using projected interest rate data in your
12		analyses. How do you respond?
13	А.	I find Mr. Gorman's criticisms on this point to be questionable. He, of course,
14		
		also used projected interest rate data in his risk premium analysis. I think we both
15		also used projected interest rate data in his risk premium analysis. I think we both recognize that interest rates are projected to increase over the time that rates from
15 16
