Affidavit of James R. Dauphinais

James R. Dauphinais, being first duly sworn, on his oath states:

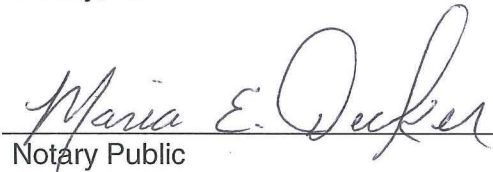

1. My name is James R. Dauphinais. I am a consultant with Brubaker & Associates, Inc., having its principal place of business at 16690 Swingley Ridge Road, Suite 140, Chesterfield, Missouri 63017. We have been retained by Noranda Aluminum, Inc. in this proceeding on its behalf.
2. Attached hereto and made a part hereof for all purposes are my surrebuttal testimony and schedules which were prepared in written form for introduction into evidence in Missouri Public Service Commission Case No. EC-2014-0224.
3. I hereby swear and affirm that the testimony and schedules are true and correct and that they show the matters and things that they purport to show.

James R. Dauphinais

Subscribed and sworn to before me this 29th day of May, 2014.

Case No. EC-2014-0224

Surrebuttal Testimony of James R. Dauphinais

1 **I. Introduction**

2 **Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

3 A James R. Dauphinais. My business address is 16690 Swingley Ridge Road,
4 Suite 140, Chesterfield, MO 63017.

5 **Q ARE YOU THE SAME JAMES R. DAUPHINAIS WHO PREVIOUSLY FILED**
6 **DIRECT TESTIMONY IN THIS PROCEEDING ON BEHALF OF NORANDA**
7 **ALUMINUM, INC. ("NORANDA")?**

8 A Yes.

9 **Q WHAT IS THE PURPOSE OF YOUR SURREBUTTAL TESTIMONY?**

10 A The purpose of my surrebuttal testimony is to respond to the rebuttal testimonies of
11 Ameren Missouri witness Matt Michels and Staff witness Sarah L. Kliethermes with
12 respect to the impact on Ameren Missouri's Actual Net Energy Cost ("ANEC") of a
13 shutdown of Noranda's New Madrid facilities. I also respond to both witnesses with
14 respect to Midcontinent Independent System Operator, Inc. ("MISO") load-based

James R. Dauphinais
Page 1

1 charges that are not included in Ameren Missouri's ANEC that Ameren Missouri
2 would avoid if Noranda's New Madrid facilities were shutdown.

3 My colleague, Mr. Brubaker, addresses the other aspects of the rebuttal
4 testimonies of Mr. Michels and Ms. Kliethermes.

5 The fact that I do not address every point raised by these witnesses, or points
6 raised by other witnesses, should not be interpreted as agreement with those points
7 or those witnesses.

8 **Q YOU INCLUDED A DETAILED EXPLANATION OF AMEREN MISSOURI'S ANEC**
9 **IN YOUR DIRECT TESTIMONY (DAUPHINAIS DIRECT AT 2-3). PLEASE**
10 **PROVIDE A VERY BRIEF RECAP.**

11 **A** ANEC is the portion of Ameren Missouri's revenue requirement that is tracked
12 through Ameren Missouri's Fuel Adjustment Clause ("FAC"). It includes Ameren
13 Missouri's fuel and purchased power costs as reduced by Ameren Missouri's
14 off-system sales revenues. The change in Ameren Missouri's ANEC that would occur
15 from a shutdown of Noranda's New Madrid facilities is of major importance in this
16 proceeding because such a shutdown would essentially result in Ameren Missouri
17 selling the power it currently sells to Noranda into the MISO market instead of to
18 Noranda. This will essentially increase Ameren Missouri's off-system sales revenues
19 (and, as a result, decrease Ameren Missouri's ANEC) by the cost saved by not
20 clearing the Noranda load in the MISO market. As discussed by Mr. Brubaker, this
21 will only partially offset the retail revenues Ameren Missouri would lose from a
22 shutdown of Noranda's New Madrid facilities.

1 **Q PLEASE SUMMARIZE YOUR SURREBUTTAL TESTIMONY CONCLUSIONS.**

2 A While certain aspects of the criticism by Mr. Michels and Ms. Kliethermes of my direct
3 testimony ANEC impact estimate are valid, even when (i) my ANEC impact estimate
4 is adjusted to reasonably respond to those specific criticisms and (ii) MISO market
5 settlement and other MISO load-based charges are added in (which should only be
6 done if the small market price reduction from the shutdown of the Noranda New
7 Madrid facilities is also incorporated), I still estimate a combined ANEC and MISO
8 charge impact that is below the \$30 per MWh in retail sales revenues that would be
9 provided by Noranda under its rate proposal in this proceeding. Specifically, my
10 revised ANEC impact estimate indicates Ameren Missouri's ANEC (plus its MISO
11 load-based charges not included in ANEC) would decrease between \$27.91 and
12 \$28.49 for every MWh that would have been sold to Noranda.

13 With respect to the use of forecasted market prices, they are speculative and
14 generally should not be used in ratemaking. Furthermore, the Polar Vortex Anomaly
15 event of this past winter has distorted the current level of these prices. For these
16 reasons, the ANEC impact should be estimated based on three years of known
17 historical market prices with severe abnormalities removed and any consistent known
18 and measurable trend reflected. This is the approach I have used to develop my
19 revised ANEC impact estimate. Furthermore, while the proposed Noranda rate plan
20 of \$30 per MWh provides for up to 2% rate increase for Noranda during each future
21 Ameren Missouri base rate case over the 10-year term of the Noranda proposal, it is
22 my understanding that the Commission is not precluded from reviewing the continued
23 reasonableness of the Noranda rate in future Ameren Missouri rate proceedings.

24 With respect to the future resource needs of Ameren Missouri, Ameren
25 Missouri is not currently projecting the need for any new generation resources during

James R. Dauphinais
Page 3

1 the 10-year period of Noranda's rate proposal. In fact, its last available projection,
2 which it provided in 2013, is that Ameren Missouri will not need to add a major new
3 generation facility until sometime after 2029. Furthermore, as I discuss in detail in
4 this testimony, the continued operation of Ameren Missouri's existing generation
5 facilities will be a function of market prices and the cost for environmental compliance,
6 not the MW level of Ameren Missouri's load.

7 Finally, Ameren Missouri has in previous proceedings before the Commission
8 raised concerns with increased transmission congestion costs if Noranda's New
9 Madrid facilities were to be shut down. This increase in transmission congestion
10 could increase costs for Ameren Missouri customers and Associated Electric
11 Cooperatives, Inc. ("AECI") member system customers. It could also require these
12 two utility systems to incur new capital expenditures on their respective transmission
13 systems to address the increased transmission congestion. As a result, a shutdown
14 of Noranda's New Madrid facilities could actually require Ameren Missouri to incur
15 capital expenditures that it would not have otherwise had to incur.

16 My Schedule JRD-Surrebuttal-1 provides a high level summary of my revised
17 ANEC impact estimate and Schedules JRD-Surrebuttal-2 and JRD-Surrebuttal-3
18 provide the underlying detail for that schedule. My revisions can be summarized as
19 follows:

- 20 • I have updated the original core components of Ameren Missouri's ANEC that
21 were included in my direct testimony estimate of \$27.05 per MWh to reflect:
 - 22 – The AMMO.UE MISO pricing node rather than the AECI.AMMO pricing
23 node;
 - 24 – The AECI 3.5% loss factor;
 - 25 – The use of normalized historical energy market prices for the most recent
26 36 month period with the Polar Vortex Anomaly removed;

- 1 – The effect of the estimated 1.5% reduction in energy market prices due to
2 a shutdown of Noranda’s load on the avoided cost of clearing the Noranda
3 load in the MISO energy market; and
- 4 – The 2014-2015 MISO Planning Resource Auction capacity price of
5 \$16.75 per MW-day.
- 6 • I have expanded my ANEC impact estimate to include all of Ameren Missouri’s
7 material MISO market settlement charges and credits that are materially sensitive
8 to the amount of load served by Ameren Missouri.
- 9 • I have expanded my ANEC impact estimate to include the impact of the estimated
10 1.5% reduction in energy market prices due to a shutdown of Noranda’s load on
11 Ameren Missouri’s off-system energy sales revenues and purchased power costs.
- 12 • I have expanded my ANEC impact estimate to include the very small drop in
13 Ameren Missouri’s Schedule 26 regional transmission charges that would result
14 from a shutdown of Noranda’s load.
- 15 • I have added to my ANEC impact estimate the MISO administration charges that
16 Ameren Missouri would avoid due to a shutdown of the Noranda load.

17 As I have noted, the net impact of all of the above adjustments is to raise my
18 direct testimony estimate of Ameren Missouri’s incremental cost savings from a
19 shutdown of the Noranda load from \$27.05 for every MWh that would have been sold
20 to Noranda to a range of \$27.91 to \$28.49 for every MWh that would have been sold
21 to Noranda. However, this revised ANEC and MISO administration cost savings
22 estimate is still \$1.51 per MWh to \$2.09 per MWh lower than the \$30 per MWh rate
23 proposed by Noranda.

1 **II. Response to Ameren Missouri Witness**
2 **Matt Michels and Staff Witness Sarah Kliethermes**

3 **Q ON A HIGH LEVEL, PLEASE BRIEFLY SUMMARIZE MR. MICHELS' AND MS.**
4 **KLIETHERMES' CRITICISMS OF YOUR \$27.05 PER MWH DIRECT TESTIMONY**
5 **ESTIMATE ON THE IMPACT ON AMEREN MISSOURI'S ANEC IF THE NORANDA**
6 **NEW MADRID FACILITIES WERE TO SHUT DOWN.**

7 **A** On a high level, Mr. Michels' and Ms. Kliethermes' criticisms are as follows:

- 8 • Mr. Michels testifies that my direct testimony ANEC impact estimate should have
9 been calculated at the AMMO.UE MISO CPNode not the AECI.AMMO CPNode.
10 Ms. Kliethermes proposes to calculate the ANEC impact estimate¹ at the
11 AMMO.TS1, AMMO.OSAGE1 and AMMO.RUSHIS1 CPNodes rather than the
12 AECI.AMMO CPNode.
- 13 • Mr. Michels argues that the 12-month historical period ending October 31, 2013
14 that I used for energy market prices in my ANEC impact estimate was too narrow
15 and out of date for purposes of estimating the ANEC impact. Ms. Kliethermes
16 proposes to use the 48-month historical period ending March 31, 2014 or the
17 12-month historical period ending April 1, 2014.
- 18 • Both Mr. Michels and Ms. Kliethermes propose to replace the \$1.05 per MW-day
19 capacity market price that I utilized in my direct testimony ANEC impact estimate
20 with the more recent MISO capacity market price of \$16.75 per MW-day.
- 21 • Mr. Michels indicates that my direct testimony ANEC impact estimate failed to
22 include Associated Electric Cooperatives, Inc. ("AECI") losses of 3.5% from the
23 MISO border with AECI to Noranda's meter. Ms. Kliethermes also proposes to
24 apply the 3.5% AECI loss factor in the ANEC impact estimate.
- 25 • Mr. Michels argues that my direct testimony ANEC impact estimate failed to
26 include certain MISO settlement charges (including ancillary service charges),
27 MISO Schedule 26 transmission charges and other MISO load-based charges.
28 Ms. Kliethermes also advocates the inclusion of additional MISO charges in the
29 ANEC impact estimate.
- 30 • Mr. Michels' argues that my ANEC impact estimate should have considered the
31 current forecasted market prices for energy and capacity over the 10-year period
32 of the Noranda proposal.

¹Ms. Kliethermes in her testimony refers to the change in the ANEC as "Ameren Missouri's wholesale energy cost of providing service to Noranda." I disagree with her characterization. The reduction in Ameren Missouri's ANEC from a shutdown of the Noranda New Madrid facilities is the incremental net fuel and purchased power cost that is avoided by Ameren Missouri by not having to clear the Noranda load in the MISO energy, operating reserve and capacity markets. It is not Ameren Missouri's wholesale energy cost for serving Noranda.

- 1 • Mr. Michels argues that Ameren Missouri could experience savings in future
2 generation resource capital expenditures from a Noranda shutdown.

3 **Q IN GENERAL, HOW DO YOU RESPOND TO THESE CRITICISMS?**

4 A Certain portions of these criticisms are valid and warrant revision to my direct
5 testimony ANEC impact estimate. However, the balance of the criticisms, especially
6 those that rely on current forecasted market price information that has been distorted
7 by the Polar Vortex Anomaly of this past winter, are unwarranted. Furthermore, as I
8 have noted, even when I revise my direct testimony ANEC impact estimate to
9 reasonably address those portions of Mr. Michels' and Ms. Kliethermes' criticisms that
10 are valid, I still end up with an estimated total cost savings impact of less than
11 \$30 per MWh.

12 A. *MISO Pricing Node*

13 **Q HOW DO YOU SPECIFICALLY RESPOND TO MR. MICHELS' CRITICISM OF**
14 **YOUR USE OF THE AECI.AMMO CPNODE IN YOUR DIRECT TESTIMONY ANEC**
15 **IMPACT ESTIMATE RATHER THAN THE AMMO.UE CPNODE?**

16 A At the time of preparing my direct testimony, I did not know with certainty whether
17 Ameren Missouri clears the Noranda load in the MISO market at AMMO.UE or some
18 other MISO pricing node. This was an issue of concern because the Noranda load is
19 physically interconnected to the AECI transmission system rather than directly
20 interconnected to the Ameren Missouri transmission system. Due to this uncertainty
21 and to be conservative in my estimate, I chose the higher priced of the two nodes that
22 I considered to be most likely to be the location where Ameren Missouri clears the
23 Noranda load in the MISO market – AECI.AMMO.

1 In response to discovery, which was not available in this proceeding when my
2 direct testimony was prepared, and in Mr. Michels' rebuttal testimony, Ameren
3 Missouri has provided certainty with respect to the pricing node where Noranda's load
4 is cleared by Ameren Missouri in the MISO market – AMMO.UE. As a result, I agree
5 with Mr. Michels that my direct testimony ANEC impact estimate should be revised to
6 use AMMO.UE historic prices rather than AECI.AMMO historic prices. I have
7 included this change in the revised ANEC impact estimate that I present in Schedules
8 JRD-Surrebuttal-1, JRD-Surrebuttal-2 and JRD-Surrebuttal-3.

9 **Q HOW DO YOU RESPOND TO MS. KLIETHERMES' POSITION THAT THE**
10 **AMMO.TS1, AMMO.OSAGE1 AND AMMO.RUSHIS1 CPNODES SHOULD BE**
11 **USED?**

12 A In response to Data Request Noranda 1.2 to Staff, Ms. Kliethermes indicated that she
13 was in error in using those three generation pricing nodes in her direct testimony and
14 now agrees it would be more appropriate to use the AMMO.UE CPNode for the
15 ANEC impact estimate.²

16 B. *Historic Period for Energy Market Prices*

17 **Q PLEASE EXPLAIN YOUR SELECTION OF THE 12 MONTHS ENDING OCTOBER**
18 **31, 2013 FOR THE HISTORIC ENERGY MARKET PRICES YOU USED IN YOUR**
19 **DIRECT TESTIMONY ANEC IMPACT ANALYSIS.**

20 A I selected the most recent 12 month period available when I performed the calculation
21 for my direct testimony in November of 2013. I did not revise it prior to filing my direct

²Schedule JRD-Surrebuttal-12 contains a complete copy of all data request responses that I cite to in this testimony.

1 testimony because nothing had fundamentally changed in the market between the
2 performance of the calculation and the filing of my direct testimony.

3 After considering some of the points made by Mr. Michels and
4 Ms. Kliethermes, I believe it is reasonable to normalize the historic energy market
5 prices being utilized in my ANEC impact estimate in a manner that is generally
6 consistent with the way this has been done in recent years for the determination of
7 Ameren Missouri's Net Base Energy Cost ("NBEC") in Ameren Missouri's base rate
8 proceedings.³ Specifically, 36 months of historic energy market prices should be
9 averaged with severe market anomalies removed and any known and measurable
10 long-term trends reflected. I propose to use: (i) the 36 month period ending
11 December 31, 2013 with no adjustments, or (ii) alternatively, the period of the
12 36 months ending April 30, 2014, with January through March energy market prices
13 from 2014 (the period of the Polar Vortex Anomaly), replaced with the average of
14 energy market prices from January through March of 2012 and 2013.

15 The 36-month period ending December 31, 2013 averages to an
16 around-the-clock day-ahead hourly market price of \$27.26 per MWh at the AMMO.UE
17 pricing node. The 36-month period ending April 30, 2014, with January through
18 March of 2014 prices replaced with the average of January through March prices from
19 2012 and 2013, averages to an around-the-clock day-ahead hourly market price of
20 \$26.69 per MWh at the AMMO.UE pricing node. I have used both of these alternative
21 measures of normalized historical market prices in the revised ANEC estimate that I
22 present in Schedules JRD-Surrebuttal-1, JRD-Surrebuttal-2 and JRD-Surrebuttal-3.

³NBEC is the baseline value of fuel and purchased power costs reduced by off-system sales revenues to which Ameren Missouri's ANEC is compared in Ameren Missouri's FAC.

1 Q MR. MICHELS OFFERS AN UPDATED HISTORICAL PERIOD OF THE
2 12 MONTHS ENDING APRIL 30, 2014 (MICHELS REBUTTAL AT 19).
3 MS. KLIETHERMES OFFERS THE HISTORICAL PERIODS OF THE 48 MONTHS
4 ENDING MARCH 31, 2014 OR THE 12 MONTHS ENDING APRIL 1, 2014
5 (KLIETHERMES REBUTTAL AT 8-9). ARE ANY OF THESE HISTORIC PERIODS
6 REASONABLE TO USE FOR THE ANEC IMPACT ESTIMATE?

7 A No. First, Mr. Michels himself agrees that a 12-month period is too narrow (Michels
8 Rebuttal at 12). Second, all three of these proposals would include the Polar Vortex
9 Anomaly period of January through March 2014 with no downward adjustments to
10 remove the market anomaly. Finally, while Ms. Kliethermes' use of a 48 months
11 historic period could be viewed as an attempt to try average out the Polar Vortex
12 Anomaly, it fails to do so because the 48 month average in effect assumes a Polar
13 Vortex Anomaly event will repeat every four years (i.e., every 48 months).

14 C. *Normalization of Historic Energy Market Prices*
15 *in Past Ameren Missouri Base Rate Proceedings*

16 Q IN PAST RATE PROCEEDINGS, HAS AMEREN MISSOURI PROPOSED TO USE
17 THE AVERAGE OF HISTORIC MARKET PRICES WITH SEVERE ANOMALIES
18 REMOVED TO DETERMINE ITS NBEC?

19 A Yes. In all of its base rate proceedings before the Commission since the start of
20 operation of the MISO energy market in 2005, Ameren Missouri in one form or
21 another has proposed to use normalized historic energy market prices to determine
22 the NBEC portion of its base rate revenue requirement.

23 In Case No. ER-2007-0002, Ameren Missouri proposed to use an average of
24 36 months of historic energy market prices from January 2003 through December of
25 2005, with downward adjustments to remove certain severe market anomalies in

1 2005 (Ameren Missouri witness Schukar Direct in Case No. ER-2007-0002 at 8-9).
2 Specifically, Ameren Missouri made downward market price adjustments to remove
3 the effects of: (i) abnormally high on-peak historic market prices over the period of
4 August through December of 2005 due to Hurricanes Dennis, Katrina and Rita and
5 (ii) abnormally high off-peak historic market prices over the period of July through
6 December of 2005 due to rail transportation disruptions (*Id.* at 12-16). As
7 Mr. Schukar indicated in his rebuttal testimony in that proceeding:

8 "Taking a simple three-year average does not address these market
9 disruptions, because the averaging will only help to average out
10 *normal* volatility that occurs in any given year. It will not address the
11 *abnormal* impact that occurs as a result of extraordinary events like the
12 2005 hurricanes or the rail disruptions."

13 and

14 "[T]hese types of events had an extraordinary impact on market
15 conditions that cannot be expected to occur every couple years –
16 which means taking the three-year average without further
17 adjustments cannot be used to 'normalize' market conditions."

18 (Schukar Rebuttal in Case No. ER-2007-0002 at 4)

19 In Case No. ER-2008-0318, Ameren Missouri proposed to perform an average
20 of 24 months of historic energy market prices from January 2006 through December
21 2007, with no downward adjustments (Ameren Missouri witness Schukar Direct in
22 Case No. ER-2008-0318 at 10-12). However, Mr. Schukar made clear in his direct
23 testimony in that proceeding that he did not propose to use more than 24 months of
24 data because, in his opinion, market conditions prior to 2006 were unusually high and
25 not representative of normalized market conditions, particularly "... in 2005, when
26 disruptions in coal transportation, the effects of Hurricanes Dennis and Katrina, and
27 the start-up of the MISO energy markets created highly unusual market conditions"
28 (*Id.* at 13). Thus, Ameren Missouri's proposal in Case No. ER-2008-0318 was
29 effectively to use the average of 36 months of historical prices ending December 31,

1 2007, but with the 12 month period of January 2005 through December of 2005
2 removed from the average due to it being anomalous.

3 In Case Nos. ER-2010-0036, ER-2011-0028 and ER-2012-0166, Ameren
4 Missouri proposed to average 36 months of historic energy market prices at the end
5 of the applicable true-up period, with no adjustments for severe market anomalies.
6 However, it was important to note that no severe market anomalies were identified in
7 those proceedings by Ameren Missouri (or any other party) for the 36-month historic
8 periods considered in each of those three cases.

9 **Q DID STAFF OFFER AN OPINION WITH REGARD TO REMOVING SEVERE**
10 **MARKET ABNORMALITIES IN THESE PREVIOUS PROCEEDINGS?**

11 A Yes. For example, in his direct testimony in Case No. ER-2007-0002, Staff witness
12 Dr. Michael Proctor noted the rail transportation and hurricane market anomalies of
13 2005 and indicated:

14 "The objective of my analyses is to remove the effects of these
15 abnormal events on prices and recommend a set of normal prices to
16 be used in this rate case."

17 (Staff witness Proctor Direct in Case No. ER-2007-0002 at 3).

1 Q YOU INDICATED IN YOUR DIRECT TESTIMONY THAT YOU HAVE PREVIOUSLY
2 TESTIFIED IN EACH OF THESE PREVIOUS AMEREN MISSOURI BASE RATE
3 PROCEEDINGS WITH RESPECT TO AMEREN MISSOURI'S FUEL COSTS,
4 PURCHASED POWER COSTS AND OFF-SYSTEM SALES REVENUES
5 (DAUPHINAIS DIRECT AT 1-2). WHAT POSITION HAVE YOU TAKEN WITH
6 RESPECT TO THE HISTORICAL ENERGY MARKET PRICE NORMALIZATION
7 APPROACH?

8 A I have generally not opposed the averaging of 36 months of historical hourly energy
9 market prices with severe market anomalies removed provided any known and
10 measurable historic trend in those prices is incorporated into the final normalized
11 results (e.g., Dauphinais Direct in Case No. ER-2007-0002 at 7-11). In Ameren
12 Missouri Case Nos. ER-2007-0002 and ER-2008-0318, there had been a consistent
13 ongoing escalation trend in historic energy market prices for several years in a row as
14 shown in Figure JRD-1 below (previously presented as Figure JRD-3 of my
15 Surrebuttal Testimony in Case No. ER-2008-0318 and in Staff witness Michael
16 Proctor's testimony in that proceeding).

Figure JRD-1

1 As a result, I opposed using averages of historical market prices, with or
2 without anomalies removed, unless the ongoing escalation trend in market prices was
3 also reflected (e.g., by only using the most recent 12 of the 36 months in the
4 average). However, in later cases, specifically, Case Nos. ER-2010-0036,
5 ER-2011-0028 and ER-2012-0166, as shown in Figure JRD-2 below, the previous
6 consistent upward trend in natural gas and electric energy market prices that had
7 been previously present from 2002 through 2008 had ended. This end in the
8 previous trend is the result of the fracking and horizontal drilling revolution in the
9 natural gas industry.

Figure JRD-2

1 Due to the end of the previous known and measurable upward price trend, I
2 did not suggest incorporating a trend adjustment to averaged historic energy market
3 prices in these three most recent Ameren Missouri base rate cases. For the same
4 reason, I have not proposed a trend adjustment in this current proceeding to
5 averaged historic energy market prices.

6 D. *The Polar Vortex Anomaly*

7 Q **PLEASE DESCRIBE THE POLAR VORTEX ANOMALY AND YOUR BASIS OF**
8 **NOT INCLUDING THE PERIOD DURING WHICH IT OCCURRED IN YOUR**
9 **36 MONTHS OF AVERAGED HISTORICAL HOURLY ENERGY PRICES IN THIS**
10 **PROCEEDING.**

11 A The “Polar Vortex Anomaly” is the term I use to refer to the period of extreme cold
12 temperature events that occurred during the months of January, February and March

1 of 2014. During this period, the coldest temperatures seen in many years were
2 experienced in the Midwest, Mid-Atlantic, South Central and Southeast United States.
3 For example, the National Weather Service reported that Chicago had the coldest
4 weather on record since 1872 for the period of December through March (National
5 Weather Service Public Information Statement, April 1, 2014, 9:37 AM CDT, attached
6 as Schedule JRD-Surrebuttal-9).

7 Furthermore, MISO, in its April 1, 2014 presentation to the Federal Energy
8 Regulatory Commission ("FERC") in *Winter 2013-2014 Operations and Market*
9 *Performance in RTOs and ISOs*, Docket No. AD14-8-000 reported extreme low
10 temperatures were experienced across the entire MISO Region and temperatures in
11 many areas were the coldest in 20 years.⁴ MISO's presentation also indicated
12 numerous days from January through March of 2014 on a MISO system wide basis
13 that were well below average hourly low temperatures for the same days in 2012 and
14 2013 and well below monthly average low temperatures from the past six years.
15 (*Winter 2013-2014 Operations and Market Performance*, Richard Doying,
16 Midcontinent Independent System Operator, April 1, 2014 at Slide 3, attached as
17 Schedule JRD-Surrebuttal-10.)

18 Also, the FERC Staff's presentation during the same technical conference on
19 April 1, 2014 in Docket No. AD14-8-000 showed the wide geographical breadth of
20 several of the extreme cold weather events that took place (*Winter 2013-2014*
21 *Operations and Market Performance in RTOs and ISOs*, FERC Staff, April 1, 2014 at
22 Slide 2, attached as Schedule JRD-Surrebuttal-11).

23 These extremely low temperatures led to very high natural gas and electricity
24 demand, as well as non-firm natural gas disruptions, coal pile freeze ups and other

⁴The MISO Region stretches from Montana to Michigan and from Manitoba to Louisiana.

1 forced generation derates and outages. All of this elevated hourly day-ahead and
2 real-time electricity market prices to astronomical levels that have not been seen in
3 the Midwest since the late 1990s.

4 The FERC Staff presentation from Docket No. AD14-8-000 shows that
5 national natural gas demand soared above five-year averages on several occasions
6 from January through March of 2014 and peak natural gas demand in the Northeast
7 and Southeast coincided (Schedule JRD-Surrebuttal-11 at Slides 3 and 4). The
8 FERC Staff presentation also shows that new winter peak electricity demands were
9 set in MISO and the adjacent PJM and SPP Regional Transmission Organizations
10 (“RTO”) (*Id.* at Slide 6). Additionally, the FERC Staff presentation shows the impact
11 of this soaring natural gas demand on spot natural gas prices, especially in the
12 Northeast, but also as far west as Chicago Citygates (*Id.* at Slide 5). The MISO
13 presentation in Docket No. AD14-8-000 shows the extent of forced generation
14 outages within MISO for select days from January through March of 2014 that
15 resulted from scarce, high priced natural gas and the freeze up of generation
16 components (Schedule JRD-Surrebuttal-10 at Slide 4). As can be seen from this
17 slide, MISO generation outage levels were well above 2013 levels.

18 Figure JRD-3 below shows the impact all of this had on daily averaged MISO
19 day-ahead hourly energy market prices at the AMMO.UE pricing node for the January
20 through March period for 2014 versus that for the same period in 2011, 2012 and
21 2013. As can be seen, average day-ahead market prices for 2014 for January
22 through March were much higher and much more volatile than they were in 2011,
23 2012 and 2013 illustrating the anomalous nature of January through March of 2014.

Figure JRD-3

1 The extreme cold weather event of this past January through March is a
2 severe market anomaly much like the one that followed Hurricanes Katrina and Rita
3 in 2005. As I noted earlier, Ameren Missouri made downward market price
4 adjustments for the Hurricanes Katrina and Rita market anomaly in Case Nos.
5 ER-2007-0002 and ER-2008-0318.

6 Figure JRD-4 below shows averaged hourly day-ahead energy prices at the
7 AMMO.UE pricing node for the periods of January through March and September
8 through December from the April 1, 2005 start of the MISO energy market. Hurricane
9 Katrina made landfall on August 29, 2005 and Hurricane Rita on
10 September 24, 2005.

Figure JRD-4

1 Figure JRD-4 shows the abnormally high market prices that resulted in the
2 four months immediately following the first of the two Hurricanes (September through
3 December of 2005). The figure also shows this market anomaly largely dissipated
4 during the immediately following January through March of 2006 period, was
5 completely gone by September through December of 2006 and has not subsequently
6 repeated itself. The figure also clearly shows several other market characteristics of
7 the past 10 years including: (i) the persistent year-to-year escalation in spot energy
8 prices that denoted the pre-fracking revolution period of 2002 through 2008, (ii) the
9 financial collapse of 2008, and (iii) the start of the fracking revolution in natural gas
10 that continues to this day. Finally, the figure shows the January through March 2014
11 Polar Vortex Anomaly and provides another perspective with respect to its magnitude
12 on a three-month average basis versus market prices for the same three months in

1 the preceding five years. Short of another severe market anomaly occurring in the
2 next few months, there is no compelling reason to believe that the impact of the Polar
3 Vortex Anomaly on spot energy market prices will not quickly dissipate just like with
4 the Hurricanes Katrina and Rita Anomaly as shown above.

5 *E. Capacity Prices*

6 **Q MR. MICHELS HAS CRITICIZED YOUR USE OF A SINGLE HISTORIC VALUE**
7 **FOR THE CAPACITY MARKET PRICE FOR YOUR ANEC IMPACT ESTIMATE**
8 **WHILE MS. KLIETHERMES PROPOSES TO USE A MORE RECENT MISO**
9 **CAPACITY MARKET PRICE. HOW DO YOU RESPOND?**

10 **A** Prior to the start of the MISO capacity market in June of 2013, there was no reliable
11 source for market prices available within MISO for capacity. The capacity market was
12 purely bilateral and these bilateral transactions in a number of cases included an
13 energy delivery component at a specified energy price. Furthermore, unlike for the
14 bilateral energy market, the industry did not maintain market price indices reflecting
15 surveys of the market prices that market participants were paying for capacity. In
16 light of all of this, the only reliable source for capacity prices within MISO available to
17 me prior to the filing of my direct testimony was MISO's 2013-2014 Planning
18 Resource Auction ("PRA") result for Local Resource Zone 5 -- the Local Resource
19 Zone in which Ameren Missouri is located.

20 On April 15, 2014, over two months after I filed my direct testimony in this
21 proceeding, MISO released the results of its second PRA -- this time for the period of
22 June 1, 2014 through May 31, 2015. Mr. Michels is correct in that this new capacity
23 market price, \$16.75 per MW-day, is much higher than this past year's price of
24 \$1.05 per MW-day. However, this is not necessarily indicative of steeply rising

James R. Dauphinais
Page 20

1 capacity market prices in the near future but rather a reflection that the 2013-2014
2 PRA result was extremely low. As such, I do not propose to average the 2014-2015
3 PRA capacity price with the very low 2013-2014 PRA capacity price. Instead, in my
4 revised ANEC impact estimate presented in Schedules JRD-Surrebuttal-1,
5 JRD-Surrebuttal-2 and JRD-Surrebuttal-3, I utilize the much higher 2014-2015 MISO
6 PRA capacity market price of \$16.75 per MW-day as is. This is the same capacity
7 market price that Ms. Kliethermes proposes to use (Kliethermes Rebuttal at 9).

8 **Q THIS SOUNDS LIKE A LARGE INCREASE, TO PLACE IT INTO PERSPECTIVE,**
9 **HOW MUCH DOES THE INCREASE AFFECT THE ANEC IMPACT ESTIMATE?**

10 A It amounts to an increase of \$0.76 per MWh.

11 *F. AECI Losses*

12 **Q HOW DO YOU RESPOND TO MR. MICHELS' CRITICISM WITH RESPECT TO**
13 **NOT REFLECTING AECI LOSSES IN YOUR ANEC IMPACT ESTIMATE AND MS.**
14 **KLIETHERMES' PROPOSAL TO APPLY THOSE LOSSES TO THE ANEC IMPACT**
15 **ESTIMATE?**

16 A They are correct in that AECI losses should have been incorporated into my direct
17 testimony ANEC impact estimate since the proposed rate for Noranda does not
18 include a separate charge to collect the cost for AECI losses. I have applied the
19 3.5% AECI loss factor in my revised ANEC impact calculation that I present in
20 Schedules JRD-Surrebuttal-1, JRD-Surrebuttal-2 and JRD-Surrebuttal-3.

1 G. *MISO Market Settlement Charges*
2 *(Including Ancillary Service and Uplift Charges),*
3 *MISO Regional Transmission Charges and other MISO Load-Based Charges*

4 Q HOW DO YOU RESPOND TO MR. MICHELS' CRITICISM WITH RESPECT TO
5 NOT INCLUDING AVOIDED MISO MARKET SETTLEMENT CHARGES
6 (INCLUDING ANCILLARY SERVICE CHARGES AND UPLIFT CHARGES),
7 CERTAIN MISO REGIONAL TRANSMISSION CHARGES AND OTHER MISO
8 LOAD-BASED CHARGES IN YOUR DIRECT TESTIMONY ANEC IMPACT
9 ESTIMATE (MICHELS REBUTTAL AT 15-16) AND MS. KLIETHERMES
10 PROPOSAL TO INCLUDE SUCH ADDITIONAL CHARGES IN THE ANEC IMPACT
11 ESTIMATE (KLIETHERMES REBUTTAL AT 9)?

12 A I did not include MISO market settlement charges (including ancillary service charges
13 and uplift charges) for two reasons. First, as I noted at the bottom of Schedule JRD-2
14 of my direct testimony, the MISO market settlement charges generally net to a
15 relatively small number. Second, I had conservatively assumed in my direct
16 testimony ANEC impact estimate that MISO market prices would not drop by any
17 amount due to the shutdown of Noranda's New Madrid facilities. In fact, as I
18 discussed in my direct testimony, MISO market prices for energy will drop by some
19 small amount (Dauphinais Direct at 9-10). This amount will not necessarily be
20 enough to significantly change the dispatch of Ameren Missouri's generation facilities
21 by MISO, but it would be enough to have some downward impact on the price of
22 Ameren Missouri's off-system energy sales revenues and purchased energy costs.
23 Therefore, if the analysis is expanded in detail to include net MISO market settlement
24 charge savings from a shutdown of Noranda (as Mr. Michels has done), an estimate
25 of the impact of the small drop in energy market prices should also be incorporated.

James R. Dauphinais
Page 22

1 With respect to MISO regional transmission charges, Ameren Missouri is only
2 subject to MISO regional transmission service charges on the basis of load under
3 MISO Schedules 26 and 26-A. I included the estimated change in Ameren Missouri's
4 MISO Schedule 26-A charges in my direct testimony ANEC impact estimate (see
5 Schedule JRD-2). I did exclude MISO Schedule 26 charges, but only did so for the
6 reason I noted on the bottom of my direct testimony Schedule JRD-2 – MISO
7 Schedule 26 charges would not likely be significantly reduced for Ameren Missouri
8 from a shutdown of Noranda's New Madrid facilities.

9 I did not include other MISO load-based charges for the same reason I did not
10 include MISO Market Settlement charges – they are relatively small and should not
11 be considered unless the impact from the small drop in energy market prices that
12 would result from a shutdown of Noranda's New Madrid facilities is also considered.
13 In addition, it should be noted that these other load-based MISO charges consist of
14 administration charges that are not part of Ameren Missouri's ANEC and, as a result,
15 are base rate costs that are not recoverable through Ameren Missouri's FAC. So,
16 while they are costs that would be reduced for Ameren Missouri by a shutdown of
17 Noranda's New Madrid facilities, the reduction in costs would only be seen through
18 base rates and not through a reduction in Ameren Missouri's ANEC.

19 **Q IN HIS REBUTTAL TESTIMONY, MR. MICHELS PRESENTS AN ESTIMATE OF**
20 **\$0.40 PER MWH FOR THESE SO CALLED "OMITTED MISO CHARGES"**
21 **(MICHAELS REBUTTAL AT 13). HAVE YOU REVIEWED HIS ESTIMATE?**

22 **A Yes. As Ameren Missouri itself has admitted in response to Data Request Noranda**
23 **4-27, Mr. Michel's direct testimony estimate \$0.40 per MWh includes errors and is**

1 missing a number of MISO market settlement and administration items whose
2 amounts are sensitive to the amount of load that is served by Ameren Missouri.

3 For example, Ameren Missouri admits to miscalculating and, as a result,
4 overstating the sensitivity of its MISO Schedule 26 regional transmission charges to a
5 reduction in Ameren Missouri's load (Ameren Missouri Response to Data Request
6 4-27 j). Ameren Missouri also admits to not including its MISO Real-Time Distribution
7 of Losses Amount in its \$0.40 per MWh calculation.⁵ The MISO Real-Time
8 Distribution of Losses Amount is a significant credit against other MISO market
9 settlement, transmission and administration charges that would diminish in value for
10 Ameren Missouri if Noranda's New Madrid facilities were shut down (Ameren Missouri
11 Response to Data Request 4-27 c, d and e).

12 Finally, Ameren did not include another load-sensitive MISO market
13 settlement item that is also a sizable credit -- its MISO Auction Revenue Rights
14 ("ARR") Stage 2 Distribution Amount.⁶ It did so despite admitting in discovery that the
15 combined total MW of Auction Revenue Rights ("ARR") (including ARR Stage 2
16 entitlements) that are allocated to it by MISO for the network transmission service
17 Ameren Missouri receives from MISO is based on the peak demand of Ameren
18 Missouri's load (Ameren Missouri Response to Data Request 4-27 f). In summary,
19 Mr. Michels' rebuttal testimony estimate of MISO market settlement, transmission and
20 administration charges beyond those I included in my direct testimony ANEC impact

⁵The MISO Real-Time Distribution of Losses Amount essentially pays back to Load Serving Entities such as Ameren Missouri the marginal loss charges that MISO collects through energy market prices that are in excess of MISO's actual cost to provide real power losses.

⁶The MISO ARR Stage 2 Distribution Amount pays out to network transmission customers such as Ameren Missouri the annual Financial Transmission Right ("FTR") auction revenues that MISO collects in excess of those auction revenues due to holders of Stage 1A, Restoration, Underminated LTTR and Stage 1B ARRs. ARR Stage 2 payments are made by MISO in direct proportion to the difference between the network transmission customer's forecasted annual non-coincident peak demand and the total of that customer's Stage 1A, Restoration, Underminated LTTR and Stage 1B ARRs.

1 estimate contains significant errors and overstates the net magnitude of those
2 additional MISO charges.

3 **Q DID MS. KLIETHERMES IN HER REBUTTAL TESTIMONY INCLUDE AN**
4 **ESTIMATE FOR ADDITIONAL MISO SETTLEMENT, TRANSMISSION AND**
5 **ADMINISTRATION CHARGES?**

6 A Yes. She includes a public estimate and a highly confidential estimate. Her public
7 estimate is that the additional MISO charges (ancillary service and uplift) amount to
8 \$0.44 per MWh (Kliethermes Schedule SLK 3 – Energy). Her highly confidential
9 estimate is that these additional MISO charges amount to **Highly Confidential Information Removed** per MWh
10 (Kliethermes Schedule SLK 5 HC Impact). Both of her calculations are flawed and
11 overstate the actual amount.

12 For her public estimate, she bases her numbers on what appears to be the
13 average market wide cost for ancillary services and uplift per MWh of load as
14 reported by the MISO Independent Market Monitor (“IMM”) from March 2013 through
15 February 2014 (Kliethermes Workpapers at “NP Other Charges”). While these are
16 useful metrics for evaluating the overall performance of the MISO market with respect
17 to these two types of costs, these are not the specific ancillary service and uplift
18 charges that Ameren Missouri is subject. For example, MISO Voltage and Local
19 Reliability (“VLR”)-related uplift charges are directly assigned to the load in the Local
20 Balancing Area (“LBA”) where VLR issues exist – they are not uplifted to all load
21 within MISO.

22 In addition, Ameren Missouri’s MISO ancillary service charges and uplift
23 charges are offset by significant MISO credits -- MISO Distribution of Losses of
24 Amounts and MISO ARR Stage 2 Distribution Amounts. Ms. Kliethermes has not

1 included these offsets in her public estimate of additional MISO charges. As a result,
2 her public estimate is not correct and overstates the additional load-sensitive net
3 MISO settlement, transmission and administration charges that were not included in
4 my direct testimony ANEC impact estimate.

5 There are also flaws with her highly confidential estimate. For example, she
6 includes a so called average transmission charge for one MWh of energy in the
7 Ameren Missouri load zone that she drew on from Ameren Missouri's response to
8 Data Request MPSC 0006 (Kliethermes Workpapers at "HC AMMO"). However, the
9 magnitude of that average transmission charge is such that it must include Ameren
10 Missouri's MISO Schedule 26 transmission service charges – charges that are largely
11 not sensitive to the amount of load served by Ameren Missouri and as a result will not
12 be significantly reduced for Ameren Missouri by a shutdown of Noranda's New Madrid
13 facilities.

14 In addition, like with Mr. Michels' estimate, her highly confidential estimate
15 only includes a subset of the MISO market settlement, transmission and
16 administration charges and credits that Ameren Missouri settles with MISO that are
17 sensitive to the amount of load which is served by Ameren Missouri. In particular, like
18 with Mr. Michels' estimate and her public estimate, her highly confidential estimate
19 neglects to include the two large MISO credits that I previously mentioned that
20 Ameren Missouri receives which are sensitive to the amount of load that Ameren
21 Missouri serves – Real-time Distribution of Losses Amounts and ARR Stage 2
22 Distribution Amounts. As a result, Ms. Kliethermes' highly confidential estimate, like
23 her public estimate and Mr. Michel's estimate, is not correct and overstates the
24 additional load-sensitive net MISO market settlement, transmission and

1 administration charges that were not included in my direct testimony ANEC impact
2 estimate.

3 **Q PLEASE IDENTIFY ALL OF THE MATERIAL MISO MARKET SETTLEMENT,**
4 **TRANSMISSION AND ADMINISTRATION CHARGES AND CREDITS THAT WERE**
5 **NOT INCLUDED IN YOUR DIRECT TESTIMONY ANEC IMPACT ESTIMATE AND**
6 **ARE MATERIALLY AFFECTED BY THE AMOUNT OF LOAD THAT AMEREN**
7 **MISSOURI SERVES.**

8 A In Table JRD-1 below I present each of the material Ameren Missouri MISO market
9 settlement, transmission and administration credits and changes that I did not include
10 in my direct testimony ANEC impact estimate and are materially sensitive to the
11 amount off load that Ameren Missouri serves. In the table, I note which of the items
12 are part of Ameren Missouri's ANEC and which are not. The items included in
13 Ameren Missouri's ANEC are MISO market settlement charges and credits. The
14 other items are MISO administration charges that are only recoverable in Ameren
15 Missouri's base rates. I also denote in the table which of the items were included in
16 the rebuttal testimony estimate of Mr. Michels and the highly sensitive rebuttal
17 testimony estimate of Ms. Kliethermes. As can be seen, neither Mr. Michels nor
18 Ms. Kliethermes has included all of these items in their respective estimates of
19 additional load-sensitive MISO market settlement, transmission and administration
20 charges and credits.

Table JRD-1

Material Ameren Missouri MISO Market Settlement, Transmission and Administration Items Materially Sensitive to the Amount of Load Served by Ameren Missouri (excluding Energy settlements, Capacity settlements and MISO Schedule 26-A Charges)			
Item	Part of ANEC	Michels Rebuttal	Kliethermes Highly Sensitive Rebuttal
DA RSG Distribution Amount	Yes	No	No
RT Distribution of Losses Amount (credit)	Yes	No	No
RT Miscellaneous Amount	Yes	No	No
RT Net Inadvertent Amount	Yes	Yes	No
RT Revenue Neutrality Uplift Amount	Yes	No	Yes
RT RSG First Pass Distribution Amount	Yes	No	No
RT Regulation Cost Distribution Amount	Yes	Yes	Yes
RT Spinning Reserve Cost Distribution Amount	Yes	Yes	Yes
RT Supplemental Reserve Cost Distribution Amount	Yes	Yes	Yes
ARR Stage 2 Distribution Amount (credit)	Yes	No	No
MISO Market Administration Charges (MISO Schedule 17)	No	Yes	Yes
MISO Schedule 24 Allocation Amount	No	Yes	Yes
MISO Schedule 10 Transmission Administration Charge	No	No	Yes
MISO Schedule 10-FERC (FERC Assessment)	No	No	Yes

1 **Q IF THE DETAIL OF YOUR DIRECT TESTIMONY ANEC IMPACT ESTIMATE IS**
2 **EXPANDED TO INCLUDE ANY OF THE ITEMS IN TABLE JRD-1, SHOULD IT BE**
3 **EXPANDED TO INCLUDE ALL OF THE ITEMS?**

4 **A** Yes, if any of the items are added all of them should be added as some are charges
5 and others are credits. However, as I noted earlier, none of them should be added
6 unless the detail of the estimate is also expanded to include the impact of the small
7 reduction in energy market prices that would result from the shutdown of Noranda's
8 New Madrid facilities.

9 **Q HAVE YOU ESTIMATED THE IMPACT OF A NORANDA SHUTDOWN ON ALL OF**
10 **THESE MISO CHARGES AND CREDITS?**

11 **A** Yes. I have developed estimates for all of these MISO charges and credits.

12 In response to Data Request MPSC 0010, Ameren Missouri provided
13 historical data on its actual day-ahead cleared load, actual real-time cleared load, and

1 actual cleared amounts for each of the above MISO market settlement items for the
2 past five years. For each of the MISO market settlements items (i.e., those items in
3 Table JRD-1 that are included in Ameren Missouri's ANEC) except for ARR Day 2
4 Distribution Amounts, I calculated the annual amount per MWh of actual metered load
5 for 2011, 2012 and 2013 to obtain the change in these amounts per MWh of load
6 reduction as shown in Schedule JRD-Surrebuttal-4.

7 For ARR Day 2 Distribution Amounts, I took the total annual amount for this
8 credit for Ameren Missouri for 2013 and divided it through an estimate of Ameren
9 Missouri's Stage 2 ARR entitlement MW in order to obtain the change in Ameren
10 Missouri's ARR Stage 2 Distribution Amount per MW-year of load reduction as shown
11 in Schedule JRD-Surrebuttal-5.

12 In Schedules JRD-Surrebuttal-2 and JRD-Surrebuttal-3, I combined the per
13 MW-year ARR Stage 2 Distribution Amount estimate and the per MWh estimate for
14 the remaining MISO market settlement charges and credits to arrive at a net increase,
15 rather than decrease, in Ameren Missouri's ANEC from these charges and credits of
16 \$0.18 for every MWh Ameren Missouri would have sold to Noranda.

17 With respect to the MISO administration charges in Table JRD-1 (i.e., the
18 items in Table JRD-1 that are not included in Ameren Missouri's ANEC), except for
19 MISO Schedule 24, I used MISO's latest posted rate for each charge. For MISO
20 Schedule 24, I used Ameren's Missouri's actual 2013 MISO Schedule 24 Allocation
21 Amount charges divided by Ameren Missouri's actual metered load for 2013 as
22 shown in Schedule JRD-Surrebuttal-4. Summing all of these MISO administration
23 charges together in Schedules JRD-Surrebuttal-2 and JRD Surrebuttal-3, I calculated
24 Ameren Missouri would see a net decrease of its costs from these items of \$0.31 for
25 every MWh that it would have sold to Noranda. Combining this \$0.31 per MWh MISO

James R. Dauphinais
Page 29

1 administration cost decrease with the \$0.18 per MWh net MISO market settlement
2 cost increase yields a net MISO cost decrease for Ameren Missouri from all of the
3 items in Table JRD-1 of \$0.13 for every MWh that Ameren Missouri would have sold
4 to Noranda. This is far less of a decrease in this cost than was estimated by either
5 Mr. Michels and Ms. Kliethermes. However, even then, it does not reflect the
6 offsetting increase in its Ameren Missouri's ANEC that would result from the small
7 reduction of energy market prices that would occur from a shutdown of Noranda's
8 New Madrid facilities.

9 **Q PLEASE EXPLAIN WHY YOU HAVE NOT INCLUDED MISO SCHEDULE 26**
10 **REGIONAL TRANSMISSION CHARGES IN TABLE JRD-1.**

11 A I excluded them because, as I have noted, Ameren Missouri's MISO Schedule 26
12 transmission charges are not materially sensitive to the amount of load served by
13 Ameren Missouri. This is true because under Schedule 26 the percent allocation of
14 the cost of each MISO Schedule 26 transmission project to each transmission pricing
15 zone in MISO is fixed at the time the transmission project is approved by MISO. As a
16 result, the cost allocation under MISO Schedule 26 to each transmission pricing zone
17 is unaffected by any future change in the load in that transmission pricing zone. This
18 means that, if an electric utility in a transmission pricing zone has a very high share of
19 the total load in that transmission pricing zone (e.g., Ameren Missouri in MISO
20 Transmission Pricing Zone 3B), the utility will see only a very small reduction in its
21 Schedule 26 charges from the loss of a portion of its load (e.g., Noranda's load)
22 because the loss of the load will not cause the MISO Schedule 26 revenue
23 requirement allocated to the transmission pricing zone to go down.

James R. Dauphinais
Page 30

1 Q HAVE YOU QUANTIFIED THE VERY SMALL REDUCTION IN AMEREN
2 MISSOURI'S SCHEDULE 26 CHARGES THAT WOULD RESULT FROM A
3 SHUTDOWN OF NORANDA'S NEW MADRID FACILITIES?

4 A Yes, I have done so in my Schedule JRD-Surrebuttal-6. In the schedule, I calculate
5 the MISO Schedule 26 rate for MISO Transmission Pricing Zone 3B (the transmission
6 pricing zone in which Ameren Missouri is located) with and without the Noranda load
7 and Ameren Missouri's MISO Schedule 26 billing units with and without Noranda's
8 load. In the schedule, I estimate Ameren Missouri's annual Schedule 26 charges to
9 be \$11.081 million with Noranda's load and \$11.026 million without Noranda's load.
10 So, the annual MISO Schedule 26 charge savings from a shutdown of Noranda would
11 be less than \$60,000 or approximately \$0.01 for every MWh of sales that would have
12 been made to Noranda. I have incorporated this very small value into my revised
13 ANEC impact estimate that I present in Schedules JRD-Surrebuttal-1,
14 JRD-Surrebuttal-2 and JRD-Surrebuttal-3.

15 Q DOES AMEREN MISSOURI GENERALLY AGREE THAT ITS MISO SCHEDULE 26
16 CHARGES ARE NOT MATERIALLY SENSITIVE TO THE AMOUNT OF LOAD IT
17 SERVES?

18 A Yes, this appears to be the case. In its response to Data Request Noranda 4-27 j.,
19 Ameren Missouri identified a corrected annual Schedule 26 charge savings in the
20 same neighborhood as the number I estimated above from publicly available data.

1 Q YOU HAVE INDICATED THAT YOUR DIRECT TESTIMONY ANEC IMPACT
2 ESTIMATE SHOULD NOT BE EXPANDED IN DETAIL TO INCORPORATE ANY
3 OF THE MISO CHARGES AND CREDITS IN YOUR TABLE JRD-1 UNLESS THE
4 ESTIMATE IS ALSO EXPANDED TO CAPTURE THE IMPACT OF THE SMALL
5 REDUCTION IN ENERGY MARKET PRICES THAT WOULD RESULT FROM A
6 SHUTDOWN OF NORANDA'S LOAD. HAVE YOU DEVELOPED AN ESTIMATE
7 OF THE IMPACT OF THE SMALL REDUCTION IN ENERGY MARKET PRICES
8 THAT WOULD RESULT FROM A SHUTDOWN OF NORANDA'S LOAD?

9 A Yes. I have developed a conservative estimate of the around-the-clock average
10 expected percentage drop in energy market prices at the AMMO.UE pricing node for
11 the shutdown of Noranda's load. I then applied this result in two ways. First, I used it
12 to reduce the market price for the Net Energy, Transmission Loss and Congestion
13 Cost that Ameren Missouri would directly avoid for not having to clear the Noranda
14 load in the MISO energy market. Second, I reduced Ameren Missouri's average
15 actual annual off-system energy sales revenues and purchased power expenses for
16 2011 through 2013 by my estimated average percentage drop in energy market
17 prices that would result from the shutdown of the Noranda load. This captures the
18 fact that a reduction in energy market prices would lower Ameren Energy's off-system
19 energy sales and purchased energy cost roughly in direct proportion to the
20 percentage drop in energy market prices.

1 **Q PLEASE EXPLAIN HOW YOU ESTIMATED THE AVERAGE EXPECTED**
2 **AROUND-THE-CLOCK DROP IN ENERGY MARKET PRICES AT THE AMMO.UE**
3 **PRICING NODE FOR A SHUTDOWN OF NORANDA’S LOAD.**

4 A I obtained from the MISO website historical hourly data on day-ahead energy market
5 prices at the AMMO.UE pricing node and total MISO market load⁷ for the 36 month
6 period ending December 31, 2013. I then, for each hour, calculated the percent
7 change in energy market prices from the previous hour per MW of load change from
8 the previous hour. I then sorted this data from lowest to highest percentage per MW
9 and determined the median and percentile ranks of the data that are presented in
10 Schedule JRD-Surrebutal-7. The median from this analysis was an energy market
11 price reduction of 1.76% for Noranda’s average hourly load of 492.6 MW (4,314,915
12 MWh / 8,760 hour). I then had a linear regression of this data performed which
13 yielded an energy market price reduction of 1.81% for Noranda’s average hourly load
14 of 492.6 MW. I then rounded these combined analytical results down to a 1.5%
15 energy market price reduction to be conservative.

16 **Q PLEASE EXPLAIN HOW YOU APPLIED THIS 1.5% ENERGY MARKET PRICE**
17 **REDUCTION ESTIMATE TO YOUR ANEC IMPACT ESTIMATE.**

18 A First, I added the line item titled “1.5% Market Price Reduction Impact on Net Energy
19 Transmission Loss and Congestion Costs” as shown in Schedules JRD-Surrebuttal-2
20 and JRD-Surrebuttal-3 to capture the 1.5% lower market price at which Ameren
21 Missouri would be able to sell the power it would have sold to Noranda into the MISO
22 market. This reduced the ANEC savings to Ameren Missouri from a shutdown of

⁷MISO’s Medium Term Load Forecast was used as a proxy for MISO’s total day-ahead cleared market load.

1 Noranda's load by \$0.41 to \$0.42 for every MWh that would have been sold to
2 Noranda.

3 Second, in Schedule JRD-Surrebuttal-8, I calculated an estimate of the
4 decrease in off-system energy sales revenues and purchased power expenses for
5 Ameren Missouri that would result from the energy market price reduction. I did this
6 by first subtracting Ameren Missouri's average annual purchased power expense
7 from 2011 through 2013 from its average annual off-system energy sales revenues
8 from 2011 to 2013. I then multiplied these annual average off-system energy sales
9 revenues less annual average purchased power expenses by 1.5% to estimate the
10 net annual impact of the decrease in off-system energy sales revenues and
11 purchased power costs for Ameren Missouri that would result from the market energy
12 price decrease. In Schedule JRD-Surrebuttal-8, I calculated this to be a net annual
13 decrease in Ameren Missouri's off-system energy sales revenues of \$2,626,080. In
14 other words, the small reduction in energy market prices due to a shutdown of
15 Noranda would increase Ameren Missouri's ANEC by \$2,626,080 annually due to
16 reduced off-system energy revenues even after deducting the savings in Ameren
17 Missouri's purchased power expenses that would result from the same reduction in
18 energy market prices. As shown in my Schedules JRD-Surrebuttal-2 and
19 JRD-Surrebuttal-3, this \$2,626,080 annual amount translates to an ANEC increase
20 for Ameren Missouri of \$0.63 for every MWh that would have otherwise been sold to
21 Noranda.

1 H. *Forecasted Market Prices for Capacity and Energy*

2 Q MR. MICHELS CRITICIZES YOUR DIRECT TESTIMONY ANEC IMPACT
3 ESTIMATE BECAUSE IT DOES NOT CONSIDER FORECASTED MARKET
4 PRICES FOR CAPACITY AND ENERGY FOR THE NEXT 10 YEARS INCLUDING
5 CURRENT FORWARD MARKET PRICES FOR ENERGY (MICHELS REBUTTAL
6 AT 23-38). HOW DO YOU RESPOND?

7 A First and foremost, while the Noranda rate proposal of \$30 per MWh provides for up
8 to 2% rate increase for Noranda during each future Ameren Missouri base rate case
9 over the term, it is my understanding that the Commission is not precluded from
10 reviewing the continued reasonableness of the Noranda rate in future Ameren
11 Missouri rate proceedings before the Commission. Thus, if anything even remotely
12 close to the horror story Mr. Michels tries to paint with forward market prices for
13 energy and Ameren Missouri's own 10 year projection of the market price for capacity
14 and energy were to develop in actual hourly MISO day-ahead market prices for
15 energy and actual annual MISO market prices for capacity during the 10 year
16 proposed term of the Noranda rate proposal, the Commission would have an ability to
17 revisit the Noranda rate.

18 Second, neither forward market prices for energy nor Ameren Missouri's own
19 projections for the market prices for energy and capacity over the next 10 years are
20 known and measurable values that should be utilized in setting a rate.

21 Third, Ameren Missouri itself has opposed the use of forward market prices for
22 energy to set the NBEC portion of its base rate revenue requirement. Furthermore, to
23 the extent it has referenced forward market prices in those proceedings, it has
24 focused on forward market prices on a rolling 12-month basis rather than forward
25 market prices for delivery of power a few years into the future. In addition, it has not

James R. Dauphinais
Page 35

1 in any of those five base rate proceedings proposed to use its own long-term
2 projections of future market prices for capacity and energy.

3 Fourth, the current forward market prices for energy are greatly distorted as
4 part of the aftermath of the Polar Vortex Anomaly. As after the market anomaly
5 associated with Hurricanes Katrina and Rita, it will take some time for forward market
6 prices for energy to come down to more rational levels. Until that time, they should
7 not be utilized at all in ratemaking other than to understand the degree of fear that is
8 present in the current forward market for energy.

9 **Q YOU HAVE ASSERTED FORWARD MARKET PRICES FOR ENERGY AND**
10 **AMEREN MISSOURI'S 10-YEAR PROJECTIONS OF MARKET PRICES FOR**
11 **CAPACITY AND ENERGY ARE NOT KNOWN AND MEASURABLE VALUES AND**
12 **SHOULD NOT BE USED TO SET RATES. PLEASE EXPLAIN WHY THESE**
13 **VALUES SHOULD NOT BE CONSIDERED KNOWN AND MEASURABLE VALUES**
14 **FOR RATEMAKING PURPOSES.**

15 These forward market prices and projections of market prices are not the prices at
16 which Ameren Missouri will sell the power that it would have otherwise sold to
17 Noranda. This power will instead be sold into the MISO day-ahead energy market,
18 MISO annual PRA for capacity and/or the bilateral market for capacity. Forward
19 market prices for energy at best represent the market consensus on a particular
20 trading day of the spot market price for energy for a future delivery period at a specific
21 delivery point. Thus, both forward market prices for energy and Ameren Missouri's
22 own projections of the future market price of capacity and energy are only predictions
23 of the future that may or may not come true. While it is appropriate to give some
24 consideration in ratemaking to these predictions (e.g., with respect to whether they

1 provide any anecdotal evidence in support of the continuation of upward or downward
2 cost trends that are seen in historical prices), it is not reasonable to set rates on the
3 basis of predictions especially when the Commission will have the ongoing ability to
4 review the reasonableness of the proposed rate in the future as necessary.

5 Rates should be set based on known and measureable values such as three
6 years worth of known historical market prices with severe abnormalities removed and
7 any consistent known and measurable historic trend reflected as I have proposed in
8 this testimony. As I have noted, this is the same general approach that has been
9 used in Ameren Missouri's five most recent base rate proceedings to set the NBEC
10 portion of Ameren Missouri's base rate revenue requirement both without an FAC and
11 with an FAC. This approach should be used as the measuring stick to evaluate the
12 reasonableness of Noranda's rate proposal in this proceeding, not predictions of
13 future spot market prices that may or may not be wrong.

14 **Q CAN YOU PLEASE PROVIDE SOME MORE BACKGROUND ON AMEREN**
15 **MISSOURI'S HISTORIC USE IN ITS RECENT BASE RATE PROCEEDINGS OF**
16 **FORWARD MARKET PRICES FOR ENERGY AND ITS OWN PROJECTIONS OF**
17 **FUTURE MARKET PRICES FOR CAPACITY AN ENERGY?**

18 **A** Yes. As I discussed in detail earlier, for its most recent five base rate proceedings,
19 Ameren Missouri has consistently proposed to use average historical spot energy
20 prices (with any Ameren Missouri-identified anomalies removed) as an input to the
21 determination of the NBEC portion of its base rate revenue requirement. It has not
22 proposed to use forward market prices for energy or other projections of the future
23 market price for energy to determine its NBEC except in the limited context of a
24 temporary placeholder for future delivery months until actual hourly energy prices

1 became available in the proposed true-up period proposed by Ameren Missouri for
2 that rate proceeding. Furthermore, Ameren Missouri witness Schukar in Case
3 No. ER-2007-0002 indicated “[w]e understand that reliance on forward market prices
4 is not appropriate for the purpose of ratemaking in Missouri” (Ameren Missouri
5 witness Schukar Rebuttal in Case No. ER-2007-0002 at 30). This said, Ameren
6 Missouri in those past proceedings has on occasion offered forward market prices for
7 energy on a rolling 12-month basis as anecdotal evidence.

8 **Q PLEASE EXPLAIN HOW FORWARD MARKET PRICES FOR ENERGY ARE**
9 **CURRENTLY DISTORTED BY THE POLAR VORTEX ANOMALY AND WHAT**
10 **LESSON WE CAN DRAW FROM THE HURRICANES KATRINA AND RITA**
11 **MARKET ANOMALY.**

12 A I have already discussed the Polar Vortex Anomaly itself and its impact on actual
13 hourly market prices for energy. In his rebuttal testimony, Mr. Michels provided the
14 following figure, which I repeat here as Figure JRD-5, depicting around-the-clock
15 Indiana Hub forward market prices for 2015, 2016, 2017 and 2018 as traded during
16 and immediately following the Polar Vortex Anomaly as compiled by Ameren Missouri
17 from publications and market quotes.⁸

⁸It is important to note that Indiana Hub and AMMO.UE have a significant basis differential between them due to transmission congestion between them. As a result, any forward energy market product purchased at AMMO.UE would have a lower cost than at Indiana Hub (neglecting any sparsity premiums or discounts due to AMMO.UE being a much less commonly used forward market trading location than Indiana Hub).

Figure JRD-5

1 As can be seen in Figure JRD-5, there has been a very large increase in
2 forward market prices for energy for 2015, 2016, 2017 and 2018 during this trading
3 period. However, this is not normal and the abnormality can be attributed to the after
4 effects of the Polar Vortex Anomaly. Figure JRD-6 below provides around-the-clock
5 forward market prices for 2015 for Indiana Hub as reported by Platts for the trading
6 days in the period of November 1, 2013 through December 31, 2013 – just before the
7 Polar Vortex Anomaly began.

Figure JRD-6

1 Figure JRD-7 below provides around-the-clock forward market prices for the
2 prompt calendar year (the calendar year immediately following the trading date) for
3 Indiana Hub as reported by Platts for the trading days for the period of February 12
4 through April 30 of 2012 and 2013 – the same group of trading days in 2012 and
5 2013 as shown in 2014 during and immediately after the Polar Vortex Anomaly.

Figure JRD-7

1 In neither Figure JRD-6 nor Figure JRD-7 do we see the abnormal forward
2 market behavior that we see in Figure JRD-5 during and immediately following the
3 Polar Vortex Anomaly. Current forward market prices are distorted as a result of the
4 aftermath of the Polar Vortex Anomaly and, as a result, cannot be relied upon as a
5 good indicator of future actual hourly energy market prices.

6 **Q PLEASE COMPARE THIS TO FORWARD ENERGY MARKET PRICES DURING**
7 **AND FOLLOWING THE HURRICANES KATRINA AND RITA MARKET ANOMALY.**

8 A Figure JRD-8 below provides on-peak and off-peak forward energy market prices
9 trades at Cinergy Hub, the ancestor of Indiana Hub, from May 2002 through March
10 2007.

Figure JRD-8

**Forward Prices for Next Calendar Year
(On-Peak 5x16 block purchases)**

1 Hurricane Dennis made landfall in the US on July 11, 2005 followed by Katrina
2 on August 29, 2005 and Rita on September 24, 2005. A steep rise in forward energy
3 market prices can be seen to begin in August of 2005 that ultimately peaked in
4 December of 2005. This is generally similar to the rise in forward energy market
5 prices that we have seen in the aftermath of the Polar Vortex Anomaly. Figure JRD-8
6 also shows that it took until September of 2006 to completely shake off from the
7 forward energy market the aftermath of the Hurricanes Katrina and Rita anomaly.
8 However, the bottom line is that the market did ultimately shake off the anomaly and
9 returned to the then normal consistent year after year upward trend in forward energy

1 market prices that existed until 2008. The same forward energy market recovery
2 should happen again with the Polar Vortex Anomaly.

3 **Q WILL ACTUAL HOURLY ENERGY MARKET PRICES TAKE AS LONG TO**
4 **RECOVER AS FORWARD ENERGY MARKET PRICES?**

5 A It is unlikely it will take as long largely because the forward energy market reflects
6 fears associated with future risks that are not present in the day-to-day hourly energy
7 market. As shown back on my Figure JRD-4, actual MISO day-ahead hourly energy
8 market prices largely returned to normal levels following the Hurricanes Katrina and
9 Rita anomaly by January of 2006, while, as shown above in Figure JRD-8, rolling
10 12-month forward energy market prices remained elevated into the summer of 2006.
11 This can also be seen back on my Figure JRD-1 in that annual average hourly energy
12 market prices in that figure for calendar year 2006 are much lower than for calendar
13 year 2005 in that same figure. Similar to what happened after the Hurricanes Katrina
14 and Rita Anomaly, it is reasonable to expect current actual hourly energy market
15 prices will fully return to normal levels much sooner than forward energy market
16 prices.

17 *I. Avoided Generation Resource and Other Avoided Capital Expenditures*

18 **Q PLEASE EXPLAIN MR. MICHELS' CRITICISM OF YOUR ANEC IMPACT**
19 **ESTIMATE NOT CAPTURING SAVINGS FROM AVOIDED GENERATION**
20 **RESOURCE CAPITAL EXPENDITURES.**

21 Q Mr. Michels asserts that if Noranda's New Madrid facilities ceased operation, Ameren
22 Missouri's addition of any new generation resources could be substantially delayed or
23 even eliminated (Michels Rebuttal at 30). He goes on to suggest it would allow for

1 greater flexibility in addressing environmental regulations, planning for the eventual
2 retirement of aging generators in Ameren Missouri's existing generation fleet and
3 taking steps to transition Ameren Missouri's resource portfolio to one that relies more
4 on cleaner sources of energy (*Id.*).

5 **Q HOW DO YOU RESPOND TO MR. MICHELS WITH RESPECT TO THIS ISSUE?**

6 A Due to Ameren Missouri's current supply portfolio, which is already long on capacity,
7 the issue is a red herring at best. Furthermore, Ameren Missouri has filed previous
8 testimony citing concerns with significant transmission congestion on the Ameren
9 Missouri and AECl transmission systems if Noranda's New Madrid facilities were to
10 be shut down. This transmission congestion could increase costs for both Ameren
11 Missouri and AECl customers. Those increased costs might trigger the need for new
12 transmission capital expenditures. Thus, a shutdown of Noranda's New Madrid
13 facilities might trigger the need for capital expenditures by Ameren Missouri.

14 In discovery in this current proceeding, Ameren Missouri was asked to
15 identify when it currently projects the need for a major new generation facility if
16 Noranda's New Madrid facilities remain in operation and are served by Ameren
17 Missouri. Ameren Missouri's answer to the data request was that it had not
18 performed the necessary analysis (Ameren Missouri response to Data Request
19 Noranda 4-5). Despite Ameren Missouri's claim it needs to perform an analysis, we
20 know from its February 8, 2013 filing of a Notification of Change in Preferred
21 Resource Plan in Case No. EO-2013-0392, that it will no longer include a new
22 combined cycle gas resource with an in service date of 2029 in its resource plan as a
23 result of changes in its load forecast (Notification of Change in Ameren Missouri's
24 Preferred Resource Plan, Case No. EO-2013-0392, February 8, 2013 at 3). As a

1 result, even if Ameren Missouri continues to serve Noranda's New Madrid facilities,
2 Ameren Missouri will not need to add any major new generation facilities until
3 sometime after 2029 – at least six years after the end of the 10-year term of
4 Noranda's rate proposal in this proceeding. Therefore, it is not a potentially avoidable
5 capital expenditure that should be considered in this proceeding.

6 **Q WHAT IF AMEREN MISSOURI ALSO RETIRED ONE OF ITS EXISTING**
7 **COAL-FIRED GENERATION FACILITIES EARLY?**

8 A This might accelerate Ameren Missouri's need for a major new generation facility by a
9 few years. However, Ameren Missouri has not announced any such intentions. So, it
10 should not be a determining factor in this proceeding. Furthermore, the continued
11 operation of Ameren Missouri's existing generation facilities will not be a function of
12 Ameren Missouri's load. Those decisions will be primarily driven by the value those
13 generation resources provide to Ameren Missouri's customers in the MISO market
14 versus the cost of environmental compliance and the cost of the additional capital
15 expenditures, if any, necessary to keep those resources operational. How much
16 value that each of Ameren Missouri's existing generation facilities provides to Ameren
17 Missouri customers in the MISO market is not a function of Ameren Missouri's load.
18 Nor are environmental compliance costs or other capital expenditure needs for those
19 generation facilities a function of Ameren Missouri's load.

1 Q YOU PREVIOUSLY NOTED THAT AMEREN MISSOURI HAS PREVIOUSLY
2 IDENTIFIED INCREASES IN TRANSMISSION CONGESTION COSTS THAT
3 MIGHT BE INCURRED IF NORANDA'S NEW MADRID FACILITIES WERE SHUT
4 DOWN. PLEASE EXPAND UPON THIS ISSUE.

5 A In Case No. EA-2005-0180, the proceeding in which Noranda became an Ameren
6 Missouri customer, Ameren Missouri witness Edward Pfeiffer filed direct testimony
7 that indicated:

8 "If Noranda were to cease operations, the power from these
9 surrounding generating sources would flow to a new sink and
10 destination. This could create significant amounts of congestion in the
11 area until additional outlet capacity could be built. It is unlikely that
12 normal load growth would add new loads to substitute for that of a
13 disappearing Noranda absent a replacement large- load customer.
14 Thus, Noranda's continued operation is important to avoid congestion
15 on the AmerenUE and AECI transmission systems."

16 (Ameren Missouri witness Pfeiffer Direct in Case No. EA-2005-0180 at 5).
17 This indicates that a shutdown of Noranda's New Madrid facilities could lead to
18 increased transmission congestion costs for both Ameren Missouri customers and
19 AECI member system customers. If those increased costs are high enough it could
20 lead to the need to make new transmission capital expenditures in order to address
21 that transmission congestion.

22 Q HAVE YOU INCLUDED AN ESTIMATE OF THESE COSTS ASSOCIATED WITH
23 CLOSURE OF THE SMELTER?

24 A No. Were I to do so the benefits of retaining Noranda would be even larger.

1 **III. Conclusion and Revised Estimate**

2 **Q PLEASE SUMMARIZE YOUR CONCLUSIONS.**

3 A While certain aspects of the criticism by Mr. Michels and Ms. Kliethermes of my direct
4 testimony ANEC impact estimate are valid, even when (i) my ANEC impact estimate
5 is adjusted to reasonably respond to those specific criticisms and (ii) MISO market
6 settlement and other MISO load-based charges are added in (which should only be
7 done if the small market price reduction from the shutdown of the Noranda New
8 Madrid facilities is also incorporated), I still estimate a combined ANEC and MISO
9 charge impact that is below the \$30 per MWh in retail sales revenues that would be
10 provided by Noranda under its rate proposal in this proceeding. Specifically, my
11 revised ANEC impact estimate indicates Ameren Missouri's ANEC (plus its MISO
12 load-based charges not included in ANEC) would decrease between \$27.91 and
13 \$28.49 for every MWh that would have been sold to Noranda.

14 With respect to the use of forecasted market prices, they are speculative and
15 generally should not be used in ratemaking. Furthermore, the Polar Vortex Anomaly
16 event of this past winter has distorted the current level of these prices. For these
17 reasons, the ANEC impact should be estimated based on three years of known
18 historical market prices with severe abnormalities removed and any consistent known
19 and measurable trend reflected. This is the approach I have used to develop my
20 revised ANEC impact estimate. Furthermore, while the proposed Noranda rate plan
21 of \$30 per MWh provides for up to 2% rate increase for Noranda during each future
22 Ameren Missouri base rate case over the 10-year term of the Noranda proposal, it is
23 my understanding that the Commission is not precluded from reviewing the continued
24 reasonableness of the Noranda rate in future Ameren Missouri rate proceedings.

James R. Dauphinais
Page 47

1 With respect to the future resource needs of Ameren Missouri, Ameren
2 Missouri is not currently projecting the need for any new generation resources during
3 the 10-year period of Noranda's rate proposal. In fact, its last available projection,
4 which it provided in 2013, is that Ameren Missouri will not need to add a major new
5 generation facility until sometime after 2029. Furthermore, as I discuss in detail in
6 this testimony, the continued operation of Ameren Missouri's existing generation
7 facilities will be a function of market prices and the cost for environmental compliance,
8 not the MW level of Ameren Missouri's load.

9 Finally, Ameren Missouri has in previous proceedings before the Commission
10 raised concerns with increased transmission congestion costs if Noranda's New
11 Madrid facilities were to be shut down. This increase in transmission congestion
12 could increase costs for Ameren Missouri customers and Associated Electric
13 Cooperatives, Inc. ("AECI") member system customers. It could also require these
14 two utility systems to incur new capital expenditures on their respective transmission
15 systems to address the increased transmission congestion. As a result, a shutdown
16 of Noranda's New Madrid facilities could actually require Ameren Missouri to incur
17 capital expenditures that it would not have otherwise had to incur.

18 My Schedule JRD-Surrebuttal-1 provides a high level summary of my revised
19 ANEC impact estimate and Schedules JRD-Surrebuttal-2 and JRD-Surrebuttal-3
20 provide the underlying detail for that schedule. My revisions can be summarized as
21 follows:

- 22 • I have updated the original core components of Ameren Missouri's ANEC that
23 were included in my direct testimony estimate of \$27.05 per MWh to reflect:
 - 24 – The AMMO.UE MISO pricing node rather than the AECI.AMMO pricing
25 node;
 - 26 – The AECI 3.5% loss factor;

- 1 – The use of normalized historical energy market prices for the most recent
2 36 month period with the Polar Vortex Anomaly removed;
- 3 – The effect of the estimated 1.5% reduction in energy market prices due to
4 a shutdown of Noranda’s load on the avoided cost of clearing the Noranda
5 load in the MISO energy market; and
- 6 – The 2014-2015 MISO Planning Resource Auction capacity price of
7 \$16.75 per MW-day.
- 8 • I have expanded my ANEC impact estimate to include all of Ameren Missouri’s
9 material MISO market settlement charges and credits that are materially sensitive
10 to the amount of load served by Ameren Missouri.
- 11 • I have expanded my ANEC impact estimate to include the impact of the estimated
12 1.5% reduction in energy market prices due to a shutdown of Noranda’s load on
13 Ameren Missouri’s off-system energy sales revenues and purchased power costs.
- 14 • I have expanded my ANEC impact estimate to include the very small drop in
15 Ameren Missouri’s Schedule 26 regional transmission charges that would result
16 from a shutdown of Noranda’s load.
- 17 • I have added to my ANEC impact estimate the MISO administration charges that
18 Ameren Missouri would avoid due to a shutdown of the Noranda load.

19 As I have noted, the net impact of all of the above adjustments is to raise my
20 direct testimony estimate of Ameren Missouri’s incremental cost savings from a
21 shutdown of the Noranda load from \$27.05 for every MWh that would have been sold
22 to Noranda to a range of \$27.91 to \$28.49 for every MWh that would have been sold
23 to Noranda. However, this revised ANEC and MISO administration cost savings
24 estimate is still \$1.51 per MWh to \$2.09 per MWh lower than the \$30 per MWh rate
25 proposed by Noranda.

26 **Q DOES THIS CONCLUDE YOUR SURREBUTTAL TESTIMONY?**

27 **A Yes.**

Ameren Missouri
Missouri Public Service Commission Case No. EC-2014-0224

Updated and Expanded Estimate of the Annual Reduction in Ameren Missouri's Actual Net Energy Cost ("ANEC")
and MISO Administration Charges
Under a Noranda Shutdown

Description	Using Average of Historic Energy Market Prices for May 2011 through April 2014 with January through March of 2014 Replaced with the Average of January through March of 2012 and 2013		Using Average of Historic Energy Market Prices for January 2011 through December 2013

Sources:

The \$26.69 per MWh Historical Market Price used for the Net Energy, Transmission Loss and Congestion Cost savings estimate is the around-the-clock average of the day-ahead hourly LMPs for the AMMO.UE Node for the 36 months ending April 30, 2014 (with January through March of 2014 replaced with the average of January through March of 2012 and 2013) as posted on the MISO website. This downward adjusted 36 month normalization period was selected to exclude the Polar Vortex anomaly event of January through March of 2014.

The Market Price of \$16.75 per MW-day used for the Net Capacity Cost savings estimate is the market clearing price for Zonal Resource Credits (ZRCs) for Local Resource Zone 5 (Missouri) in the MISO's Planning Resource Auction for the MISO 2014/2015 Planning Year as reported by MISO on its website at https://www.misoenergy.org/_layouts/MISO/ECM/Redirect.aspx?ID=174894.

The Forecasted MISO Tariff Schedule 26-A rate of \$0.37 per MWh is MISO's indicative Multi-Value Project (MVP) Schedule 26-A Annual Charge estimate for the Ameren Missouri Transmission Pricing Zone for 2014 as of August 6, 2013 as posted on the MISO website at www.misoenergy.org.

The MISO Market Settlement Components calculated from historical Ameren Missouri MISO Market Settlement amounts from 2011 through 2013 that are sensitive to load. 2013 data was ultimately utilized to be conservative since Ameren Missouri's Stage 2 ARR MW entitlements were only known for 2013 and the average non-ARR Stage 2 Market Settlement Amounts for 2011 through 2013 were lower than in 2013 alone.

All MISO administration charges, except for MISO Schedule 24, were based on the latest rate posted on the MISO website. Schedule 24 charges were based on Ameren Missouri's actual 2013 MISO Schedule 24 costs.

Notes:

Noranda Retail Sales assumed to be 4,169,000 MWh annually with a 98% Load Factor and 100% Annual Coincidence Factor at Noranda's meter. These sales gross up to 4,314,915 MWh at the AECI/MISO border due to AECI's 3.5% loss factor under Noranda transmission service agreement with AECI.

201,180 MW-days = 4,314,915 MWh / 8,760 hours per year / 98% (Load Factor) / 100% (Annual Coincidence Factor) x 107.3% (UCAP Planning Reserve Margin) x 102.2% (MISO Transmission Losses) x 365 days

513.68 MW-years = 4,314,915 MWh / 8,760 hours per year / 98% (Load Factor) / 100% (Annual Coincidence Factor) x 102.2% (MISO Transmission Losses)

4,499,840 MWh = 513.68 MW-years x 8,760 hours per year

502.62 MW-years = 4,314,915 MWh / 8,760 hours per year / 98% (Load Factor) / 100% (Annual Coincidence Factor)

National Weather Service Weather Forecast Office Chicago, IL

Coldest December-March Period in Chicago History

CHICAGO:

THE IMPRESSIVE COLD THIS PAST WINTER CONTINUED DURING MARCH...WITH A MONTHLY AVERAGE TEMPERATURE OF ONLY 31.7 DEGREES FOR THE MONTH. THIS RANKS AS THE 19TH COLDEST MARCH ON RECORD IN CHICAGO. HOWEVER...OF EVEN MORE INTEREST IS THE FACT THAT WITH THE ABNORMALLY COLD MARCH ACROSS THE AREA...THIS MADE THE AVERAGE TEMPERATURE FOR THE DECEMBER THROUGH MARCH PERIOD IN CHICAGO 22.0 DEGREES...WHICH IS THE COLDEST SUCH PERIOD ON RECORD FOR CHICAGO DATING BACK TO 1872!

HERE IS A LIST OF THIS YEARS DECEMBER THROUGH MARCH AVERAGE TEMPERATURE RELATED TO THE OTHER COLDEST SUCH PERIODS ON RECORD IN CHICAGO:

RANK	AVERAGE DEC-MAR TEMP	YEAR
1.	22.0	2013-14
2.	22.3	1903-04
3.	22.5	1977-78
	22.5	1892-93
5.	22.7	1978-79

ROCKFORD:

UNSEASONABLY COLD CONDITIONS ALSO OCCURRED IN ROCKFORD IN MARCH. THE AVERAGE MONTHLY TEMPERATURE WAS 29.6 DEGREES...WHICH WAS THE 12TH COLDEST MARCH ON RECORD. THE DECEMBER THROUGH MARCH AVERAGE TEMPERATURE FOR ROCKFORD WAS 18.4 DEGREES. THIS RANKS AS THE 2ND COLDEST SUCH PERIOD ON RECORD IN ROCKFORD DATING BACK TO 1906!

HERE IS A LIST OF THIS YEARS DECEMBER THROUGH MARCH AVERAGE TEMPERATURE RELATED TO THE OTHER COLDEST SUCH PERIODS ON RECORD IN ROCKFORD:

RANK	AVERAGE DEC-MAR TEMP	YEAR
1.	18.2	1977-78
2.	18.4	2013-14
3.	18.5	1978-79
4.	19.1	1911-12
5.	21.0	1981-82

Winter 2013-2014 Operations and Market Performance

Richard Doying
Midcontinent Independent System Operator
April 1, 2014

Overview

- Coldest temperatures experienced in two decades
- Successfully prepared for and managed new all-time winter market peak
- Electric/Gas Coordination Field Trial allowed for open communication
- Historic event led to key takeaways and lessons learned

Impacts of extreme low temperatures were experienced across the entire MISO Region. Temperatures in many areas were the coldest experienced in 20 years.

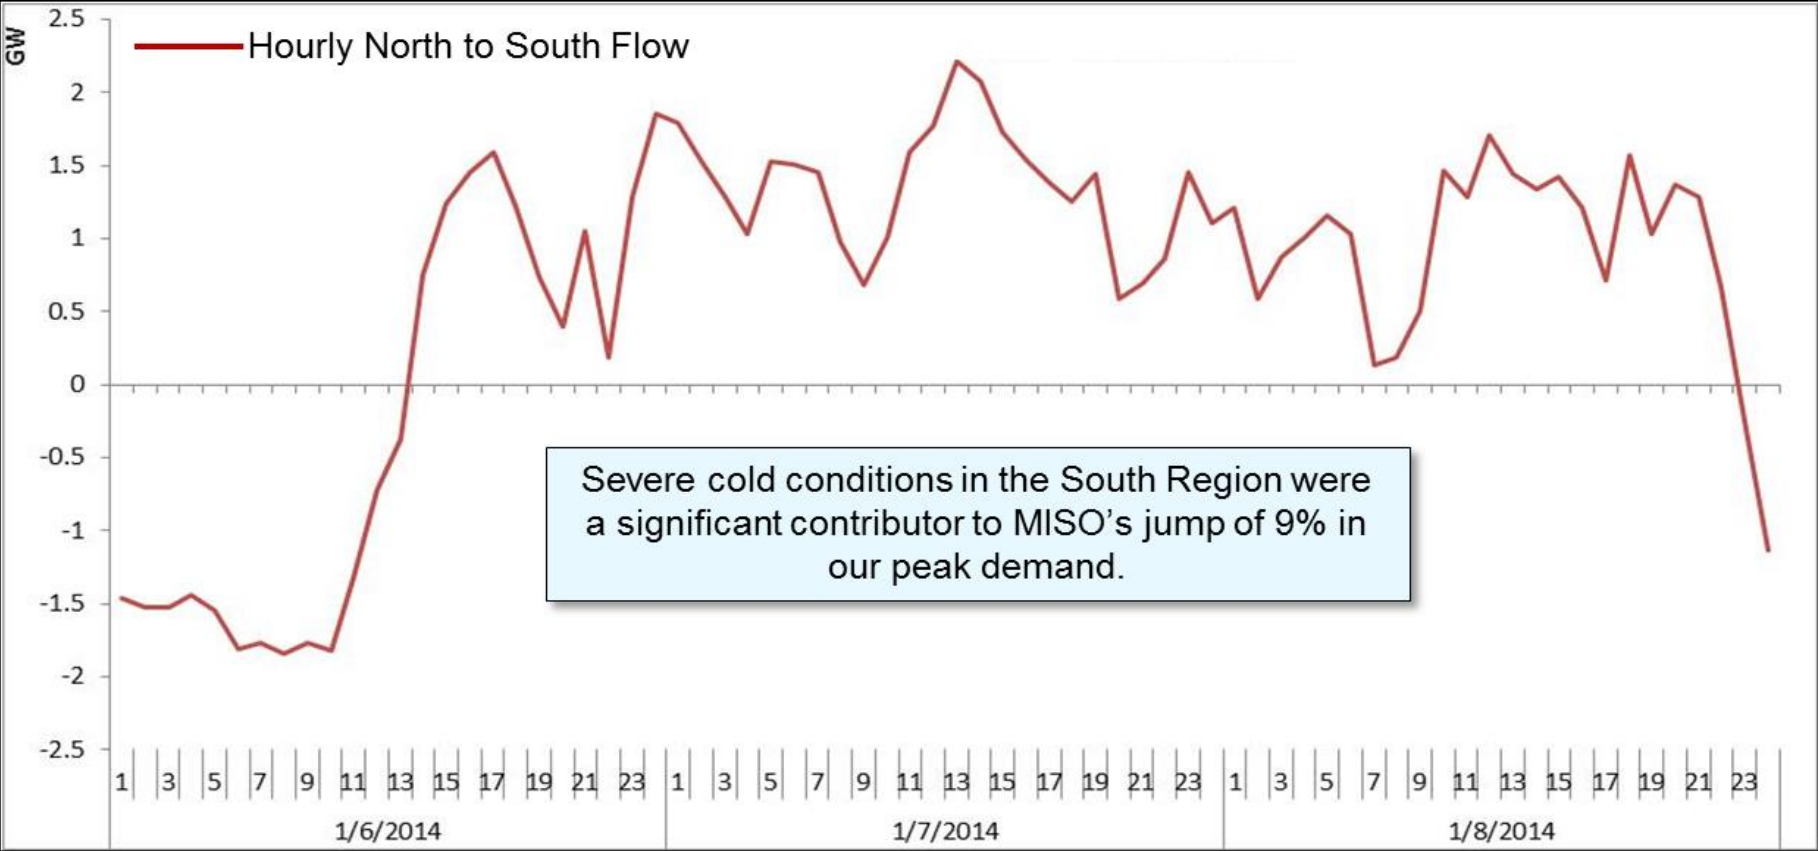

MISO System Wide Low Temperature Comparison
January/February/March

The number of forced outages escalated as the severe weather conditions moved into the footprint. Freezing components and fuel restrictions caused challenges for many units.

Load was able to be served broadly as flows reversed based on the low temperatures and high loads even while the South was experiencing peak conditions within their region near summer peak demands.

Negative North to South Flow means flow is from north to south

MISO experienced winter peak conditions on January 6th. Reduced peak load obligations on subsequent days freed up resources allowing MISO to assist PJM as the extreme cold temperatures moved into the East.

Negative sign of NSI between MISO and PJM means net import from PJM and positive sign indicates net export from PJM

Electric/Gas Coordination Field Trial allowed for open coordination with gas pipeline companies during these extreme weather conditions and during the TransCanada Pipeline explosion.

Provided opportunity to communicate any issues that could have impacted pipeline operations and gas flows to generation resources within our footprint

Explosion of a gas pipeline on the TransCanada Pipeline on January 25th added to the winter season's operational challenges

Extreme conditions were managed successfully due to extensive preparation and significant coordination with members and natural gas pipeline operators.

While this historic winter season was managed reliably, MISO continues to explore opportunities to improve.

Improved Coordination with the Gas Pipeline Operators through Electric-Natural Gas Coordination Task Force & on-going field trial

Substantial seasonal variation in Demand Side Resource availability

Enhance situational awareness around generation unavailability and post- analysis capabilities

Develop reliable, efficient, localized processes to manage local constraints to not unnecessarily impede regional transactions

Market Pricing, in general, was reflective of the tight operating system conditions. Need to enhance pricing to ensure demand response doesn't distort market signals.

Analytics and Surveillance Response

- Automated computer routines (“screens”) that sift through both public and non-public data, such as EQR data, ISO/RTO market data, including offer, uplift, and outage data and FTR holdings, e-Tags, ICE transaction data, large trader reporting data, Form 552 data, Bentek, and Platts.
- Built by DAS staff based on:
 - ✓ Known manipulative schemes
 - ✓ Market rules
 - ✓ Behavior that could constitute manipulation if entered into
 - ✓ Statistical measures that help identify market anomalies
 - ✓ Persistence measures

Analytics and Surveillance Response

- Analysts routinely run screens and analyze the output, sharing the results with all division staff, including management.
- While DAS surveillance screens are based on different parameters and theoretical approaches, many follow a common framework composed of three building blocks:
 - Tool → Target → Benefiting Position

Analytics and Surveillance Response

- Algorithmic surveillance screens generated multiple alerts in January and February for New England, the Mid-Atlantic, the Midwest and California.
- Staff followed up on these alerts and other information it received to identify potential market misbehavior.
 - ✓ Coordinated with RTO/ISO and market monitoring staff to discuss market conditions and operations and any issues they identified related to their markets
 - ✓ Conducted dozens of interviews with generators, gas suppliers and traders to gather market insights and facts relating to operations and bidding
 - ✓ Used Order 760 datasets to gather generator uplift payments and offers
 - ✓ Used the recently received CFTC Large Trader Report data to identify financial incentives by company at volatile hubs
 - ✓ Data requests were issued to certain companies

Analytics and Surveillance Observations

➤ Preliminary observations:

- ✓ Natural gas spot prices were at record levels, driven by high demand, pipeline flow restrictions, covering of physical short positions and concern for pipeline penalties .
- ✓ Pricing issues aggravated by power users not knowing gas needs within the gas trading window and pipelines restricting hourly usage flexibility. Users reflected expectation of low Northeast basis in their supply planning (e.g., due to increased Marcellus supply and new transport).

Analytics and Surveillance Observations

- Preliminary observations:
 - ✓ Higher levels of uplift related to conservative operations and high natural gas prices
 - ✓ Unable to re-supply oil as quickly as needed due to significant oil for power generation (fewer problems in New England due to this winter's fuel program)
 - ✓ Spot market supply was reduced. Firm users were able to buy gas but certain interruptible customers (especially power peaking units) were unable to obtain gas for some periods.
- Our review is ongoing and we will report to the Commission upon completion.

Ameren Missouri
Response to Noranda Data Request
MPSC Case No. EC-2014-0224
In the Matter of Noranda Aluminum, Inc.'s Request For Revisions to Union Electric
Company d/b/a Ameren Missouri's Large Transmission Service
Tariff to Decrease its Rate for Electric Service.

Data Request No.: Noranda 4-5

- 4.1. Please refer to Mr. Michels's rebuttal testimony at page 30, lines 4 through 8 and 15 through 18. Assuming Ameren Missouri continues to serve Noranda, Noranda remains in full operation and no retirements of the Company's existing generation facilities in the next 10 years, please identify the Company's latest projection of the year in which it will need to add new generation facilities to serve its retail customers. In addition, please provide a detailed explanation of the basis of that projection and a complete copy of all analyses and studies prepared by, or on behalf of, the Company regarding that projection.

**Noranda Aluminum, Inc.'s First Set
of Data Requests to Missouri Public Service Commission Staff**

- 1.2. Regardless of the response to the preceding question concerning MISO nodes, please explain in detail why these generation nodes are the relevant measure, as opposed to the AMMO.UE node.

Answer: Staff had misunderstood that these generation nodes are relevant in that the AMMO.UE Load Node is an aggregate price node per the MISO Tariff Module A Common Tariff Provisions part 1.9. Having had further discussion with Ameren Missouri, Staff has concluded that it would be more appropriate to use the AMMO.UE Load Node.
