Hong Hu/Direct

Public Counsel

GR-99-315

**FILED**

JUL 6 1999

Missouri Public  
Service Commission

**DIRECT TESTIMONY**

**OF**

**HONG HU**

Submitted on Behalf of the Office of the Public Counsel

**LACLEDE GAS COMPANY**

**Case No.: GR-99-315**

July 6, 1999

**BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI**

In the matter of Laclede Gas Company's     )  
tariff to revise natural gas rate schedules.     )

Case No. GR-99-315

**AFFIDAVIT OF HONG HU**

STATE OF MISSOURI     )  
                                                      ) ss  
COUNTY OF COLE     )

Hong Hu, of lawful age and being first duly sworn, deposes and states:

1. My name is Hong Hu. I am a Public Utility Economist for the Office of the Public Counsel.
2. Attached hereto and made a part hereof for all purposes is my direct testimony consisting of pages 1 through 20 and Schedules DIR HH-1 through DIR HH-5.
3. I hereby swear and affirm that my statements contained in the attached testimony are true and correct to the best of my knowledge and belief.

  
\_\_\_\_\_  
**Hong Hu**

Subscribed and sworn to me this 6th day of July, 1999.

  
\_\_\_\_\_  
Mary S. Koestner, Notary Public

My Commission expires August 20, 2001.

**DIRECT TESTIMONY  
OF  
HONG HU**

**LACLEDE GAS COMPANY**

**CASE NO. GR-99-315**

1       **Q.     PLEASE STATE YOUR NAME, TITLE, AND BUSINESS ADDRESS.**

2       A.     Hong Hu, Public Utility Economist, Office of the Public Counsel, P. O. Box 7800,  
3             Jefferson City, Missouri 65102.

4       **Q.     PLEASE SUMMARIZE YOUR EDUCATIONAL AND EMPLOYMENT BACKGROUND.**

5       A.     I hold a Bachelor of Engineering degree in Management of Information Systems from  
6             Tsinghua University of Beijing, China and a Masters of Arts degree in Economics from  
7             Northeastern University. I have completed the comprehensive exams for a Ph.D. in  
8             Economics from the University of Missouri at Columbia. I have been employed as a  
9             regulatory economist with the Office of Public Counsel (OPC) since March 1997.

10      **Q.     HAVE YOU TESTIFIED PREVIOUSLY BEFORE THIS COMMISSION?**

11      A.     Yes.

12      **Q.     WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

13      A.     I will present OPC's Class Cost of Service (COS) Study and the basis for OPC's rate  
14             design recommendations for this case. My testimony will describe how the Class COS

Direct Testimony of  
Hong Hu

1 results were derived and explain the rationale behind OPC's rate design  
2 recommendations.

3 **I. CLASS COST OF SERVICE STUDY**

4 **Q. PLEASE OUTLINE THE BASIC ELEMENTS OF THE CLASS COS STUDY THAT YOU**  
5 **PERFORMED FOR THIS CASE.**

6 A. The main purpose of a Class COS Study is to provide an estimate of the cost of providing  
7 service to each of the customer classes to be used as a basis for setting rates to the extent  
8 allowed by other rate design goals of the Commission. The three primary steps that must  
9 be taken in order to perform a Class COS Study are functionalization, classification, and  
10 allocation of costs.

11 Functionalization of costs involves categorizing accounts by the type of function with  
12 which an account is associated. Accounts are categorized as being related to Production,  
13 Transmission, Distribution, Customer Accounts, Administrative and General, etc.,  
14 depending on the Local Distribution Company (LDC) functions of which they are a part.  
15 The FERC system of accounts is the starting point in functionalizing accounts since it  
16 already has most accounts grouped by functional area.

17 Once costs have been functionalized, they are classified as being customer (related to the  
18 number of customers), demand (related to the class portion of peak usage), commodity  
19 (related to annual throughput), or "other" related, depending on the classification with  
20 which they are most closely associated. For example, meter, regulator, and service line  
21 expenses are considered customer-related, since a certain amount of meter, regulator, and  
22 service line expense will be incurred solely for hooking a customer up to the LDC.

**Direct Testimony of  
Hong Hu**

1 Finally, after classifying costs, the analyst chooses allocation factors that will distribute a  
2 fair share of jurisdictional costs to each customer class. Allocation factors are based on  
3 ratios that reflect the proportion of total units (total number of customers, total annual  
4 throughput, etc.) attributable to a certain customer class. These ratios are then used to  
5 calculate the proportions of various cost categories for which a class is responsible.

6 **Q. WHICH CUSTOMER CLASSES HAVE YOU USED?**

7 A. I have used the following customer rate classes: Residential General Service  
8 (Residential), Commercial and Industrial General Service (C&I), Large Volume (LV),  
9 Interruptible, Firm Sales and Transportation (Firm), Basic Sales and Transportation  
10 (Basic), L.P. Gas (LP) and Unmetered Gas Lights (UMGL).

11 **Q. ON WHAT DATA IS YOUR CLASS COS STUDY BASED?**

12 A. The Missouri Public Service Commission Staff (Staff) Accounting Schedules that were  
13 filed with the Staff's non-rate design testimony on June 29, 1999 were the source of most  
14 of the financial data that I utilized in my COS study. This data is from the year ending  
15 December 31, 1998 and updated through March 31, 1999. Most of the billing  
16 determinant information that I utilized was also provided by the Commission Staff. I  
17 have also utilized data received from Laclede in response to OPC Data Requests. My use  
18 of this information should not be viewed as an endorsement of either Staff's or Laclede's  
19 methods for calculating accounting costs or billing determinants. I have used this  
20 information because it was readily available and contains the level of detail necessary to  
21 perform a COS study.

Direct Testimony of  
Hong Hu

1       **Q.     PLEASE DISCUSS THE METHODS THAT YOU USED TO ALLOCATE FUNCTIONALIZED**  
2       **COSTS.   FIRST, HOW DID YOU ALLOCATE PLANT AND EXPENSE ACCOUNTS**  
3       **ASSOCIATED WITH MANUFACTURED GAS AND GAS STORAGE FACILITIES?**

4       A.     I allocated gas production costs on the basis of estimated peak day coincident sales  
5       demand since manufactured gas facilities are used primarily during periods of peak  
6       system demand. Gas storage costs were allocated on the basis of weather normalized  
7       winter sales volumes. LP gas customers do not benefit from either manufactured gas or  
8       gas storage facilities so none of these costs were allocated to them.

9       **Q.     HOW DID YOU ALLOCATE UNSUCCESSFUL EXPLORATION AND DEVELOPMENT**  
10       **(E & D) COSTS AND OTHER UTILITY PLANT (ACCOUNTS 338 AND 118.3)?**

11       A     Since the amounts in these accounts arise from Laclede's E & D efforts to reduce per unit  
12       gas costs, I allocated both of them on a commodity basis (annual gas sales).

13       **Q.     PLEASE DESCRIBE HOW OPC ALLOCATED TRANSMISSION PLANT.**

14       A.     Transmission plant was allocated to all classes except for LP Gas based on the modified  
15       relative system utilization method (RSUM) allocator. This allocator is developed on the  
16       basis of weather-normalized class monthly peak day demands. The underlying data is  
17       provided by the Staff. I have chosen to use the allocator that was developed by former  
18       OPC engineer Barry Hall in Case No. GR-98-374 since the Staff has indicated that the  
19       peak demand data underlying the Mr. Hall's allocator has not been updated. The result is  
20       shown in Schedule DIR HH-1. I have also included a separate section in this testimony  
21       to explain the rationale of this method.

Direct Testimony of  
Hong Hu

**Q. HOW WERE LAND AND LAND RIGHTS, STRUCTURES AND IMPROVEMENTS, AND  
MAINS PLANT (ACCOUNTS 374, 375, AND 376) ALLOCATED?**

A. The Distribution mains account was allocated to all classes except for LP Gas based on the modified RSUM allocator. Unlike transmission mains that are considered to be shared by all customer classes other than the LP class, for the distribution mains, a reasonable distinction can be drawn between mains which serve predominately the smaller usage customers and those mains which serve all customer classes in common. Based on Mr. Hall's study of Laclede trended costs from the prior Laclede case, GR-96-193, I have apportioned a percentage of the costs based on main diameter (mains 2" or less in diameter which accounted for almost 60% of the total length) to be used only by those smaller usage customers, namely residential and C&I general service customers. Thus about 27% of the costs are split between these two customer classes based on each class' RSUM allocator. The remaining 73% of costs is split between all the customer classes according to the RSUM allocators. The results of this allocation methodology are shown in Schedule DIR HH-1.

The costs associated with the land and land rights account and the structures and improvements account are mains-related costs and thus are allocated on the same basis as the mains account.

**Q. HOW DID YOU ALLOCATE ACCOUNTS 380 THROUGH 383 (SERVICES, METERS, AND  
REGULATORS)?**

A. Service lines, meters and regulators are generally classified as customer related cost since additional cost in these accounts is incurred with the addition of every customer. However, since larger customers generally use larger and more costly services, meters and regulators, a weighted customer allocation rather than a simple customer allocation is

Direct Testimony of  
Hong Hu

1 appropriate. The weight should reflect different unit costs of services, meters and  
2 regulators, different lengths of service lines, and different numbers of meters or service  
3 lines each customer uses for different customer classes. To develop the appropriate  
4 weight, I have utilized a sample that the Company prepared pursuant to the Stipulation  
5 and Agreement reached in Case No. GR-94-220. The allocators developed based upon  
6 this sample are shown at Schedule DIR HH-2.

7 **Q. PLEASE DESCRIBE THE ALLOCATORS THAT YOU APPLIED TO THE REMAINING**  
8 **DISTRIBUTION ACCOUNTS.**

9 A. I used total annual throughput to allocate Measuring and Regulating Station Equipment  
10 (Accounts 378 and 379). I allocated Other Equipment (Account 387) based on the  
11 allocation of all other previously allocated distribution plant.

12 **Q. HOW DID YOU ALLOCATE GENERAL PLANT?**

13 A. All General Plant accounts were allocated on the basis of each class' proportion of total  
14 non-general net plant.

15 **Q. LET'S TURN NOW TO THE ALLOCATION OF OPERATION AND MAINTENANCE**  
16 **EXPENSES. HOW DID YOU ALLOCATE GAS DISTRIBUTION EXPENSES?**

17 A. I used the "expenses follow plant principle" for allocating most of the accounts in this  
18 category. For example, the allocator that I applied to Mains plant (Account 376) was also  
19 applied to Mains maintenance (Account 887).

Direct Testimony of  
Hong Hu

**Q. HOW DID YOU ALLOCATE METER READING EXPENSES?**

A. I used an allocator based on a weighted customer allocator that the Staff developed. The weights developed were 3.42 for Small General Service and 9.04 for all the other large customers.

**Q. HOW WERE CUSTOMER SERVICE AND SALES PROMOTION EXPENSES ALLOCATED?**

A. Customer Service accounts were allocated on the basis of unweighted customer numbers and Sales Promotion expenses were allocated based on my COS allocator. I chose to use the COS allocator for Sales Promotion expenses since these costs are incurred for the purpose of lowering the average margin cost (by increasing sales) of providing service to customers in each of the customer classes. The amount by which customers in each class benefit from a lower average cost will be proportional to the share of overall costs of service per customer that they are responsible for incurring.

**Q. HOW DID YOU ALLOCATE ADMINISTRATIVE AND GENERAL (A & G) EXPENSES?**

A. I divided these expenses into three categories. I allocated Property Insurance expense (Account 924) on the basis of net plant since this expense is linked to the amount of plant that the Company requires in order to serve each customer class. Injuries and Damages and Employee Pensions and Benefits (Accounts 925 and 926) are both payroll related expenses so they were allocated on the basis of the amount of payroll expense that I had previously allocated to each class. I believe all of the remaining A & G accounts represent expenditures that support the Company's overall operation, so I have allocated them on the basis of each class's share of total Company COS.

Direct Testimony of  
Hong Hu

**Q. HOW DID YOU ALLOCATE PROPERTY AND PAYROLL TAXES?**

A. Property taxes were allocated on the basis of the amount of total plant that I had previously allocated to each class. Payroll taxes were allocated on the basis of the amount of payroll expenses that I had previously allocated to each class.

**Q. HOW DID YOU ALLOCATE STATE AND FEDERAL INCOME TAXES?**

A. These taxes are allocated on the basis of rate base since a utility company's income taxes are a function of the size of its rate base, and thus a class should contribute revenues for income taxes in accordance with the proportion of rate base that is necessary to serve it.

**II. ALLOCATION OF MAINS COST - THE MODIFIED RELATIVE SYSTEM**

**UTILIZATION METHOD**

**Q. WHAT ARE THE CHARACTERISTICS OF MAINS COST?**

A. First, mains cost is a shared cost. The Company's investment in mains provides the Company with the means to deliver the gas to its customers' locations in response to customers' year-round demands for natural gas. All customers benefit from the existence of mains on every day that they use gas.

The second characteristics of mains cost is the presence of economies of scale. According to various flow formulas, a 4" pipe has a flow capacity of about 6 times of that of a 2" pipe. On the other hand, the per foot cost to install the 4" pipe may be less than 2 times of the cost to install the 2" pipe. This means that cost of the incremental capacity needed to serve the peak is less than the average cost of capacity.

Direct Testimony of  
Hong Hu

**Q. PLEASE COMMENT ON TRADITIONAL MAIN ALLOCATION METHODS.**

A. There are a wide variety of alternative methods for allocating and determining capacity cost such as mains cost and they produce drastically different cost assignments to different customer classes. A method that is commonly used by industrial users is to allocate the main costs on coincident or noncoincident peak demand. This method fails to reflect the fact that the utility system is built to satisfy the customers' daily demand for gas, not only the demand on the peak day. A clear example of the shortcoming of a peak demand allocation is that no cost will be allocated to the interruptible class because theoretically they would be off the system during the peak period. In other words, these interruptible customers would be receiving a "free ride" to use the system without paying a fair share of costs.

Another commonly used method is called the average and peak demand (A&P) method. This method attempts to account for the energy supply needs of the company in addition to the capacity needs. Total mains cost are multiplied by the system's load factor to arrive at the capacity costs attributed to average use and these capacity costs are apportioned to the various customer classes on an annual energy usage basis. The rest of the costs are considered to have been incurred to meet the individual peak demands of the various classes of service.

Both peak demand methods and the A&P method allocate too much cost to peak users because they fail to consider economies of scale.

**Q. PLEASE EXPLAIN THE MODIFIED RELATIVE SYSTEM UTILIZATION METHOD.**

A. The RSUM method was developed by Charles Laderoute at the 1988 NARUC Biennial Regulatory Information Conference and modified by former OPC economist Philip Thompson at the 1992 NARUC Biennial Regulatory Information Conference. The

Direct Testimony of  
Hong Hu

1 modified RSUM method attempts to account for both economies of scale and the fact that  
2 all users who receive benefits from the system should share its cost. The basic idea is to  
3 identify the portion of capacity that is corresponding to each month's demand, and  
4 allocate the corresponding cost to customers who use gas in the month that this portion of  
5 the system is used. For example, if 75% of capacity is used in 12 months of the year and  
6 80% of capacity is used in 11 months, the extra 5% of capacity is not utilized in, say,  
7 July, then the cost corresponding to 75% of capacity is allocated to every month, and  
8 customers who use gas in every month but July will also receive a share of the cost that is  
9 corresponding to the additional 5% capacity.

10 **Q. PLEASE PROVIDE A STEP BY STEP DESCRIPTION OF THE MODIFIED RELATIVE SYSTEM**  
11 **UTILIZATION METHOD.**

12 A. Please refer to Schedule DIR HH-3.1. The first column of this schedule contains the sum  
13 of weather-normalized monthly peak day demands for all customer classes sorted in  
14 descending order. This information was provided by Staff witness Beck in Case No.  
15 GR-98-374.

16 In the next column (Months % of Annual Peak) the peak day demands are converted to  
17 percentages of the maximum monthly peak day demand. For instance, the month having  
18 the second highest peak day demand has a peak that is 91.34% of the maximum peak day  
19 demand. Another way of stating this is that there is an 8.66% increment of demand  
20 separating the two months.

21 In the third column, the percentages of peak day are converted to percentages of total  
22 capacity costs by raising the capacity percentages to the  $r$ th power. The factor  $r$  is a  
23 measurement of the degree of the economies of scale. There will be no economies of  
24 scale if  $r$  equals to 1. Here, Mr. Hall chose  $r$  to be 0.3 per his research. Considering the

Direct Testimony of  
Hong Hu

1 second and third columns it is easy to state what is indicated by the mathematical  
2 relationship here. The first 11.50% of capacity requires an expenditure of more than 52%  
3 of the costs of the system, i.e. there are substantial fixed costs involved. Likewise,  
4 50.19% or approximately half of the capacity requires over 81% of the total costs to  
5 supply. Conversely, adding roughly the last 50% of the capacity accounts for less than  
6 20% of the costs.

7 The fourth column simply calculates successive differences in percentages of costs from  
8 the third column. The top figure is the difference in percentage costs incurred to supply  
9 the additional capacity in moving from the second highest monthly peak to the maximum  
10 monthly peak day demand. The second figure in this column is the same difference, only  
11 moving from the third highest monthly peak to the second highest monthly peak.

12 The adjacent column depicts the number of months over which that cost increment  
13 should be spread. The first (highest or top increment) cost increment, occurring only on  
14 the peak day of one month is only spread to that month. The next increment of  
15 cost/capacity is utilized for two months. The last or base increment is utilized in all the  
16 months. Each cost increment is divided by the number of months in which the  
17 corresponding capacity increment is utilized.

18 In the last column partial sums are formed for the cost increments utilized in each month.  
19 For instance, the peak month sums all the increments of costs in the previous column,  
20 since all increments of capacity are used in that month. The next partial sum for the next  
21 lowest month omits the top cost increment in its sum and so on. The result is the  
22 percentage of capacity costs attributable to each month.

23 Refer to Schedule DIR HH-3.2. The top block of numbers is the class peak day demands  
24 by month. In the block below, class peaks have been converted to percentages of the sum  
25 of peak day demands for all the classes each month.

Direct Testimony of  
Hong Hu

Summing the product of the class share of monthly peaks on Schedule DIR HH-3.2 and the portion of total capacity costs in each month in the last column on Schedule DIR HH-3.1 gives the RSUM allocators at the bottom of Schedule DIR HH-3.2. These are allocators that are applicable to the 'common' portion of the distribution mains.

**III. CLASS COST OF SERVICE STUDY RESULTS**

**Q. PLEASE DESCRIBE THE RESULTS OF OPC'S CLASS COS STUDY.**

A. Schedule DIR HH-4 shows the results of OPC's Class COS Study which was based on the assumption that total company revenues remain constant. It is important to note that all of the numbers appearing in this testimony's tables and the attached schedules are in thousands (e.g. \$10,000 in testimony tables is actually \$10,000,000.) The fourth line from the bottom of this schedule (line number 37) shows the percentage by which margin rate revenues in each class would have to change in order to make all customer class rates of return equal to the Company's overall rate of return. The fifth line from the bottom of this schedule (line number 36) shows the revenue shifts that would be needed to equalize class rates of return. The information from lines 36 and 37 of Schedule 1 is summarized below in Table 1 for the reader's convenience.

**Table 1 – COS Indicated Class Revenue Shifts (000)**

|              | Residential | Com. &<br>Ind. | Large<br>Volume | Inter-<br>ruptible | Firm  | Basic  | LP    | UMGL   |
|--------------|-------------|----------------|-----------------|--------------------|-------|--------|-------|--------|
| Class Shifts | (15,874)    | 13,428         | 1,183           | 175                | 326   | 758    | 2     | 1      |
| % Change     | -9.81%      | 42.57%         | 47.66%          | 56.28%             | 9.81% | 14.21% | 5.06% | 16.08% |

Direct Testimony of  
Hong Hu

As line 19 on Schedule DIR HH-4 indicates, the margin rate level for the Residential class is currently producing returns that exceed the total company return. Conversely, the Commercial and Industrial GS, Large Volume, Interruptible, Firm, and Basic classes are currently producing a return below the level of the total company return. The results that my study shows for UMGL, LP, and to a lesser extent for Interruptible, should be interpreted with caution since these classes are very small. This class rate of return information is summarized below in Table 2.

Table 2 – COS Indicated Customer Class Returns

|         | Residential | Com. &<br>Ind. | Large<br>Volume | Inter-<br>ruptible | Firm  | Basic | LP    | UMGL  |
|---------|-------------|----------------|-----------------|--------------------|-------|-------|-------|-------|
| Returns | 13.22%      | -3.03%         | -2.77%          | -3.69%             | 5.61% | 4.35% | 6.75% | 4.17% |

I will furnish the more detailed workpapers that support OPC's COS study to any party requesting them.

**Q. HOW WOULD YOU CHARACTERIZE THE REVENUE DEFICIENCIES THAT ARE INDICATED BY OPC'S STUDY FOR THE COMMERCIAL AND INDUSTRIAL GENERAL SERVICE, LARGE VOLUME, INTERRUPTIBLE CLASSES?**

A. I would characterize these revenue deficiencies as very significant relative to each classes' total cost of service (revenue requirement). Table 1 shows that the rate levels for these classes are well below the level required to recover the costs associated with serving these classes.

**IV. RATE DESIGN RECOMMENDATIONS**

**Q. WHAT IS THE RELATIVE IMPORTANCE OF CLASS COS STUDY RESULTS IN RATE DESIGN?**

A. I believe that even the most meticulously conducted COS study, based on accurate and thorough data, requires judgment and involves arbitrary allocations of numerous common costs or shared costs, so that the results of such studies are, at best, imprecise and may vary substantially from reality. Given this inherent imprecision, plus any imprecision brought about by the possible inaccuracy and unavailability of data, COS study results should be used only as a general guide for the allocation of costs among customer classes and the design of rates. The Commission should decide a rate design that reflects both the underlying cost structure of a LDC and the considerations of affordability, rate impact and rate continuity.

**Q. WHAT RATE DESIGN CHANGES IS OPC PROPOSING BASED ON THE REVENUE SHIFTS NEEDED TO EQUALIZE CLASS RATES OF RETURN INDICATED IN TABLE 1?**

A. OPC recommends that the Commission adopt a rate design that balances movement towards cost of service with rate impact and affordability considerations. To reach this balance, OPC believes that the Commission should impose, at a maximum, revenue shifts equal to one half of the revenue neutral shifts indicated by OPC's CCOS study.

**Q. WHAT REVENUE NEUTRAL CLASS REVENUE SHIFTS IS OPC RECOMMENDING IN THIS CASE?**

A. These shifts are shown in lines 39 and 40 of Schedule DIR HH-4 and have also been summarized below in table 3.

Table 3 – OPC Recommended Class Revenue Shifts (000)

|              | Residential | Com. &<br>Ind. | Large<br>Volume | Inter-<br>ruptible | Firm  | Basic | LP    | UMGL  |
|--------------|-------------|----------------|-----------------|--------------------|-------|-------|-------|-------|
| Class Shifts | (7,937)     | 6,714          | 591             | 88                 | 163   | 379   | 1     | 1     |
| % Change     | -4.90%      | 21.28%         | 23.83%          | 28.14%             | 4.90% | 7.11% | 2.53% | 8.04% |

**Q. PLEASE DESCRIBE THE INFORMATION CONTAINED IN SCHEDULE DIR HH-5 AND EXPLAIN HOW IT WAS CALCULATED.**

A. Schedule DIR HH-5 shows the combined impact of spreading the various potential revenue requirement increase or reduction amounts to customer classes and the revenue neutral class revenue shifts recommended by OPC. Lines 14 through 19 of this Schedule show how the different revenue requirement increases or reduction have been spread to the various customer classes. The spread of these revenue requirement increase or reduction amounts are based on the percentages that appear in line 12 of Schedule DIR HH-5.

**Q. HOW WERE THE RECOMMENDED REVENUE PERCENTAGES IN LINE 12 OF SCHEDULE DIR HH-5 CALCULATED?**

A. These percentages were calculated by taking the recommended revenue neutral shifts that appear in line 10 of Schedule DIR HH-5 (also in line 39 of Schedule DIR HH-4) and adding them to total current class revenues (line 12 of Schedule DIR HH-4). This percentage is equal to the ratio of the sum of these two amounts to the amount of total company non-gas revenues (see line 12 of Schedule DIR HH-4).

Direct Testimony of  
Hong Hu

1 **Q. PLEASE EXPLAIN HOW THE COMBINED IMPACT AMOUNTS THAT APPEAR IN LINES 21**  
2 **THROUGH 26 OF SCHEDULE DIR HH-5 WERE CALCULATED.**

3 A. For various revenue requirement increase levels, the combined impact was derived by  
4 adding each classes' share of the overall revenue requirement increase to the revenue  
5 neutral shifts that OPC has recommended for each class. For example, under the  
6 residential column in line 16, we see the \$11,261 (actually \$11,261,000) that results from  
7 spreading a revenue requirement increase of \$15,000,000 to the residential class. This  
8 \$11,261 amount is then added to the negative \$7,937 revenue neutral shift amount for the  
9 residential class that appears in line 10. The sum of these two amounts, \$3,324, appears  
10 in line 23 under the residential column and represents OPC's recommendation (prior to  
11 adjustment for rate impact considerations) for the combined impact of revenue neutral  
12 shifts and share of overall revenue requirement increase that should be reflected in rates  
13 resulting from this case if the overall revenue requirement is increased by \$15 million.

14 **Q. PLEASE EXPLAIN HOW THE COMBINED IMPACT AMOUNTS THAT APPEAR IN LINES 35**  
15 **THROUGH 47 OF SCHEDULE DIR HH-5 WERE CALCULATED.**

16 A. Based on rate impact and equity considerations, I believe that no customer class should  
17 receive a net class rate revenue increase when there is an overall revenue requirement  
18 reduction and no customer class should receive a net class revenue decrease when there is  
19 an overall revenue requirement increase. The combined impact of revenue  
20 increase/decrease and OPC's revenue neutral shift numbers are thus adjusted further to  
21 reflect this consideration. For example, for the \$10 million reduction case, line 26 of  
22 Schedule DIR HH-5 shows that the spread of the overall revenue reduction to C&I, LV,  
23 Interruptible, and Basic is too small to offset the revenue neutral shift thus they end up  
24 with a net increase. In this case I recommend: (1) keeping the current class rate revenue  
25 requirement for these classes unchanged; (2) giving the Firm class and LP class their

Direct Testimony of  
Hong Hu

1 share of the reduction (\$7,000 and \$1,000, respectively); and (3) reducing the reduction  
2 in the residential class rate revenue by an amount equals to the sum of net increases for  
3 C&I, LV, Interruptible, and Basic classes that were eliminated. Lines 42 though 47  
4 showed the revenue percentage results for each case.

5 **Q. YOU JUST NOTED THAT RATE IMPACT AND EQUITY CONSIDERATIONS SHOULD BE**  
6 **TAKEN INTO ACCOUNT IN DETERMINING ANY APPROPRIATE INTERCLASS REVENUE**  
7 **SHIFTS THAT WOULD BE PART OF THE RATE DESIGN RESULTING FROM THIS CASE.**  
8 **PLEASE EXPLAIN HOW THIS CONSIDERATION SHOULD BE APPLIED.**

9 A. As I pointed out earlier in this testimony, OPC's class COS study in this docket  
10 demonstrates that there are some significant interclass subsidies incorporated in the  
11 Company's rate design. In other words, the class revenues that are being collected from  
12 each of the classes as a result of the currently tariffed margin rates are causing certain  
13 classes to make payments for service that greatly exceed the cost of the service that is  
14 being provided to them. For the most part, OPC's results are not showing anything  
15 significantly different than OPC's class COS study showed in the most recent Laclede  
16 rate case, GR-98-374.

17 There is, however, one significant difference between the studies that OPC has performed  
18 for both this case and GR-98-374 and the current rate structure. That difference is the  
19 separation of the GS class into a Residential portion and a Commercial and Industrial  
20 portion. This separation is long overdue, especially in light of the intra-class subsidies  
21 that have been revealed by OPC's study.

22 OPC has recommended that the Commission adopt a rate design that only goes, at most,  
23 half-way towards our study results, due to rate impact, equity, and affordability  
24 considerations. The Commission could reasonably determine that even going half-way

Direct Testimony of  
Hong Hu

1           towards OPC's study results is too big of a jump to make in one step due to these same  
2           considerations.

3           **Q.   PLEASE SUMMARIZE OPC'S RATE DESIGN RECOMMENDATION FOR THE CLASS**  
4           **REVENUE REQUIREMENTS THAT SHOULD RESULT FROM ANY INCREASE OR REDUCTION**  
5           **IN OVERALL REVENUE REQUIREMENT THAT THE COMMISSION DETERMINES TO BE**  
6           **REASONABLE IN THIS CASE.**

7           A.   In this testimony, OPC has proposed and illustrated the application of a method for  
8           increasing or decreasing class revenue requirements to go along with any increase or  
9           reduction in the overall revenue requirement. This method could be utilized to calculate  
10          class revenue requirements for any level of overall revenue requirement increase or  
11          reduction that is ultimately decided in this case. Schedule DIR HH-5 shows the result of  
12          applying OPC's recommended method for determining class revenue requirements to a  
13          range of potential revenue requirement increase levels. OPC could supply similar  
14          calculations to the Commission for any other amounts of change in the overall revenue  
15          requirement if requested to do so.

16          **Q.   DID YOU PERFORM ANY ANALYSIS TO SEE IF LACLEDE'S PROPOSED RESIDENTIAL**  
17          **CUSTOMER CHARGE INCREASE IS JUSTIFIED BASED ON THE CUSTOMER-RELATED**  
18          **COSTS THAT ARE ATTRIBUTABLE TO THE RESIDENTIAL CLASS?**

19          A.   Yes, my analysis showed that the customer-related cost, which is one of the factors  
20          considered in the determination of a customer charge level, is \$6.30. My customer-  
21          related cost calculation was based on the assumption that Laclede's costs are accurately  
22          reflected in the accounting schedules contained in the Staff's direct testimony filing.

Direct Testimony of  
Hong Hu

1     **Q.   WHAT CATEGORIES OF COSTS ARE INCLUDED IN YOUR CUSTOMER CHARGE**  
2     **ANALYSIS?**

3     A.   I have included costs that are related to services, meters, regulators, and customer  
4     accounts expenses. The costs associated with services, meters, and regulators include the  
5     return on rate base for the relevant plant accounts, distribution operation and maintenance  
6     expenses associated with services, meters, and regulators, plus the depreciation expense  
7     associated with services, meters, and regulators.

8     **Q.   WHAT IS OPC'S PROPOSAL FOR THE CUSTOMER CHARGE FOR RESIDENTIAL**  
9     **CUSTOMERS?**

10    A.   OPC recommends decreasing the residential customer charge from its current level of  
11    \$12.00 to \$8.50. Reducing Laclede's residential customer charge to this level would put  
12    this charge more in line with the residential customer charges of other Missouri LDCs.  
13    Laclede's residential customer charge is currently the highest for any Missouri LDC and  
14    may be one of the highest in the nation. The rest of residential class rate revenue  
15    requirement should be recovered from the commodity charge. We are not making any  
16    recommendations at this time regarding rate components for the other customer classes.

Direct Testimony of  
Hong Hu

1       **Q.     BASED ON THE INTRA-CLASS SUBSIDIES REVEALED BY YOUR CLASS COS STUDY IN**  
2       **THIS CASE WHERE YOU SEPARATED THE RESIDENTIAL CUSTOMERS FROM THE REST**  
3       **OF THE GS CUSTOMERS, DO YOU BELIEVE IT IS POSSIBLE TO HAVE A COST STUDY ON**  
4       **WHICH INFORMED RATE DESIGN RECOMMEDATIONS CAN BE MADE FOR LACLEDE'S**  
5       **RESIDENTIAL CUSTOMERS WITHOUT TREATING RESIDENTIAL CUSTOMERS AS A**  
6       **SEPARATE CLASS?**

7       A.     Definitely not. My experience from treating residential customers as a totally separate  
8       class in the class COS study that I performed for this case leads me to believe that any  
9       Residential rate design recommendations that are made without the important information  
10      provided by a class COS study that treats residential customers as a totally separate class  
11      should be treated with great skepticism.

12      **Q.     DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

13      A.     Yes.

| Main Diameter | Trended Costs   | Lower Usage Customers<br>(Residential & Gen C&I) |

## Notes:

1 Each months percentage of annual peak is raised to the  $r$ th power to convert successive monthly increments of capacity to increments of costs.
