1		DIRECT TESTIMONY
2		OF
3		CHARLES D. NASLUND
4		CASE NO. ER-2007-0002
5		I. <u>INTRODUCTION</u>
6	Q.	Please state your name and business address.
7	А.	Charles D. Naslund, Ameren Services Company ("Ameren Services"), One
8	Ameren Plaz	za, 1901 Chouteau Avenue, St. Louis, Missouri 63103.
9	Q.	What is your position with Ameren Services?
10	А.	I am Senior Vice President and Chief Nuclear Officer.
11	Q.	What is Ameren Services?
12	А.	Ameren Services provides various corporate, administrative and technical
13	support servi	ices for Ameren Corporation ("Ameren") and its affiliates, including Union
14	Electric Con	npany d/b/a AmerenUE ("Company" or "AmerenUE"). Because AmerenUE is
15	the only Am	eren company owning or operating a nuclear power plant, all of Ameren
16	Services' act	ivities relating to nuclear generation are provided to AmerenUE.
17	Q.	Please describe your educational background and employment
18	experience.	
19	А.	I earned a bachelor's degree in Electrical Engineering in 1974 from the
20	University of	f Missouri-Rolla and have completed 27 of 30 hours toward a master's degree in
21	Civil Engine	ering Construction Management at the University of Missouri – Columbia.
22		I began my career at Union Electric Company in December 1974 as an
23	assistant eng	ineer in substation design. In February 1976 I became Construction Supervisor

1	for the new Callaway Nuclear Power Plant ("Callaway Plant"), working at the Callaway
2	Plant at the time of its groundbreaking. In 1980, I was promoted to Supervising Engineer
3	Start-up and I became Superintendent of Start-up in 1983. After the nuclear core of the
4	Callaway Plant was loaded in June 1984, I became the Superintendent of Instrument &
5	Controls. Over the next thirteen years, I held the following additional positions at the
6	Callaway Plant: Manager of Operations Support, 1986 to 1991; Manager of Nuclear
7	Engineering, 1991 to 1998; and Assistant Vice-President of Power Operations, July 1998 to
8	January 1999. From 1999 to September 2004, I was in charge of the fossil and hydroelectric
9	generating fleet for AmerenUE. In September 2004, I returned to Callaway Plant as Vice-
10	President, Nuclear Operations, and in December 2004 I was promoted to Senior Vice-
11	President and Chief Nuclear Officer.
12	II. <u>PURPOSE AND SUMMARY OF TESTIMONY</u>
12 13	II.PURPOSE AND SUMMARY OF TESTIMONYQ.What is the purpose of your testimony in this proceeding?
13	Q. What is the purpose of your testimony in this proceeding?
13 14	Q. What is the purpose of your testimony in this proceeding?A. The purpose of my testimony is to: (a) provide a background of the Callaway
13 14 15	 Q. What is the purpose of your testimony in this proceeding? A. The purpose of my testimony is to: (a) provide a background of the Callaway Nuclear Plant's performance and its importance to Missouri; (b) discuss the substantial

1 the Company should seek to relicense the Callaway Plant. Attachment A is an Executive

- 2 Summary of my testimony.
- 3

III. **BACKGROUND OF CALLAWAY'S PERFORMANCE**

4 5 Q. Please briefly describe the Callaway Plant.

The Callaway Plant is a 1,292 megawatt ("MW") nuclear plant located in A.

6 Callaway County, Missouri. In 2005, the Callaway Plant was the third largest power

7 producer on the Ameren system, accounting for 10.3 percent of AmerenUE's total

8 generation. Only the coal-fired Labadie and Rush Island plants produced more power than

9 Callaway. Callaway's 2005 net generation of 8 million megawatt-hours ("MWh") was

10 enough to supply all the electricity needs of more than 656,000 homes.

11

12

Q. How has production from the Callaway Plant compared with production at other nuclear plants?

- 13 Callaway's production has exceeded that of most other nuclear units. Since A. beginning operation in 1984, Callaway has achieved the sixth highest lifetime generation 14 15 among the 103 nuclear power plants operating in the U.S. (188,831,745 MWh through 2005). Callaway's lifetime generation through 2005 also ranked 22nd in the world, out of 443 16 17 nuclear plants operating in 30 countries.
- 18

How has the operation of the Callaway Plant impacted the economy in **Q**. 19 **Central Missouri?**

20 Callaway is a major factor in both the state and local economy. More than A. 21 1,000 AmerenUE employees and contractors work there full time, with a total annual payroll 22 of \$81 million. During refueling outages which occur every 18 months, hundreds of 23 additional workers are usually brought in for several weeks—providing a significant boost to

1	the local economy. The Callaway Plant is a major source of tax revenue to fund education
2	and other critical services. In 2005, the plant accounted for \$9.5 million of AmerenUE's
3	property taxes paid to Callaway County, with \$6.5 million of that amount going to local
4	schools. In addition, assessed values based on AmerenUE's investment in the plant resulted
5	in another \$20.9 million in taxes shared by the remaining 68 counties in AmerenUE's
6	Missouri service area.
7	IV. MAJOR CAPITAL ADDITIONS
8	Q. Please summarize the capital additions made to the Callaway Plant since
9	2001.
10	A. Significant major component replacements have been made to the Callaway
11	Plant since 2001, including the 2005 replacement of the plant's four steam generatorsthe
12	giant boilers that produce steam for generating electricity. In addition, in 2005 AmerenUE
13	replaced one high pressure and three low pressure turbines and their associated casings and
14	diaphragms. Turbines are the components of the plant which spin with steam pressure to
15	operate the generators. Finally, the Company replaced the main feedwater isolation valve
16	actuators, and installed new distributed control systems. In the area of plant security
17	infrastructure, the Company installed a number of new security barriers, devices and systems
18	required to meet federal guidelines. In total, the Company made \$449,677,723 in capital
19	additions to the Callaway Plant over approximately the past 5 years. Schedule CDN-1
20	summarizes each of these additions and their associated costs.
21	Q. Please explain some of the key drivers that necessitated the nearly \$450
22	million of capital additions at the Callaway Plant over this period.

Q.

Q.

A. From a general perspective, each of these additions to the Callaway Plant was necessary to ensure that Callaway remains a reliable source of power for AmerenUE and its Missouri ratepayers. The Callaway Plant has now been in operation for more than 20 years. Many of its components are at end of their useful lives and/or have become obsolete due to the unavailability of replacement parts necessary to perform proper maintenance on them.

6

Are there more specific drivers?

7 Yes. Several components were fabricated almost 30 years ago from "alloy A. 8 600" materials. "Alloy 600" is a special type of stainless steel metal used to fabricate steam 9 generator tubing, piping and as a weld filler metal for many of the welds made in Callaway's 10 reactor coolant system. In the 1970's when Callaway was being designed and components 11 fabricated, alloy 600 was the best alloy available for the required temperature and pressure 12 operating conditions. It is now known that alloy 600 materials were not able to withstand the 13 operating temperature and pressure they were subjected to in a nuclear power plant, over the periods for which they were designed. As a result, the alloy 600 materials have failed 14 15 prematurely. Among other consequences, the premature failure of the alloy 600 materials 16 necessitated the replacement of all four of the Callaway Plant's steam generators.

17

What materials were used to replace the alloy 600 materials?

A. In designing the new components, including the new steam generators, AmerenUE selected state-of-the-art materials that we expect to last for the remaining life of the plant. For the new steam generator tubing, alloy 690, a more durable stainless steel alloy was utilized. In addition, AmerenUE utilized modern design technologies to increase the efficiency of the components. This allowed the Company to improve both durability and plant output.

Q.

1

Q. What was involved in replacing the Callaway steam generators?

2 Replacing the steam generators was no small task, because each one is about A. 3 70 feet tall and 17 feet in diameter, and weighs about 400 tons. The new steam generators 4 were manufactured in France and contain tubing from Sweden. They feature improved 5 technology that has proven to be more efficient and durable than the original units. The 6 improved efficiency of the new steam generators, combined with turbine upgrades that were 7 also performed during the 2005 outage, increased Callaway's net generating capacity by 60 8 MW. The cost of the steam generator replacement and turbine upgrade projects was 9 approximately \$200 million.

10

Please address the increase in plant output more specifically.

A. As a byproduct of replacing the newly designed steam generators, turbines and actuators in 2005, the Company was able to increase the output of the Callaway Plant from 1,232 MW gross to 1,292 MW, or a 60 MW output increase. This increase in plant output further assists the Company in serving its growing loads with a low-cost supply of energy.

Q. Was the Company successful in completing its replacement projects in 2005?

A. Yes. In 2005, Callaway set a new world record for the shortest time it took to replace four steam generators. Callaway's replacement time of 63 days and 13 hours was more than a day shorter than the previous record of 64 days and 17 hours set by the South Texas Project in 2002.

The entire 2005 outage was completed on time, under budget, and with no lost-time accidents among either Ameren employees or contractors. This was the most

complex and challenging outage since construction, because it included replacement of all 1 2 four steam generators as well as replacement of all four turbines. The plant shut down 3 September 17 and returned to service on November 19. 4 As in past refueling outages, which occur approximately every 18 months, 5 thousands of maintenance activities, modifications, inspections and tests were performed 6 throughout the plant to ensure top safety and reliability until the next refueling. About 3,000 7 people worked on the project, including more than 2,000 contractors and Ameren employees 8 from other locations who joined the plant's regular staff to help handle the large volume of 9 work. They completed approximately 2.1 million work hours. 10 Q. You previously mentioned post-9/11 upgrades in security infrastructure 11 and related costs. Please elaborate. 12 A. After September 11, 2001, the Nuclear Regulatory Commission ("NRC") 13 issued a series of orders to all U.S. nuclear plants, requiring major changes in how nuclear 14 power plant operators must provide security for and defense of their nuclear plants. These 15 changes were primarily driven by a revised Design Basis Threat, or "DBT." A DBT is the 16 set of threat assumptions imposed by the NRC for which each nuclear plant must be able to 17 defend against and protect the safety of the nuclear core. In order to meet these new 18 requirements, the Company implemented a number of capital modifications by October 19 2004. Schedule CDN-2 summarizes the capital costs incurred to meet this new DBT. In 20 addition to the security/defense related capital additions to the plant itself, the new DBT 21 required a substantial increase in staffing requirements and other O&M expenses. These 22 security-related costs have added \$5 million per year to the Callaway Plant's O&M cost

23 structure. These costs increases are also shown in Schedule CDN-2.

1

Q. What was the nature of these security changes?

2 The security changes to the plant include a concrete barrier around the entire A. 3 site perimeter to act as a vehicle barrier to defend against the design basis threat. A portal 4 through this barrier system to allow the processing of materials in and out of the plant was 5 constructed. Multiple new fences with detection and monitoring systems were installed. 6 Elevated hardened defense positions that provide 100% oversight of the site's perimeter were 7 also constructed. Finally a new training facility and firing range were constructed to meet the 8 training requirements established for the security force. 9 V. **PERIODIC REFUELINGS**

Q. You mentioned in the purpose section of your testimony the subject of
periodic refuelings of the Callaway Plant. Please explain the need for those refuelings
and what a "refueling outage" entails.

13 A. The Company completed the most recent refueling outage at the Callaway Plant in November of 2005. Like all nuclear power plants, the Callaway Plant's nuclear fuel 14 15 must be replaced; i.e., the reactor must be "refueled" periodically. In the case of the 16 Callaway Plant, refuelings must occur nominally every 18 months. During a refueling 17 outage, the Company not only completes the necessary refueling, but also uses the outage as 18 an opportunity to perform required maintenance of the plant and implement any 19 capital/maintenance modifications required to meet regulatory requirements, address 20 reliability issues or replace obsolete equipment. By combining scheduled maintenance and 21 capital addition work with refuelings, the Company can minimize outage time and maximize 22 the efficiency of the necessary operations. Schedule CDN-3 summarizes the duration and

1 costs of each outage since Callaway went online in December 1984. During this 21 year

2 period and 14 outage cycles, Callaway has averaged 49.4 days per outage.

3

VI. FUTURE DECISIONS REGARDING CALLAWAY

4 Q. You indicated earlier that the Callaway Plant had been in operation for 5 over 20 years and that the age of the plant required these rather major upgrades. What 6 is the life of the Callaway Plant?

7 A. When the Callaway Plant commenced operations in 1984, the NRC granted 8 the Company a 40 year license for the plant. This license will expire approximately 18 years 9 from now in 2024. The plant is thus just over one-half of the way through its licensing 10 period. The NRC has established a process for extending the original licenses an additional 11 20 years. This process normally is started about 10 years before the license is scheduled to 12 expire. Consequently, AmerenUE will not be deciding whether or not to commence the 13 relicensing process until around 2014. As of now, AmerenUE has made no decision as to 14 whether it should request an extension of the Callaway license. The Company continues to 15 engage in extensive data gathering, including monitoring critical plant components for life 16 impacts due to radiation exposure and high temperature environments. The single most 17 critical consideration in determining whether or not relicensing may be feasible is the 18 condition of the reactor vessel itself. Extensive monitoring is in place to measure neutron 19 embrittlement of the vessel wall. The additional data gained over the next approximately 20 eight years will be critical in assisting the Company in making a relicensure decision. While 21 no decision can be made for a number of years, the Company continues to do all the things 22 necessary to preserve this option.

1 Q. Are there other factors that AmerenUE will consider in deciding whether

2 to seek a license extension for the Callaway Plant?

- 3 A. Yes. The overall cost of continuing to operate the plant will also be a
- 4 consideration. The cost can be impacted by a number of factors including changing
- 5 regulatory requirements, increases in the cost of purchasing fuel or disposing of spent fuel
- 6 rods and increases in O&M costs. In addition, the relative costs of other power sources will
- 7 have to be considered at the time the decision is made.
- 8 Q. Does this conclude your testimony?
- 9 A. Yes, it does.

BEFORE THE PUBLIC SERVICE COMMISSION OF THE STATE OF MISSOURI

)

)

)

)

)

In the Matter of Union Electric Company d/b/a AmerenUE for Authority to File Tariffs Increasing Rates for Electric Service Provided to Customers in the Company's Missouri Service Area.

Case No. ER-2007-0002

AFFIDAVIT OF CHARLES D. NASLUND

STATE OF MISSOURI)) ss CITY OF ST. LOUIS)

Charles D. Naslund, being first duly sworn on his oath, states:

 My name is Charles D. Naslund. I work in the City of St. Louis, Missouri, and I am employed by Ameren Services Company as Senior Vice President and Chief Nuclear Officer.

2. Attached hereto and made a part hereof for all purposes is my Direct

Testimony on behalf of Union Electric Company d/b/a AmerenUE consisting of 10 pages,

Attachment A and Schedules CDN-1 through CDN-3, all of which have been prepared in

written form for introduction into evidence in the above-referenced docket.

3. I hereby swear and affirm that my answers contained in the attached testimony to the questions therein propounded are true and correct.

Charles D. Naslund

Subscribed and sworn to before me this 5th day of July, 2006.

My commission expires: 8 - 3 - 2007

LORI L. TWILLMAN Notary Public - Notary Seal STATE OF MISSOURI Callaway County My Commission Expires: Aug. 3, 2007

EXECUTIVE SUMMARY

Charles D. Naslund

Senior Vice President and Chief Nuclear Officer

* * * * * * * * * *

The purpose of my testimony is to: (a) provide a background of the Callaway Nuclear Plant's performance and its importance to Missouri; (b) discuss the substantial capital additions made to the Callaway Plant since the Company's last rate proceeding (Case No. EC-2002-1); (c) provide up-to-date information on several changes to the Callaway Plant's security infrastructure and the associated operation and maintenance ("O&M") cost increases, nearly all of which were driven by governmentally-mandated requirements following the September 11, 2001 terrorist attack; (d) discuss a key Callaway Plant operation, its regular (every 18 months) refueling outages; and (e) provide information related to a future decision that will have to be made regarding whether or not the Company should seek to relicense the Callaway Plant.

Callaway's production has exceeded that of most other nuclear units. Callaway's lifetime generation was the sixth highest among the 103 operating U.S. nuclear power plants, and 22nd in the world, out of 443 nuclear plants operating in 30 countries. Callaway has over 1,000 full-time employees and contractors. In 2005, the plant accounted for \$9.5 million of AmerenUE's property taxes paid to Callaway County, with \$6.5 million of that amount going to local schools.

Significant major component replacements have been made to the Callaway Plant since 2001, including the 2005 replacement of the plant's four steam generators--the giant

boilers that produce steam for generating electricity. In total, the Company made \$449,677,723 in capital additions to the plant over approximately the past 5 years.

In order to meet new security requirements imposed by the Nuclear Regulatory Commission ("NRC") after September 11, 2001, the Company implemented a number of capital modifications by October 2004 and substantially increased staffing and other O&M expenses. These security-related costs have added \$5 million per year to the Callaway Plant's O&M cost structure.

The Company completed a regular refueling outage at the Callaway Plant in November of 2005. By combining scheduled maintenance and capital addition work with such refuelings, the Company minimizes outage time and maximizes the efficiency of these necessary operations.

The NRC license for the Callaway Plant will expire approximately 18 years from now in 2024. The NRC's process for extending licenses an additional 20 years normally is started about 10 years before the license is scheduled to expire. Consequently, AmerenUE will not be deciding whether or not to commence the relicensing process until around 2014. The single most critical consideration in determining whether or not relicensing may be feasible is the condition of the reactor vessel itself. The additional data gained over the next approximately eight years will be critical in assisting the Company in making a relicensure decision. During that time, the Company will continue to do all the things necessary to preserve this option.
