

# **Volume 3: Residential Measures**

MEEIA 2024-26 Plan

	111550ul l	<u>I KIVI – Volume 5: Residential Measures Revision Log</u>
Revision	Date	Description
1.0	05/30/2018	Initial version filed for Commission approval.
2.0	12/21/2018	Updated "Deemed Tables" with PY2017 Evaluation results per Stipulation and Agreement (File No. EO-2018-0211). Added Demand Response language per Stipulation and Agreement.
3.0	1/01/2020	Updated "Deemed Tables" with PY2018 Evaluation results. Also includes revisions to HVAC measures and multifamily measures, based on feedback from evaluation contractor. This includes updates to Volume 3 of the TRM.
4.0	10/15/2020	Updated "Deemed Tables" with PY19 Evaluation results and other revisions to improve consistency with Deemed tables.
5.0	09/15/21	Updated "Deemed Tables" with PY20 Evaluation results and other revisions to improve consistency with Deemed tables.
6.0	09/26/2022	Updated "Deemed Tables" with PY21 Evaluation results and other revisions to improve consistency with Deemed Tables. Other revisions include updates to incremental costs for low flow showerheads, in-service rates for low flow showerheads and faucet aerators based on PY21 evaluation, incorporation of SEER to SEER2 and HSPF to HSPF2 conversion factors due to upcoming Code of Federal Regulation testing procedures, and updates to PTHP and PTAC baseline code efficiencies.
6.1	12/15/2022	Updated headers and footers to reflect MEEIA 2024-26. Made minor adjustments to reflect 14 SEER baselines for CAC & ASHP. This document will need to be updated in PY2023 per the normal TRM update process with new or updated measure assumptions as appropriate for PY2024-26.

## Volume 3: Residential Measures

## 3.1 Appliances

## 3.1.1 Refrigerator and Freezer Recycling

#### DESCRIPTION

This measure describes savings from the retirement and recycling of inefficient but operational refrigerators and freezers. Savings are provided in two ways. First, a regression equation is provided that requires the use of key inputs describing the retired unit (or population of units) and is based on a 2013 workpaper provided by Cadmus using data from a 2012 ComEd metering study and metering data from a Michigan study. The second methodology is a deemed approach based on 2011 Cadmus analysis of data from a number of evaluations.<sup>1</sup>

The savings are equivalent to the unit energy consumption of the retired unit and should be claimed for the assumed remaining useful life of that unit. A Part Use Factor is applied to account for those secondary units that are not in use throughout the entire year. The user should note that the regression algorithm is designed to provide an accurate portrayal of savings for the population as a whole and includes those parameters that have a significant effect on the consumption. The precision of savings for individual units will vary. This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating and cooling loads.

This measure was developed to be applicable to the following program type: ERET.

If applied to other program types, the measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT** N/A

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing inefficient unit must be operational and have a capacity of between 10 and 30 cubic feet.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The estimated remaining useful life of the recycling units is 8 years.<sup>2</sup>

#### **DEEMED MEASURE COST**

Measure cost includes the cost of pickup and recycling of the refrigerator and should be based on actual costs of running the program. If unknown, assume \$140 per unit.<sup>3</sup>

#### LOADSHAPE

Refrigeration RES Freezer RES

#### CALCULATION OF SAVINGS

#### **ENERGY SAVINGS**

#### Regression analysis: Refrigerators

-

Daily energy savings for refrigerators are based upon a linear regression model using the following coefficients:<sup>4</sup>

Independent Variable Description	Estimate Coefficient
Intercept	0.5822
Age (years)	0.0269
Pre-1990 (=1 if manufactured pre-1990)	1.0548
Size (cubic feet)	0.0673
Dummy: Side-by-Side (= 1 if side-by-side)	1.0706
Dummy: Single Door (= 1 if single door)	-1.9767
Dummy: Primary Usage Type (in absence of the program) (= 1 if primary unit)	0.6046
Interaction: Located in Unconditioned Space x CDD/365	0.0200
Interaction: Located in Unconditioned Space x HDD/365	-0.0447

$$\Delta kWh_{Unit} = \left[ 0.5822 + (Age * 0.0269) + (Pre - 1990 * 1.0548) + (Size * 0.0673) + (Side - by - side * 1.0706) + (Single - door * -1.9767) + (Primary Usage * 0.6046) + \left(\frac{CDD}{365} * Unconditioned * 0.0200\right) + \left(\frac{HDD}{365} * Unconditioned * -0.0447\right) \right] * Days * Part Use Factor$$

Where:

Age	= Age of retired unit
Pre-1990	= Pre-1990 dummy (=1 if manufactured pre-1990, else 0)
Size	= Capacity (cubic feet) of retired unit
Side-by-Side	= Side-by-side dummy (= 1 if side-by-side, else 0)
Single-Door	= Single-door dummy (= 1 if single-door, else 0)
Primary Usage	= Primary Usage Type (in absence of the program) dummy
	(= 1 if Primary, else 0. If unknown, assume 0.262. <sup>5</sup> )
CDD	= Cooling Degree Days
	$= 1678:^{6}$
Unconditioned	= If unit in unconditioned space = 1, otherwise 0. If unknown, assume $0.64$ . <sup>7</sup>
HDD	= Heating Degree Days

	= 365
Part Use	= To account for those units that are not running throughout the entire year. If available, Part-Use Factor
Factor	participant survey results should be used. If not available, assume 0.864.9

Deemed approach: Refrigerators

 $\Delta kWh_{Unit} = UEC * Part Use Factor$ 

Where:

UEC	= Unit Energy Consumption
	$= 1181 \text{ kWh}^{10}$
Part Use	= To account for those units that are not running throughout the entire year. If available, Part-Use Factor
Factor	participant survey results should be used. If not available, assume 0.864. <sup>11</sup>
$\Delta kWh_{Unit}$	= 1181 * 0.864
	= 1020  kWh

#### Regression analysis: Freezers:

Daily energy savings for freezers are based upon a linear regression model using the following coefficients:12

Independent Variable Description	<b>Estimate Coefficient</b>
Intercept	-0.8918
Age (years)	0.0384
Pre-1990 (=1 if manufactured pre-1990)	0.6952
Size (cubic feet)	0.1287
Chest Freezer Configuration (=1 if chest freezer)	0.3503
Interaction: Located in Unconditioned Space x CDD	0.0695
Interaction: Located in Unconditioned Space x HDD	-0.0313

 $\Delta kWh_{Unit} = [-0.8918 + (Age * 0.0384) + (Pre - 1990 * 0.6952) + (Size * 0.1287) + (Chest Freezer * 0.3503) + (CDD/365 * Unconditioned * 0.0695) + (HDD/365 * Unconditioned * -0.0313)] * Part Use Factor$ 

Where:

Age	= Age of retired unit
Pre-1990	= Pre-1990 dummy (=1 if manufactured pre-1990, else 0)
Size	= Capacity (cubic feet) of retired unit
Chest Freezer	= Chest Freezer dummy (= 1 if chest freezer, else 0)
CDD	= Cooling Degree Days (see table in refrigerator section)
Unconditioned	= If unit in unconditioned space = 1, otherwise 0. If unknown, assume $0.67$ . <sup>13</sup>
HDD	= Heating Degree Days (see table in refrigerator section)
Days	= Days per year = 365
Part Use	= To account for those units that are not running throughout the entire year. If available, Part-Use Factor
Factor	participant survey results should be used. If not available, assume 0.778. <sup>14</sup>

Deemed approach: Freezers

 $\Delta kWh_{Unit} = UEC * Part Use Factor$ 

Where:

UEC<br/>Reitred= Unit Energy Consumption of retired unit<br/>= 1061 kWh15Part Use= To account for those units that are not running throughout the entire year. If available, Part-Use Factor<br/>participant survey results should be used. If not available, assume  $0.778.^{16}$ <br/>= 1061 \* 0.778<br/>= 825 kWh

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh_{unit} * CF$ 

Where:

 $\Delta kWh_{unit}$  = Savings provided in algorithm above (not including  $\Delta kWh_{wasteheat}$ )

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor<sup>17</sup> Refrigerators = 0.0001285253 Freezers = 0.0001285253

#### NATURAL GAS SAVINGS

 $\Delta Therms = \Delta kWh_{Unit} * WHFeHeatGas * 0.03412$ 

Where:

 $\Delta kWh_{Unit}$  = kWh savings calculated from either method above, not including the  $\Delta kWh_{WasteHeat}$

**MEASURE CODE:** 

MEEIA 2024-26 Plan

Revision 6.1

<sup>&</sup>lt;sup>18</sup> Based on 212 days where HDD 65>0, divided by 365.25.

<sup>&</sup>lt;sup>19</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences. The predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the state. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8))\*(1-0.15) = 0.71.

<sup>&</sup>lt;sup>20</sup> Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls."

## 3.1.2 Air Purifier/Cleaner

#### DESCRIPTION

An air purifier (cleaner) meeting the efficiency specifications of ENERGY STAR<sup>®</sup> is purchased and installed in place of a model meeting the current federal standard.

This measure was developed to be applicable to the following program types: TOS and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient equipment is defined as an air purifier meeting the efficiency specifications of ENERGY STAR® as provided below.

1. Must produce a minimum 50 Clean Air Delivery Rate (CADR) for Dust<sup>21</sup> to be considered under this specification.

- 2. Minimum Performance Requirement: = 2.0 CADR/Watt (Dust)
- 3. Standby Power Requirement: = 2.0 Watts Qualifying models that perform secondary consumer functions (e.g., clock, remote control) must meet the Standby Power Requirement.
- 4. UL Safety Requirement: Models that emit ozone as a byproduct of air cleaning must meet UL Standard 867 (ozone production must not exceed 50ppb)

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is assumed to be a conventional unit.<sup>22</sup>

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The measure life is assumed to be 9 years.<sup>23</sup>

#### **DEEMED MEASURE COST**

The incremental cost for this measure is \$70.24

#### **LOADSHAPE** HVAC RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS<sup>25</sup>**

Energy Savings  $(kWh_{Year}) = \{CADR \times (1/Eff_{BL} - 1/Eff_{ES}) \times (Hr_{oper}) + (SBBL - SBES) \times (24 - Hr_{oper})\} \times 365/1000 * ISR$ Where:

CADR	= Clean air recovery rate for dust
$\mathrm{Eff}_{\mathrm{BL}}$	= Clean air recovery rate for dust per watt for baseline unit
$Eff_{ES}$	= Clean air recovery rate for dust per watt for ENERGY STAR® unit
Hr <sub>oper</sub>	= Hours per day of operation
SBBL	= Standby for baseline unit
SBES	= Standby for ENERGY STAR <sup>®</sup> unit
365	= Days/year
1,000	= Conversion factor (Wh/kWh)

Term	Value <sup>26</sup>
CADR	157.56
EFF <sub>BL</sub>	1.00
EFF <sub>ES</sub>	3.00
Hr <sub>oper</sub>	16
$SB_{BL}$	1.00
SB <sub>ES</sub>	0.391
ISR	94%

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

Where:

 $\Delta kWh$  = Gross customer annual kWh savings for the measure CF = 0.0004660805

NATURAL GAS SAVINGS

#### N/A

## WATER IMPACT DESCRIPTIONS AND CALCULATION $\ensuremath{\mathrm{N/A}}$

#### DEEMED O&M COST ADJUSTMENT CALCULATION

There are no operation and maintenance cost adjustments for this measure.<sup>27</sup>

**MEASURE CODE:** 

<sup>&</sup>lt;sup>21</sup> Measured according to the latest ANSI/AHAM AC-1 (AC-1) Standard.

<sup>&</sup>lt;sup>22</sup> As defined as the average of non-ENERGY STAR<sup>®</sup> products found in EPA research, 2011, ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator.

<sup>&</sup>lt;sup>23</sup> ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator.

<sup>&</sup>lt;sup>24</sup> Ameren Missouri MEEIA 2016-18 TRM, January 1, 2018.

<sup>&</sup>lt;sup>25</sup> ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator.

<sup>&</sup>lt;sup>26</sup> Ameren Missouri Efficient Products Evaluation PY2018

<sup>&</sup>lt;sup>27</sup> Some types of room air cleaners require filter replacement or periodic cleaning, but this is likely to be true for both efficient and baseline units and so no difference in cost is assumed.

## 3.1.3 Clothes Dryer

#### DESCRIPTION

This measure relates to the installation of a residential clothes dryer meeting the ENERGY STAR<sup>®</sup> criteria. ENERGY STAR<sup>®</sup> qualified clothes dryers save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions such as air flow and/or heat input rate, improving air circulation through better drum design or booster fans, and improving efficiency of motors. Reducing the runtime of dryers through automatic termination by temperature and moisture sensors is believed to have the greatest potential for reducing energy use in clothes dryers.<sup>28</sup> ENERGY STAR<sup>®</sup> provides criteria for both gas and electric clothes dryers.

This measure was developed to be applicable to the following program types: TOS and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

Clothes dryer must meet the ENERGY STAR<sup>®</sup> criteria, as required by the program.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is a clothes dryer meeting the minimum federal requirements for units manufactured on or after January 1, 2015.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 14 years.<sup>29</sup>

#### **DEEMED MEASURE COST**

Dryer Size	Incremental Cost <sup>30</sup>
Standard	\$75
Compact	\$105

#### LOADSHAPE

Miscellaneous RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

$$\Delta kWh = \left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff}\right) * Ncycles * \% Electric$$

Where:

Load

= The average total weight (lbs) of clothes per drying cycle. If dryer size is unknown, assume standard.

Dryer Size	Load (lbs) <sup>31</sup>
Standard	8.45
Compact	3

CEFbase = Combined energy factor (CEF) (lbs/kWh) of the baseline unit is based on existing federal standards energy factor and adjusted to CEF as performed in the ENERGY STAR<sup>®</sup> analysis.<sup>32</sup> If product class unknown, assume electric, standard.

Product Class	CEFbase
Vented Electric, Standard ( $\geq 4.4 \text{ ft}^3$ )	3.11
Vented Electric, Compact (120V) (< 4.4	3.01
Vented Electric, Compact (240V) (<4.4	2.73
Ventless Electric, Compact (240V) (<4.4	2.13
Vented Gas	2.8433

CEFeff = CEF (lbs/kWh) of the ENERGY STAR<sup>®</sup> unit based on ENERGY STAR<sup>®</sup> requirements.<sup>34</sup> If product class unknown, assume electric, standard.

Product Class	CEFeff
Vented or Ventless Electric, Standard ( $\geq$ 4.4 ft <sup>3</sup> )	3.93
Vented or Ventless Electric, Compact (120V) (< 4.4	3.80
Vented Electric, Compact (240V) (< 4.4 ft <sup>3</sup> )	3.45
Ventless Electric, Compact (240V) (< 4.4 ft <sup>3</sup> )	2.68
Vented Gas	3.4835

Ncycles = Number of dryer cycles per year. Use actual data if available. If unknown, use 283 cycles per year.<sup>36</sup>

%Electric = The percent of overall savings coming from electricity

<sup>&</sup>lt;sup>28</sup> ENERGY STAR<sup>®</sup> Market & Industry Scoping Report. Residential Clothes Dryers. Table 8. November 2011.

<sup>&</sup>lt;sup>32</sup> ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis.

<sup>&</sup>lt;sup>33</sup> Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

<sup>&</sup>lt;sup>34</sup> ENERGY STAR<sup>®</sup> Clothes Dryers Key Product Criteria. <u>https://www.energystar.gov/index.cfm?c=clothesdry.pr\_crit\_clothes\_dryers</u>

<sup>&</sup>lt;sup>35</sup> Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

<sup>&</sup>lt;sup>36</sup> Appendix D to Subpart B of Part 430 – Uniform Test Method for Measuring the Energy Consumption of Dryers.

= 100% for electric dryers, 5% for gas dryers<sup>37</sup>

Using defaults provided above:

Product Class	ΔkWh
Vented Electric, Standard ( $\geq 4.4 \text{ ft}^3$ )	145.7
Vented Electric, Compact (120V) (< 4.4 ft <sup>3</sup> )	53.8
Vented Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	58.9
Ventless Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	74.3
Vented Gas	7.0

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Where:

 $\Delta kW = \Delta kWh * CF$ 

∆kWh CF

= Energy Savings as calculated above

= Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001148238

Using defaults provided above:

Product Class	ΔkW
Vented Electric, Standard ( $\geq$ 4.4 ft <sup>3</sup> )	0.0251
Vented Electric, Compact (120V) (< 4.4 ft <sup>3</sup> )	0.0092
Vented Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	0.0101
Ventless Electric, Compact (240V) (<4.4 ft <sup>3</sup> )	0.0128
Vented Gas	0.0012

NATURAL GAS ENERGY SAVINGS

Natural gas savings only apply to ENERGY STAR<sup>®</sup> vented gas clothes dryers.

$$\Delta Therm = \left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff}\right) * Ncycles * Therm\_convert * \%Gas$$

Where:

Therm\_convert = Conversion factor from kWh to therm = 0.03413 %Gas = Percent of overall savings coming from gas = 0% for electric units and 84% for gas units<sup>38</sup>

Using defaults provided above:

ΔTherm

= (8.45/2.84 - 8.45/3.48) \* 257 \* 0.03413 \* 0.84 = 4.03 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

**Deemed O&M Cost Adjustment Calculation** N/A

**MEASURE CODE:** 

<sup>38</sup> Zero percent for gas dryers accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). Eighty-four percent was determined using a ratio of the gas to total savings from gas dryers given by ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis.

 <sup>&</sup>lt;sup>37</sup> One hundred percent for electric dryers accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). Five percent for gas dryers was determined using a ratio of the electric to total savings from gas dryers given by ENERGY STAR<sup>®</sup> Draft 2 Version 1.0 Clothes Dryers Data and Analysis. Value reported in 2015 EPA ENERGY STAR<sup>®</sup> appliance calculator.
 <sup>38</sup> Zero percent for gas dryers accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc.). Eighty-four percent was determined using

## 3.1.4 Clothes Washer

#### DESCRIPTION

This measure relates to the installation of a clothes washer meeting the ENERGY STAR<sup>®</sup> (CEE Tier1), ENERGY STAR<sup>®</sup> Most Efficient (CEE Tier 2), or CEE Tier 3 minimum qualifications. If the Domestic Hot Water (DHW) and dryer fuels of the installations are unknown (for example through a retail program), savings are based on a weighted blend using RECS data (the resultant values (kWh, therms and gallons of water) are provided). The algorithms can also be used to calculate site-specific savings where DHW and dryer fuels are known.

This measure was developed to be applicable to the following program types: TOS and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

Clothes washer must meet the ENERGY STAR<sup>®</sup> (CEE Tier1), ENERGY STAR<sup>®</sup> Most Efficient (CEE Tier 2), or CEE Tier 3 minimum qualifications (provided in the table below), as required by the program.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is a standard-sized clothes washer meeting the minimum federal baseline as of March 2015.<sup>39</sup>

Efficiency Level		Top loading >2.5 Cu ft	Front Loading >2.5 Cu ft
Baseline	Federal Standard	≥1.29 IMEF, ≤8.4 IWF	≥1.84 IMEF, ≤4.7 IWF
	ENERGY STAR <sup>®</sup> , CEE Tier 1	≥2.06 IMEF, ≤4.3 IWF	≥2.38 IMEF, ≤3.7 IWF
Efficient	ENERGY STAR <sup>®</sup> Most Efficient, CEE Tier 2	≥2.76 IMEF, ≤3.5 IWF	≥2.74 IMEF, ≤3.2 IWF
	CEE Tier 3	≥2.92 IMEF, ≤3.2 IWF	

The Integrated Modified Energy Factor (IMEF) includes unit operation, standby, water heating, and drying energy use, with the higher the value the more efficient the unit: "The quotient of the cubic foot (or liter) capacity of the clothes container divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, the energy required for removal of the remaining moisture in the wash load, and the combined low-power mode energy consumption."

The Integrated Water Factor (IWF) indicates the total water consumption of the unit, with the lower the value the less water required: "The quotient of the total weighted per-cycle water consumption for all 67 wash cycles in gallons divided by the cubic foot (or liter) capacity of the clothes washer."<sup>40</sup>

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 14 years.<sup>41</sup>

#### **DEEMED MEASURE COST**

The incremental cost assumptions are provided below:<sup>42</sup>

Efficiency Level	Incremental Cost
ENERGY STAR <sup>®</sup> , CEE Tier 1	\$32
ENERGY STAR <sup>®</sup> Most Efficient, CEE TIER 2	\$393
CEE TIER 3	\$454

Algorithm

#### CALCULATION OF SAVINGS

**ELECTRIC ENERGY SAVINGS** 

$$\Delta kWh = \left[ \left( Capacity * \frac{1}{IMEFbase} * Ncycles \right) * \left( \%CWbase + (\%DHWbase * \%Electric_{DHW}) + (\%Dryerbase * \%Electric_{DHW}) \right) \right] - \left[ \left( Capacity * \frac{1}{IMEFeff} * Ncycles \right) * \left( \%CWeff + (\%DHWeff * \%Electric_{DHW}) + (\%Dryereff * \%Electric_{Dryer}) \right) \right]$$

#### Where:

Capacity	= Clothes washer capacity (cubic feet)
	= Actual - If capacity is unknown, assume 3.45 cubic feet $^{43}$
IMEFbase	= Integrated Modified Energy Factor of baseline unit
IMEFeff	= Integrated Modified Energy Factor of efficient unit
	= Actual. If unknown, assume average values provided below.
Ncycles	= Number of Cycles per year
	$=271^{44}$
%CW	= Percentage of total energy consumption for Clothes Washer operation (different for baseline and efficient unit – see table below)

%DHW = Percentage of total energy consumption used for water heating (different for baseline and efficient unit – see table below)

%Dryer = Percentage of total energy consumption for dryer operation (different for baseline and efficient unit – see table below)

%Electric<sub>DHW</sub> = Percentage of DHW savings assumed to be electric

%Electric<sub>Dryer</sub> = Percentage of dryer savings assumed to be electric

<sup>&</sup>lt;sup>39</sup> See <u>http://www1.eere.energy.gov/buildings/appliance\_standards/product.aspx/productid/39</u>.

<sup>&</sup>lt;sup>40</sup> Definitions provided in ENERGY STAR<sup>®</sup> v7.1 specification on the ENERGY STAR<sup>®</sup> website.

<sup>&</sup>lt;sup>41</sup> Based on DOE Chapter 8 Life-Cycle Cost and Payback Period Analysis.

<sup>&</sup>lt;sup>42</sup> Based on weighted average of top loading and front loading units (based on available product from the California Energy Commission (CEC) Appliance database (<u>https://cacertappliances.energy.ca.gov/Pages/ApplianceSearch.aspx</u>) and cost data from Life-Cycle Cost and Payback Period Excel-based analytical tool. See "2015 Clothes Washer Analysis.xls" for details.

<sup>&</sup>lt;sup>43</sup> Based on the average clothes washer volume of all units that pass the new federal standard on the CEC database of clothes washer products (accessed on 08/28/2014). If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.
<sup>44</sup> Weighted average of 271 clothes washer cycles per year (based on 2009 Residential Energy Consumption Survey (RECS) national sample survey of housing appliances section, Midwest Census Region for state of Missouri): <u>http://www.eia.gov/consumption/residential/data/2009/</u>. See "2015 Clothes Washer Analysis.xls" for details. If utilities have specific evaluation results providing a more appropriate assumption for singlefamily or multifamily homes in a particular market or geographical area, then that should be used.

	IMEFbase

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

<sup>45</sup> Weighted average IMEF of Federal Standard rating for Front Loading and Top Loading units. Weighting is based upon the relative top v front loading percentage of available non-ENERGY STAR® product in the CEC database (accessed 08/28/2014). The relative weightings are: 67% front and 33% top for Baseline; 62% front and 38% top for ENERGY STAR CEE Tier 1; 98% front and 2% top for ENERGY STAR Most Efficient, CEE Tier 2; and 100% front for CEE Tier 3. See more information in "2015 Clothes Washer Analysis.xlsx."

<sup>46</sup> Weighting is based upon the relative top vs. front loading percentage of available product in the CEC database (accessed 08/28/2014).

<sup>47</sup> The percentage of total energy consumption that is used for the machine, heating the hot water, or by the dryer is different depending on the efficiency of the unit. Values are based on a weighted average of top loading and front-loading units based on data from DOE Life-Cycle Cost and Payback Analysis. See "2015 Clothes Washer Analysis.xls" for details.

<sup>48</sup> Default assumption for unknown fuel is based on EIA Residential Energy Consumption Survey (RECS) 2009 for Midwest Region, data for the state of Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.
 <sup>49</sup> Default assumption for unknown is based on percentage of homes with clothes washers that use an electric dryer from EIA Residential Energy Consumption Survey (RECS)

<sup>49</sup> Default assumption for unknown is based on percentage of homes with clothes washers that use an electric dryer from EIA Residential Energy Consumption Survey (RECS)
 2009 for Midwest Region, data for the state of Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.
 <sup>50</sup> Note that the baseline savings for all cases (front, top and weighted average) is based on the weighted average baseline IMEF (as opposed to assuming front baseline for front-

<sup>50</sup> Note that the baseline savings for all cases (front, top and weighted average) is based on the weighted average baseline IMEF (as opposed to assuming front baseline for frontefficient unit and top baseline for top- efficient unit). The reasoning is that the support of the program of more efficient units (which are predominately front loading) will result in some participants switching from planned purchase of a top loader to a front loader. Where:

$$\Delta kWh = Energy Savings as calculated above CF = Summer peak coincidence factor for measure = 0.0001148238$$

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below:

Front Loaders:

	ΔkW			
	<b>Electric DHW</b>	Gas DHW	Electric DHW	Gas DHW
	<b>Electric Dryer</b>	<b>Electric Dryer</b>	Gas Dryer	Gas Dryer

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

**MEASURE CODE:** 

<sup>&</sup>lt;sup>53</sup> Weighted average IWF of Federal Standard rating for front loading and top loading units. Weighting is based upon the relative top vs. front loading percentage of available non-ENERGY STAR<sup>®</sup> products in the CEC database.

<sup>&</sup>lt;sup>54</sup> IWF values are the weighted average of the new ENERGY STAR<sup>®</sup> specifications. Weighting is based upon the relative top vs. front loading percentage of available ENERGY STAR<sup>®</sup> and ENERGY STAR<sup>®</sup> Most Efficient products in the CEC database. See "2015 Clothes Washer Analysis.xls" for the calculation.

## 3.1.5 Dehumidifier

#### DESCRIPTION

A dehumidifier meeting the minimum qualifying efficiency standard established by the current ENERGY STAR<sup>®</sup> Version 4.0 (effective 2/1/2016) is purchased and installed in a residential setting in place of a unit that meets the minimum federal standard efficiency.

This measure was developed to be applicable to the following program types: TOS and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the new dehumidifier must meet the ENERGY STAR® standards as defined below:

Capacity (pints/day)	ENERGY STAR <sup>®</sup> Criteria (L/kWh)
<75	≥2.00
75 to ≤185	≥2.80

Qualifying units must be equipped with an adjustable humidistat control or must have a remote humidistat control to operate.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline for this measure is defined as a new dehumidifier that meets the federal standard efficiency standards. The federal standard for dehumidifiers as of October 2012 is defined below:

Capacity (pints/day)	Federal Standard Criteria (L/kWh)
Up to 35	≥1.35
> 35 to ≤45	≥1.50
> 45 to $\leq$ 54	≥1.60
> 54 to $\leq$ 75	≥1.70
$> 75 \text{ to} \le 185$	≥2.50

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The assumed lifetime of the measure is 12 years.<sup>55</sup>

#### **DEEMED MEASURE COST**

The assumed incremental capital cost for this measure is \$5.56

#### LOADSHAPE

Cooling RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

$$\Delta kWh = (((Avg Capacity * 0.473) / 24) * Hours) * (1 / (L/kWh_{Base}) - 1 / (L/kWh_{Eff}))$$

Where:

Avg Capacity	= Average capacity of the unit (pints/day)
	= Actual, if unknown assume capacity in each capacity range as provided in table below, or if capacity range
	unknown assume average.
0.473	= Constant to convert Pints to Liters
24	= Constant to convert Liters/day to Liters/hour
Hours	= Run hours per year
	$= 1632^{57}$
L/kWh	= Liters of water per kWh consumed, as provided in tables above

#### Annual kWh results for each capacity class are presented below:

Capacity Range	Capacity Used	Federal Standard	ENERGY STAR®	Annual kWh				
(pints/day) (pints/day)		Criteria (≥ L/kWh)	Criteria (≥ L/kWh)	Federal Standard	ENERGY STAR <sup>®</sup>	Savings		
≤25	20	1.35	2.0	477	322	155		
> 25 to ≤35	30	1.35	2.0	714	482	232		
> 35 to ≤45	40	1.5	2.0	857	643	214		
> 45 to $\leq$ 54	50	1.6	2.0	1005	804	201		
$> 54 \text{ to} \le 75$	65	1.7	2.0	1,229	1,045	184		
$> 75 \text{ to} \le 185$	130	2.5	2.8	1,672	1,493	179		
Average <sup>58</sup>						204		

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

Where:

$\Delta kWh$	= Energy Savings as calculated above
CF	= Summer peak coincidence demand (kW) to annual energy (kWh) factor
	= 0.0009474181

<sup>&</sup>lt;sup>55</sup> Lifetime determined by EPA research, 2012. ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator. (ENERGY STAR<sup>®</sup> Appliance Calculator.xlsx).

<sup>&</sup>lt;sup>56</sup> Incremental costs determined by EPA research on available models, July 2016. ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator. (ENERGY STAR<sup>®</sup> Appliance Calculator.xlsx).

<sup>&</sup>lt;sup>57</sup> Based on 24-hour operation over 68 days of the year. ENERGY STAR<sup>®</sup> Qualified Room Air Cleaner Calculator. (ENERGY STAR<sup>®</sup> Appliance Calculator.xlsx).

<sup>&</sup>lt;sup>58</sup> The relative weighting of each product class is based on number of units on the ENERGY STAR® certified list. See "Dehumidifier Calcs.xls."

Summer coincident peak demand results for each capacity class are presented below:

Capacity Range (pints/day)	Annual Summer peak kW Savings
≤25	0.095
> 25 to ≤35	0.142
> 35 to ≤45	0.131
> 45 to $\le$ 54	0.123
> 54 to $\leq$ 75	0.113
$> 75 \text{ to} \le 185$	0.110
Average	0.125

## NATURAL GAS SAVINGS N/A

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

**DEEMED O&M COST ADJUSTMENT CALCULATION** N/A

**MEASURE CODE:** 

## 3.1.6 Dehumidifier Recycling

#### DESCRIPTION

This measure describes the savings resulting from the retirement of existing residential, inefficient dehumidifier units from service prior to end of their natural life. This measure assumes that a percentage of these units will be replaced with a baseline standard efficiency unit (note that if the unit is actually replaced by a new ENERGY STAR<sup>®</sup> qualifying unit, the savings increment between baseline and ENERGY STAR<sup>®</sup> will be recorded in the Efficient Products program).

This measure was developed to be applicable to the following program type: ERET.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

N/A. This measure relates to the retiring of an existing inefficient unit.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is the existing inefficient dehumidifier unit.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 5 years.

#### **DEEMED MEASURE COST**

The incremental cost for this measure is \$42.76.

**LOADSHAPE** HVAC RES

Algorithm

#### CALCULATION OF SAVINGS

## ELECTRIC ENERGY SAVINGS<sup>59</sup>

Program Deemed Savings estimate:

Gross Electric Savings	Gross Demand Savings
(kWh/unit)	(kW/home)
139	.0648

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

Where:

 $\Delta kWh = Gross customer annual kWh savings for the measure$ CF = 0.0004660805

#### **MEASURE CODE:**

<sup>&</sup>lt;sup>59</sup> Deemed value per 2018 MEMD database for a drop-off program.

## 3.1.7 Refrigerator

#### DESCRIPTION

A refrigerator meeting either ENERGY STAR<sup>®</sup>/CEE Tier 1 specifications or the higher efficiency specifications of CEE Tier 2 or CEE Tier 3 is installed instead of a new unit of baseline efficiency. The measure applies to TOS and early replacement programs.

This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The high-efficiency level is a refrigerator meeting ENERGY STAR<sup>®</sup> specifications effective September 15th, 2014 (10% above federal standard), a refrigerator meeting CEE Tier 2 specifications (15% above federal standard), or CEE Tier 3 specifications (20% above federal standards).

#### **DEFINITION OF BASELINE EQUIPMENT**

Baseline efficiency is a new refrigerator meeting the minimum federal efficiency standard for refrigerators effective September 15th, 2014, for all programs except low-income direct install programs. For low-income programs, the baseline is the existing equipment.

**DEEMED LIFETIME OF EFFICIENT EQUIPMENT** 

17 years60

#### **DEEMED MEASURE COST**

The full cost of a baseline unit is \$742.61

The incremental cost to the ENERGY STAR<sup>®</sup> level is \$11, to CEE Tier 2 level is \$20, and to CEE Tier 3 is \$59.62

#### LOADSHAPE

Refrigeration RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Savings by model may be pulled directly from ENERGY STAR<sup>®</sup> data. Alternatively, savings by product class may be calculated according to the algorithm below:

$$\Delta kWh_{Unit} = kWh_{base} - (kWh_{new} * (1 - \%Savings))$$

Where:

kWh<sub>base</sub> = Baseline consumption,<sup>63</sup> assuming 22.5 ft<sup>3</sup> adjusted volume<sup>64</sup> = Calculated using algorithms in table below, or using defaults provided based on 22.5 ft<sup>3</sup> adjusted volume<sup>64</sup>

%Savings = Specification of energy consumption below Federal Standard – see table below.

Tier	%Savings
Energy Star <sup>®</sup> and CEE Tier 1	10%
Energy Star <sup>®</sup> Most Efficient and CEE Tier 2	15%
CEE Tier 3	20%

For low-income programs, the following table may be used to calculate baseline usage:

Age	Bottom Freezer (16 cu ft)	Side- by- Side (14 cu ft)	Side- by- Side (15 cu ft)	Side- by- Side (16 cu ft)	Top Freezer (cu ft 14)	Top Freezer (15 cu ft)	Top Freezer (16 cu ft)	Top Freezer (17 cu ft)	Top Freezer (18 cu ft)
2011-2015	483	592	592	592	374	374	374	412	412
2001 (after July-2010	724	747	747	747	556	556	556	613	613
1993-2001(before June)	962	1,139	1,139	1,139	861	861	861	962	962
1990-1992	1,519	1,617	1,617	1,617	1,272	1,272	1,272	1,432	1,432
1980-1989	1,992	2,119	2,119	2,119	1,668	1,668	1,668	1,877	1,877
Before 1980	2,523	2,684	2,684	2,684	2,112	2,112	2,112	2,377	2,377

Additional Waste Heat Impacts

For units in conditioned spaces in the home (if unknown, assume unit is in conditioned space).

```
\Delta kWh_{WasteHeat} = \Delta kWh * (WHFeHeatElectric + WHFeCool)
```

Where:

 ΔkWh
 = kWh savings calculated from either method above

 WHFeHeatElectric
 = Waste Heat Factor for Energy to account for electric heating increase from removing waste heat from refrigerator/freezer (if fossil fuel heating – see calculation of heating penalty in that section).

 = - (HF / ηHeat<sub>Electric</sub>) \* %ElecHeat

**MEASURE CODE:** 

<sup>77</sup> Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls."

<sup>78</sup> Personal Communication from Melisa Fiffer, ENERGY STAR<sup>®</sup> Appliance Program Manager, EPA 10/26/14.

<sup>&</sup>lt;sup>74</sup> Personal Communication from Melisa Fiffer, ENERGY STAR® Appliance Program Manager, EPA 10/26/1.4.

<sup>&</sup>lt;sup>75</sup> Based on 212 days where HDD 65>0, divided by 365.25.

<sup>&</sup>lt;sup>76</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 52% of Missouri homes - based on Energy Information Administration, 2009 Residential Energy Consumption Survey). Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60\*0.92) + (0.40\*0.8)) \* (1-0.15) = 0.74.

## 3.1.8 Room Air Conditioner Recycling

#### DESCRIPTION

This measure describes the savings resulting from the retirement of existing residential, inefficient room air conditioner units from service prior to their natural end of life. This measure assumes that a percentage of these units will be replaced with a baseline standard efficiency unit (note that if it is actually replaced by a new ENERGY STAR<sup>®</sup> qualifying unit, the savings increment between baseline and ENERGY STAR<sup>®</sup> will be recorded in the Efficient Products program).

This measure was developed to be applicable to the following program type: ERET.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

N/A. This measure relates to the retiring of an existing inefficient unit.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is the existing inefficient room air conditioning unit.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed remaining useful life of the existing room air conditioning unit being retired is 4 years.<sup>79</sup>

#### **DEEMED MEASURE COST**

The actual implementation cost for recycling the existing unit should be used.

#### LOADSHAPE

Cooling RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

DkWh = kWhexist - (%replaced \* kWhnewbase)

 $= \frac{Hours * BtuH}{EERexist * 1000} - (%replaced * \frac{Hours * BtuH}{EERNewBase * 1000})$ 

Where:

Hours	= Full Load Hours of room air conditioning unit
EERexist	= Efficiency of recycled unit
BtuH	= Average size of rebated unit. Use actual if available - if not, assume $8500^{80}$
	= Actual if recorded - If not, assume $9.0^{81}$
%replaced	= Percentage of units that are replaced
EERNewBase	= Efficiency of baseline unit
	$= 10.9^{82}$

Weather Basis (City based upon)	Hours <sup>83</sup>
St Louis, MO	860 for primary use and 556 for secondary use

Scenario	%replaced
Customer states unit will not be replaced	0%
Customer states unit will be replaced	100%
Unknown	76% <sup>84</sup>

Results using defaults provided above:

weather basis (City based upon)	Unit not replaced	Unit replaced	Unknown		
St Louis, MO	525.4	91.6	195.7		

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * CF$$

Where:

CF = Summer Peak Coincidence Factor for measure =  $0.0009474181^{85}$ 

<sup>&</sup>lt;sup>79</sup> One third of assumed measure life for room air conditioners.

<sup>&</sup>lt;sup>80</sup> Based on maximum capacity average from the RLW Report; "Final Report Coincidence Factor Study Residential Room Air Conditioners, June 23, 2008."

<sup>&</sup>lt;sup>81</sup> The federal minimum for the most common type of unit (8000 – 13999 Btuh with side vents) from 1990-2000 was 9.0 EER, from 2000-2014 it was 9.8 EER, and is currently (2015) 10.9 CEER. Retirement programs will see a large array of ages being retired, and the true EER of many will have been significantly degraded. We have selected 9.0 as a reasonable estimate of the average retired unit. This is supported by material on the ENERGY STAR<sup>®</sup> website, which, if reverse-engineered, indicates that an EER of 9.16 is used for savings calculations for a 10-year old room air conditioner. Another statement indicates that units that are at least 10 years old use 20% more energy than a new ES unit, which equates to: 10.9EER/1.2 = 9.1 EER; <u>http://www.energystar.gov/ia/products/recycle/documents/RoomAirConditionerTurn-InAndRecyclingPrograms.pdf</u>.

<sup>&</sup>lt;sup>82</sup> Minimum federal standard for capacity range and most popular class (without reverse cycle, with louvered sides, and 8,000 to 13,999 Btu/h).

http://www1.eere.energy.gov/buildings/appliance\_standards/product.aspx/productid/41.

<sup>&</sup>lt;sup>83</sup> Ameren Missouri PY 2013 Coolsavers evaluation.

http://www.puc.nh.gov/Electric/Monitoring%20and%20Evaluation%20Reports/National%20Grid/117\_RLW\_CF%20Res%20RAC.pdf) to FLH for Central Cooling for the same locations (provided by AHRI: <u>http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls</u>) is 31%. This factor was applied to published CDD65 climate normals data to provide an assumption for FLH for Room AC.

<sup>&</sup>lt;sup>84</sup> Based on Nexus Market Research Inc, RLW Analytics, December 2005; "Impact, Process, and Market Study of the Connecticut Appliance Retirement Program: Overall Report." Report states that 63% were replaced with ENERGY STAR<sup>®</sup> units and 13% with non-ENERGY STAR<sup>®</sup>. However, this formula assumes all are non-ENERGY STAR<sup>®</sup> since the increment of savings between baseline units and ENERGY STAR<sup>®</sup> would be recorded by the Efficient Products program when the new unit is purchased.
<sup>85</sup> Based on Ameren Missouri 2016 loadshape for residential cooling end-use.

## 3.2 Electronics

## 3.2.1 Advanced Tier 1 Power Strips

#### DESCRIPTION

This measure applies to Tier 1 Advanced Power Strips (APS), which are multi-plug power strips with the ability to automatically disconnect specific connected loads depending upon the power draw of a master control load, also plugged into the strip. Power is disconnected from the switched (controlled) outlets when the master control load power draw is reduced below a certain adjustable threshold, thus turning off the appliances plugged into the switched outlets. By disconnecting, the standby load of the controlled devices, the overall load of a centralized group of equipment (i.e. entertainment centers and home office) can be reduced. Uncontrolled outlets are also provided that are not affected by the control device and are always providing power to any device plugged into it. This measure characterization provides savings for use of an APS in a home entertainment system, home office, or unknown setting.

This measure was developed to be applicable to the following program types: TOS, NC, DI, and KITS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient case is the use of a 4-8 plug Tier 1 master-controlled APS.

#### **DEFINITION OF BASELINE EQUIPMENT**

For TOS and NC applications, the baseline is a standard power strip that does not control connected loads. For DI and KITS, the baseline is the existing equipment used in the home.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed lifetime of the Tier 1 APS is 10 years.<sup>86</sup>

#### **DEEMED MEASURE COST**

For TOS and NC, the incremental cost of an APS over a standard power strip with surge protection is assumed to be \$20.<sup>87</sup> For DI and KITS, the actual full installation cost of an APS (including equipment and labor) should be used.

LOADSHAPE Miscellaneous RES

Algorithm

#### CALCULATION OF SAVINGS

**ELECTRIC ENERGY SAVINGS** 

 $\Delta kWh = (kWh_{Office} * Weighting_{Office} + kWh_{Ent} * Weighting_{Ent}) * ISR$ 

<sup>87</sup> Incremental cost based on "Advanced Power Strip Research Report." Typical cost of an advanced power strip is \$35, and average cost of a standard power strip is \$15.

MEEIA 2024-26 Plan

Revision 6.1

<sup>&</sup>lt;sup>86</sup> "Advanced Power Strip Research Report," NYSERDA, August 2011.

Where:

Home Office	KITS	29.08
Home Entertainment	TOS, NC, DI	71.35
System	KITS	70.44
Unknown	TOS, NC, DI	56.26
Unknown	KITS	50.59

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS $\Delta kW = \Delta kWh * CF$

Where:

 $\Delta kWh$  = Electric energy savings, as calculated above.

= Summer peak coincidence demand (kW) to annual energy (kWh) factor =  $0.0001148238^{94}$ 

NATURAL GAS SAVINGS N/A

CF

WATER IMPACT DESCRIPTIONS AND CALCULATION N/A

**Deemed O&M** Cost Adjustment Calculation N/A

**MEASURE CODE:** 

<sup>88</sup> "Advanced Power Strip Research Report." Note that estimates are not based on pre/post metering but on analysis based on frequency and consumption of likely products in active, standby, and off modes. This measure should be reviewed frequently to ensure that assumptions continue to be appropriate.

<sup>89</sup> Relative weightings of home office and entertainment systems is based on "Ameren Missouri Efficient Product Impact and Process Evaluation: Program Year 2015," Cadmus, May 13, 2016. If the programs have their own evaluations of weightings, they should be used.

<sup>90</sup> "Advanced Power Strip Research Report."

<sup>91</sup> Relative weightings of home office and entertainment systems is based on "Ameren Missouri Efficient Product Impact and Process Evaluation: Program Year 2015," Cadmus, May 13, 2016. If the programs have their own evaluations of weightings, they should be used.

<sup>&</sup>lt;sup>92</sup> Ameren Missouri Single Family Low Income Evaluation: PY2019, Table 10-10.

<sup>&</sup>lt;sup>93</sup>Ameren Missouri Efficient Products Evaluation: PY2019, Table 6-9.

<sup>&</sup>lt;sup>94</sup> Based on Ameren Missouri 2016 loadshape for residential miscellaneous end-use. This is deemed appropriate, because savings occur during hours when the controlled standby loads are turned off by the APS. This is estimated to be approximately 7,129, which representing the average of hours for controlled TV and computer from "Advanced Power Strip Research Report."

## 3.2.2 Tier 2 Advanced Power Strip – Residential Audio Visual

#### DESCRIPTION

This measure applies to the installation of a Tier 2 Advanced Power Strip for household audio visual environments (Tier 2 AV APS). Tier 2 AV APS are multi-plug power strips that remove power from audio visual equipment through intelligent control and monitoring strategies. Using advanced control strategies such as true RMS (Root Mean Square) power sensing, and/or external sensors,<sup>95</sup> both active power loads and standby power loads of controlled devices are managed by Tier 2 AV APS devices. Monitoring and controlling both active and standby power loads of controlled devices will reduce the overall load of a centralized group of electrical equipment (i.e. the home entertainment center). This intelligent sensing and control process has been demonstrated to deliver increased energy savings and demand reduction compared with Tier 1 Advanced Power Strips.

The Tier 2 AV APS market is a relatively new and developing one. With several new Tier 2 AV APS products coming to market, it is important that energy savings be clearly demonstrated through independent field trials. Field trial should effectively address the inherent variability in AV system usage patterns. Until there is enough independent evidence to demonstrate deemed savings for each of the various control strategies, it is recommended that products with independent field trial results be placed into performance bands and savings claimed accordingly.

This measure was developed to be applicable to the following program type: DI. If applied to other program types, the installation characteristics, including the number of AV devices under control and an appropriate in-service rate, should be verified through evaluation.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient case is the use of a Tier 2 AV APS in a residential AV (home entertainment) environment that includes control of at least 2 AV devices, one being the television.<sup>96</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

The assumed baseline equipment is the existing equipment used in the home (e.g., a standard power strip or wall socket) that does not control loads of connected AV equipment.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed lifetime of the Tier 2 AV APS is assumed to be 10 years.97

#### **DEEMED MEASURE COST**

The actual full installation cost of the Tier 2 AV APS (including equipment and labor) should be used. The estimated incremental cost is \$30 based on online market research in 2019. Products installed through Direct Installation channels may also incur additional labor costs.

## 3.3 Hot Water

#### 3.3.1 Low Flow Faucet Aerator

This measure relates to the installation of a low flow faucet aerator in a household kitchen or bath faucet fixture.

This measure may be used for units provided through efficiency kit's. However, the in-service rate for such measures should be derived through evaluation results specifically for this implementation methodology.

This measure was developed to be applicable to the following program types: TOS, NC, RF, DI, and KITS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure the installed equipment must be a low flow faucet aerator for bathrooms rated at 1.5 gallons per minute (GPM) or less or for kitchens rated at 2.2 GPM or less. Savings are calculated on an average savings per faucet fixture basis.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is assumed to be a standard bathroom faucet aerator rated at 2.25 GPM or greater or a standard kitchen faucet aerator rated at 2.75 GPM or greater. Average measured flow rates are used in the algorithm and are lower, reflecting the penetration of previously installed low flow fixtures (and therefore the freerider rate for this measure should be 0), use of the faucet at less than full flow, debris buildup, and lower water system pressure than fixtures are rated at.

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life is assumed to be 10 years.<sup>105</sup>

#### **DEEMED MEASURE COST**

The incremental cost for this measure is \$11.33<sup>106</sup> or program actual.

For faucet aerators provided in efficiency kits, the actual program delivery costs should be utilized. Absent of program data, use \$3.00<sup>107</sup>

## LOADSHAPE

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Note these savings are per faucet retrofitted<sup>108</sup> (unless faucet type is unknown, then it is per household).

 $\Delta kWh = \% ElectricDHW * (GPM_{base} * L_{base} - GPM_{low} * L_{low}) * Household * 365.25 * DF / FPH$  $* EPG_electric * ISR$ 

Where:

```
%ElectricDHW
                              proportion of water heating supplied by electric resistance heating
                                                                   6ElectricDHW
                                         DHW fuel
                                Electric
                                                                       100%
                                Natural Gas
                                                                        0%
                                                                      42%<sup>109</sup>
                                Unknown
                            = Average flow rate, in gallons per minute, of the baseline faucet "as-used." This includes the effect of existing
GPM<sub>base</sub>
                            low flow fixtures and therefore the freerider rate for this measure should be 0.
                            = 2.2^{110} or custom based on metering studies<sup>111</sup> or if measured during DI:
                            = Measured full throttle flow * 0.83 throttling factor<sup>112</sup>
                            = Average flow rate, in gallons per minute, of the low-flow faucet aerator "as-used"
GPM<sub>low</sub>
                            = 1.5^{113} or custom based on metering studies<sup>114</sup> or if measured during DI:

**MEASURE CODE:** 

<sup>&</sup>lt;sup>153</sup> Based on Ameren Missouri 2016 loadshape for residential water heating end-use.

 <sup>&</sup>lt;sup>154</sup> Default assumption for unknown fuel is based on EIA Residential Energy Consumption Survey (RECS) 2009 for Midwest Region, data for the state of Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then that should be used.
 <sup>155</sup> DOE final rule discusses recovery efficiency with an average around 0.76 for gas- fired storage water heaters and 0.78 for standard efficiency gas fired tankless water heaters up to 0.95 for the highest efficiency gas fired condensing tankless water heaters. These numbers represent the range of new units however, not the range of existing units in stock.
 Review of AHRI Directory suggests range of recovery efficiency ratings for new gas DHW units of 70-87%. Average of existing units is estimated at 78%.
 <sup>156</sup> Water heating in multifamily buildings is often provided by a larger central boiler. This suggests that the average recovery efficiency is somewhere between a typical central boiler efficiency of 0.59 and the 0.75 for single family homes. An average efficiency of 0.67 is used for this analysis as a default for multifamily buildings.

## 3.3.2 Low Flow Showerhead

#### DESCRIPTION

This measure relates to the installation of a low flow showerhead in a single or multifamily household.

This measure may be used for units provided through efficiency kit's. However, the in-service rate for such measures should be derived through evaluation results specifically for this implementation methodology.

This measure was developed to be applicable to the following program types: TOS, RF, NC, DI, and KITS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure the installed equipment must be a low flow showerhead, typically rated at 2.0 gallons per minute (GPM) or less. Savings are calculated on a per showerhead fixture basis.

#### **DEFINITION OF BASELINE EQUIPMENT**

For DI programs, the baseline condition is assumed to be a standard showerhead rated at 2.5 GPM<sup>157</sup> or greater.

For RF and TOS programs, the baseline condition is assumed to be a representative average of existing showerhead flow rates of participating customers including a range of low flow showerheads, standard-flow showerheads, and high-flow showerheads.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.<sup>158</sup>

#### **DEEMED MEASURE COST**

The incremental cost for TOS, NC, or KITS is \$7159 for standard showerheads and \$15.02 for handheld showerheads or program actual.

For low flow showerheads provided in RF or DI programs, the actual program delivery costs should be utilized; if unknown assume \$15.33<sup>160</sup> for standard showerheads and \$23.35 for handheld showerheads.

#### LOADSHAPE

Water Heating RES

Algorithm

#### **CALCULATION OF SAVINGS**

## ELECTRIC ENERGY SAVINGS

Note these savings are per showerhead fixture

 $\Delta kWh = \% ElectricDHW * ((GPM_{base} * L_{base} - GPM_{low} * L_{low}) * Household * SPCD * 365.25 / SPH)$  $* EPG_electric * ISR$ 

Where:

%ElectricDHW

= proportion of water heating supplied by electric resistance heating

DHW fuel	%ElectricDHW
Electric	100%
Natural Gas	0%
Unknown	42% <sup>161</sup>

**GPM**<sub>base</sub>

= Flow rate of the baseline showerhead

Program Delivery	GPM_base
Direct-install, SFLI Kits	$2.2^{162}$
Retrofit, Efficiency Kits, NC or TOS	$2.35^{163}$
MFMR	$2.5^{164}$

**GPM**<sub>low</sub>

= As-used flow rate of the lowflow showerhead, which may, as a result of measurements of program evaulations deviate from rated flows, see table below:

<b>Rated Flow</b>
2.0 GPM
1.75 GPM
1.5 GPM
Custom or Actual <sup>165</sup>

L<sub>base</sub>

Llow

= Shower length in minutes with baseline showerhead

=  $7.8 \text{ min}^{166}$  and 8.66 for Income Eligible, MFMR, SFIE Kits<sup>167</sup>

= Shower length in minutes with low-flow showerhead

<sup>157</sup> Maximum showerhead flow rate at 80 PSI is 2.5 GPM in accordance with federal standard 10 CFR Part 430.32(p). See docket filed at https://www.regulations.gov/document?D=EERE-2011-BT-TP-0061-0039

<sup>158</sup> Table C-6, "Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures," GDS Associates, June 2007. Evaluations indicate that consumer dissatisfaction may lead to reductions in persistence, particularly in Multifamily, <u>http://neep.org/uploads/EMV%20Forum/EMV%20Studies/measure\_life\_GDS%5B1%5D.pdf</u>. <sup>159</sup> Based on online pricing market research 2/6/2017.

<sup>160</sup> Direct-install price per showerhead assumes cost of showerhead (market research average of \$7) and also assumes assess and install cost of \$8.33 (20min at \$25 per hour, which is in line with the typical prevailing wage of a General Laborer, as per the Annual Wage Order No. 23 published by the Missouri Department of Labor).

<sup>161</sup> Ameren Missouri Energy Efficient Kits Impact and Process Evaluation: PY2019.

<sup>162</sup> Ameren Missouri Community Savers Evaluation: PY2018.

<sup>163</sup> Representative value from sources 1, 2, 4, 5, 6, and 7 (See Source Table at end of measure section) adjusted slightly upward to account for program participation, which is expected to target customers with existing higher flow devices rather than those with existing low flow devices.

<sup>164</sup> PY19 Program Data

<sup>165</sup> Note that actual values may be either: a) program-specific minimum flow rate, or b) program-specific evaluation-based value of actual effective flow-rate due to increased duration or temperatures. The latter increases in likelihood as the rated flow drops and may become significant at or below rated flows of 1.5 GPM. The impact can be viewed as the inverse of the throttling described in the footnote for baseline flowrate.

<sup>166</sup> Cadmus and Opinion Dynamics Showerhead and Faucet Aerator Meter Study Memorandum, dated June 2013, directed to Michigan Evaluation Working Group. This study of 135 single and multifamily homes in Michigan metered energy parameters for efficient showerhead and faucet aerators.

Variables as defined above

**Deemed O&M Cost Adjustment Calculation** N/A

**MEASURE CODE:** 

MEEIA 2024-26 Plan

<sup>&</sup>lt;sup>197</sup> Water heating in multifamily buildings is often provided by a larger central boiler. This suggests that the average recovery efficiency is somewhere between a typical central boiler efficiency of 0.59 and the 0.75 for single family homes. An average efficiency of 0.67 is used for this analysis as a default for multifamily buildings.

## 3.3.3 Water Heater Wrap

#### DESCRIPTION

This measure applies to a tank wrap or insulation "blanket" that is wrapped around the outside of an electric or gas domestic hot water (DHW) tank to reduce stand-by losses.

This measure was developed to be applicable to the following program types: DI, and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition is an electric or gas DHW tank with wrap installed that has an R-value that meets program requirements.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is an uninsulated electric or gas DHW tank.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 12 years.<sup>198</sup>

#### **DEEMED MEASURE COST**

The measure cost is the actual cost of material and installation. If actual costs are unknown, assume \$58<sup>199</sup> for material and installation.

#### LOADSHAPE

Water Heating RES

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Custom calculation below for electric DHW tanks, otherwise use default values from table that follows:

$$\Delta kWh = ((A_{Base}/R_{Base} - A_{EE}/R_{EE}) * \Delta T * Hours)/(\eta DHW_{Elec} * 3,412)$$

#### Where:

A <sub>Base</sub>	= Surface area ( $ft^2$ ) of storage tank prior to adding tank wrap <sup>200</sup>
	= Actual or if unknown, use default based on tank capacity (gal) from table below
R <sub>Base</sub>	= Thermal resistance coefficient (hr-°F-ft <sup>2</sup> /BTU) of uninsulated tank
	= Actual or if unknown, assume $14^{201}$
$\mathbf{A}_{\mathrm{EE}}$	= Surface area ( $ft^2$ ) of storage tank after addition of tank wrap <sup>202</sup>
	= Actual or, if unknown, use default based on tank capacity (gal) from table below
$\mathbf{R}_{\mathrm{EE}}$	= Thermal resistance coefficient ((hr-°F-ft2/BTU) of tank after addition of tank wrap (R-value of uninsulated tank + R-
	value of tank wrap)
	= Actual or if unknown, assume 24
$\Delta T$	= Average temperature difference (°F) between tank water and outside air
	= Actual or if unknown, assume $60^{\circ}F^{203}$
Hours	= Hours per year
	= 8,766
$\eta DHW_{Elec}$	= Recovery efficiency of electric hot water heater
	= Actual or if unknown, assume $0.98^{204}$
3,412	= Conversion factor from Btu to kWh

The following table contains default savings for various tank capacities.

Capacity (gal)	$A_{Base}  (ft^2)^{205}$	${ m A_{EE}}({ m ft}^2)^{206}$	ΔkWh	$\Delta \mathbf{kW}$
30	19.16	20.94	78.0	0.00890

## 3.3.4 Heat Pump Water Heater

#### **DESCRIPTION**

This measure applies to the installation of a heat pump water heater (HPWH) in place of a standard electric water heater in a home. Savings are presented dependent on the heating system installed in the home due to the impact of the heat pump water heater on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, and NC.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure, the installed equipment must be an ENERGY STAR<sup>®</sup> heat pump water heater with a storage volume  $\leq$  55 gallons.<sup>211</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is assumed to be a new, electric storage water heater meeting federal minimum efficiency standards<sup>212</sup> for units  $\leq$ 55 gallons: 0.96 - (0.0003 \* rated volume in gallons).

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life is assumed to be 13 years.<sup>213</sup>

#### **DEEMED MEASURE COST**

Actual costs should be used where available. The default value for incremental capital costs is \$588.<sup>214</sup>

WATER IMPACT DESCRIPTIONS AND CALCULATION N/A

**DEEMED O&M COST ADJUSTMENT CALCULATION** N/A

**MEASURE CODE:** 

<sup>&</sup>lt;sup>231</sup> This is the additional energy consumption required to replace the heat removed from the home during the heating season by the heat pump water heater. The variable kWh\_heating (electric resistance) is that additional heating energy for a home with electric resistance heat (COP 1.0). This formula converts the additional heating kWh for an electric resistance home to the MMBtu required in a natural gas heated home, applying the relative efficiencies.

<sup>&</sup>lt;sup>232</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). See reference "HC6.9 Space Heating in Midwest Region.xls." In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8)) \* (1-0.15) = 0.71.<sup>233</sup> Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls."

## 3.3.5 Hot Water Pipe Insulation

#### DESCRIPTION

This measure applies to the addition of insulation to uninsulated domestic hot water (DHW) pipes. The measure assumes the pipe wrap is installed on the first length of both the hot and cold pipe up to the first elbow. This is the most cost-effective section to insulate since the water pipes act as an extension of the hot water tank up to the first elbow, which acts as a heat trap. Insulating this section helps to reduce standby losses.

This measure was developed to be applicable to the following program types: DI, and RF

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition is a domestic hot or cold water pipe with pipe wrap installed that has an R value that meets program requirements.

### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is an uninsulated, domestic hot or cold water pipe.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.<sup>234</sup>

#### **DEEMED MEASURE COST**

The measure cost is the actual cost of material and installation. If the actual cost is unknown, assume a default cost of \$7.10<sup>235</sup> per linear foot, including material and installation. For a kit program, assume a default cost of \$2.87.<sup>236</sup>

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Custom calculation below for electric systems, otherwise assume 24.7 kWh per 6 linear feet of <sup>3</sup>/<sub>4</sub> in, R-4 insulation or 35.4 kWh per 6 linear feet of 1 in, R-6 insulation:

 $\Delta kWh = \% Electric DHW * ((C_{Base}/R_{Base} - C_{EE}/R_{EE}) * L * \Delta T * Hours)/(\eta DHW_{Elec} * 3,412) * ISR$ 

#### Where:

%ElectricDHW = proportion of water heating supplied by electric resistance heating

DHW fuel	%ElectricDHW
Electric	100%
Natural Gas	0%
Unknown	42% <sup>237</sup>

C <sub>Base</sub>	= Circumference (ft) of uninsulated pipe
	= Diameter (in) * $\pi/12$
	= Actual or if unknown, assume 0.196 ft for a pipe with a 0.75 inch diameter
R <sub>Base</sub>	= Thermal resistance coefficient (hr- $^{\circ}$ F-ft <sup>2</sup> )/Btu) of uninsulated pipe
	$= 1.0^{238}$
$C_{\text{EE}}$	= Circumference (ft) of insulated pipe
	= Diameter (in) * $\pi/12$
	= Actual or if unknown, assume 0.524 ft for a 0.46 in diameter pipe insulated with $3/4$ in, R-4 wrap ((0.75 + $1/2$ + $1/2$ ) *
	$\pi/12)$
R <sub>EE</sub>	= Thermal resistance coefficient (hr-°F-ft <sup>2</sup> )/Btu) of insulated pipe
	= 1.0 + R value of insulation
	= Actual or if unknown, assume 5.0 for R-4 wrap or 7.0 for R-6 wrap
L	= Length of pipe from water heating source covered by pipe wrap (ft)
	= Actual or if unknown, assume 6 ft
$\Delta T$	= Average temperature difference (°F) between supplied water and outside air
	= Actual or if unknown, assume $60^{\circ}F^{239}$
Hours	= Hours per year
	= 8,766
$\eta DHW_{Elec}$	= Recovery efficiency of electric hot water heater
	= Actual or if unknown, assume $0.98^{240}$
3,412	= Conversion factor from Btu to kWh
ISR	= Installation rate (varies by program)

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ 

Where:

∆kWh

CF

= Electric energy savings, as calculated above.

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

## 3.3.6 Thermostatic Restrictor Shower Valve

#### DESCRIPTION

The measure is the installation of a thermostatic restrictor shower valve in a single or multifamily household. This is a valve attached to a residential showerhead which restricts hot water flow through the showerhead once the water reaches a set point (generally 95F or lower).

This measure was developed to be applicable to the following program types: RF, NC, and DI.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure the installed equipment must be a thermostatic restrictor shower valve installed on a residential showerhead.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline equipment is the residential showerhead without the restrictor valve installed.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.<sup>242</sup>

#### **DEEMED MEASURE COST**

The incremental cost of the measure should be the actual program cost (including labor if applicable) or \$30<sup>243</sup> plus \$20 labor<sup>244</sup> if not available.

**LOADSHAPE** Water Heating RES

#### **COINCIDENCE FACTOR**

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0000887318

Algorithm

#### CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = \&ElectricDHW * ((GPM_base_S * L_showerdevice) * Household * SPCD * 365.25 / SPH) * EPG_electric * ISR Where:$ 

%ElectricDHW = proportion of water heating supplied by electric resistance heating

DHW fuel	%ElectricDHW
Electric	100%
Natural Gas	0%
Unknown	16% <sup>245</sup>

<sup>245</sup> Default assumption for unknown fuel is based on EIA Residential Energy Consumption Survey (RECS) 2009 for Midwest Region, data for the state of Illinois. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then that should be used.

<sup>&</sup>lt;sup>242</sup> Assumptions based on NY TRM, Pacific Gas and Electric Company Work Paper PGECODHW113 and measure life of lowflow showerhead.

<sup>&</sup>lt;sup>243</sup> Based on actual cost of the SS-1002CP-SB Ladybug Water-Saving Shower-Head adapter from Evolve showerheads.

<sup>&</sup>lt;sup>244</sup> Estimate for contractor installation time.

GPM\_base\_S = Flow rate of the base case showerhead, or actual if available

Program	GPM
Direct-install, device only	$1.5^{246}$
New Construction or direct	Rated or actual flow
install of device and low	of program-installed
flow showerhead	showerhead
Retrofit or TOS	2.35 <sup>247</sup>

L\_showerdevice = Hot water waste time avoided due to thermostatic restrictor valve  $\frac{1}{2}$ 

 $= 0.89 \text{ minutes}^{248}$ 

Household = Average number of people per household

Household Unit Type <sup>249</sup>	Household
Single-Family - Deemed	$2.67^{250}$
Multi-Family - Deemed	$2.07^{251}$
Custom	Actual Occupancy or Number of Bedrooms <sup>252</sup>

SPCD = Showers Per Capita Per Day

 $= 0.66^{253}$ 

365.25 = Days per year, on average.

SPH = Showerheads Per Household so that per-showerhead savings fractions can be determined

Household Type	SPH
Single-Family	2.05 <sup>254</sup>
Multi-Family	$1.4^{255}$
Custom	Actual

EPG\_electric = Energy per gallon of hot water supplied by electric

=  $(8.33 * 1.0 * (ShowerTemp - SupplyTemp)) / (RE_electric * 3,412)$ 

= (8.33 \* 1.0 \* (105 - 61.3)) / (0.98 \* 3,412)

= 0.109 kWh/gal= Specific weight of water (lbs/gallon) 8.33 = Heat capacity of water (btu/lb-°) 1.0 = Assumed temperature of water ShowerTemp  $= 105 F^{256}$ = Assumed temperature of water entering house SupplyTemp  $= 61.3F^{257}$ = Recovery efficiency of electric water heater RE electric  $= 98\%^{258}$ 3412 = Converts Btu to kWh (btu/kWh) ISR = In service rate of showerhead

= Dependent on program delivery method as listed in table below

Selection	ISR
Direct Install - Single Family	0.91
Direct Install – Multi Family	0.91 <sup>259</sup>
Efficiency Kits	To be determined through evaluation

EXAMPLE

For example, a direct installed valve in a single-family home with electric DHW:  $\Delta kWh = 1.0 * (2.67 * 0.89 * 1.5 * 0.66 * 365.25 / 2.05) * 0.108 * 0.91$ = 42 kWh

**Summer Coincident Peak Demand Savings** 

 $\Delta kW = \Delta kWh/Hours * CF$ 

Where:

 $\Delta kWh = calculated value above$ 

Hours = Annual electric DHW recovery hours for wasted showerhead use prevented by device

- = ((GPM\_base\_S \* L\_showerdevice) \* Household \* SPCD \* 365.25) \*  $0.712^{260}$  / GPH
- GPH = Gallons per hour recovery of electric water heater calculated for 65.9F temp rise (120-54.1), 98% recovery efficiency, and typical 4.5kW electric resistance storage tank.

= 34.4 for SF direct install; 28.3 for MF direct install

http://ilsagfiles.org/SAG\_files/Technical\_Reference\_Manual/Version\_5/Final/IL-TRM\_Version\_5.0\_dated\_February-11-2016\_Final\_Compiled\_Volumes\_1-4.pdf. Assumes low flow showerhead is included in direct installation.

<sup>247</sup> Representative value from sources 1, 2, 4, 5, 6 and 7 (See Source Table at end of measure section) adjusted slightly upward to account for program participation which is expected to target customers with existing higher flow devices rather than those with existing low flow devices.

<sup>&</sup>lt;sup>261</sup> Default assumption for unknown fuel is based on EIA Residential Energy Consumption Survey (RECS) 2009 for Midwest Region, data for the state of Illinois. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then that should be used. <sup>262</sup> DOE final rule discusses recovery efficiency with an average around 0.76 for gas-fired storage water heaters and 0.78 for standard efficiency gas fired tankless water heaters up to 0.95 for the highest efficiency gas fired condensing tankless water heaters. These numbers represent the range of new units however, not the range of existing units in stock. Review of AHRI Directory suggests range of recovery efficiency ratings for new gas DHW units of 70-87%. Average of existing units is estimated at 78%. <sup>263</sup> Water heating in multifamily buildings is often provided by a larger central boiler. This suggests that the average recovery efficiency is somewhere between a typical central boiler efficiency of 0.59 and the 0.75 for single family homes. An average efficiency of 0.67 is used for this analysis as a default for multifamily buildings.

**Measure Code:** 

MEEIA 2024-26 Plan

Revision 6.1

## 3.4 HVAC

## 3.4.1 Advanced Thermostat

## DESCRIPTION

This measure characterizes the household energy savings from the installation of a new thermostat(s) for reduced heating and cooling consumption through a configurable schedule of temperature setpoints (like a programmable thermostat) *and* automatic variations to that schedule to better match HVAC system runtimes to meet occupant comfort needs. These schedules may be defaults, established through user interaction, and be changed manually at the device or remotely through a web or mobile app. Automatic variations to that schedule could be driven by local sensors and software algorithms and/or through connectivity to an internet software service. Data triggers to automatic schedule changes might include, for example: occupancy/activity detection, arrival & departure of conditioned spaces, optimization based on historical or population-specific trends, or weather data and forecasts.<sup>264</sup> This class of products and services are relatively new, diverse, and rapidly changing. Generally, the savings expected for this measure aren't yet established at the level of individual features, but rather at the system level and how it performs overall. Like programmable thermostats, it is not suitable to assume that heating and cooling savings follow a similar pattern of usage and savings opportunity, so this measure treats these savings independently. This is a very active area of ongoing study to better map features to savings value and establish standards of performance measurement based on field data so that a standard of efficiency can be developed.<sup>265</sup> That work is not yet complete but does inform the treatment of some aspects of this characterization and recommendations. Energy savings are applicable at the household level; installation of multiple advanced thermostats per home does not accrue additional savings.

This measure was developed to be applicable to the following program types: TOS, NC, RF, and DI.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

This measure involves replacement of a manual-only or programmable thermostat with one that has the default-enabled capability or the automatic capability to establish a schedule of temperature setpoints according to driving device inputs above and beyond basic time and temperature data of conventional programmable thermostats. As summarized in the description, this category of products and services is broad and rapidly advancing with regard to thermostat capability, usability, and sophistication. At a minimum, a qualifying thermostat must be capable of two-way communication<sup>266</sup> and exceed the typical performance of manual and conventional programmable thermostats through the automatic or default capabilities described above.

## **DEFINITION OF BASELINE EQUIPMENT**

The baseline is either the actual thermostat type (manual or programmable), if known,<sup>267</sup> or an assumed mix of both types based upon information available from evaluations or surveys that represent the population of program participants. This mix may vary by program, but as a default, 44% programmable and 56% manual thermostats may be assumed.<sup>268</sup>

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life for advanced thermostats is assumed to be similar to that of a programmable thermostat, 10 years,<sup>269</sup> based upon equipment life only.<sup>270</sup>

## **DEEMED MEASURE COST**

For DI and other programs for which installation services are provided, the actual material, labor, and other costs should be used. For retail, Bring Your Own Thermostat (BYOT) programs,<sup>271</sup> or other program types, actual costs are still preferable.<sup>272</sup> If actual costs are unknown, then the average incremental cost for the new installation measure is assumed to be \$125.<sup>273</sup>

**LOADSHAPE** Cooling RES

Heating RES

#### Algorithm

## CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

Electrical savings are a function of both heating and cooling energy usage reductions. For heating, this is a function of the percent of electric heat (heat pumps) and fan savings in the case of a natural gas furnace.

 $\Delta kWh = \Delta kWh_{heating} + \Delta kWh_{cooling}$ 

 $\Delta kWh_{heating} = \% ElectricHeat * HeatingConsumption_{Electric} * HF * HeatingReduction * Eff_ISR + (\Delta Therms * Fe * 29.3)$ 

 $\Delta kWh_{cool} = \%AC * ((EFLHcool * CapacityCool * 1/SEER)/1000) * CoolingReduction * Eff_ISR$ 

Where:

%ElectricHeat = Percentage of heating savings assumed to be electric

<sup>264</sup> For example, the capabilities of products and added services that use ultrasound, infrared, or geofencing sensor systems, automatically develop individual models of a home's thermal properties through user interaction. The termostats optimize system operation based on equipment type and performance traits, such as using n weather forecasts, to demonstrate the type of automatic schedule change functionality that apply to this measure characterization.

<sup>265</sup> The ENERGY STAR<sup>®</sup> program discontinued its support for basic programmable thermostats effective 12/31/09, and is presently developing a new specification for "Residential Climate Controls."

<sup>266</sup> This measure recognizes that field data may be available, through the thermostat's two-way communication capability, to more accurately establish efficiency criteria and make savings calculations. It is recommended that program implementations incorporate this data into their planning and operation activities to improve understanding of the measure to manage risks and enhance savings results.

<sup>267</sup> If the actual thermostat is programmable and is found to be used in override mode or otherwise is effectively being operated like a manual thermostat, then the baseline may be considered to be a manual thermostat.

<sup>268</sup> Value for blend of baseline thermostats comes from an Illinois potential study conducted by ComEd in 2013; Opinion Dynamics Corporation, "ComEd Residential Saturation/End Use, Market Penetration & Behavioral Study," Appendix 3: Detailed Mail Survey Results, April 2013, p. 34.

<sup>269</sup> Table 1, HVAC Controls, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007.

<sup>270</sup> Future evaluation is strongly encouraged to inform the persistence of savings to further refine measure life assumption. As this characterization depends heavily upon a number of savings studies that lasted a single year or less, the longer-term impacts should be assessed.

<sup>271</sup> In contrast to program designs that utilize program-affiliated contractors or other trade ally partners that support customer participation through thermostat distribution, installation, and other services, BYOT programs enroll customers after the time of purchase through online rebate and program integration sign-ups.

<sup>272</sup> Actual costs include any one-time software integration, annual software maintenance, and/or individual device energy feature fees.

<sup>273</sup> Market prices vary considerably in this category, generally increasing with thermostat capability and sophistication. The core suite of functions required by this measure's eligibility criteria can be found on units readily available in the market. Prices are in the range of \$200 and \$250, excluding the availability of any wholesale or volume discounts. The assumed incremental cost is based on the middle of the range (\$175) minus a cost of \$50 for the baseline equipment blend of manual. Add-on energy service costs, which may include one-time setup and/or annual per device costs, are not included in this assumption.

Heating fuel	%ElectricHeat

	$= 8.0\%^{286}$	

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

#### $\Delta kW$ $= \Delta kWh_{cooling} * CF$

Where:

kWh<sub>cooling</sub> = Electric energy savings for cooling, calculated above = Summer peak coincidence demand (kW) to annual energy (kWh) factor CF  $= 0.0009474181^{287}$ 

## NATURAL GAS ENERGY SAVINGS

 $\Delta Therms = \% FossilHeat * HeatingConusmption_{Gas} * HF * HeatingReduction * Eff_ISR$ 

Where:

%FossilHeat = Percentage of heating savings assumed to be Natural Gas

Heating fuel	%FossilHeat
Electric	0%
Natural Gas	100%
Unknown	67% <sup>288</sup>

HeatingConsumption<sub>Gas</sub>

<sup>277</sup> Multifamily household heating consumption relative to singlefamily households is affected by overall household square footage and exposure to the exterior. This 65% reduction factor is applied to multifamily homes with electric resistance, based on professional judgment that average household size, and heat loads of multifamily households are smaller than singlefamily homes

<sup>278</sup> Program-specific household factors may be utilized on the basis of sufficiently validated program evaluations.

<sup>279</sup> These values represent adjusted baseline savings values for different existing thermostats, as presented in Navigant's IL TRM Workpaper on Impact Analysis from Preliminary Gas savings findings (page 28). The unknown assumption is calculated by multiplying the savings for manual and programmable thermostats by their respective share of baseline. Further evaluation and regular review of this key assumption is encouraged. Ameren Missouri Efficient Products Evaluation PY2017.

<sup>280</sup> As a function of the method for determining savings impact of these devices, in-service rate effects are already incorporated into the savings value for heating reduction above. <sup>281</sup> Fe is not one of the AHRI certified ratings provided for residential furnaces but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBTU/yr) and Eae (kWh/yr). An average of a 300- record sample (non-random) out of 1495 was 3.14%. This is appropriately ~50% greater than the ENERGY STAR® version 3 criteria for 2% Fe. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference.

282 91% of homes have central cooling in Missouri (based on 2009 Residential Energy Consumption Survey, see "RECS 2009 Air Conditioning hc7.9.xls").

<sup>283</sup> Based on full load hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR® calculator

(http://www.energystar.gov/ia/business/bulk purchasing/bpsavings calc/Calc CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren Missouri territory, which suggests an appropriate EFLH of 869. The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point).

<sup>284</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>285</sup> Based on minimum federal standard: <u>http://www1.eere.energy.gov/buildings/appliance\_standards/residential/residential\_cac\_hp.html</u>.

<sup>286</sup> This assumption is based upon the review of many evaluations from other regions in the United States. Cooling savings are more variable than heating due to significantly more variability in control methods and potential population and product capability.

287 2016 Ameren Missouri Coincident Peak Demand Factor for Residential Cooling. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

**MEASURE CODE:** 

MEEIA 2024-26 Plan

<sup>&</sup>lt;sup>289</sup> Values in table are based on average household heating load (834 therms) for Chicago based on Illinois furnace metering study ('Table E-1, Energy Efficiency/Demand Response Nicor Gas Plan Year 1: Research Report: Furnace Metering Study, Draft, Navigant, August 1 2013) and adjusted for Missouri climate region values using the relative climate- normal HDD data with a base temp ratio of 60°F. This load value is then divided by standard assumption of existing unit efficiency of 83.5% (estimate based on 29% of furnaces purchased in Missouri were condensing in 2000 (based on data from GAMA, provided to Department of Energy) (see 'Thermostat\_FLH and Heat Load Calcs.xls'). The resulting values are generally supported by data provided by Laclede Gas, which showed an average pre-furnace replacement consumption of 1009 therms for St Louis, and a post-replacement consumption of 909. Assuming a typical hot water consumption at 225 therms (using defaults from <a href="http://energy.gov/eere/femp/energy-cost-calculator-electric-and-gas-water-heaters-0#output">http://energy.gov/eere/femp/energy-cost-calculator-electric-and-gas-water-heaters-0#output</a>), this indicates a heating load of 684-784 therms. Ameren Missouri Efficient Products Evaluation PY2017

## 3.4.2 Air Source Heat Pump Including Dual Fuel Heat Pumps

#### DESCRIPTION

An air source heat pump (ASHP) provides heating and/or cooling by moving heat between indoor and outdoor air. A dual fuel heat pump (DFHP) pairs an air source heat pump with a gas furnace such that the air source heat pump provides heating in mild weather, and as temperature drops the heat pump shuts off and the furnace provides heating. This measure may also apply to replacing a Central Air Conditioner with non-electric heating with an Air Source Heat Pump. In this case, only cooling savings (ER1, ER2, ROF) may be claimed using the ASHP cooling algorithm.

This measure characterizes:

- 1. TOS, NC: The installation of a new residential sized (<= 65,000 Btu/hr) air source heat pump that is more efficient than required by federal standards. This could relate to the replacement of an existing ASHP at the end of its useful life or the installation of a new ASHP in a new home.
- 2. EREP: The early removal of functioning electric heating and cooling systems from service, prior to its natural end of life, and replacement with a new high efficiency ASHP unit. To qualify as Early Replacement, the existing unit must be operational when replaced. If the SEER of the existing unit is known and the Baseline SEER is the actual SEER value of the unit replaced and if unknown use assumptions in the variable list below (SEER<sub>exist</sub> and HSPF<sub>exist</sub>). If the operational status of the existing unit is unknown, use TOS assumptions.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

A new residential-sized (<= 65,000 Btu/hr) air source heat pump with specifications to be determined by the program.

### **DEFINITION OF BASELINE EQUIPMENT**

A new residential-sized (<= 65,000 Btu/hr) air source heat pump meeting federal standards.

The baseline for the TOS measure is based on the current federal standard efficiency level as of January 1, 2015; 14 SEER and 8.2 HSPF, when replacing an existing air source heat pump; and 14 SEER and 3.41 HSPF when replacing a central air conditioner and electric resistance heating. Non-electric heating replaced with an air source heat pump can only claim cooling savings.

The baseline for the early replacement measure is the efficiency of the existing equipment for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 18 years.<sup>290</sup> Remaining life of existing ASHP/CAC equipment is assumed to be 6 years<sup>291</sup> and 18 years for electric resistance.

## **DEEMED MEASURE COST**

Dual Fuel Heat Pump:

Efficiency (EER)	Cost (including labor) per measure
DFHP - SEER 19 MF heat pump base	\$2,936.60
DFHP - SEER 20 MF heat pump base	\$3,176.60
DFHP - SEER 21 MF heat pump base	\$3,626.60

Air Source Heat Pump:

TOS/ROF: The incremental capital cost for this measure is dependent on the efficiency and capacity of the new unit.:

MEEIA 2024-26 Plan

 <sup>&</sup>lt;sup>290</sup> Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007, <a href="http://www.ctsavesenergy.org/files/Measure%20Life%20Report%202007.pdf">http://www.ctsavesenergy.org/files/Measure%20Life%20Report%202007.pdf</a>.
 <sup>291</sup> Assumed to be one third of effective useful life.

Efficiency (SEER)	ROF Incremental Cost (\$)	Source
SEER 15	\$303.00	IL TRM V8.0
SEER 16	\$438.00	IL TRM V8.0
SEER 17	\$724.00	IL TRM V8.0
SEER 18	\$962.92	Derived using IL TRM
SEER 19	\$1,203.65	(\$/unit) and the % change
SEER 20	\$1,444.38	in Mid Atlantic TRM V9
SEER 21	\$1,689.92	(\$/ton)

Early Replacement (ER): The full install cost for this measure is the actual cost of removing the existing unit and installing the new one. If this is unknown, assume the following (note these costs are per ton of unit capacity):

Efficiency (SEER)	*ER Incremental Cost for 3 ton unit (\$)	Source			
SEER 15	\$1,019.81	IL TRM V8.0			
SEER 16	\$1,154.81	IL TRM V8.0			
SEER 17	\$1,440.81	IL TRM V8.0			
SEER 18	\$1,679.73	Derived using IL TRM			
SEER 19	\$1,920.46	(\$/unit) and the percent			
SEER 20	\$2,161.19	change in Mid-Atlantic TRM			
SEER 21	\$2,406.74	V9 (\$/ton)			
*Hypothetical values calculated based on a 3 ton system. Actual values based on system size and SEER combinations.					

Assumed deferred cost (after 6 years) of replacing existing equipment with new baseline unit is assumed to be \$1,525<sup>292</sup> per ton of capacity. This cost should be discounted to present value using the utilities' real discount rate.

## **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

TOS:

 $\Delta kWh = \left[ \left( \left( EFLH_{cool} * Capacity_{cool} * \left( 1/SEER_{base} - 1/SEER_{ee} \right) \right) / 1000 \right) + \left( \left( EFLH_{heat} * Capacity_{heat} * \left( 1/HSPF_{base} - 1/HSFP_{ee} \right) \right) / 1,000 \right] * ISR$ 

Cooling only for Central Air Conditioning and Non-Electric Heating Backup

$$\Delta kWh = \left[ \left( (EFLH_{cool} * Capacity_{cool} * (1/SEER_{base} - 1/SEER_{ee}) \right) / 1000 \right) * ISR$$

#### EREP:293

 $\Delta$ kWh for remaining life of existing unit (1st 6 years for replacing an ASHP, 18 years for replacing electric resistance):

$$= [((EFLH_{cool} * Capacity_{cool} * (1/SEER_{exist} - 1/SEER_{ee})) / 1000) + ((EFLH_{heat} * Capacity_{heat} * (1/HSPF_{exist} - 1/HSFP_{ee})) / 1,000)] * ISR$$

Cooling only for Central Air Conditioning and Non-Electric Heating Backup

$$\Delta kWh = \left[ \left( (EFLH_{cool} * Capacity_{cool} * (1/SEER_{exist} - 1/SEER_{ee}) \right) / 1000 \right] * ISR$$

 $\Delta$ kWh for remaining measure life (next 12 years if replacing an ASHP):

$$= [((EFLH_{cool} * Capacity_{cool} * (1/SEER_{base} - 1/SEER_{ee})) / 1000) + ((EFLH_{heat} * Capacity_{heat} * (1/HSPF_{base} - 1/HSFP_{ee})) / 1,000)] * ISR$$

Cooling only for Central Air Conditioning and Non-Electric Heating Backup

$$\Delta kWh = \left[ \left( (EFLH_{cool} * Capacity_{cool} * (1/SEER_{base} - 1/SEER_{ee}) \right) / 1000 \right) * ISR$$

Where:

**EFLH**<sub>cool</sub>

= Equivalent full load hours of air conditioning $^{294}$ :

Average)	EFLH <sub>cool</sub> (Hours)
SF or MF	869
MFc (comprehensive envelope)	632 <sup>295</sup>

Capacity<sub>cool</sub> = Cooling Capacity of Air Source Heat Pump (Btu/hr)

= Actual (1 ton = 12,000Btu/hr)

SEER<sub>exist</sub> = Seasonal Energy Efficiency Ratio of existing cooling system (kBtu/kWh)

 $<sup>^{292}</sup>$  Ibid. \$1381 per ton (IL TRM V8.0) inflated using rate of 2.0%

<sup>&</sup>lt;sup>293</sup> The two equations are provided to show how savings are determined during the initial phase of the measure (existing to efficient) and the remaining phase (new baseline to efficient). In practice, the screening tools used may either require a first year savings (using the first equation) and then a "number of years to adjustment" and "savings adjustment" input, which would be the either the new base to efficient savings or the (existing to efficient savings.

<sup>&</sup>lt;sup>294</sup> Based on Full Load Hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR<sup>®</sup> calculator

<sup>(</sup>http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren Missouri' service territory, suggesting an appropriate EFLH of 869. The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point). <sup>295</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

= Use actual SEER rating where it is possible to measure or reasonably estimate. If using rated efficiencies, derate the efficiency value based on the age of the existing equipment (up to a maximum of 30 years) to account for degradation over time.<sup>296</sup> If age is unknown, use 12 years.

$$=$$
 SEER \* (1-1.44%)<sup>Age</sup>

If unknown, use defaults provided below:

Existing Cooling System	SEER <sub>exist</sub> <sup>297</sup>
Air Source Heat Pump	7.2
Central AC	6.8
No central cooling <sup>298</sup>	Let '1/SEER <sub>exist</sub> ' = $0$

= Seasonal Energy Efficiency Ratio of baseline Air Source Heat Pump (kBtu/kWh)<sup>299</sup> **SEER**<sub>base</sub>  $= 14^{300}$ 

**SEER**<sub>ee</sub> = Seasonal Energy Efficiency Ratio of efficient Air Source Heat Pump (kBtu/kWh) = Actual

= Equivalent full load hours of heating: $^{301}$ **EFLH**<sub>heat</sub>

Weather Basis (Ameren Missouri Average)	EFLH <sub>heat</sub> (Hours)
SF or MF	1496 for ASHP, 1119 for DFHP, and 1769 <sup>302</sup> for ccAHSP
MFc (comprehensive envelope)	510 <sup>303</sup> for ASHP and DFHP, and 603 for ccASHP

**Capacity**<sub>heat</sub> = Heating Capacity of Air Source Heat Pump (Btu/hr) = Actual (1 ton = 12,000Btu/hr)

=Heating Seasonal Performance Factor of existing heating system (kBtu/kWh)

= Use actual HSPF rating where it is possible to measure or reasonably estimate. If not available use:

	Existing Heating System	HSPF <sub>exist</sub>		
	Air Source Heat Pump	5.44 <sup>304</sup>		
	Electric Resistance	3.41 <sup>305</sup>		
HSPF <sub>base</sub>	=Heating Seasonal Performance Factor of baseli = $8.33^{307}$	ne Air Source Heat Pump (kBtu/kWh) <sup>30</sup>		
HSFP <sub>ee</sub>	=Heating Seasonal Performance Factor of efficient Air Source Heat Pump (kBtu/kWh) = Actual			
ISR	= Actual = In Service Rate = $100\%^{308}$

**MEASURE CODE:** 

SEER CAC nameplate gives an operational SEER of 6.8.

<sup>298</sup> If there is no central cooling in place but the incentive encourages installation of a new ASHP with cooling, the added cooling load should be subtracted from any heating benefit.

<sup>299</sup> SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting an existing system that is rated in SEER to SEER2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both SEER or SEER2) before applying formulas. <sup>300</sup> Based on minimum federal standard effective 1/1/2015:

http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec430-32.pdf.

<sup>301</sup> Ameren Missouri HVAC Evaluation PY2017

<sup>302</sup> Evaluation – Opinion Dynamics review PY22. The recommended values are consutructed based on weather conditions (heating degree days and cooling degree days) for St. Louis and technological differences between traditional and cold climate heat pumps, which are capable of meeting whole home heating requirements at lower temperatures than traditional heat pumps, resulting in increased effective full load operating hours.

<sup>303</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>304</sup> This is estimated based on finding the average HSPF/SEER ratio from the AHRI directory data (using the least efficient models – SEER 12 and SEER 13) – 0.596, and applying to the average nameplate SEER rating of all early replacement qualifying equipment in Ameren PY3-PY4. This estimation methodology appears to provide a result within 10% of actual HSPF.

 $^{305}$  Electric resistance has a COP of 1.0 which equals 1/0.293 = 3.41 HSPF.

<sup>306</sup> HSPF to HSPF2 conversion factor: HSPF2 = HSPF x 87%. Conversion factor for HSPF to HSPF2 is used when converting an existing system that is rated in HSPF to HSPF2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both HSPF or HSPF2) before applying formulas.

<sup>7</sup> Ameren Missouri HVAC Evaluation: PY2017.

<sup>&</sup>lt;sup>296</sup> Based on IL TRM V8.0, which bases justification for degradation factors on page 21 of 'AIC HVAC Metering Study Memo FINAL 2 28 2018'. Default of 12 years based on the remaining measure life of the equipment.

<sup>&</sup>lt;sup>297</sup> ASHP existing efficiency assumes degradation and is sourced from the Ameren Missouri Heating and Cooling Program Impact and Process Evaluation: Program Year 2015. CAC assumed to follow the same trend in degradati ASHP: 9.12 SEER nameplate to 7.2 open

## 3.4.3 Duct Sealing and Duct Repair

### **DESCRIPTION**

This measure describes evaluating the savings associated with performing duct sealing to the distribution system of homes with central cooling and/or a ducted heating system. While sealing ducts in conditioned space can help with control and comfort, energy savings are largely limited to sealing ducts in unconditioned space where the heat loss is to outside the thermal envelope. Therefore, for this measure to be applicable at least 30% of ducts should be within unconditioned space (e.g., attic with floor insulation, vented crawlspace, unheated garages; basements should be considered conditioned space).

Three methodologies for estimating the savings associate from sealing the ducts are provided.

- 1. Modified Blower Door Subtraction this technique is described in detail on p. 44 of the Energy Conservatory Blower Door Manual; http://dev.energyconservatory.com/wp-content/uploads/2014/07/Blower-Door-model-3-and-4.pdf. It involves performing a whole house depressurization test and repeating the test with the ducts excluded.
- 2. Duct Blaster Testing as described in RESNET Test 803.7: http://www.resnet.us/standards/DRAFT Chapter 8 July 22.pdf. This involves using a blower door to pressurize the house to 25 Pascals and pressurizing the duct system using a duct blaster to reach equilibrium with the inside. The air required to reach equilibrium provides a duct leakage estimate.
- 3. Deemed Savings per Linear Foot this method provides a deemed conservative estimate of savings and should only be used where performance testing described above is not possible.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition is sealed duct work throughout the unconditioned space in the home.

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing baseline condition is leaky duct work with at least 30% of the ducts within the unconditioned space in the home.

#### **DEEMED LIFETIME OF EFFICIENT EOUIPMENT**

The assumed lifetime of this measure is 20 years.<sup>309</sup>

#### **DEEMED MEASURE COST**

The actual duct sealing measure cost should be used.

LOADSHAPE HVAC RES

Algorithm

#### **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

Methodology 1: Modified Blower Door Subtraction

a. Determine Duct Leakage rate before and after performing duct sealing:

Duct Leakage  $(CFM50_{DL}) = (CFM50_{Whole House} - CFM50_{Envelope Only}) * SCF$ 

Where:

= Standard Blower Door test result finding Cubic Feet per Minute at 50 Pascal pressure differentials CFM50<sub>Whole House</sub>  $CFM50_{Envelope\ Only}$ 

= Blower Door test result finding Cubic Feet per Minute at 50 Pascal pressure differentials with all supply and return registers sealed

SCF

= Subtraction Correction Factor to account for underestimation of duct leakage due to connections between the duct system and the home. Determined by measuring pressure with respect to the building in the sealed duct system, with the building pressurized to 50 Pascals with respect to the outside. Use the following look up table provided by energy conservatory to determine the appropriate subtraction correction factor:

		1		
House	Subtraction		House	Sut
to Duct Pressure	Correction Factor		to Duct Pressure	Co I
50	1.00		30

COP

= Efficiency in COP of Heating equipment

= Actual - If not available, use: $^{321}$ 

<sup>312</sup> Assumes that for each percent of supply air loss there is one percent annual energy penalty. This assumes supply leaks are direct losses to the outside and are not recaptured back to the house. This could be adjusted downward to reflect regain of usable energy to the house from duct leaks. For example, during the winter some of the energy lost from supply leaks in a crawlspace will probably be regained back to the house (sometimes 1/2 or more may be regained). More information provided in "Appendix E Estimating HVAC System Loss From Duct Airtightness Measurements" from Energy Conservatory Blower Door Manual. <sup>313</sup> Assumes 50% of leaks are in supply ducts.

<sup>314</sup> Assumes that for each percent of return air loss there is a half percent annual energy penalty. Note that this assumes that return leaks contribute less to energy losses than do supply leaks. This value could be adjusted upward if there was reason to suspect that the return leaks contribute significantly more energy loss than "average" (e.g., pulling return air from a super-heated attic), or can be adjusted downward to represent significantly less energy loss (e.g., pulling return air from a moderate temperature crawl space). More information provided in "Appendix E Estimating HVAC System Loss From Duct Airtightness Measurements" from Energy Conservatory Blower Door Manual. <sup>315</sup> Assumes 50% of leaks are in return ducts.

<sup>316</sup> This conversion is an industry rule of thumb. E.g., see http://www.hvacsalesandsupply.com/Linked%20Documents/Tech%20Tips/61-Why%20400%20CFM%20per%20ton.pdf.

<sup>317</sup> Based on Full Load Hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR® calculator

(http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren territory suggesting an appropriate EFLH of 869.The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point). <sup>318</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select

Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>319</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

<sup>320</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>321</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for heat pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

<sup>&</sup>lt;sup>310</sup>25 Pascals is the standard assumption for typical pressures experienced in the duct system under normal operating conditions.

Actual

324 2016 Ameren Missouri Coincident Peak Demand Factor for Residential Cooling. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf."

<sup>325</sup> Based on natural draft furnaces requiring 100 CFM per 10,000 Btu, induced draft furnaces requiring 130CFM per 10,000Btu, and condensing furnaces requiring 150 CFM per 10,000 Btu (rule of thumb from http://contractingbusiness.com/enewsletters/cb\_imp\_43580/). Data provided by GAMA during the federal rulemaking process for furnace efficiency standards, suggested that in 2000, 29% of furnaces purchased in Missouri were condensing units. Therefore, a weighted average required airflow rate is calculated assuming a 50:50 split of natural v induced draft non-condensing furnaces, as 125 per 10,000Btu or 0.0125/Btu. <sup>326</sup> The actual Heating Equipment Efficiency can be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. If there is more than one

heating system, the weighted (by consumption) average efficiency should be used.

If the heating system or distribution is being upgraded within a package of measures together with the insulation upgrade, the new average heating system efficiency should be used.

<sup>327</sup> In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment; see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the state. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: (0.29\*0.92) + (0.71\*0.8) = 0.835.

<sup>328</sup> The distribution efficiency can be estimated via a visual inspection and by referring to a look-up table such as that provided by the Building Performance Institute -(<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) - or by performing duct blaster testing. <sup>329</sup> Estimated as follows: 0.835 \* (1-0.15) = 0.710.

<sup>330</sup> Savings per unit are based upon analysis performed by Cadmus for the 2011 Joint ssessment of Potential. It was based on 10% savings in system efficiency. This would represent savings from homes with significant duct work outside of the thermal envelope. With no performance testing or verification, a deemed savings value should be very conservative and therefore the values provided in this section represent half of the savings - or 5% improvement. These values are provided as a conservative deemed estimate for Missouri, while encouraging the use of performance testing and verification for determination of more accurate savings estimates.

Revision 6.1

## 3.4.4 Mini/Multi-Split Air Source Heat Pump and Air Conditioners

## DESCRIPTION

This measure is designed to calculate electric savings from retrofitting existing electric HVAC systems with ductless and/or ducted mini/multi-split heat pumps (*MMSHPs*) or mini/multi-split air conditioners. *MMSHPs* save energy in heating mode because they provide heat more efficiently than electric resistance heat and central ASHP systems. Additionally, *MMSHPs* use less fan energy to move heat and don't incur heat loss through a lengthy duct distribution system while operating at very low static pressure. Often *MMSHPs* are installed in addition to (do not replace) existing heating or cooling equipment because the existing heating or cooling equipment is inadequate to efficiently heat or cool the space. Both ductless and ducted indoor units can be installed as a mixed mini/multi-split heat pump or air conditioner under this measure. Duct runs for a ducted mini/multi-split indoor unit should be installed within the conditioned envelope, be well-sealed and insulated ducts, and maintain low static pressure per manufacturer specifications for the installation configuration to maximize energy savings.

For cooling, the proposed savings calculations are aligned with those of typical replacement systems. *MMSHPs* save energy in cooling mode because they provide cooling capacity more efficiently than other types of unitary cooling equipment. A *MMSHPs* installed in a home with an existing central ASHP or CAC system will save energy by offsetting some of the cooling energy of the ASHP or CAC. In order for this measure to apply, the control strategy for the heat pump or air conditioner is assumed to be chosen to maximize savings per installer recommendation.<sup>331</sup>

This measure was developed to be applicable to the following program type: NC, ROF, and ER.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the new equipment must be a high-efficiency, variable-capacity (typically "inverter-driven" DC motor) ductless and/or ducted mini/multi-split heat pump or air conditioning system that exceeds the program minimum efficiency requirements.

### **DEFINITION OF BASELINE EQUIPMENT**

In order for this characterization to apply, baseline equipment must include a permanent electric resistance heating source or a ducted air-source heat pump or ducted air conditioner. For residences with central air conditioner/non-electric heating, cooling savings will only apply. For multifamily buildings, each residence must have existing individual heating equipment. Multifamily residences with central heating do not qualify for this characterization. Existing cooling equipment is assumed to be standard efficiency. Note that in order to claim cooling savings, there must be an existing air conditioning system (e.g. central air conditioning, Window ACs, or air source heat pump).

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 18 years.<sup>332</sup>

## **DEEMED MEASURE COST**

The incremental cost for this measure is provided below:

Measure	Incremental Cost (\$/ 1.5 ton)	Source
Mini/Multi-Split AC - ER1 SF	\$1,231.16	IL-TRM v8.0

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS Electric savings  $\Delta kWh = \Delta kWh_{heating} + \Delta kWh_{cooling}$ 

 $\Delta kWh_{heating} = \left( \left( Capacity_{heat} * EFLH_{heat} * \left( \frac{1}{HSPF_{exist}} - \frac{1}{HSPF_{ee}} \right) \right) / 1000 \right) * HF * ISR$ 

<sup>&</sup>lt;sup>331</sup> The whole purpose of installing ductless heat pumps is to conserve energy, so the installer can be assumed to be capable of recommending an appropriate control strategy. For most applications, the heating setpoint for the ductless heat pump should be at least 2F higher than any remaining existing system and the cooling setpoint should be at least 2F cooler than the existing system (this should apply to all periods of a programmable schedule, if applicable). This helps ensure that the ductless heat pump will be used to meet as much of the load as possible before the existing system operates to meet the remaining load. Ideally, the new ductless heat pump controls should be set to the current comfort settings, while the existing system setpoints should be adjusted down (heating) and up (cooling) to capture savings. <sup>332</sup> Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

 $\Delta kWh_{cooling} = ((Capacity_{cool} * EFLH_{cool} * (1/SEER_{exist} - 1/SEER_{ee})) / 1000) * HF * ISR$  $\Delta kW = \Delta kWh_{cooling} * CF \qquad \Delta kW = \Delta kWh_{heating} * CF$ 

Electric savings - cooling only in presence of non-electric heating or MMAC (Mini/Multi-Split AC)

 $\Delta kWh_{cooling} = ((Capacity_{cool} * EFLH_{cool} * (1/SEER_{exist} - 1/SEER_{ee})) / 1000) * HF * ISR$ 

 $\Delta kW = \Delta kWh_{cooling} * CF$

## 3.4.5 Standard Programmable Thermostat

#### **DESCRIPTION**

This measure characterizes the household energy savings from the installation of a new standard programmable thermostat for reduced heating and cooling energy consumption through temperature set-back during unoccupied or reduced demand times.

Energy savings are applicable at the household level; installation of multiple programmable thermostats per home does not accrue additional savings.

If the home has a heat pump, a programmable thermostat specifically designed for heat pumps should be used to minimize the use of backup electric resistance heat systems.

This measure was developed to be applicable to the following program types: RF, and DI.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EOUIPMENT**

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature setpoints according to a schedule without manual intervention.

### **DEFINITION OF BASELINE EQUIPMENT**

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change temperature set point.

## **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected equipment life of a programmable thermostat is assumed to be 10 years.<sup>342</sup>

#### **DEEMED MEASURE COST**

Actual material and labor costs should be used if the implementation method allows. If unknown (e.g., through a retail program), the capital cost for the new installation is assumed to be \$70.343

#### LOADSHAPE

Cooling RES Heating RES

#### Algorithm

## **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

For central air conditioners and air source heat pumps:

 $\Delta kWh_{cool} = EFLH_{cool} * Capacity_{Cooling} * \left(\frac{1}{SEER}\right) * SBdegrees * SF * EF/1000$ 

For air source heat pumps there are additional heating savings:

 $\Delta kWh_{heat} = EFLH_{heat} * Capacity_{Heating} * \left(\frac{1}{HSPF}\right) * SBdegrees * SF * EF/1000$ 

Where: EFLH<sub>cool</sub>

= Equivalent full load hours of air conditioning<sup>344</sup>:

Weather Basis (Ameren Missouri	EFLH <sub>cool</sub>
Average)	(Hours)
SF or MF	869
MFc (comprehensive envelope)	632

 $Capacity_{Cooling}$  = Cooling capacity of system in BTU/hr (1 ton = 12,000 BTU/hr) = Use Actuals based upon units served

SEER

= Seasonal Energy Efficiency Ratio of cooling system (kBtu/kWh) If unknown, use defaults provided below:

Cooling System	SEER
Air Source Heat Pump	10 <sup>345</sup>
Central AC	10 <sup>346</sup>

**HSPF** = Heating Season Performance Factor of heating system (kBtu/kWh)

If unknown, use defaults provided below:

Existing Heating System	HSPF <sub>exist</sub>
Air Source Heat Pump	7.00 <sup>347</sup>
Electric Resistance	3.41 <sup>348</sup>

<sup>343</sup> Market prices vary significantly in this category, generally increasing with thermostat capability and sophistication. The basic functions required by this measure's eligibility criteria are available on units readily available in the market for \$30. Labor is assumed to be one hour at \$40 per hour.

<sup>344</sup> Based on Full Load Hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR® calculator

(http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren Missouri' service territory, suggesting an appropriate EFLH of 869. The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point). <sup>345</sup> IL-TRM (V5) - based on minimum federal standards between 1992 and 2006 – Ameren Missouri Community Saver Program Evaluation PY2018. <sup>346</sup> IL-TRM - based on minimum federal standards between 1992 and 2006 – Ameren Missouri Community Saver Program Evaluation PY2018. <sup>347</sup> IL-TRM (Based on minimum federal standards between 1992 and 2006) – Ameren Missouri Community Saver Program Evaluation PY2018. <sup>348</sup> Electric resistance has a COP of 1.0 which equals 1/0.293 = 3.41 HSPF.

<sup>&</sup>lt;sup>342</sup> Table 1, HVAC Controls, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007. Future evaluation is strongly encouraged to inform the persistence of savings to further refine measure life assumption. As this characterization depends heavily upon a large scale but only 2-year study of the energy impacts of programmable thermostats, the longer-term impacts should be assessed.

**EFLH**<sub>heat</sub>

= Equivalent full load hours of heating:<sup>349</sup>

<sup>354</sup> Average (default) value of 65% gas space heating from 2009 Residential Energy Consumption Survey for Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.
 <sup>355</sup> Values in table are based on average household heating load (834 therms) for Chicago based on Illinois furnace metering study ('Table E-1, Energy Efficiency/Demand

<sup>355</sup> Values in table are based on average household heating load (834 therms) for Chicago based on Illinois furnace metering study ('Table E-1, Energy Efficiency/Demand Response Nicor Gas Plan Year 1: Research Report: Furnace Metering Study, Draft, Navigant, August 1 2013) and adjusted for Missouri weather basis values using the relative climate normals HDD data with a base temp ratio of 60°F. This load value is then divided by standard assumption of existing unit efficiency of 83.5% (estimate based on 29% of furnaces purchased in Missouri were condensing in 2000 (based on data from GAMA, provided to Department of Energy) (see 'Thermostat\_FLH and Heat Load Calcs.xls'). The resulting values are generally supported by data provided by Laclede Gas, which showed an average pre-furnace replacement consumption of 1009 therms for St Louis, and a postreplacement consumption of 909. Assuming a typical hot water consumption at 225 therms (using defaults from <u>http://energy.gov/eere/femp/energy-cost-calculator-electric-and-gas-water-heaters-0#output</u>), this indicates a heating load of 684-784 therms.

## 3.4.6 HVAC Tune-Up (Central Air Conditioning or Air Source Heat Pump)

#### DESCRIPTION

This measure involves the measurement of refrigerant charge levels and airflow over the central air conditioning or heat pump unit coil, correction of any problems found, and post-treatment re-measurement. Tune-up activities include a general tune-up, refrigerant charge, indoor coil cleaning, and outdoor coil cleaning. These tune-up actions may be performed individually or as a packaged service with more than one tune-up activity.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

### DEFINITION OF EFFICIENT EQUIPMENT

A tuned and commissioned residential central air conditioning unit or air source heat pump.

#### **DEFINITION OF BASELINE EQUIPMENT**

An existing residential central air conditioning unit or air source heat pump that has required tuning to restore optimal performance.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 2 years.<sup>356</sup>

### **DEEMED MEASURE COST**

As a RF measure, actual costs should be used. If unavailable, the measure cost should be assumed to be \$175.<sup>357</sup> The table below identifies more specific costs for varying services.

Tune- up Service for HP or AC	Incremental Cost (\$)	
General Tune-Up (no charge or coil clean)	\$70.00	
Tune-up / refrigerant charge	\$81.00	
Tune-up / Indoor Coil (Evaporator) Cleaning	\$63.00	\$175.00
Tune-up / Outdoor Coil (Condenser) Cleaning	\$31.00	
Tune-Up / Packaged Service	\$185358

## 3.4.7 Blower Motor

### DESCRIPTION

A new furnace with a brushless permanent magnet (BPM) blower motor is installed instead of a new furnace with a lower efficiency motor. This measure characterizes only the electric savings associated with the fan and could be coupled with gas savings associated with a more efficient furnace. Savings decrease sharply with static pressure so duct improvements, and clean, low pressure drop filters can maximize savings. Savings improve when the blower is used for cooling as well and when it is used for continuous ventilation, but only if the non-BPM motor would have been used for continuous ventilation too. If the resident runs the BPM blower continuously because it is a more efficient motor and would not run a non-BPM motor that way, savings are near zero and possibly negative. This characterization uses a 2009 Focus on Energy study of BPM blower motor savings in Wisconsin, which accounted for the effects of this behavioral impact.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

A furnace with a brushless permanent magnet (BPM) blower motor, also known by the trademark ECM, BLDC, and other names.

### **DEFINITION OF BASELINE EQUIPMENT**

A furnace with a non-BPM blower motor. As part of the Code of Federal Regulations, energy conservation standards for covered residential furnace fans became effective on July 3, 2019 (10 CFR 430.32(y)). This code requirement effectively makes ECMs part of the baseline for New Construction (NC), Replace-on-Fail (ROF), Time-of-Replacement (TOS), and Early Replacement (EREP) scenarios.

### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life is assumed to be 20 years.<sup>370</sup>

### **DEEMED MEASURE COST**

The capital cost for this measure is assumed to be:

Incremental Cost (\$)	
\$74.33 <sup>371</sup>	Time of Sale
\$475 <sup>372</sup>	Early Replacement

**MEASURE CODE:** 

<sup>379</sup> Average nameplate efficiencies of all early replacement qualifying equipment in Ameren IL PY3-PY4.

<sup>&</sup>lt;sup>377</sup> The blower fan is in the heating duct so all, or very nearly all, of its waste heat is delivered to the conditioned space. Negative value since this measure will increase the heating load due to reduced waste heat. <sup>378</sup> Minimum efficiency rating from ENERGY STAR<sup>®</sup> Furnace Specification v4.0, effective February 1, 2013.

## 3.4.8 Central Air Conditioner

## DESCRIPTION

This measure characterizes:

- 1. TOS: The installation of a new residential sized (<= 65,000 Btu/hr) central air conditioning ducted split system meeting ENERGY STAR<sup>®</sup> efficiency standards presented below. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- 2. EREP: Early Replacement determination will be defined by program requirements. All other conditions will be considered TOS. The baseline SEER of the existing central air conditioning unit replaced: If the SEER of the existing unit is known and, the baseline SEER is the actual SEER value of the unit replaced. If the SEER of the existing unit is unknown, use assumptions in variable list below (SEER\_exist).

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to be a ducted split central air conditioning unit meeting the minimum ENERGY STAR<sup>®</sup> efficiency level standards; 15 SEER and 12 EER.

### **DEFINITION OF BASELINE EQUIPMENT**

The baseline for the TOS measure is based on the current federal standard efficiency level: 14 SEER and 11 EER.

The baseline for the early replacement measure is the efficiency of the existing equipment for the assumed remaining useful life of the unit and the new baseline as defined above<sup>380</sup> for the remainder of the measure life.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 18 years.<sup>381</sup>

Remaining life of existing equipment is assumed to be 6 years.<sup>382</sup>

### **DEEMED MEASURE COST**

TOS: The incremental capital cost for this measure is dependent on efficiency. Assumed incremental costs are provided below:

Early replacement: The full install cost for this measure is the actual cost of removing the existing unit and installing the new one. If this is unknown, assume the following:

Efficiency Level	ROF Cost (\$)	*Early Replacement Cost <sup>383</sup>	Source
SEER 14	\$0.00	\$447.06	IL-TRM v8.0
SEER 15	\$108	\$555.06	IL-TRM v8.0
SEER 16	\$221	\$668.06	IL-TRM v8.0
SEER 17	\$620.00	\$1,067.06	IL-TRM v8.0
SEER 18	\$826.67	\$1,273.73	Derived using IL-TRM
SEER 19	\$1,033.33	\$1,480.39	(\$/unit) and the
SEER 20	\$1,240.00	\$1,687.06	percentage change in
SEER 21	\$1,446.67	\$1,893.73	Mid-Atlantic TRM V9 (NEEP)(\$/ton)
Average	\$686.96	\$1,134.02	
*Hypothetical values calculated based on a 3 ton system.			
Actual values based on system size and SEER combinations.			

Assumed deferred cost (after 6 years) of replacing existing equipment with new baseline unit is assumed to be \$3,217.<sup>384</sup> This cost is based on a 3 ton unit and should be discounted to present value using the utilities' discount rate.

## LOADSHAPE

Cooling RES

## CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Time of sale:

 $\Delta kWh = ((FLH_{cool} * Capacity * (1/SEER_{base} - 1/SEER_{ee}))/1,000) * HF * ISR$ 

Early replacement:385

 $\Delta$ kWh for remaining life of existing unit (1st 6 years):

$$= ((FLH_{cool} * Capacity * (1/SEER_{exist} - 1/SEER_{ee}))/1,000) * HF * ISR$$

 $\Delta$ kWh for remaining measure life (next 12 years):

=  $((FLH_{cool} * Capacity * (1/SEER_{base} - 1/SEER_{ee}))/1,000) * HF * ISR$ 

Where:

<sup>&</sup>lt;sup>380</sup> Baseline SEER and EER should be updated when new minimum federal standards become effective.

<sup>&</sup>lt;sup>381</sup> Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007. <u>http://www.ctsavesenergy.org/files/Measure%20Life%20Report%202007.pdf.</u>

The "lifespan" of a central air conditioner is about 15 to 20 years (US DOE: <u>http://www.energysavers.gov/your\_home/space\_heating\_cooling/index.cfm/mytopic=12440</u>). <sup>382</sup> Assumed to be one third of effective useful life.

<sup>&</sup>lt;sup>383</sup> These values are calculated in the deemed tables based on the unit size and SEER combination.

<sup>&</sup>lt;sup>384</sup> Based on 3 ton initial cost estimate for a conventional unit from ENERGY STAR® central AC calculator, \$2,857, and applying inflation rate of 2.0%

<sup>(&</sup>lt;u>http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls</u>). While baselines are likely to shift in the future, there is currently no good indication of what the cost of a new baseline unit will be in 6 years. In the absence of this information, assuming a constant federal baseline cost is within the range of error for this prescriptive measure.

<sup>&</sup>lt;sup>385</sup> The two equations are provided to show how savings are determined during the initial phase of the measure (existing to efficient) and the remaining phase (new baseline to efficient). In practice, the screening tools used may either require a First Year savings (using the first equation) and then a "number of years to adjustment" and "savings adjustment" input which would be the (new base to efficient savings)/(existing to efficient savings).

FLH<sub>cool</sub> = Full load cooling hours:<sup>386</sup>

	Weather Basis (Ameren	EFLHcool	
	Missouri Average)	(Hours)	
	SF or MF	869	
	MFc (comprehensive envelope)	632387	
Capacity	= Size of new equipment in Btu/hr (not	$e \ 1 \ ton = 12,000$	Btu/hr)
	= Actual installed, or if actual size unkr	nown 33,600Btu/	hr for single-family buildings <sup>388</sup>
SEER <sub>base</sub>	= Seasonal Energy Efficiency Ratio of baseline unit (kBtu/kWh) <sup>389</sup>

<sup>&</sup>lt;sup>386</sup> Based on Full Load Hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR® calculator

<sup>(</sup>http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren territory suggesting an

appropriate EFLH of 869. The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point). <sup>387</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>&</sup>lt;sup>388</sup> Actual unit size required for multifamily building, no size assumption provided because the unit size and resulting savings can vary greatly depending on the number of units. <sup>389</sup> SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting an existing system that is rated in SEER to SEER2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both SEER or both SEER2) before applying formulas.

<sup>&</sup>lt;sup>391</sup> Based on IL TRM V8.0, which bases justification for degradation factors on page 21 of 'AIC HVAC Metering Study Memo FINAL 2\_28\_2018'. Default of 12 years based on the remaining measure life of the equipment.

<sup>&</sup>lt;sup>392</sup> Estimate based on Department of Energy standard between 1992 and 2006. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then that should be used. <sup>393</sup> Ameren Missouri HVAC Evaluation: PY2020.

## 3.4.9 Filter Cleaning or Replacement and Dirty Filter Alarms

#### DESCRIPTION

An air filter on a central forced air heating system is replaced prior to the end of its useful life with a new filter, resulting in a lower pressure drop across the filter. As filters age, the pressure drop across them increases as filtered medium accumulates. Replacing filters before they reach the point of becoming ineffective can save energy by reducing the pressure drop required by filtration, subsequently reducing the load on the blower motor.

This measure was developed to be applicable to the following program type: RET.

If applied to other program types, the measure savings should be verified.

### **DEFINITION OF EFFICIENT EQUIPMENT**

A new filter offering a lower pressure drop across the filter medium compared to the existing filter.

#### **DEFINITION OF BASELINE EQUIPMENT**

A filter that is nearing the end of its effective useful life, defined by having a pressure drop twice that of its original state.

### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 1 year<sup>394</sup> for a filter replacement and 14 years for a dirty filter alarm.

### **DEEMED MEASURE COST**

Actual material and labor cost should be used if known, since there is a wide range of filter types and costs. If unknown,<sup>395</sup> the cost of a fiberglass filter is assumed to be \$7.33 and the cost of a pleated filter is assumed to be \$15.66. If unknown, the cost of a dirty filter alarm is assumed to be \$5.

LOADSHAPE

HVAC RES

Algorithm

## CALCULATION OF SAVINGS

Electric energy savings are calculated by estimating the difference in power requirements to move air through the existing and new filter and multiplying by the anticipated operating hours of the blower during the heating season.

## **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh = kWh_{heating} + kWh_{cooling} \\ kWh_{heating} = \% Heating * kW_{motor} * EFLH_{heat} * EI * Utility Adjustment * ISR \\ kWh_{cooling} = \% AC * kW_{motor} * EFLH_{cool} * EI * Utility Adjustment * ISR$

MEEIA 2024-26 Plan

Revision 6.1

## **3.4.10** Packaged Terminal Air Conditioner (PTAC) and Packaged Terminal Heat Pump (PTHP)

#### DESCRIPTION

A PTAC is a packaged terminal air conditioner that cools and provides heat through an electric resistance heater (heat strip). A PTHP is a packaged terminal heat pump. A PTHP uses its compressor year-round to heat or cool. In warm weather, it efficiently captures heat from inside a space and pumps it outside for cooling. In cool weather, it captures heat from outdoor air and pumps it into a space, adding heat from electric heat strips as necessary to provide heat.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

This measure characterizes:

- 1. TOS: the purchase and installation of a new efficient PTAC or PTHP.
- 2. EREP: the early removal of an existing PTAC or PTHP from service, prior to its natural end of life, and replacement with a new efficient PTAC or PTHP unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life. The measure is only valid for non-fuel switching installations for example replacing a cooling only PTAC with a PTHP can currently not use the TRM.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, the efficient equipment is assumed to be PTACs or PTHPs that exceed baseline efficiencies.

#### **DEFINITION OF BASELINE EQUIPMENT**

TOS: the baseline condition is defined by the Code of Federal Regulations at 10 CFR 431.97(c), section §431.97.

EREP: the baseline is the existing PTAC or PTHP for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life is assumed to be 15 years.<sup>403</sup>

Remaining life of existing equipment is assumed to be 5 years.<sup>404</sup>

#### **DEEMED MEASURE COST**

TOS: The incremental capital cost for this equipment is estimated to be \$84/ton.405

EREP: The measure cost is the full cost of removing the existing unit and installing a new one. The actual program cost should be used; if unknown, assume \$1,047 per ton.<sup>406</sup>

The assumed deferred cost (after 5 years) of replacing existing equipment with new baseline unit is assumed to be \$1,039 per ton.<sup>407</sup> This cost should be discounted to present value using the utilities' discount rate.

LOADSHAPE Cooling RES Heating RES

<sup>406</sup> Based on DCEO – IL PHA Efficient Living Program data.

<sup>407</sup> Based on subtracting TOS incremental cost from the DCEO data and incorporating inflation rate of 1.91%.

<sup>&</sup>lt;sup>403</sup> Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.

<sup>&</sup>lt;sup>404</sup>Standard assumption of one third of effective useful life.

#### Algorithm

#### **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

Electric savings for PTACs and PTHPs should be calculated using the following algorithms

Time of sale:

$$\Delta kWh = ((EFLH_{cool} * Capacity_{cool} * (1/SEER_{base} - 1/SEER_{ee})) / 1000) + ((EFLH_{heat} * Capacity_{heat} * (1/HSPF_{base} - 1/HSFP_{ee})) / 1000)$$

Early replacement:<sup>408</sup>

**EFLH**<sub>heat</sub>

 $\Delta$ kWh for remaining life of existing unit:

 $= ((EFLH_{cool} * Capacity_{cool} * (1/SEER_{exist} - 1/SEER_{ee})) / 1000) + ((EFLH_{heat} * Capacity_{heat} * (1/HSPF_{exist} - 1/HSFP_{ee})) / 1000)$ 

 $\Delta kWh$  for remaining measure life:

$$= ((EFLH_{cool} * Capacity_{cool} * (1/SEER_{base} - 1/SEER_{ee})) / 1000) + ((EFLH_{heat} * Capacity_{heat} * (1/HSPF_{base} - 1/HSFP_{ee})) / 1000)$$

#### Where:

Capacity <sub>heat</sub>	= Heating capacity of the unit in Btu/hr
	= Actual

= Equivalent Full Load Hours for heating.

= Custom input if program or regional evaluation results are available, otherwise, per the following table:

EFLH <sub>heat</sub> <sup>409</sup>
1,040

 $HSPF_{ee} = HSPF$  rating of new equipment (kbtu/kwh)

= Actual installed

HSPF<sub>base</sub> =Heating System Performance Factor of baseline unit (kBtu/kWh)

Equipment Type	HSPF <sub>base</sub> (manufacture date prior to 1/1/2017)	HSPF <sub>base</sub> (manufacture date on or after 1/1/2017)
PTHP (Heating mode) Standard Sized	3.7 – (0.052 x Capacity <sub>cool</sub> /1000) x 3.41	
PTHP (Heating mode) Non-Standard Size	2.9 – (0.026 x Capacity <sub>cool</sub> /1000) x 3.41	

HSPF<sub>exist</sub> = Actual HSPF rating of existing equipment (kbtu/kwh). If unknown, assume:

I I OI I CAISI	rietuar rist rithing er existing equipment (nota non). It unine on, assume.		
		Existing Equipment Type	HSPF <sub>exist</sub>
		Electric resistance heating (PTAC)	3.412410
		PTHP	5.44 <sup>411</sup>
Capacity <sub>cool</sub>	<ul> <li>= the cooling capacity of the ductless heat pump unit in Btu/hr.<sup>412</sup></li> <li>= Actual installed</li> </ul>		

SEER<sub>ee</sub> = SEER rating of new equipment (kbtu/kwh)

= Actual installed<sup>413</sup>

SEER<sub>base</sub>

= Seasonal Energy Efficiency Ratio of baseline unit (kBtu/kWh). When using the formulas in the table below, convert the baseline EER to SEER using the EER conversion formula.<sup>414</sup>

Equipment Type	EER <sub>base</sub> (manufacture date prior to 1/1/2017)	EER <sub>base</sub> (manufacture date on or after 1/1/2017)
PTAC (Cooling mode) Standard Sized	13.8 – (0.3 x Capacity <sub>cool</sub> /1000)	14.0 – (0.300 x Capacity <sub>cool</sub> /1000)
PTAC (Cooling mode) Non-Standard Size	10.9 – (0.213 x Capacity <sub>cool</sub> /1000)	
PTHP (Cooling mode) Standard Sized	14.0 - (0.300 x Capacity <sub>cool</sub> /1000)	
PTHP (Cooling mode) Non-Standard Size	10.8 – (0.213 x Capacity <sub>cool</sub> /1000)	

<sup>&</sup>lt;sup>408</sup> The two equations are provided to show how savings are determined during the initial phase of the measure (existing to efficient) and the remaining phase (new baseline to efficient). In practice, the screening tools used may either require a first year savings (using the first equation) and then a "number of years to adjustment" and "savings adjustment" input which would be the (new base to efficient savings)/(existing to efficient savings).

<sup>&</sup>lt;sup>409</sup> Base values reported in *All-Electric Homes PY6 Metering Results: Multifamily HVAC Systems*, Cadmus, October 2015, Ameren. Illinois were adjusted to fit Missouri climate zones by a comparison of relative annual heating and cooling degree hours (base 65). See 3.4.8 EFLH 06022016.xlsx for derivation. FLH values are based on metering of multifamily units that were used as the primary heating source to the whole home, and in buildings that had received weatherization improvements. A DMSHP installed in a single-family home may be used more sporadically, especially if the DMSHP serves only a room, and buildings that have not been weatherized may require longer hours. Additional evaluation is recommended to refine the EFLH assumptions for the general population.

<sup>&</sup>lt;sup>410</sup> Electric resistance has a COP of 1.0 which equals 1/0.293 = 3.41 HSPF.

<sup>&</sup>lt;sup>411</sup> This is estimated based on finding the average HSPF/SEER ratio from the AHRI directory data (using the least efficient models – SEER 12 and SEER 13) – 0.596 and applying to the average nameplate SEER rating of all early replacement qualifying equipment in Ameren PY3-PY4. This estimation methodology appears to provide a result within 10% of actual HSPF.

 $<sup>^{412}</sup>$  1 Ton = 12 kBtu/hr.

<sup>&</sup>lt;sup>413</sup> Note that if only an EER rating is available, use the following conversion equation; EER\_base =  $(1.12 - \sqrt{(1.2544 - 0.08 * EER)}) / 0..$  From Wassmer, M. (2003), "A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations," (Masters thesis), University of Colorado at Boulder. <sup>414</sup> Ibid.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

To qualify for this measure the new room air conditioning unit must meet the ENERGY STAR® efficiency standards presented above.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline assumption is a new room air conditioning unit that meets the current minimum federal efficiency standards presented above.

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The measure life is assumed to be 9 years.<sup>421</sup>

#### **DEEMED MEASURE COST**

The incremental cost for this measure is assumed to be \$20 for an ENERGY STAR® unit.422

## 3.4.12 Ground Source Heat Pump

#### DESCRIPTION

A heat pump provides heating or cooling by moving heat between indoor and the ground.

This measure characterizes:

- 1. TOS: The installation of a new residential sized ground source heat pump. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- 2. EREP: The early removal of functioning electric heating and cooling systems from service, prior to its natural end of life, and replacement with a new high efficiency ground source heat pump unit. To qualify as early replacement, the existing unit must be operational when replaced. If the SEER of the existing unit is known and the baseline SEER is the actual SEER value of the unit replaced and if unknown use assumptions in the variable list below (SEER<sub>exist</sub> and HSPF<sub>exist</sub>). If the operational status of the existing unit is unknown, use TOS assumptions.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT**

A new residential sized ground source heat pump with specifications to be determined by program.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline for the TOS measure is federal standard efficiency level as of: 3.3 COP and 14.1 EER when replacing an existing ground source heat pump, 14 SEER and 8.2HSPF when replacing an existing air source heat pump, and 13 SEER and 3.41 HSPF when replacing a central air conditioner and electric resistance heating.

The baseline for the early replacement measure is the efficiency of the existing equipment for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

#### **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

The expected measure life is assumed to be 18 years.

For early replacement, the remaining life of existing equipment is assumed to be 6 years for GSHP, ASHP and CAC and 18 years for electric resistance.

#### **DEEMED MEASURE COST**

TOS: The incremental capital cost for this measure is dependent on the efficiency and capacity of the new unit.<sup>426</sup>

Efficiency (EER)	Cost (including labor) per measure	
GSHP - EER 23 - replace electric furnace / CAC	\$4,717	
GSHP EER 23 Replace at Fail GSHP	\$3,200	

EREP: The full install cost for this measure is the actual cost of removing the existing unit and installing the new one. If this is unknown, assume the following (note these costs are per ton of unit capacity):<sup>427</sup>

Efficiency (EER)	Cost (including labor) per measure	
GSHP - EER 23 - replace electric furnace / CAC Early Replacement	\$5,250	
GSHP EER 23	\$4,859

<sup>&</sup>lt;sup>430</sup> Based on IL TRM V8.0, which bases justification for degradation factors on page 21 of 'AIC HVAC Metering Study Memo FINAL 2\_28\_2018'. Default of 12 years based on the remaining measure life of the equipment.

<sup>&</sup>lt;sup>431</sup>Ameren Missouri HVAC Program Evaluation PY2018 - Operating would have the manufacturers recommendations of 10-12 EER and 2.4-2.8 COP. Use of 12 EER and 2.8 COP. is conservative.

# 3.5 Lighting

## 3.5.1 LED Screw Based Omnidirectional Bulb

## DESCRIPTION

This measure provides savings assumptions for LED screw-based omnidirectional (e.g., A-Type) lamps installed in a known location (i.e., residential and in-unit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location. For upstream programs, utilities should develop an assumption of the Residential v Commercial split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

A provision in the EISA regulations required that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in effect making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective. However, an example of a potential midlife adjustment is provided below.

This measure was developed to be applicable to the following program types: TOS, NC, and RF.

If applied to other program types, the measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this measure to apply, new lamps must be ENERGY STAR<sup>®</sup> labeled based upon the ENERGY STAR<sup>®</sup> specification v2.0 which became effective on 1/2/2017 (<u>https://www.energystar.gov/sites/default/files/Luminaires%20V2%200%20Final.pdf</u>).

Qualification could also be based on the Design Light Consortium's qualified product list.439

## **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition for this measure is a reflection of applicable codes and standards, products available in the market, and standards agreed upon in practice. Through 2021, the baseline is assumed to be an EISA-qualified halogen or incandescent lamp. Beginning in 2022, the baseline will be updated to reflect a CFL lamp. Therefore a midlife adjustment is not applied to measures installed prior to 2022.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is 19 years for residential applications and 6 years for non-residential applications.<sup>440</sup>

## **DEEMED MEASURE COST**

While LEDs may have a higher upfront cost than a halogen or CFL, the incremental cost for LEDs in an upstream lighting program is assumed to be zero because the net present value of the costs to replace the halogen or CFL multiple times over the life of the LED is greater than the upfront cost of the LED. The incentive in this case is not designed to reduce the incremental cost over the lifetime of the measure. Instead the incentive is designed to reduce the initial upfront cost that may have been a barrier to the customer choosing the efficient lighting option. In the case of direct install programs or lighting included in efficient kits, the actual cost of the measure should be used.

%RES = percentage of bulbs sold to residential customers

= 100% for Online Store and 96% for Upstream Lighting, or 96.02% if unknown<sup>442</sup>

<sup>440</sup> Measure life is estimated based on the ratio of average equipment specifications for lifetime hours to the estimated annual operating hours. EULs of 19 years for residential and 6 years for non-residential are based on average rated lifetime for 2021 program measures (through 8/3/2021) divided by 995 hours for residential settings and by 3,351 for non-residential settings.

<sup>441</sup> Watts<sub>EE</sub> defaults are based upon the average available ENERGY STAR<sup>®</sup> product, accessed 06/18/2015. For any lumen range where there is no ENERGY STAR<sup>®</sup> product currently available, Watts<sub>EE</sub> is based upon the ENERGY STAR<sup>®</sup> minimum luminous efficacy (55Lm/W for lamps with rated wattages less than 15W and 65 Lm/W for lamps with rated wattages  $\geq$  15 watts) for the mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx." These assumptions should be reviewed regularly to ensure they represent the available product.

<sup>442</sup> Ameren Missouri Lighting Evaluation: PY2019. 96.02% is the weighted average for bulbs sold through the Online Store and Upstream Programs based on evaluation results and the distribution of bulbs in the PY19 program.

Building without cooling or exterior	1.0
Unknown	$1.11^{467}$

#### Mid-Life Baseline Adjustment example:

During the lifetime of a standard omnidirectional LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. Since the baseline bulb changes to a CFL equivalent beginning in 2020 (depending upon availability of halogen bulbs in the market), due to the EISA backstop provision (except for <310 and 2600+ lumen lamps) the annual savings claim must be reduced within the life of the measure to account for this baseline shift. This reduced annual savings will need to be incorporated in to cost-effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

For example, for 43W equivalent LED lamp installed in 2016, the full savings (as calculated above in the Algorithm) should be claimed for the first four years and a reduced annual savings (calculated energy savings above multiplied by the adjustment factor in the table below) claimed for the remainder of the measure life.

Lower Lumen Range	Upper Lumen Range	Mid Lumen Range	WattsEE	WattsBase before EISA 2020	Delta Watts before EISA 2020	WattsBase after EISA 2020 <sup>468</sup>	Delta Watts after EISA 2020
250	309	280	4.0	25	21	25	21.0
310	749	530	6.7	29	22.3	9.4	2.7

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

Where:

∆kWh = Energy Savings as calculated above = Summer peak coincidence demand (kW) to annual energy (kWh) factor CF = 0.0001492529 for residential bulbs and 0.0001899635 for nonresidential bulbs

#### **NATURAL GAS SAVINGS**

Heating Penalty for Natural Gas heated homes:469

<sup>&</sup>lt;sup>462</sup> This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Iowa (Des Moines, Mason City, and Burlington). These results were judged to be equally applicable to Missouri.

<sup>464</sup> Calculation assumes 50% heat pump and 50% resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls." Average efficiency of heat pump is based on assumption 50% are units from before 2006 and 50% 2006-2014.

<sup>465</sup> Average (default) value of 35% electric space heating from 2009 Residential Energy Consumption Survey for Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

<sup>466</sup> The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)), and it is based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Iowa (Des Moines, Mason City, and Burlington)). The estimate also assumes typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 \* SEER<sup>2</sup>) + (1.12 \* SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Masters Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP). Results of the Iowa study are assumed to be applicable to Missouri.

<sup>467</sup> The value is estimated at 1.11 (calculated as 1 + (0.91\*(0.34 / 2.8)), which is based on assumption that 91% of homes have central cooling (based on 2009 Residential Energy Consumption Survey, see "HC7.9 Air Conditioning in Midwest Region.xls").

<sup>468</sup> Calculated with EISA requirement of 45lumens/watt.

<sup>469</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>463</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 and 2015, the federal standard for heat pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

#### Where:

HF	= Heating Factor or percentage of light savings that must now be heated = $53\%^{470}$ for interior or unknown location = 0% for exterior or unheated location
0.03412	=Converts kWh to therms
$\eta Heat_{Gas}$	= Efficiency of heating system = $71\%^{471}$
%GasHeat	= Percentage of heating savings assumed to be Natural Gas

Heating fuel	%GasHeat
Electric	0%
Natural Gas	100%
Unknown	65%472

#### **MEASURE CODE:**

<sup>471</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). See reference "HC6.9 Space Heating in Midwest Region.xls." In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the state. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) +(0.71\*0.8))\*(1-0.15) = 0.71.<sup>472</sup> Average (default) value of 65% gas space heating from 2009 Residential Energy Consumption Survey for Missouri. If utilities have specific evaluation results providing a more

appropriate assumption for homes in a particular market or geographical area, then they should be used.

<sup>&</sup>lt;sup>470</sup> This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Iowa (Des Moines, Mason City, and Burlington). Results of the Iowa study are judged to be equally applicable to Missouri.

## 3.5.2 LED Specialty Lamp

#### DESCRIPTION

This measure provides savings assumptions for LED directional, decorative, and globe lamps when the LED is installed in a known location (i.e., residential and in-unit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location. For upstream programs, utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in effect making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

This measure was developed to be applicable to the following program types: TOS, NC, and RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

In order for this characterization to apply, new lamps must be ENERGY STAR<sup>®</sup> labeled based upon the ENERGY STAR<sup>®</sup> specification v2.0 which became effective on 1/2/2017 <u>https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2\_0%20Revised%20AUG-2016.pdf</u>). Qualification could also be based on the Design Light Consortium's qualified product list.<sup>473</sup>

#### **DEFINITION OF BASELINE EQUIPMENT**

Through 2021, the baseline condition for this measure is assumed to be an EISA qualified halogen or incandescent.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is 19 years for residential applications and 6 years for non-residential applications.<sup>474</sup>

#### **DEEMED MEASURE COST**

While LEDs may have a higher upfront cost than a halogen or CFL, the incremental cost for LEDs in an upstream lighting program is assumed to be zero because the net present value of the costs to replace the halogen or CFL multiple times over the life of the LED is greater than the upfront cost of the LED. Therefore, the incentive in this case is not designed to reduce the incremental cost over the lifetime of the measure. Instead the incentive is designed to reduce the initial upfront cost that may have been a barrier to the customer choosing the efficient lighting option. In the case of direct install programs or lighting included in efficient kits, the actual cost of the measure should be used.

Lighting RES Lighting BUS

Algorithm

## CALCULATION OF SAVINGS

#### **ELECTRIC ENERGY SAVINGS**

 $\Delta kWh_{RES} = (Watt_{Base} - Watt_{EE}) * \% RES * ISR * (1 - LKG) * Hours_{RES} * WHF_{RES} / 1,000$ 

 $\Delta kWh_{NRES} = (Watt_{Base} - Watt_{EE}) * (1 - \% RES) * ISR * (1 - LKG) * Hours_{NRES} * Days * WHF_{NRES}/1,000$ 

#### Where:

 $Watts_{Base}$  $Watts_{EE}$  = Based on bulb type and lumens of LED bulb installed. See table below.

= Actual wattage of LED purchased / installed - If unknown, use default provided below:<sup>475</sup>

Bulb Type	Lower Lumen Range	Upper Lumen Range	Watts <sub>Base</sub>	Watts <sub>EE</sub>	Delta Watts
	250	349	25	5.6	19.4
	350	399	35	6.3	28.7
Directional	400	599	40	7.5	32.5
Directional	600	749	60	9.7	50.3
	750	999	75	12.7	62.3
	1000	1250	100	16.2	83.8
	70	89	10	1.8	8.2
	90	149	15	2.7	12.3
Decorative	150	299	25	3.2	21.8
	300	499	40	4.7	35.3
	500	699	60	6.9	53.1
	250	349	25	4.1	20.9
Globe	350	499	40	5.9	34.1
	500	574	60	7.6	52.4
	575	649	75	13.6	61.4
	650	1099	100	17.5	82.5

#### <sup>473</sup> <u>https://www.designlights.org/QPL.</u>

<sup>474</sup> Measure life is estimated based on the ratio of average equipment specifications for lifetime hours to the estimated annual operating hours. EULs of 19 years for residential and 6 years for non-residential are based on average rated lifetime for 2021 progrmaprogram measures (through 8/3/2021) divided by 995 hours for residential settings and by 3,351 for non-residential settings.

<sup>475</sup> Watts<sub>EE</sub> defaults are based upon the average available ENERGY STAR<sup>®</sup> product, accessed 06/18/2015. For any lumen range where there is no ENERGY STAR<sup>®</sup> product currently available, Watts<sub>EE</sub> is based upon the ENERGY STAR<sup>®</sup> minimum luminous efficacy (directional; 40Lm/W for lamps with rated wattages less than 20Wand 50 Lm/W for lamps with rated wattages  $\geq$  20 watts. decorative and globe; 45Lm/W for lamps with rated wattages less than 15W, 50lm/W for lamps  $\geq$  15 and <25W, 60 Lm/W for lamps with rated wattages  $\geq$  25 watts.) for the mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx." These assumptions should be reviewed regularly to ensure they represent the available product.

## NATURAL GAS SAVINGS

Heating Penalty for Natural Gas heated home:s488

and the distribution of bulbs in the PY2019 program.

<sup>477</sup> Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. Average daily HOU for efficient bulbs is listed as 3.6 for outside bulbs and a weighted (by inventory) average of 1.99 for inside spaces. Unknown location is weighted average (by inventory) of all bulbs. See 'MO Lamp Hours.xls' for calculations.

<sup>478</sup> Calculated using defaults: 1 - ((0.53/1.57) \* 0.35) = 0.88.

<sup>479</sup> This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Iowa (Des Moines, Mason City, and Burlington). Results of the Iowa study were judged to be equally applicable to Missouri.

<sup>480</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 and 2015 the federal standard for heat pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

<sup>481</sup>Ameren Missouri Lighting Evaluation: PY2019. 3.98% is the weighted average for bulbs sold through the Online Store and Upstream Programs based on evaluation results and the distribution of bulbs in the PY2019 program.

<sup>482</sup> Ameren Missouri Community Savers Program Evaluation: PY2018.

<sup>483</sup> Ameren Missouri Efficient Kits Impact and Process Evaluation: Program Year 2018

<sup>484</sup> Calculatoin assumes 50% heat pump and 50% resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Regionals." Average efficiency of heat pump is based on assumption 50% are units from before 2006 and 50% 2006-2014.

<sup>485</sup> Average (default) value of 35% electric space heating from 2009 Residential Energy Consumption Survey for Missouri. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

 $^{486}$  The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)), is based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Iowa (Des Moines, Mason City, and Burlington)). The estimate also assumies typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 \* SEER<sup>2</sup>) + (1.12 \* SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Masters Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP). Results of the Iowa study were assumed to be applicable to Missouri.

 $^{487}$  The value is estimated at 1.11 (calculated as 1 + (0.91\*(0.34 / 2.8))). Based on assumption that 91% of homes have central cooling (based on 2009 Residential Energy Consumption Survey, see "HC7.9 Air Conditioning in Midwest Region.xls").

<sup>488</sup> Negative value because this is an increase in heating consumption due to the efficient lighting.

<sup>476</sup> Ameren Missouri Lighting Evaluation: PY2019. 96.02% is the weighted average for bulbs sold through the Online Store and Upstream Programs based on evaluation results

**MEASURE CODE:** 

<sup>490</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). See reference "HC6.9 Space Heating in Midwest Region.xls." In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) +(0.71\*0.8))\*(1-0.15)=0.71.<sup>491</sup> Average (default) value of 65% gas space heating from 2009 Residential Energy Consumption Survey for Missouri. If utilities have specific evaluation results providing a more

appropriate assumption for homes in a particular market or geographical area, then they should be used.

<sup>&</sup>lt;sup>489</sup> This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, Iowa. Results of the Iowa study were judged to be equally applicable to Missouri.

## 3.6 Motors

## 3.6.1 High Efficiency Pool Pumps

## DESCRIPTION

Residential outdoor pool pumps can be single speed, two/multi-speed or variable speed. A federal standard (82 FR 5650) effective July 19, 2021 effectively requires pool pumps to be at least two speed.

Single speed pumps are often oversized, and run frequently at constant flow regardless of load. Single speed pool pumps require that the motor be sized for the task that requires the highest speed. As such, energy is wasted performing low speed tasks at high speed. Two- speed and variable speed pool pumps reduce speed when less flow is required, such as when filtering is needed but not cleaning, and have timers that encourage programming for fewer on-hours. Variable speed pool pumps use advanced motor technologies to achieve efficiency ratings of 90% while the average single speed pump will have efficiency ratings between 30% and 70%.<sup>492</sup> This measure is the characterization of the purchasing and installing of a new ENERGY STAR variable speed residential pool pump motor in place of a new baseline pump meeting the federal standard for Time of Sale and New Construction, or the early replacement of a standard single speed motor of equivalent horsepower.

This measure was developed to be applicable to the following program types: TOS, NC, and RF.

If applied to other program types, the measure savings should be verified.

## DEFINITION OF EFFICIENT EQUIPMENT

The high efficiency equipment is an ENERGY STAR<sup>®</sup> variable speed residential pool pump for in-ground pools.

## **DEFINITION OF BASELINE EQUIPMENT**

For TOS and NC, the baseline equipment is a two speed residential pool pump meeting the Federal Standard, effective July 19, 2021 provided below:

Size Class	Baseline (Effective 7/19/2021)
Extra Small (hhp $\leq 0.13$ )	WEF ≥ 5.55
Small (hhp > 0.13 and < 0.711)	WEF $\ge$ -1.30 x ln (hhp) + 2.90
Standard Size (hhp $\ge$ 0.711)	WEF $\ge$ -2.30 x ln (hhp) + 6.59

For early replacement, the baseline is the existing single speed residential pool pump.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The estimated useful life for a two speed or variable speed pool pump is 10 years.<sup>493</sup>

## **DEEMED MEASURE COST**

For TOS and NC, the incremental cost is estimated \$314 for a variable speed motor.<sup>494</sup>

For early replacement, the actual cost of the measure should be used; if actual is unknown, use \$549.495

## LOADSHAPE

Pool Spa RES

Algorithm

## **CALCULATION OF ENERGY SAVINGS**

Electric Energy Savings496

For TOS and NC:

$$\Delta kWh = \left(Gallons * Turnovers * \left(\frac{1}{WEF_{base}} - \frac{1}{WEF_{ee}}\right) * Days\right) / 1,000 * ISR$$

For Early Replacement:

$$\Delta kWh = \left(Gallons * Turnovers * \left(\frac{1}{EF_{exist}} - \frac{1}{WEF_{ee}}\right) * Days\right) / 1,000 * ISR$$

Where:

Gallons	= Capacity of the pool. Use actual, or if unknown assume 22,000.497
Turnovers	= Desired number of pool water turnovers per day
	$=2^{498}$
WEF <sub>base</sub>	= Weighted Energy Factor of baseline pump (gal/Wh)
	$=4.6^{499}$
WEF <sub>ee</sub>	= Weighted Energy Factor of installed ENERGY STAR pump (gal/Wh)

	$= 6.31^{500}$
EF <sub>exist</sub>	= Energy Factor of existing single speed pump (gal/Wh)
	$=2.3^{501}$
Days	= Days per year of operation = $122^{502}$

<sup>492</sup> U.S. DOE, 2012. Measure Guideline: Replacing Single-Speed Pool Pumps with Variable Speed Pumps for Energy Savings. Report No. DOE/GO-102012-3534.

<sup>493</sup> The CEE Efficient Residential Swimming Pool Initiative, p18, indicates that the average motor life for pools in use year round is 5-7 years. For pools in use for under a third of a year, you would expect the lifetime to be higher so 10 years is selected as an assumption. This is consistent with DEER, 2014 and the ENERGY STAR<sup>®</sup> Pool Pump Calculator assumptions.

<sup>494</sup> ENERGY STAR<sup>®</sup> Pool Pump Calculator, using the difference between the two speed pool pump and variable speed pool pump incremental costs.

<sup>495</sup> ENERGY STAR<sup>®</sup> Pool Pump Calculator, estimated cost for a variable speed pool pump.

<sup>496</sup> The methodology followed is consistent with the most recent version of the 2020 ENERGY STAR calculator (Pool\_Pump\_Calculator\_2020.05.05\_FINAL.xlsx), however this has not been updated to account for the new federal standard.

<sup>497</sup> Consistent with assumption in the 2020 ENERGY STAR calculator (Pool\_Pump\_Calculator\_2020.05.05\_FINAL.xlsx).

498 Ibid.

<sup>499</sup> Consistent with IL-TRM V10.0 assumption, which is based on applying the federal standard specifications to the average Curve-C rated hydraulic horsepower (hhp) from the ENERGY STAR Qualified Products List, accessed 3/31/2021.

<sup>500</sup> Consistent with IL-TRM V10.0 assumption, which is based on applying the ENERGY STAR specifications to the average Curve-C rated hydraulic horse power (hhp) from the ENERGY STAR Qualified Products List, accessed 3/31/2021.

<sup>501</sup> Consistent with assumption in the 2020 ENERGY STAR calculator, assuming 1.5 HP pump (Pool\_Pump\_Calculator\_2020.05.05\_FINAL.xlsx).

<sup>502</sup> Consistent with assumption in the 2020 ENERGY STAR calculator (Pool\_Pump\_Calculator\_2020.05.05\_FINAL.xlsx).

# 3.7 Building Shell

## 3.7.1 Air Sealing

## DESCRIPTION

Thermal shell air leaks are sealed through strategic use and location of air-tight materials. An estimate of savings is provided in two ways. It is highly recommended that leaks be detected and pre- and post-sealing leakage rates measured with the assistance of a blower-door by qualified/certified inspectors.<sup>504</sup> Where this occurs, an algorithm is provided to estimate the site-specific savings. Where test in/test out has not occurred, a conservative deemed assumption is provided.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

## **DEFINITION OF EFFICIENT EQUIPMENT**

Air sealing materials and diagnostic testing should meet all eligibility program qualification criteria. The initial and final tested leakage rates should be assessed in such a manner that the identified reductions can be properly discerned, particularly in situations wherein multiple building envelope measures may be implemented simultaneously.

## **DEFINITION OF BASELINE EQUIPMENT**

The existing air leakage should be determined through approved and appropriate test methods using a blower door. The baseline condition of a building upon first inspection significantly affects the opportunity for cost-effective energy savings through air sealing.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.<sup>505</sup>

## **DEEMED MEASURE COST**

The actual capital cost for this measure should be used.

## CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS Test In / Test Out Approach

 $\Delta kWh = \Delta kWh_cooling + \Delta kWh_heating$ 

Where:

 $\Delta kWh_{cooling} = If central cooling, reduction in annual cooling requirement due to air sealing$ 

$$=\frac{\left(\frac{CFM50_{Pre} - CFM50_{Post}}{N_{cool}}\right) * 60 * 24 * CDD * DUA * 0.018 * LM}{(1000 * nCool)}$$

	$(1000 * \eta c 00l)$
CFM50 <sub>Pre</sub>	= Infiltration at 50 Pascals as measured by blower door before air sealing
	= Actual <sup>506</sup>
CFM50 <sub>Post</sub>	= Infiltration at 50 Pascals as measured by blower door after air sealing
	= Actual

<sup>&</sup>lt;sup>504</sup> Refer to the Energy Conservatory Blower Door Manual for more information on testing methodologies.

<sup>&</sup>lt;sup>505</sup> Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007.

<sup>&</sup>lt;sup>506</sup> Because the pre- and post-sealing blower door test will occur on different days, there is a potential for the wind and temperature conditions on the two days to affect the readings. There are methodologies to account for these effects. For wind – first, if possible, avoid testing in high wind, place blower door on downwind side, take a pre-test baseline house pressure reading, adjust house pressure readings by subtracting the baseline reading, and use the time averaging feature on the digital gauge, etc. Corrections for air density due to temperature swings can be accounted for with air density correction factors. Refer to the Energy Conservatory Blower Door Manual for more information.

	2015 and after	8.2	2.04
Resistance	N/A	N/A	1

3412 = Converts Btu to kWh

Conservative Deemed Approach

 $\Delta kWh = SavingsPerUnit * SqFt$ 

Where:

SavingsPerUnit = Annual savings per square foot, dependent on heating / cooling equipment<sup>514</sup>

<sup>508</sup> Based on climate normals data with a base temperature of 65°F.

<sup>509</sup> This factor's source: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research," p31.

<sup>510</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

<sup>511</sup> The LM is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

<sup>512</sup> N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, *Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings*; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30 year climate normals. For more information see Bruce Harley, CLEAResult "Infiltration Factor Calculations Methodology.doc" and calculation worksheets.

<sup>513</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for heat pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

<sup>514</sup> The values in the table represent estimates of savings from a 15% improvement in air leakage. The values are half those provided by Cadmus for the Iowa Joint Assessment, based on building simulations performed. While 30% savings are certainly achievable, this represents a thorough job in both the attic and basements and could not be verified without testing. The conservative 15% estimate is more appropriate for a deemed estimate. These values should be re-evaluated if EM&V values provide support for a higher deemed estimate.

<sup>&</sup>lt;sup>507</sup> N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, *Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings*; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30-year climate normals. WATER IMPACT DESCRIPTIONS AND CALCULATION N/A

**DEEMED O&M COST ADJUSTMENT CALCULATION** N/A

**MEASURE CODE:** 

<sup>515</sup> Fe is not one of the AHRI certified ratings provided for residential furnaces but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300-record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR® version 3 criteria for 2% Fe. See "Furnace Fan Analysis.xlsx" for reference.

<sup>516</sup> Based on Ameren Missouri 2016 loadshape for residential HVAC end-use.

<sup>517</sup> N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30-year climate normals. For more information see Bruce Harley, CLEAResult "Infiltration Factor Calculations Methodology.doc" and calculation worksheets.

<sup>518</sup> Ideally, the system efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The distribution efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute -

(<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u> - or by performing duct blaster testing. <sup>519</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and noncondensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8))\*(1-0.15) = 0.71.

<sup>520</sup> The values in the table represent estimates of savings from a 15% improvement in air leakage. The values are half those provided by Cadmus for the Iowa Joint Assessment, based on building simulations performed. While 30% savings are certainly achievable, this represents a thorough job in both the attic and basements and could not be verified without testing. The conservative 15% estimate is more appropriate for a deemed estimate. These values should be re-evaluated if EM&V values provide support for a higher deemed estimate.

## 3.7.2 Ceiling Insulation

#### DESCRIPTION

This measure describes savings from adding insulation to the attic/ceiling. This measure requires a member of the implementation staff evaluating the pre- and post-project R-values and to measure surface areas. The efficiency of the heating and cooling equipment in the home should also be evaluated if possible.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The requirements for participation in the program will be defined by the utilities.

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing condition will be evaluated by implementation staff or a participating contractor.

## DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.<sup>521</sup>

#### **DEEMED MEASURE COST**

The actual installed cost for this measure should be used in screening.

<sup>&</sup>lt;sup>531</sup> Ideally, the system efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The distribution efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute -

<sup>(</sup>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf) - or by performing duct blaster testing. <sup>532</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and noncondensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8))\*(1-0.15) = 0.71.

## 3.7.3 Duct Insulation

#### DESCRIPTION

This measure describes evaluating the savings associated with performing duct insulation on the distribution system of homes with central cooling and/or a ducted heating system. While insulating ducts in conditioned space can help with control and comfort, energy savings are largely limited to insulating ducts in unconditioned space where the heat loss is to outside the thermal envelope. Therefore, for this measure to be applicable, at least 30% of ducts should be within unconditioned space (e.g., attic with floor insulation, vented crawlspace, unheated garages. Basements should be considered conditioned space).

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The efficient condition is insulated duct work throughout the unconditioned space in the home.

#### **DEFINITION OF BASELINE EQUIPMENT**

The baseline condition is existing duct work with at least 30% of the ducts within the unconditioned space in the home.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.<sup>533</sup>

#### **DEEMED MEASURE COST**

The actual duct insulation measure cost should be used.

**LOADSHAPE** HVAC RES

Algorithm

## **CALCULATION OF SAVINGS**

#### **ELECTRIC ENERGY SAVINGS**

Electric energy savings is calculated as the sum of energy saved when cooling the home and energy saved when heating the home.

 $\Delta kWh = \Delta kWh_{Cooling} + \Delta kWh_{Heating}$ 

If central cooling, the electric energy saved in annual cooling due to the added insulation is

$$\Delta kWh_{Cooling} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLH_{cool} * \Delta T_{AVG,cooling}}{(1,000 * SEER)}$$

Where:

 $R_{\text{new}}$ 

SEER

= Duct heat loss coefficient with existing insulation  $((hr - {}^{0}F - ft^{2})/Btu)$ 

R<sub>existing</sub> = Duct he = Actual

= Duct heat loss coefficient with new insulation  $(hr^{-0}F-ft^{2})/Btu)$ 

= Actual

Area = Area of the duct surface exposed to the unconditioned space that has been insulated  $(ft^2)$ 

EFLH<sub>cool</sub> = Equivalent Full Load Cooling Hours:

Weather Basis (Ameren Missouri Average)	EFLHcool (Hours)		
SF or MF	869 <sup>534</sup>		
MFc (comprehensive envelope)	632535		

 $\Delta T_{AVG,cooling}$  = Average temperature difference (<sup>0</sup>F) during cooling season between outdoor air temperature and assumed 60<sup>o</sup>F duct supply air temperature<sup>536</sup>

Weather Basis (City based upon)	OA <sub>AVG</sub> ,cooling [°F] <sup>537</sup>	$\Delta T_{AVG,cooling}$ [°F]
St Louis, MO	80.8	20.8

1,000 = Converts Btu to kBtu

= Efficiency in SEER of air conditioning equipment

= Actual - If not available, use: $^{538}$ 

Equipment Type	Age of Equipment	SEER Estimate
Central AC	Before 2006	10
Central AC	After 2006	13
	Before 2006	10
Heat Pump	2006-2014	13
	2015 on	14

If the home is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

 $\Delta kWh_{HeatingElectric} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLH_{heat} * \Delta T_{AVG,heating}}{(3,412 * COP)}$ 

<sup>533</sup> Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007.

<sup>534</sup> Based on Full Load Hour assumptions (for St Louis and Kansas City) taken from the ENERGY STAR® calculator

(http://www.energystar.gov/ia/business/bulk\_purchasing/bpsavings\_calc/Calc\_CAC.xls) and reduced by 28.5% based on the evaluation results in Ameren territory suggesting an appropriate EFLH of 869. The other weather basis values are calculated using the relative climate normals cooling degree day ratios (at 65F set point).

<sup>535</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>536</sup> Leaving coil air temperatures are typically about 55°F. Therefore, 60°F is used as an average temperature, recognizing that some heat transfer occurs between the ductwork and the environment it passes through.

<sup>537</sup> National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old\_data/nsrdb/1991-2005/tmy3/by\_state\_and\_city.html . Heating season defined as September 17<sup>th</sup> through April 13<sup>th</sup>, cooling season defined as May 20 through August 15<sup>th</sup>. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

<sup>538</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

If the building is heated with a gas furnace, there will be some electric savings in heating the building attributed to extra insulation since the furnace fans will run less.

 $\Delta kWhHeating_{Gas} = (\Delta Therms * Fe * 29.3)$ 

#### Where:

 $\Delta$ Therms= Therm savings as calculated in Natural Gas Savings $F_e$ = Furnace fan energy consumption as a percentage of annual fuel consumption $= 3.14\%^{543}$ = Converts therms to kWh

#### SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$ Where:

CF

 $\Delta k$ WhCooling = Electric energy savings for cooling, calculated above

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

= 0.0004660805

#### NATURAL GAS SAVINGS

If home uses a gas heating system, the savings resulting from the insulation is calculated with the following formula.

$$\Delta \text{Therms} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLHheat * \Delta T_{AVG,heating}}{(100,000 * \text{ nHeat})}$$

Where: All factors as defined above.

WATER IMPACT DESCRIPTIONS AND CALCULATION N/A

**MEASURE CODE:** 

<sup>&</sup>lt;sup>539</sup> Evaluation - Opinion Dynamics review PY19. The recommended values are constructed based on weather conditions (heating degree days and cooling degree days) in select Missouri cities (St. Louis, Cape Girardeau, Kansas City), weighted by partial year 2019 installations.

<sup>&</sup>lt;sup>540</sup> Forced air supply temperatures are typically 130°F. 115°F is used as an average temperature, recognizing that some heat transfer occurs between the ductwork and the environment it passes through.

<sup>&</sup>lt;sup>541</sup> National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old\_data/nsrdb/1991-2005/tmy3/by\_state\_and\_city.html</u>. Heating season defined as September 17 through April 13, cooling season defined as May 20 through August 15. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded. <sup>542</sup> These default system efficiencies are based on the applicable minimum federal standards. In 2006 the federal standard for heat pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

 $<sup>^{543}</sup>$  Fe is not one of the AHRI certified ratings provided for residential furnaces but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300-record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR<sup>®</sup> version 3 criteria for 2% Fe.

## 3.7.4 Floor Insulation

### DESCRIPTION

Insulation is added to the floor above a vented crawl space that does not contain pipes or HVAC equipment. If there are pipes, HVAC, or a basement, it is desirable to keep them within the conditioned space by insulating the crawl space walls and ground. Insulating the floor separates the conditioned space above from the space below the floor and is only acceptable when there is nothing underneath that could freeze or would operate less efficiently in an environment resembling the outdoors. Even in the case of an empty, unvented crawl space, it is still considered best practice to seal and insulate the crawl space perimeter rather than the floor. Not only is there generally less area to insulate this way, but there are also moisture control benefits. There is a "Foundation Sidewall Insulation" measure for perimeter sealing and insulation. This measure assumes the insulation is installed above an unvented crawl space and should not be used in other situations.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The requirements for participation in the program will be defined by the utilities.

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be no insulation on any surface surrounding a crawl space.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

=

The expected measure life is assumed to be 25 years.<sup>544</sup>

#### **DEEMED MEASURE COST**

The actual installed cost for this measure should be used in screening.

<sup>554</sup> Based on Ameren Missouri 2016 loadshape for residential building shell end-use.

<sup>555</sup> Ideally, the system efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The distribution efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute -

(<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u> - or by performing duct blaster testing. 556 This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and noncondensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8))\*(1-0.15) = 0.71.

## 3.7.5 Foundation Sidewall Insulation

#### DESCRIPTION

Insulation is added to a basement or crawl space. Insulation added above ground in conditioned space is modeled the same as wall insulation. Below ground insulation is adjusted with an approximation of the thermal resistance of the ground. Insulation in unconditioned spaces is modeled by reducing the degree days to reflect the smaller but non-zero contribution to heating and cooling load. Cooling savings only consider above grade insulation, as below grade has little temperature difference during the cooling season.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The requirements for participation in the program will be defined by the utilities.

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be no basement wall or ceiling insulation.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.557

#### **DEEMED MEASURE COST**

The actual installed cost for this measure should be used in screening.

#### WATER IMPACT DESCRIPTIONS AND CALCULATION N/A

DEEMED O&M COST ADJUSTMENT CALCULATION N/A

**MEASURE CODE:** 

<sup>&</sup>lt;sup>571</sup> Ideally, the system efficiency should be obtained either by recording the AFUE of the unit or performing a steady state efficiency test. The distribution efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute -

<sup>(</sup>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf - or by performing duct blaster testing. <sup>572</sup> This has been estimated assuming that natural gas central furnace heating is typical for Missouri residences (the predominant heating is gas furnace with 48% of Missouri homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 29% of furnaces purchased in Missouri were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years, so units purchased 16 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and noncondensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.29\*0.92) + (0.71\*0.8))\*(1-0.15) = 0.71.

## 3.7.6 Storm Windows

#### DESCRIPTION

Storm windows installed on either the interior or exterior of existing window assemblies can reduce both heating and cooling loads by reducing infiltration and solar heat gain and improving insulation properties. Glass options for storm windows can include traditional clear glazing as well as low-emissivity (Low-E) glazing. Low-E glass is formed by adding an ultra-thin layer of metal to clear glass. The metallic-oxide (pyrolytic) coating is applied when the glass is in its molten state, and the coating becomes a permanent and extremely durable part of the glass. This coating is also known as "hard-coat" Low-E glass is designed to redirect heat back towards the source, effectively providing higher insulating properties and lower solar heat gain as compared to traditional clear glass. This characterization captures the savings associated with installing storm windows to an existing window assembly (retrofit).

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

An interior or exterior storm window installed according to manufacturer specifications.

## **DEFINITION OF BASELINE EQUIPMENT**

The existing window assembly.

# **DEEMED LIFETIME OF EFFICIENT EQUIPMENT**

20 years<sup>573</sup>

#### **DEEMED MEASURE COST**

The actual capital cost for this measure should be used when available and include both material and labor costs. If unavailable, the cost for a lowe storm window can be assumed as  $7.85/ft^2$  of window area (material cost) plus 30 per window for installation expenses.<sup>573</sup> For clear glazing, cost can be assumed as  $6.72/ft^2$  of window area (material cost) plus 30 per window for installation expenses.<sup>574</sup>

#### LOADSHAPE

Building Shell RES

Algorithm

#### CALCULATION OF SAVINGS

The following reference tables show savings factors (kBtu/ft<sup>2</sup>) for both heating and cooling loads for each of the seven weather zones defined by the TRM.<sup>575</sup> They are used with savings equations listed in the electric energy and gas savings sections to produce savings estimates. If storm windows are left installed year-round, both heating and cooling savings may be claimed. If they are installed seasonally, only heating savings should be claimed. Savings are dependent on location, storm window location (interior or exterior), glazing type (clear or Low-E) and existing window assembly type.

<sup>574</sup> A comparison of Low-E to clear glazed storm windows available at large national retail outlets showed the average incremental cost for Low-E glazing to be \$1.13/ft<sup>2</sup>. Installation costs are identical.

575 Savings factors are based on simulation results, documented in "Storm Windows Savings.xlsx."

<sup>&</sup>lt;sup>573</sup> Task ET-WIN-PNNL-FY13-01\_5.3: Database of Low-E Storm Window Energy Performance across U.S. Climate Zones. KA Cort and TD Culp, September 2013. Prepared for the U.S. Department of Energy by Pacific Northwest National Laboratory. PNNL-22864.

## 3.7.7 Kneewall and Sillbox Insulation

#### DESCRIPTION

This measure describes savings from adding insulation (for example, blown cellulose, spray foam) to wall cavities (this includes kneewall and sillbox areas). This measure requires a member of the implementation staff evaluating the pre- and post-project R-values and to measure surface areas. The efficiency of the heating and cooling equipment in the home should also be evaluated if possible.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

#### **DEFINITION OF EFFICIENT EQUIPMENT**

The requirements for participation in the program will be defined by the utilities.

#### **DEFINITION OF BASELINE EQUIPMENT**

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be empty wall cavities.

#### DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.<sup>581</sup>

#### **DEEMED MEASURE COST**

The actual installed cost for this measure should be used in screening.

## 3.8 Miscellaneous

## 3.8.1 Home Energy Report

#### DESCRIPTION

These behavior/feedback programs send energy use reports to participating residential electric or gas customers in order to change customers' energy use behavior. Energy savings are evaluated by ex-post billing analysis comparing consumption before and after (or with and without) program intervention and require M&V methods that include customer-specific energy usage regression analysis and randomized controlled trial (RCT) experimental designs, among others (see national protocols developed under the sponsorship of the US Department of Energy<sup>595</sup>). As such, calculation of savings achieved by the program for the year is treated as a custom protocol.

Given that actual monitored energy use is needed, as an ex-post input for these custom calculations, estimates of program savings are used for program planning and goal setting at the beginning of the program cycles. Estimated, or ex ante, values are based on previous actual program performance developed through forecasting analysis from the program implementer, or taken from actual savings values from comparable programs delivered by other program administrators.

#### HER Program Estimated (Ex Ante) Savings Values

Year	Gross Electric Energy Savings (kWh/home)	Gross Demand Savings (kW/home)^
1	140.37 в	0.065422
2	112.29	0.052337
3	89.83	0.041870
4	71.87	0.033496
5	57.49	0.026797
	Year 1 2 3 4 5	(kWh/home)           1         140.37 в           2         112.29           3         89.83           4         71.87

<sup>A</sup> Demand savings are calculated as the product of the gross electric energy savings and the kW factor for the Building Shell RES end use. <sup>B</sup> Value is based on the Ameren Missouri Home Energy Report Evaluation PY2021. First year annual energy savings are calculated as PY2021 HER Program Adjusted Net Annual Savings / Number of Customers Treated.

#### **DEFINITION OF EFFICIENT CASE**

The efficient case is a customer who receives a Home Energy Report.

#### **DEFINITION OF BASELINE CASE**

The baseline case is a customer who does not receive a Home Energy Report.

#### **DEEMED LIFETIME OF PROGRAM SAVINGS**

Year one savings represent ex post savings for the final year of treatment. Years two through five represent savings decay from the evaluated savings in year one. Once home energy reports cease, the savings persist for four additional years, with 20% savings decay each year. With this decay rate, second year savings are 80% of savings from the final year of treatment; third year savings are 64% of savings from the final year of treatment (80% of second year savings); fourth year savings are 51.2% of savings from the final year of treatment (80% of third year savings); fifth year savings are 40.96% of savings from the final year of fourth year savings); and no savings persist beyond the fifth year.<sup>596</sup>

#### **DEEMED MEASURE COST**

It is assumed that most behavior changes in residential settings can be accomplished with homeowner labor only and without investment in new equipment. Therefore, without evidence to the contrary, measure costs in such residential programs focused on motivating changes in customer behavior may be defined as \$0.

# 3.9 Residential Demand Response

## 3.9.1 Baseline Approach

## DESCRIPTION

Residential demand response: For demand and energy savings associated with calling a demand response event, program participants will be randomly partitioned into two groups. In this scenario, on an event day, participants in one group receive a signal to initiate activity on the thermostat (treatment group), while the other group of participants would not receive this signal (control group). Demand impacts will be estimated from the average of the hours over all event periods. Energy savings impacts will be estimated from comparing the 24 hours of the control group for each event day to the 24 hours of actual kWh consumption for each event day.

## 3.9.2 Demand Response Advanced Thermostat

## DESCRIPTION

This measure characterizes the energy and demand savings for an advanced thermostat enrolled in the Residential Demand Response (DR) Program. The program controls customer energy loads and also reduces energy usage by utilizing a continuous load shaping strategy during non-peak hours. Savings impacts are evaluated by ex-post analysis comparing demand and consumption with and without program intervention, utilizing field data which may be available through advanced thermostats' 2-way communication ability. The program will require M&V methods that include customer-specific energy usage regression analysis and randomized controlled trial (RCT) experimental designs, among others. As such, calculation of both demand and energy savings achieved by the program for the year are treated as a custom protocol.

Given that actual monitored field data is needed as ex post inputs for these custom calculations, estimates of program savings based on previous year evaluation results are used for program planning and goal setting at the beginning of the program cycles.

As advanced thermostats mature, some models include embedded optimization routines that achieve energy savings. The program differentiates between thermostats with "program-driven optimization," which achieve savings through program influence to operate optional optimization, and without "program-driven optimization," which achieve no energy savings due to either the default optimization baseline or no optimization routine employed.

Demand Response Smart Thermostat Deemed Savings Estimates for 2024-2026 Planning

Utility Program	Gross Electric Savings ( <i>Annual</i> ) (kWh/thermostat)	Gross Demand Savings ( <i>Event</i> ) (kW/thermostat)
Demand Response Advanced Thermostat – with Program-Driven Optimization	47.86 <sup>597</sup>	1.15 <sup>598</sup>
Demand Response Advanced Thermostat – without Program-Driven Optimization	0.00	1.15 <sup>599</sup>

This measure was developed to be applicable to the following program type: DR.

## **DEFINITION OF EFFICIENT CASE**

The efficient case is a customer who participated in the DR program.

## **DEFINITION OF BASELINE CASE**

The baseline case is a customer who is not participating in the DR program and who has installed a thermostat with default enabled capability—or the capability to automatically—establish a schedule of temperature set points according to driving device inputs above and beyond basic time and temperature data of conventional programmable thermostats. This category of products and services is broad and rapidly advancing with regard to their capability, usability, and sophistication, but at a minimum the baseline customer must have installed a thermostat capable of two-way communication and exceed the typical performance of manual and conventional programmable thermostats through the automatic or default capabilities described above.

## **DEEMED LIFETIME OF PROGRAM SAVINGS**

The expected measure life is assumed to be 11 years.

## **DEEMED MEASURE COST**

It is assumed that program-controlled changes in residential settings are accomplished without homeowner investment in new equipment. Therefore, without evidence to the contrary, measure costs in such residential programs focused on program controlled changes in customer behavior may be defined as \$0.
