**Missouri Public
Service Commission**

BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MISSOURI

In the matter of Aquila, Inc.,)	Case No. ER-2004-0034
d/b/a Aquila Networks-L&P and)	
Aquila Networks-MPS to implement)	
a general rate increase in electricity.)	

AFFIDAVIT OF DAVID MURRAY

STATE OF MISSOURI)	
)	ss.
COUNTY OF COLE)	

David Murray, of lawful age, on his oath states: that he has participated in the preparation of the following direct testimony as modified on February 27, 2004, in question and answer form, consisting of 33 pages to be presented in the above case; that the answers in the following direct testimony as modified on February 27, 2004, were given by him; that he has knowledge of the matters set forth in such answers; and that such matters are true and correct to the best of his knowledge and belief.

David Murray

Subscribed and sworn to before me this 26th day of February 2004.

DIRECT TESTIMONY

OF

DAVID MURRAY

AQUILA, INC.

d/b/a AQUILA NETWORKS MPS-ELECTRIC

CASE NO. ER-2004-0034

Q. Please state your name.

A. My name is David Murray.

Q. Please state your business address.

A. My business address is P.O. Box 360, Jefferson City, Missouri, 65102.

Q. What is your present occupation?

A. I am employed as a Financial Analyst for the Missouri Public Service Commission (Commission). I accepted this position in June 2000.

Q. Were you employed before you joined the Commission's Staff (Staff)?

A. Yes, I was employed by the Missouri Department of Insurance in a regulatory position.

Q. What is your educational background?

A. In May 1995, I earned a Bachelor of Science degree in Business Administration with an emphasis in Finance and Banking, and Real Estate from the University of Missouri-Columbia. I should complete a Masters in Business Administration from Lincoln University by December 2003.

Direct Testimony of
David Murray

1 Q. Have you filed testimony in other cases before this Commission?

2 A. Yes. I filed testimony in the following cases:

- 3 • TR-2001-344 Northeast Missouri Rural Telephone Company
- 4 • TC-2001-402 Ozark Telephone Company
- 5 • TT-2001-328 Oregon Farmers Mutual Telephone Company
- 6 • TC-2002-1076 BPS Telephone Company
- 7 • GR-2001-292 Southern Union Company d/b/a Missouri Gas Energy
- 8 • ER-2001-672 UtiliCorp United, Inc. d/b/a Missouri Public Service
- 9 • ER-2002-424 The Empire District Electric Company
- 10 • GM-2003-0238 Southern Union Company d/b/a Missouri Gas Energy
- 11 • WR-2003-0500 Missouri-American Water Company.

12 Q. Have you made recommendations in any other cases before this Commission?

13 A. Yes, I have made recommendations on finance, merger and acquisition cases
14 before this Commission.

15 Q. What is the purpose of your testimony in this case?

16 A. My testimony is presented to recommend to the Commission a fair and
17 reasonable rate of return for Aquila, Inc. d/b/a Aquila Networks MPS
18 (MPS) rate base.

19 Q. Have you prepared any schedules to your analysis of the cost of capital for
20 MPS?

21 A. Yes. I am sponsoring a study entitled “An Analysis of the Cost of Capital for
22 Aquila, Inc. d/b/a Aquila Networks MPS Case
23 No. ER-2004-0034” consisting of 23 schedules which are attached to
24 this direct testimony (see Schedule 1).

25 Q. What do you conclude is the cost of capital for MPS?

26 A. The cost of capital for MPS is in the range of 7.97 to 8.32 percent.

Economic and Legal Rationale for Regulation

1
2 Q. Why are the prices charged to customers by utilities such as MPS
3 regulated?

4 A. A primary purpose of price regulation is to restrain the exercise of monopoly
5 power. Monopoly power represents the ability to charge excessive or unduly discriminatory
6 prices. Monopoly power may arise from the presence of economies of scale and/or from the
7 granting of a monopoly franchise.

8 For services that operate efficiently and have the ability to achieve economies of
9 scale, a monopoly is the most efficient form of market organization. Utility companies can
10 supply service at lower costs if the duplication of facilities by competitors is avoided. This
11 allows the use of larger and more efficient equipment and results in lower per unit costs. For
12 instance, it may cost more to have two or more competing companies maintaining electric
13 utility distribution systems and providing competing residential services to one household.
14 This situation could result in price wars and lead to unsatisfactory and perhaps irregular
15 service. For these reasons, exclusive rights may be granted to a single utility to provide
16 service to a given territory. This also creates a more stable environment for operating the
17 utility company. Utility regulation acts as a substitute for the economic control of market
18 competition and allows the consumer to receive adequate utility service at a reasonable price.

19 Electric utility providers such as MPS provide electric utility services
20 essentially under a monopoly franchise. Therefore, it is clear that MPS have
21 monopoly power.

22 Another purpose of price regulation is to provide the utility company with an
23 opportunity to earn a fair return on its capital, particularly on investments made as a result of
24 a monopoly franchise.

Direct Testimony of
David Murray

1 Q. Please describe your understanding of the legal basis you must use when
2 determining a fair and reasonable return for a public utility.

3 A. Several landmark decisions by the U.S. Supreme Court provide the legal
4 framework for regulation and for what constitutes a fair and reasonable rate of return for a
5 public utility. Listed below are some of the cases:

- 6 1. *Munn v. People of Illinois* (1877);
- 7 2. *Bluefield Water Works and Improvement Company* (1923);
- 8 3. *Natural Gas Pipeline Company of America* (1942); and
- 9 4. *Hope Natural Gas Company* (1944).

10 In the case of *Munn v. People of Illinois*, 94 U.S. 113 (1877), the Court found that:

11 . . . when private property is “affected with a public interest, it ceases
12 to be *juris privati* only” Property does become clothed with a
13 public interest when used in a manner to make it of public
14 consequence, and affect the community at large. When, therefore, one
15 devotes his property to a use in which the public has an interest, he, in
16 effect, grants to the public an interest in that use, and must submit to
17 be controlled by the public for the common good, to the extent of the
18 interest he has thus created. Id at 126.

19 The *Munn* decision is important because it states the basis for regulation of both utility and
20 non-utility industries.

21 In the case of *Bluefield Water Works and Improvement Company v. Public Service*
22 *Commission of the State of West Virginia*, 262 U.S. 679 (1923), the Supreme Court ruled
23 that a fair return would be:

- 24 1. A return “generally being made at the same time” in that “general
25 part of the country”;
- 26 2. A return achieved by other companies with “corresponding risks
27 and uncertainties”; and
- 28 3. A return “sufficient to assure confidence in the financial soundness
29 of the utility”.

1 The Court specifically stated:

2 A public utility is entitled to such rates as will permit it to earn a return
3 on the value of the property which it employs for the convenience of
4 the public equal to that generally being made at the same time and in
5 the same general part of the country on investments in other business
6 undertakings which are attended by corresponding risks and
7 uncertainties; but it has no constitutional right to profits such as are
8 realized or anticipated in highly profitable enterprises or speculative
9 ventures. The return should be reasonably sufficient to assure
10 confidence in the financial soundness of the utility and should be
11 adequate, under efficient and economical management, to maintain
12 and support its credit and enable it to raise the money necessary for the
13 proper discharge of its public duties. A rate of return may be
14 reasonable at one time and become too high or too low by changes
15 affecting opportunities for investment, the money market and business
16 conditions generally. Id. at 692-3.

17 In Federal Power Commission et al. v. Natural Gas Pipeline Company of America
18 et al., 315 U.S. 575 (1942), the Court decided that:

19 The Constitution does not bind rate-making bodies to the service of
20 any single formula or combination of formulas If the
21 Commission's order, as applied to the facts before it and viewed in its
22 entirety, produces no arbitrary result, our inquiry is at an end.
23 Id. at 586.

24 The U.S. Supreme Court also discussed the reasonableness of a return for a utility in
25 the case of Federal Power Commission et al. v. Hope Natural Gas Company, 320 U.S. 591
26 (1944). The Court stated that:

27 The rate-making process . . . , i.e., the fixing of "just and reasonable"
28 rates, involves a balancing of the investor and the consumer interests.
29 Thus we stated . . . that "regulation does not insure that the business
30 shall produce net revenues" . . . it is important that there be enough
31 revenue not only for operating expenses but also for the capital costs
32 of the business. These include service on the debt and dividends on
33 the stock By that standard the return to the equity owner should
34 be commensurate with returns on investments in other enterprises
35 having corresponding risks. That return, moreover, should be
36 sufficient to assure confidence in the financial integrity of the
37 enterprise, so as to maintain its credit and to attract capital. Id. at 603.

Direct Testimony of
David Murray

1 The Hope case restates the concept of comparable returns to include those achieved by any
2 other enterprises that have “corresponding risks.” The Supreme Court also noted in this case
3 that regulation does not guarantee profits to a utility company.

4 A more recent case heard by the Supreme Court of Pennsylvania discusses the Hope
5 case decision as it relates to balancing the interests of the investors and the consumers. The
6 Supreme Court of Pennsylvania stated that:

7 We do not believe, however, . . . that the end result of a
8 rate-making body’s adjudication *must* be the setting of rates at a level
9 that will, in any given case, guarantee the continued financial integrity
10 of the utility concerned In cases where the balancing of
11 consumer interests against the interests of investors causes rates to be
12 set at a “just and reasonable” level which is insufficient to ensure the
13 continued financial integrity of the utility, it may simply be said that
14 the utility has encountered one of the risks that imperil any business
15 enterprise, namely the risk of financial failure. Pennsylvania Electric
16 Company, et al. v. Pennsylvania Public Utility Commission, 502 A.2d
17 130, 133-34 (1985), cert. denied, 476 U.S. 1137 (1986).

18 I included the Pennsylvania Electric Company case in my testimony to illustrate a point,
19 which is simply this: captive ratepayers of public utilities should not be forced to bear the
20 brunt of management decisions that result in unnecessarily higher costs. It should be noted
21 that I do not believe that utility companies should be casually subjected to risk of financial
22 failure in a rate case proceeding. However, in the case of inefficient management, I do not
23 believe it would always be appropriate for a regulatory agency to provide sufficient funds for
24 management to continue operations, no matter what the costs are to the ratepayers.

25 Through these and other court decisions, it has generally been recognized that public
26 utilities can operate more efficiently when they operate as monopolies. It has also been
27 recognized that regulation is required to offset the lack of competition and maintain prices at
28 a reasonable level. It is the regulatory agency’s duty to determine a fair rate of return and the

Direct Testimony of
David Murray

1 appropriate revenue requirement for the utility, while maintaining reasonable prices for the
2 public consumer.

3 The courts today still believe that a fair return on common equity should be similar to
4 the return for a business with similar risks, but not as high as a highly profitable or
5 speculative venture requires. The authorized return should provide a fair and reasonable
6 return to the investors of the company, while ensuring that excessive earnings do not result
7 from the utility's monopolistic powers. However, this fair and reasonable rate does not
8 necessarily guarantee revenues or the continued financial integrity of the utility.

9 It should be noted that the courts have determined that a reasonable return may vary
10 over time as economic and business conditions change. Therefore, the past, present and
11 projected economic and business conditions must be analyzed in order to calculate a fair and
12 reasonable rate of return.

13 Historical Economic Conditions

14 Q. Please discuss the relevant historical economic conditions in which MPS
15 have operated?

16 A. One of the most commonly accepted indicators of economic conditions is the
17 discount rate set by the Federal Reserve Board (the Federal Reserve). The Federal Reserve
18 tries to achieve its monetary policy objectives by controlling the discount rate (the interest
19 rate charged by the Federal Reserve for loans of reserves to depository institutions) and the
20 Federal (Fed) Funds Rate (the overnight lending rate between banks). However, recently the
21 Fed Funds Rate has become the primary means for the Federal Reserve to achieve its
22 monetary policy and the discount rate has become more of a symbolic interest rate. At the
23 end of 1982, the U.S. economy was in the early stages of an economic expansion, following
24 the longest post-World War II recession. This economic expansion began when the Federal

Direct Testimony of
David Murray

1 Reserve reduced the discount rate seven times in the second half of 1982 in an attempt to
2 stimulate the economy. This reduction in the discount rate led to a reduction in the prime
3 interest rate (the rate charged by banks on short-term loans to borrowers with high credit
4 ratings) from 16.50 percent in June 1982, to 11.50 percent in December 1982. The economic
5 expansion continued for approximately eight years until July 1990, when the economy
6 entered into a recession.

7 In December 1990, the Federal Reserve responded to the slumping economy by
8 lowering the discount rate to 6.50 percent (see Schedules 2-1 and 2-2). Over the next year-
9 and-a-half, the Federal Reserve lowered the discount rate another six times to a low of
10 3.00 percent, which had the effect of lowering the prime interest rate to 6.00 percent
11 (see Schedules 3-1 and 3-2).

12 In 1993, perhaps the most important factor for the U.S. economy was the passage of
13 the North American Free Trade Agreement (NAFTA). NAFTA created a free trade zone
14 consisting of the United States, Canada and Mexico. The rate of economic growth for the
15 fourth quarter of 1993 was one the Federal Reserve believed could not be sustained without
16 experiencing higher inflation. In the first quarter of 1994, the Federal Reserve took steps to
17 try to restrict the economy by increasing interest rates. As a result, on March 24, 1994, the
18 prime interest rate increased to 6.25 percent. On April 18, 1994, the Federal Reserve
19 announced its intention to raise its targeted interest rates, which resulted in the prime interest
20 rate being increased to 6.75 percent. The Federal Reserve took action on May 17, 1994, by
21 raising the discount rate to 3.50 percent. The Federal Reserve took three additional
22 restrictive monetary actions with the last occurring on February 1, 1995. These actions

Direct Testimony of
David Murray

1 raised the discount rate to 5.25 percent, and in turn, banks raised the prime interest rate to
2 9.00 percent.

3 The Federal Reserve then reversed its policy in late 1995 by lowering its target for the
4 Fed Funds Rate by 0.25 percentage points on two different occasions. This had the effect of
5 lowering the prime interest rate to 8.50 percent. On January 31, 1996, the Federal Reserve
6 lowered the discount rate to a rate of 5 percent.

7 The actions of the Federal Reserve from 1996 through 2000 were primarily focused
8 on keeping the level of inflation under control, and it was successful. The inflation rate, as
9 measured by the *Consumer Price Index - All Urban Consumers* (CPI), was at a high of
10 3.70 percent in March 2000. The increase in CPI stood at 2.30 percent for the period ending
11 October 31, 2003 (see Schedules 4-1 and 4-2). Although inflation has not been a problem
12 recently, the unemployment rate has shown some signs that the job market has loosened,
13 meaning unemployment has increased. While not as high as the January 1993 level of
14 7.3 percent, the unemployment rate now stands at 6.1 percent as of September 30, 2003 (see
15 Schedule 6).

16 The combination of low inflation and low unemployment had led to a prosperous
17 economy, until recently, as evidenced by the real gross domestic product (GDP) of the
18 United States. Over the period of 1993 through the end of 2000, real GDP had increased
19 every quarter. However, GDP data for the first three quarters of 2001 indicate there was a
20 contraction in the economy during these three quarters. This contraction of GDP for more
21 than two quarters in a row meets the textbook definition of a recession. According to the
22 National Bureau of Economic Research, the recession began in March of 2001 and ended
23 eight months later. Since the recession ended, GDP has been low for the most part from

Direct Testimony of
David Murray

1 quarter-to-quarter, except for the first and third quarters of 2002 and the most recent quarter
2 in 2003 when it grew by 7.20 percent (see Schedule 6). The stock market, as measured by
3 the Dow Jones Composite Index, has increased by 12.73 percent between August 7, 1997 and
4 November 13, 2003, while the Dow Jones Industrial Index has increased by 20.15 percent
5 over that same time frame. The stock market has decreased 22.42 percent as measured by
6 The Value Line Geometric Averages Composite Index from August 7, 1997 through
7 November 13, 2003. The Value Line Geometric Averages Composite Index currently
8 consists of an equally weighted geometric average of 1671 companies as compared to the
9 Dow Jones Composite Index, which consists of a price-weighted arithmetic average of only
10 65 companies.

11 After raising the Fed Funds Rate six times in 1999 and 2000 to hold down inflation in
12 a rapidly growing economy, Federal Reserve policy-makers began expressing concern about
13 a slowdown in December 2000. On January 3, 2001, the Federal Open Market Committee
14 lowered the Fed Funds Rate by 50 basis points to 6 percent. In a related action, the Board of
15 Governors approved a decrease in the discount rate to 5.75 percent. These actions were
16 taken in light of further weakening of sales and production, and in the context of lower
17 consumer confidence, tight conditions in some segments of financial markets, slowing of real
18 GDP and high energy prices sapping household and business purchasing power. On
19 January 31, 2001, the Federal Reserve again lowered the Fed Funds Rate by 50 basis points
20 to 5.5 percent in an attempt to provide lower rates for many business and consumer loans. At
21 the same time, the discount rate was also lowered by 50 basis points to 5 percent (see
22 Schedule 2-1). In cutting its benchmark rate by a full point in the first month of 2001, the
23 Federal Reserve had taken its most aggressive action to boost the economy since

Direct Testimony of
David Murray

1 December 1991. The Federal Reserve justified its actions by citing eroding consumer and
2 business confidence and rising energy costs.

3 The Federal Reserve cut the Fed Funds Rate a total of eleven times in 2001 with the
4 last rate cut occurring on December 11, 2001, when it lowered the Fed Funds Rate to
5 1.75 percent. The Federal Reserve again left the Fed Funds Rate unchanged at its March 19,
6 2002 meeting stating that “the economy is expanding at a significant pace.”
7 [Source: MSNBC, “Fed Holds Interest Rate Steady,” March 19, 2002,
8 <http://www.msnbc.com/news/725818?0dm=C2BHB>].

9 The Federal Reserve announced on May 7, 2002 that, “it would wait for stronger final
10 demand before raising interest rates.” The Federal Reserve also noted that inflationary
11 pressures remained subdued, in part because of excellent productivity gains. Therefore, as of
12 May 7, 2002, the Fed Funds Rate remained at 1.75 percent with the discount rate remaining
13 at 1.25 percent. However, on November 6, 2002, the Federal Reserve lowered the Fed Funds
14 Rate to 1.25 percent and kept it at this level until June 25, 2003, when it decided to lower the
15 rate to 1.00 percent, a quarter of a percentage point less than some analysts had expected.

16 On August 12, 2003, the Federal Reserve kept its interest rate target at a 45-year low
17 of 1 percent, while making an unprecedented prediction that it will stay near that level for
18 some time to come. The Fed also went on to say that the risks to growth in the next few
19 quarters are balanced, but the risk of “undesirably low” price inflation outweighed the risk of
20 inflation rising. The Fed indicated that the risk of falling inflation would be its “predominant
21 concern” (*Wall Street Journal*, p. A2, August 13, 2003). However, although the Fed has
22 made a commitment to keeping the Fed Funds Rate at its current level for some time to

Direct Testimony of
David Murray

1 come, Thirty-Year U.S. Treasury Bonds have increased to 5.16 percent as of October 2003
2 from a low of 4.37 percent as of June 2003 (see Schedule 5-2).

3 In light of the above interest rate activity, it is important to reflect on the results of the
4 major stock market indexes in the past year. Based on opening and closing quotes from
5 *Wall Street City* from November 26, 2002 through November 26, 2003, the Dow Jones
6 Industrial Average rose 12.53 percent, the S&P 500 rose 15.39 percent and the NASDAQ
7 rose 34.52 percent.

8 These economic changes have resulted in cost of capital changes for utilities and are
9 closely reflected in the yields on public utility bonds and yields of Thirty-Year U.S. Treasury
10 Bonds (see Schedule 5-1 and 5-2). Schedule 5-3 shows how closely the Mergent's "Public
11 Utility Bond Yields" have followed the yields of Thirty-Year U.S. Treasury Bonds during the
12 period from 1988 to the present. The average spread for this period between these two
13 composite indices has been 139 basis points, with the spread ranging from a low of 80 basis
14 points to a high of 250 basis points (see Schedule 5-4). These spread parameters can be
15 utilized with numerous published forecasts of Thirty-Year U.S. Treasury Bond yields to
16 estimate future long-term debt costs for utility companies.

17 Economic Projections

18 Q. What are the inflationary expectations for the remainder of 2003 through
19 2006?

20 A. The latest inflation rate, as measured by the *Consumer Price Index-All Urban*
21 *Consumers* (CPI), was 2.30 percent for the 12-months ended October 31, 2003. *The Value*
22 *Line Investment Survey: Selection & Opinion*, August 29, 2003, predicts inflation to be
23 1.9 percent for 2003, 2.0 percent for 2004 and 2.1 percent for 2005. The Congressional
24 Budget Office, *The Budget and Economic Outlook: Fiscal Years 2003-2013*, issued

Direct Testimony of
David Murray

1 January 2003, states that inflation is expected to be 2.3 percent for 2003, 1.9 percent for 2004
2 and 2.4 percent for 2005 (see Schedule 6).

3 Q. What are interest rate forecasts for 2003, 2004 and 2005?

4 A. Short-term interest rates, those measured by Three-Month U.S. Treasury Bills,
5 are expected to be 1.1 percent in 2003, 1.6 percent in 2004 and 2.0 percent in 2005 according
6 to Value Line's predictions. Value Line expects long-term interest rates, those measured by
7 the Thirty-Year U.S. Treasury Bond, to average 5.1 percent in 2003, 5.6 percent in 2004 and
8 6.0 percent in 2005.

9 The current rate for the period ending September 1, 2003 is .96 percent for 3-month
10 T-Bills, as noted on the Federal Reserve website, <http://www.stls.frb.org/fred/data/rates.html>.
11 The current rate for the period ending October 16, 2003 is 5.16 percent for 30-Year U.S.
12 Treasury Bonds as noted on Investopedia's website, <http://www.investopedia.com>.

13 Q. What are the growth expectations for real Gross Domestic Product (GDP) in
14 the future?

15 A. GDP is a benchmark utilized by the Commerce Department to measure
16 economic growth within the United States' borders. Real GDP is measured by the actual
17 Gross Domestic Product, adjusted for inflation. Value Line stated that real GDP growth is
18 expected to increase by 2.3 percent in 2003, 3.7 percent in 2004 and 3.7 percent in 2005.
19 The Congressional Budget Office, *The Budget and Economic Outlook: Fiscal Years*
20 *2003-2013*, stated that real GDP is expected to increase by 2.2 percent in 2003, 3.8 percent in
21 2004 and 3.5 percent in 2005 (see Schedule 6).

22 Q. Please summarize the expectations of the economic conditions for the next
23 few years.

Direct Testimony of
David Murray

1 A. In summary, when combining the previously mentioned sources, inflation is
2 expected to be in the range of 1.9 to 2.4 percent, increase in real GDP in the range of 2.2 to
3 3.8 percent and long-term interest rates are expected to range from 5.1 to 6.0 percent.

4 *The Value Line Investment Survey: Selection & Opinion*, November 31, 2003, states
5 that:

6 **There are very few clouds on the economic horizon as we**
7 **approach the two-thirds mark of the fourth quarter.** Most of the
8 economy's key sectors are responding very well, with industrial
9 production, U.S. exports, retail spending (excluding autos), and
10 employment, for example, all posting anywhere from modest to solid
11 gains after selective weakness early in the year. Further, many
12 companies, upon issuing their recent quarterly earnings statements,
13 indicated that they had a strong book of new business going forward.
14 As such...

15 **We think the gross domestic product will rise by around 4% in the**
16 **current quarter and maintain that healthy pace in 2004.** True, that
17 would be a step back from the third quarter, when growth had topped
18 7%. But that eye-catching performance was helped by the effect of the
19 Bush Administration's retroactive tax cut, which was implemented
20 during the summer. Moreover, this projected rate of business growth
21 is materially greater than appeared likely just a few months ago, when
22 both capital spending and employment were still faltering.

23 **For now, we do not believe this solid rate of business activity will**
24 **fan the fires of inflation.** Although the rate of job growth is
25 increasing, the gains aren't sufficient to cause wages and benefits to
26 rise sharply. In addition, productivity is surging, which is also helping
27 to keep inflation at bay. Then, too, raw materials are still in plentiful
28 supply and there is enough industrial capacity around to avoid most
29 production bottlenecks, in our opinion.

30 **As such, we expect the Federal Reserve to proceed slowly on the**
31 **interest-rate front.** Overall, we think borrowing costs will move
32 higher in 2004, but we do not think this uptrend will commence until
33 the year is well under way and the jobless rate starts to decline. Rates
34 should then only edge modestly higher, unless there is an unexpected
35 jump in inflation.

36 **The stock market, though, has not been proceeding slowly,** with the
37 leading indexes having recently risen to their best levels in more than a

Direct Testimony of
David Murray

1 year. However, this showing, which has been interrupted by only brief
2 bouts of profit taking, has left equities a little overextended.

3 S&P's Chief Technical Analyst, Mark Arbeter, states the following in the November 19,
4 2003 issue of *The Outlook*:

5 For the 10 years ended 1999, the S&P 500 advanced more than 315%.
6 But from the end of 1999 through last year, the "500" tumbled more
7 than 40%. Even though 2003 appears likely to end with a gain, stock
8 investors could well experience a below-average decade.

9 In terms of performance, the 1990s were the best decade in modern
10 stock market history. On average, the S&P 500 gained 16.13% a year
11 during the boom period. Contrast that with what investors have seen
12 since 2000. The average annual loss for the first three complete years
13 of this decade has been 15.52%. Standard & Poor's estimates that the
14 "500" will end 2003 at 1085 for a gain of 23.32%. If the market hits
15 that target, the average annual loss for four years would still be 5.81%.

16 Could this turn out to be the worst decade for stocks in the history of
17 the S&P 500? That infamous record currently is held by the 1930s,
18 when stocks advanced a meager 0.04% a year. Assuming year end
19 2003 at 1085, the "500" would have to gain 3.94%, on average, for the
20 remaining six years of the decade to match the performance of the
21 1930s. We think that the market is likely to do significantly better and
22 that the Depression-era record for worst decade will probably stand.

23 The 1970s saw only a 3.2% annual gain in stocks. To simply match
24 that performance, the market will have to rise 9.2% annually for the
25 final six years of this decade if the index closes at 1085 this year.

26 Although that's possible, it is less probable, given our projections for
27 modest GDP growth and inflation over the next several years. The
28 upshot is that everyone, especially baby boomers set to begin retiring
29 soon, will have to save more.

30 Alternative investment choices in bonds and cash equivalents look
31 unappealing. We continue to recommend keeping 65% of your
32 investment nest egg in stocks.

Business Operations of Aquila, Inc.

1
2 Q. Please describe Aquila, Inc.'s (Aquila) business operations.

3 A. Aquila's 2002 Annual Report provides a good description of Aquila's
4 business operations:

5 Aquila, Inc. (the company, which may be referred to as "we", "us" or
6 "our") is a multinational energy provider headquartered in Kansas
7 City, Missouri. We began as Missouri Public Service Company in
8 1917 and reincorporated in Delaware as UtiliCorp United Inc. in 1985.
9 In March 2002, we changed our name to Aquila, Inc. We operate
10 regulated and non-regulated businesses in four countries. As of
11 December 31, 2002, we had 4,710 employees, with 3,496 of them in
12 the United States and the remaining 1,214 in Canada. Our business is
13 organized into two groups: Global Networks Group, which consists of
14 Domestic Networks and International Networks, and Merchant
15 Services, which consist of Capacity Services and Wholesale Services:

- 16 • **Global Networks Group-** Our Domestic Networks business
17 owns and operates regulated electric and natural gas operations
18 in the United States, where we provide natural gas and/or
19 electricity to approximately 1.3 million customers in Colorado,
20 Iowa, Kansas, Michigan, Minnesota, Missouri and Nebraska.
21 Domestic Networks also includes Everest Connections, our
22 96% owned domestic communications business. Our
23 International Networks business owns and manages interests in
24 electric, gas, and communications networks in Australia and
25 the United Kingdom serving approximately 4.0 million
26 customers. It also includes our wholly-owned electric
27 generation, transmission and distribution properties serving
28 approximately 483,000 customers in two Canadian provinces.
- 29 • **Merchant Services** – Merchant Services consists of Capacity
30 Services, **which** owns, operates, and contractually controls our
31 non-regulated electric power generation assets, and Wholesale
32 Services, our North American and European commodity client
33 and capital businesses.

34
35
36
37

Direct Testimony of
David Murray

1 Aquila's total operating revenues were \$2,575,014,000 for the 12 months ended
2 December 31, 2002. These total operating revenues resulted in an overall net loss of
3 \$2,075,086,000. These revenues and net incomes were generated from a total property, plant
4 and equipment of \$3,180,829,000 at December 31, 2002. These figures were taken from
5 Aquila's response to Staff Data Request No. MPSC-222.

6 Q. Please describe the current credit ratings of Aquila.

7 A. Currently, Standard & Poor's Corporation rates the senior unsecured debt of
8 Aquila as "B." This rating is not considered to be of "investment grade."

9 Q. Please provide Standard & Poor's Corporation's most recent outlook
10 concerning the credit rating assigned to Aquila.

11 A. Standard & Poor's Corporation's *Ratings Direct*, September 2, 2003, provides
12 a summary explaining the outlook. Specifically the report states:

13 **OUTLOOK: NEGATIVE**
14 **RATIONALE**

15 The ratings on Aquila Inc. reflect the company's strained liquidity
16 position, execution risk associated with proposed asset sales, and
17 insufficient cash flow to offset a burdensome debt level, not quite
18 mitigated by management's efforts to restructure the company as a
19 traditional regulated utility business.

20 Aquila's restructuring plan is heavily dependent on continued asset
21 sales, prompting concern over the heavy execution risk involved with
22 an asset-sales strategy. Weak market conditions increase this risk, as
23 evidenced by the delay in the sale of Avon Energy Partners Holdings.
24 Due to weak cash flow generation from operations, asset sales are
25 necessary for Aquila to reduce its debt levels and shore up its balance
26 sheet. Still, cash flow generation relative to total debt is likely to
27 remain weak and not exceed 15% in the near term.

28 Cash flows from Aquila's regulated utilities will be stable; however,
29 depressed power prices and negative spark spreads will continue to be
30 a drag on cash flow from operations on the nonregulated side of the
31 business. Overall, cash flow will be strained as the company faces
32 continued restructuring charges in 2003 and debt maturities in 2004.

Direct Testimony of
David Murray

1 Expected cash flow from the company's reconstituted business plan is
2 insufficient to fully offset Aquila's massive amount of debt.

3 Aquila has taken concerted steps toward returning to its traditional
4 regulated utility business model. The company has managed to sell
5 \$1.9 billion in assets over the past year and has achieved more than
6 \$100 million in cost reduction by curbing operational expenses and
7 rationalizing its trading and marketing business. In July 2003, Aquila
8 completed the sale of its Australian power and gas interests to
9 Australian-based companies, AMP Ltd. and AlintaGas Ltd., and used
10 net proceeds of \$477 million to retire its \$200 million 364-day secured
11 credit facility and enhance liquidity.

12 Furthermore, in May 2003, Aquila announced that it will terminate its
13 20-year tolling contract with Acadia Power Partners LLC for \$105.5
14 million. The termination agreement will return to Aquila \$45 million
15 in posted collateral and will eliminate \$843 million in payments due to
16 Acadia over the remaining term of the tolling agreement, thus
17 alleviating some of Aquila's liquidity concerns.

18 Aquila has also reduced capital investments in its noncore business
19 units, such as Everest Connections, a communications business.
20 Aquila's initiative to increase its focus on the regulated side of the
21 business is a positive step for Aquila's credit profile.

22 Q. Please provide some historical financial information for Aquila.

23 A. Schedules 7 and 8 present historical capital structures and selected financial
24 ratios from 1998 to 2002 for Aquila. Aquila and its subsidiaries' consolidated common
25 equity ratio has ranged from a high of 44.17 percent to a low of 33.24 percent from 1998
26 through 2002. As of December 31, 2002, the capital structure used for purposes of
27 calculating the rate of return to be applied to the MPS rate base, had a common
28 equity ratio of 35.31 percent (Schedule 9). Aquila's consolidated return on year-end
29 common equity (ROE) has decreased dramatically to a negative 129.06% in 2002 from a
30 high of 13.46 percent in 2000. Aquila's 2002 ROE of negative 129.06 percent is a result of
31 its nonregulated activities. Aquila's market-to-book ratio has varied in the past five years
32 from a high of 1.73 times in 2000 to a low of .21 times in 2002.

1 **Determination of the Cost of Capital**

2 Q. Please describe the approach for determining a utility company's cost of
3 capital.

4 A. The total dollars of capital for the utility company are determined as of a
5 specific point in time. This total dollar amount is then apportioned into each specific capital
6 component, i.e. common equity, long-term debt, preferred stock and short-term debt. A
7 weighted cost for each capital component is determined by multiplying each capital
8 component ratio by the appropriate embedded cost or by the estimated cost of common
9 equity component. The individual weighted costs are summed to arrive at a total weighted
10 cost of capital. This total weighted average cost of capital (WACC) is synonymous with the
11 fair rate of return for the utility company.

12 Q. Why is a total WACC synonymous with a fair rate of return?

13 A. From a financial viewpoint, a company employs different forms of capital to
14 support or fund the assets of the company. Each different form of capital has a cost and these
15 costs are weighted proportionately to fund each dollar invested in the assets.

16 Assuming that the various forms of capital are within a reasonable balance and are
17 costed correctly, the resulting total weighted cost of capital, when applied to rate base, will
18 provide the funds necessary to service the various forms of capital. Thus, the total weighted
19 cost of capital corresponds to a fair rate of return for the utility company.

20 **Capital Structure and Embedded Costs**

21 Q. What capital structure did you use for MPS?

22 A. The capital structure I have used for this case is Aquila's on a consolidated
23 basis as of December 31, 2002. Schedule 9 presents Aquila's capital structure and associated

Direct Testimony of
David Murray

1 capital ratios. The resulting capital structure consists of 35.31 percent common stock equity,
2 .38 percent short-term debt and 64.31 percent long-term debt.

3 The amount of long-term debt outstanding on December 31, 2002 includes current
4 maturities due within one year. The amount of long-term debt in the capital structure is the
5 amount of long-term debt indicated on the December 31, 2002 Balance Sheet provided by
6 Aquila in response to Staff Data Request MPSC-222.

7 As of December 31, 2002, Aquila had \$300,963,000 of short-term debt outstanding
8 with \$283,431,000 of Construction Work In Progress (CWIP) outstanding. Therefore, I
9 included a short-term debt balance of \$17,532,000 in the capital structure, which is the
10 difference between the amount of short-term debt outstanding and the CWIP outstanding.
11 The difference between actual short-term debt outstanding and CWIP was used for the short-
12 term debt balance because it is assumed that CWIP will eventually be funded by long-term
13 debt.

14 Q. Why did you use Aquila's capital structure as of the test year, December 31,
15 2002?

16 A. Because the debt and equity are
17 generated from the parent company, Aquila, MPS rely on Aquila to finance their
18 investment in MPS assets. Because MPS do not issue their own debt or
19 equity, Aquila's actual capital structure as of December 31, 2002 was used for MPS

20 .
21 In addition, Aquila's consolidated capital structure as of the test year is not
22 extraordinary for a comparable electric utility. According to Schedule 20, Aquila's year-end

Direct Testimony of
David Murray

1 common equity to total capital ratio at the end of 2002 was 35.31 percent, which is near the
2 average of 36.77 percent for the comparable companies.

3 Q. Why didn't you update the capital structure through the update period of
4 September 30, 2003?

5 A. Because the common equity ratio in the updated capital structure is not
6 consistent with the comparable companies. The common equity ratio as of September 30,
7 2003 was 30.77 percent.

8 Q. Why has Aquila's common equity ratio declined since December 31, 2002?

9 A. Because of losses associated with Aquila's ongoing nonregulated investments,
10 impairment charges and net losses on sales of assets, losses within discontinued operations
11 and margin losses incurred during the wind-down of the energy merchant trading portfolio.

12 Q. Doesn't the common equity ratio as of the updated period still fall within the
13 range of common equity ratios contained in your comparable group?

14 A. Yes, but the equity ratios of DQE, Inc. and DPL, Inc. are fairly low. As of the
15 end of 2002, DPL, Inc.'s common equity ratio was 24.70 percent and DQE, Inc.'s common
16 equity ratio was 25.50 percent (see Schedule 20).

17 Q. Should you have included these companies in your averages to determine if
18 Aquila's test year capital structure is reasonable?

19 A. Yes. Schedule 20 attached to this direct testimony shows that there were two
20 higher levels of common equity ratios for two of the comparable companies, Hawaiian
21 Electric Industries, Inc. and IDACORP, Inc. and two lower levels of common equity ratios
22 for the comparable companies, DPL, Inc. and DQE, Inc. However, the other two companies,
23 Cleco Corporation and NSTAR, have common equity ratios that are close to the average for

Direct Testimony of
David Murray

1 all six of the comparable companies. Therefore, the inclusion of DPL, Inc. and DQE, Inc.
2 have not skewed the average common equity ratio.

3 Q. What was the embedded cost of long-term debt for Aquila on December 31,
4 2002?

5 A. I determined the embedded cost of long-term debt on December 31, 2002, for
6 Aquila to be 7.633 percent (see Schedule 10). This embedded cost of debt excludes a debt
7 issuance that was issued after Aquila had its credit rating lowered. The interest rate on this
8 debt issuance was 14.875 percent. Therefore, the embedded cost of debt does not contain
9 any increased cost of capital that Aquila has incurred since S&P began to consistently
10 downgrade Aquila's credit rating to its current level of B. The embedded cost of debt
11 excludes the Australian debt because as of July 24, 2003, Aquila completed the sale of its
12 Australian energy investments

13 Q. Why was short-term debt included in the consolidated capital structure of
14 Aquila at December 31, 2002?

15 A. As of December 31, 2002, the short-term debt balance was \$300,963,000 and
16 the CWIP balance was \$283,431,000. Any time the short-term debt balance exceeds CWIP,
17 this amount of short-term debt is included in the capital structure. The philosophy behind
18 this is that because CWIP will eventually be funded by long-term debt, that at least this
19 amount of short-term debt should not be considered in the cost of capital because it is not
20 meant to be a permanent funding source.

21 Cost of Equity

22 Q. How do you propose to analyze those factors by which the cost of equity for
23 MPS may be determined?

Direct Testimony of
David Murray

1 A. In order to calculate the cost of equity for MPS, I performed a
2 comparable company analysis of six companies. I have selected the discounted cash flow
3 (DCF) model as the primary tool to determine the cost of equity for MPS, but I also
4 used the risk premium model and the Capital Asset Pricing Model to check the
5 reasonableness of the DCF results.

6 The DCF Model

7 Q. Please describe the DCF model.

8 A. The DCF model is a market-oriented approach for deriving the cost of equity.
9 The return on equity calculated from the DCF model is inherently capable of attracting
10 capital. This results from the theory that security prices adjust continually over time, so that
11 an equilibrium price exists and the stock is neither undervalued nor overvalued. It can also
12 be stated that stock prices continually fluctuate to reflect the required and expected return for
13 the investor.

14 The continuous growth form of the DCF model was used in this analysis. This model
15 relies upon the fact that a company's common stock price is dependent upon the expected
16 cash dividends and upon cash flows received through capital gains or losses that result from
17 stock price changes. The interest rate which discounts the sum of the future expected cash
18 flows to the current market price of the common stock is the calculated cost of equity. This
19 can be expressed algebraically as:

$$20 \quad \text{Present Price} = \frac{\text{Expected Dividends}}{\text{Discounted by } k} + \frac{\text{Expected Price in 1 year}}{\text{Discounted by } k} \quad (1)$$

21

22 where k equals the cost of equity. Since the expected price of a stock in one year is equal to
23 the present price multiplied by one plus the growth rate, equation (1) can be restated as:

Direct Testimony of
David Murray

1 Present Price = $\frac{\text{Expected Dividends}}{(1 + k)} + \frac{\text{Present Price (1+g)}}{(1 + k)}$ (2)
2

3 where g equals the growth rate and k equals the cost of equity. Letting the present price
4 equal P_0 and expected dividends equal D_1 , the equation appears as:

5
$$P_0 = \frac{D_1}{(1 + k)} + \frac{P_0(1+g)}{(1 + k)}$$
 (3)
6
7

8 The cost of equity equation may also be algebraically represented as:

9
$$k = \frac{D_1}{P_0} + g$$
 (4)
10
11

12 Thus, the cost of common stock equity, k, is equal to the expected dividend yield (D_1/P_0) plus
13 the expected growth in dividends (g) continuously summed into the future. The growth in
14 dividends and implied growth in earnings will be reflected in the current price. Therefore,
15 this model also recognizes the potential of capital gains or losses associated with owning a
16 share of common stock.

17 The discounted cash flow method is a continuous stock valuation model. The DCF
18 theory is based on the following assumptions:

- 19 1. Market equilibrium;
20 2. Perpetual life of the company;
21 3. Constant payout ratio;
22 4. Payout of less than 100% earnings;
23 5. Constant price/earnings ratio;
24 6. Constant growth in cash dividends;

Direct Testimony of
David Murray

- 1 7. Stability in interest rates over time;
- 2 8. Stability in required rates of return over time; and
- 3 9. Stability in earned returns over time.

4 Flowing from these, it is further assumed that an investor's growth horizon is
5 unlimited and that earnings, book values and market prices grow hand-in-hand. Although the
6 entire list of the above assumptions is rarely met, the DCF model is a reasonable working
7 model describing an actual investor's expectations and resulting behaviors.

8 Q. Can you directly analyze the cost of equity for MPS?

9 A. No. In order to directly determine the cost of equity for MPS, they
10 would have to be a stand-alone company that is publicly traded and pay a cash dividend. The
11 only way that an investor can invest in the operations of MPS is by investing in the
12 consolidated corporation of Aquila. When an investor purchases a share of Aquila, he is
13 purchasing an interest in the earnings of the entire company, which includes the financial
14 effects of the nonregulated, riskier operations that Aquila has been exiting over the last
15 couple of years.

16 Q. Please explain how you approached the determination of the cost of equity for
17 MPS.

18 A. I decided to do an analysis of the cost of equity for a comparable group of
19 electric utility companies.

20 Q. Why didn't you use Aquila's cost of equity as a proxy for the cost of equity
21 for MPS?

22 A. As explained above, Aquila's riskier, nonregulated operations have had a
23 dramatic effect on Aquila's cost of capital. Aquila's cost of capital is higher than it would be

Direct Testimony of
David Murray

1 for an electric utility company that did not get involved in riskier operations, such as energy
2 marketing and trading. The objective of this analysis is to approximate the cost of equity for
3 MPS, which are regulated utilities. Therefore, it is appropriate to estimate MPS's
4 cost of equity based on publicly traded companies that have operations that
5 resemble the operations of MPS.

6 Q. How did you determine which companies you would include to represent the
7 comparable electric utility companies?

8 A. Schedule 11 presents a list of market-traded electric utility companies
9 monitored by Value Line, which also monitors Aquila. The criteria that I used to select the
10 comparable companies are as follows:

- 11 1. Stock publicly traded: This criterion did not eliminate any companies;
- 12 2. Information printed in Value Line: This criterion eliminated two
13 companies;
- 14 3. Total capitalization less than \$5 billion: This criterion eliminated
15 thirty-two additional companies;
- 16 4. Greater than 70 percent of revenues received from electric utility
17 operations: This criterion eliminated twenty additional companies;
- 18 5. Ten years of data available: This criterion eliminated two additional
19 companies;
- 20 6. No nuclear operations: This criterion eliminated four additional
21 companies;
- 22 7. At least investment grade credit rating: This criterion eliminated six
23 additional companies;
- 24 8. No Missouri operations: This criterion did not eliminate any
25 companies.

26 This final group of six publicly traded electric utility companies serve as a proxy group to
27 determine the cost of equity for MPS. The comparables are listed on Schedule 12.

28 Q. Please explain how you approached the determination of the cost of equity for
29 the comparables.

Direct Testimony of
David Murray

1 A. I have calculated a DCF cost of equity for each of the comparables. The first
2 step was to calculate a growth rate. I reviewed the actual dividends per share (DPS),
3 earnings per share (EPS), and book values per share (BVPS) as well as projected growth
4 rates for the comparables. Schedule 13-1 lists the annual compound growth rates for DPS,
5 EPS, and BVPS for the periods 1992 through 2002. Schedule 13-2 lists the annual
6 compound growth rates for DPS, EPS, and BVPS for the periods of 1997-2002.
7 Schedule 13-3 presents the averages of the growth rates determined in Schedules 13-1 and
8 13-2. Schedule 14 presents the average historical growth rates and the projected growth rates
9 for the comparables. The projected growth rates were obtained from three outside sources;
10 I/B/E/S Inc.'s Institutional Brokers Estimate System, Standard & Poor's Corporation's
11 Earnings Guide, and The Value Line Investment Survey: Ratings and Reports. The three
12 projected growth rates were averaged to develop an average projected growth rate of
13 3.61 percent, which was averaged with the historical growth rates to produce an average
14 historical and projected growth rate of 1.86 percent. All the growth rates were then analyzed
15 to arrive at a growth rate range for the comparables of 3.10 percent to 4.10 percent.

16 The next step was to calculate an expected yield for each of the comparables. The
17 yield term of the DCF model is calculated by dividing the amount of common dividends per
18 share expected to be paid over the next twelve months by the market price per share of the
19 firm's stock. Even though a strict technical application of the model requires the use of a
20 current spot market price, I have chosen to use a monthly average market price for each of
21 the comparables. This averaging technique is an attempt to minimize the effects on the
22 dividend yield which can occur due to daily volatility in the stock market. Schedule 15
23 presents the average high / low stock price for the period of June 1, 2003 through

Direct Testimony of
David Murray

1 September 30, 2003 for each comparable. Column 1 of Schedule 16 indicates the expected
2 dividend for each comparable over the next 12 months as projected by The Value Line
3 Investment Survey: Ratings & Reports, August 15, September 5 and October 3, 2003.
4 Column 3 of Schedule 16 shows the projected dividend yield for each of the comparables.
5 The dividend yield for each comparable was averaged to calculate the projected dividend
6 yield for the comparables of 5.54 percent.

7 As illustrated in column 5 of Schedule 16, the average cost of equity based on the
8 projected dividend yield added to the average of historical and projected growth is
9 7.40 percent.

10 Q. What analysis was performed to determine the reasonableness of your DCF
11 model derived return on common equity for the comparable company group?

12 A. I performed a risk premium and capital asset pricing model (CAPM) cost of
13 equity analysis for the comparables.

14 Q. Please describe the capital asset pricing model.

15 A. The CAPM describes the relationship between a security's investment risk
16 and its market rate of return. This relationship identifies the rate of return which investors
17 expect a security to earn so that its market return is comparable with the market returns
18 earned by other securities that have similar risk. The general form of the CAPM is as
19 follows:

20
$$k = R_f + \beta (R_m - R_f)$$

21 where:

22 k = the expected return on equity for a specific security;

23 R_f = the risk-free rate;

24 β = beta; and

Direct Testimony of
David Murray

1 $R_m - R_f =$ the market risk premium.

2 The first term of the CAPM is the risk-free rate (R_f). The risk-free rate reflects the
3 level of return that can be achieved without accepting any risk. In reality, there is no such
4 risk-free asset, but it is generally represented by U.S. Treasury securities. For purposes of
5 this analysis, the risk-free rate was represented by the average yield on the 30-Year U.S.
6 Treasury Bond of 5.16 percent for the month of October 2003 as quoted on the Investopedia
7 Website: <http://www.investopedia.com>.

8 The second term of the CAPM is beta (β). Beta is an indicator of a security's
9 investment risk. It represents the relative movement and relative risk between a particular
10 security and the market as a whole (where beta for the market equals 1.00). Securities with
11 betas greater than 1.00 exhibit greater volatility than do securities with betas less than 1.00.
12 This causes a higher beta security to be less desirable and therefore requires a higher return in
13 order to attract investor capital away from a lower beta security. Schedule 17 contains the
14 appropriate betas for the comparables.

15 The final term of the CAPM is the market risk premium ($R_m - R_f$). The market risk
16 premium represents the expected return from holding the entire market portfolio less the
17 expected return from holding a risk-free investment. For purposes of this analysis, I looked
18 at two time periods for risk premium estimates. The first risk premium used was based on
19 the long-term period of 1926 to 2002, which was 6.40 percent. The second risk premium
20 used was based on the short-term, recent period of 1993 to 2002, which was determined to be
21 -.34 percent. These risk premiums were taken from Ibbotson Associates, Inc.'s Stocks,
22 Bonds, Bills, and Inflation: 2003 Yearbook.

Direct Testimony of
David Murray

1 Schedule 17 presents the CAPM analysis with regard to the comparables. The CAPM
2 analysis produces an estimated cost of common equity of 9.75 percent for the comparables
3 when using the long-term risk premium period. Using the short-term risk premium period
4 produces an estimated cost of common equity of 4.92 percent. Although the long-term risk
5 premium CAPM results support the upper part of my recommended cost of common equity
6 range based on my DCF analysis, the CAPM has not historically been relied upon by the
7 Financial Analysis Department in determining the cost of equity for a utility company. It is
8 strictly used as a test of reasonableness to provide some comfort with the results of the DCF,
9 and in this case the long-term risk premium CAPM supports the DCF results. Although the
10 short-term risk premium CAPM results are extremely low, it is interesting to observe that the
11 stock market returns over the last ten years have actually been less than the returns on long-
12 term government bonds over the last ten years.

13 The CAPM results appear to be coming in lower than in the past because interest
14 rates are at forty-year lows and because the market returns have decreased significantly in the
15 past few years. This would lend support to a lower recommended cost of common equity.

16 Q. Please describe the risk premium model.

17 A. The risk premium concept implies that the required return on equity is found
18 by adding an explicit premium for risk to a current interest rate. Schedules 18-1 through
19 18-6 show the average risk premium above the yield on the Thirty-Year U.S. Treasury Bond
20 for each of the comparables' actual returns on common equity. Although the expected
21 returns on equity are usually used by the Financial Analysis Department for the risk premium
22 analysis, this information was not available for the time period of the analysis so I relied on
23 actual returns on common equity. The use of actual returns on equity to perform the risk

Direct Testimony of
David Murray

1 premium analysis is a commonly accepted practice when estimating the cost of common
2 equity. This analysis shows, on average, that the actual returns on equity as reported by The
3 Value Line Investment Survey: Ratings & Reports ranges from 445 basis points to 964 basis
4 points higher than the average yields on the Thirty-Year U.S. Treasury Bonds for the period
5 of January 1993 through December 2002 (see Schedule 19). The risk premium is then added
6 to the current yield on the Thirty-Year U.S. Treasury Bond. Column 3 of Schedule 19 shows
7 that the risk premium cost of equity estimate for each of the comparables ranged from
8 9.61 percent to 14.80 percent, with an average of 11.51 percent.

9 Q. Please summarize your cost of equity analysis to this point.

10 A. I have performed a DCF, CAPM and risk premium cost of equity analysis on
11 a group of six comparable companies. The results are summarized below.

	<u>DCF</u>	<u>CAPM</u>	<u>Risk Premium</u>
13 Comparable Companies	8.64% - 9.64%	9.75%; 4.92%	11.51%

14 Q. Based on the analysis you performed, what is your recommended return on
15 common equity in this proceeding?

16 A. I am recommending a return on common equity in the range of 8.64 percent to
17 9.64 percent based on the results of the DCF analysis.

18 Q. Did you perform an analysis on Aquila's resulting pre-tax interest coverage
19 ratios?

20 A. Yes. However, many assumptions and hypothetical situations had to be used.
21 For example, all of the international debt was used for the interest expense because the
22 amount of debt on the December 31, 2002, Balance Sheet reflects all of this debt. I also had
23 to impute an interest expense for the \$500,000,000 of debt that was issued after Aquila's

Direct Testimony of
David Murray

1 credit rating deteriorated. I imputed the interest expense on this issuance by multiplying the
2 principal amount by the July 2002 BBB utility bond yield, which was the date this debt was
3 issued, as indicated in the Mergent Bond Record. Based on these assumptions, a pro forma
4 pre-tax interest coverage calculation was completed for Aquila (see Schedule 21). It reveals
5 that the return on equity range of 8.64 percent to 9.64 percent would yield a pre-tax interest
6 coverage ratio in the range of 2.11 times to 2.23 times. This range of pretax interest coverage
7 ratios falls between the lower quartile and median quartile for a BBB rated electric utility.

8 Rate of Return for MPS

9 Q. Please explain how the returns developed for each capital component are used
10 in the rate making approach you have adopted for MPS.

11 A. The cost of service rate making method was adopted in this case. This
12 approach develops the public utility's revenue requirement. The cost of service
13 (revenue requirement) is based on the following components: operating costs, rate base and
14 a return allowed on the rate base (see Schedule 22).

15 It is my responsibility to calculate and recommend a rate of return that should be
16 authorized on the Missouri jurisdictional electric utility rate base of MPS. Under
17 the cost of service rate making approach, a weighted cost of capital in the range of 7.97 to
18 8.32 percent was developed for MPS's electric utility operations (see
19 Schedule 23). This rate was calculated by applying an embedded cost of long-term debt of
20 7.633 percent, an average cost of short-term debt of 3.02 percent, and a cost of common
21 equity range of 8.64 percent to 9.64 percent to a capital structure consisting of 64.31 percent
22 long-term debt, .38 percent short-term debt and 35.31 percent common equity. Therefore,
23 from a financial risk / return prospective, as I suggested earlier, I am recommending that

Direct Testimony of
David Murray

1 MPS's electric utility operations be allowed to earn a return on its original cost
2 rate base in the range of 7.97 to 8.32 percent.

3 Through my analysis, I believe that I have developed a fair and reasonable return and,
4 when applied to MPS's jurisdictional rate base, will allow Aquila the opportunity
5 to earn the revenue requirement developed in this rate case.

6 Q. Does this conclude your prepared direct testimony?

7 A. Yes, it does.

Senior Debt Rating	BBB	BBB	BBB	BBB	BB

* Because the financial data was not directly provided in Aquila, Inc.'s 2002 Annual Report, the following formula was used to calculate Return on Ending Common Equity:
Return on Ending Common Equity = Net Income Available for Common Stock / Ending Common Shareholders' Equity.

Year-End Market to Book Ratio = Year-End Market Price Per Common Share / Year-End Book Value Per Common Share

Year-End Market Price Per Common Share has been adjusted for stock splits and stock dividends.

Pre-Tax Interest Coverage Ratio = (Net Income + Income Taxes + Total Interest Expense) / Total Interest Expense.

Sources:

Column 1 = The appropriate yield is equal to the average 30-year U.S. Treasury Bond yield for October 2003 which was obtained from Investopedia at: <http://www.investopedia.com>

Column 2 = Beta is a measure of the movement and relative risk of an individual stock to the market as a whole as reported by the Value Line Investment Survey: Ratings & Reports, August 15, September 5, and October 3, 2003.

Column 3 = The Market Risk Premium represents the expected return from holding the entire market portfolio less the expected return from holding a risk free investment. The appropriate Market Risk Premium for the period 1926 - 2002 was determined to be 6.40% as calculated in Ibbotson Associates, Inc.'s Stocks, Bonds, Bills, and Inflation: 2003 Yearbook.

Column 4 = The Market Risk Premium represents the expected return from holding the entire market portfolio less the expected return from holding a risk free investment. The appropriate Market Risk Premium for the period 1993 - 2002 was determined to be -0.34% as calculated in Ibbotson Associates, Inc.'s Stocks, Bonds, Bills, and Inflation: 2003 Yearbook.

Column 5 = (Column 1 + (Column 2 * Column 3)).

**Risk Premium Cost of Equity Estimates
for the Comparable Electric Utility Companies**

Company Name	(1)	(2)	(3)
Company Name	Appropriate Yield	Equity Premium	Cost of Common Equity
Cleco Corporation	5.16%	7.03%	12.19%
DPL Inc.	5.16%	9.64%	14.80%
DQE, Inc.	5.16%	5.59%	10.75%
Hawaiian Electric Industries, Inc.	5.16%	4.45%	9.61%
IDACORP, Inc.	5.16%	5.60%	10.76%
NSTAR	5.16%	5.79%	10.95%
Average			<u>11.51%</u>

NOTES:

Column 1 = The appropriate yield is equal to the average 30-year U.S. Treasury Bond yield for October 2003 which was obtained from Investopedia: <http://www.investopedia.com>.

Column 2 = The equity premium represents the average difference between the Company's actual return on common equity as reported in The Value Line Investment Survey: Ratings & Report for August 15, September 5, and October 3, 2003, and the yield on 30-year U.S. Treasury Bonds January 1993 through December 2002. See Schedules 18-1 through 18-6.

Column 3 = Column 1 + Column 2.

--	--------------------------------------	------------------------------	--------------------------------------

Note: * Long-term debt interest expense from Aquila's response to MPSC-222 and MPSC-532, which includes all international debt, but not the interest expense associated with the 14.875% debt issuance. The assumed interest expense for this issuance is as follows:
\$500,000,000 x 8.07% Yield as reported by Mergent's Public Utility Bond for July 2002 = \$40,350,000.
Total: \$40,350,000 + \$163,393,049 = \$203,743,049 Annual Interest Cost.

Public Utility Revenue Requirement

or

Cost of Service

The formula for the revenue requirement of a public utility may be stated as follows :

Equation 1 : **Revenue Requirement = Cost of Service**

or

Equation 2 : **$RR = O + (V - D)R$**

The symbols in the second equation are represented by the following factors :

RR	=	Revenue Requirement
O	=	Prudent Operating Costs, including Depreciation and Taxes
V	=	Gross Valuation of the Property Serving the Public
D	=	Accumulated Depreciation
(V - D)	=	Rate Base (Net Valuation)
(V - D)R	=	Return Amount (\$\$) or Earnings Allowed on Rate Base
R	=	$iL + dP + kE$ or Overall Rate of Return (%)
i	=	Embedded Cost of Debt
L	=	Proportion of Debt in the Capital Structure
d	=	Embedded Cost of Preferred Stock
P	=	Proportion of Preferred Stock in the Capital Structure
k	=	Required Return on Common Equity (ROE)
E	=	Proportion of Common Equity in the Capital Structure
