1 REBUTTAL TESTIMONY

2 OF

3 TOM Y. LIN

4 UNION ELECTRIC COMPANY

5 CASE NO. EM-96-149

6  
7 Q. Please state your name and business address.

8 A. My name is Tom Y. Lin and my business address  
9 is 301 West High Street, Jefferson City, Missouri, 65101.

10 Q. By whom are you employed and in what  
11 capacity?

12 A. I am employed by the Missouri Public Service  
13 Commission (MPSC or Commission), as a Staff engineer in the  
14 Engineering Section of the Utility Operation Division's  
15 Energy Department.

16 Q. Please describe your educational and  
17 professional background.

18 A. I received a Bachelor of Engineering degree  
19 in Mechanical Engineering from Nanjing Institute of  
20 Technology (now Southeast University), China, in July, 1983.  
21 After graduation in 1983, I worked for Fujian Testing and  
22 Research Institute for Electric Power, a division of Fujian  
23 Provincial Electric Power Industry Bureau as a mechanical  
24 engineer for seven years. During that time, I was  
25 responsible for developing, designing, modifying, testing  
26 and performing computer simulation programs, boiler  
27 efficiency and heat rate tests, and various projects in

Rebuttal Testimony of  
Tom Y. Lin

1 Fujian Power Plants. I then pursued an advanced degree in  
2 America and graduated from the University of Oklahoma with  
3 a Master of Science degree in Mechanical Engineering in  
4 August of 1993. I began my employment with the Commission  
5 in August 1994.

6 Q. What is the purpose of your rebuttal  
7 testimony?

8 A. The purpose of my rebuttal testimony is to  
9 respond to the testimony of Union Electric Company (UE)  
10 witness Maureen A. Borkowski regarding electric production  
11 cost savings associated with the merger based on the Joint  
12 Dispatch Agreement (JDA).

13 Q. What are the electric production cost savings  
14 associated with the merger?

15 A. The electric production cost savings are  
16 those savings attributable to the joint dispatch of UE and  
17 Central Illinois Public Service Company (CIPS) generation  
18 and transmission resources on a single system basis after  
19 the merger compared to the electric production costs of UE  
20 and CIPS on a stand alone dispatch basis as if there were no  
21 merger.

22 Q. How much in electric production cost savings  
23 was estimated by UE on the basis of joint dispatch?

24 A. UE estimated that approximately \$84 million  
25 in cost savings would result over the ten-year period from

Rebuttal Testimony of  
Tom Y. Lin

1 1997 to 2006. Approximately \$74 million of the savings  
2 result from energy costs, which are calculated through  
3 production cost model simulations, and an additional \$10  
4 million in savings is due to operational savings from  
5 coordinating maintenance schedules of both UE and CIPS over  
6 the same period. On April 19, 1996, UE updated the  
7 additional savings value from \$10 million to approximately  
8 \*\*\_\_\_\_\_\*\* which included the savings of coordinating  
9 maintenance schedules, sharing of non-spinning reserves,  
10 improved heat rates, some operation and maintenance (O&M),  
11 system analysis software consolidation, and other savings in  
12 UE and CIPS electric production costs after the merger.

13 Q. What percentage is the \$74 million savings  
14 estimate of the total fuel costs for the combined UE and  
15 CIPS system over the ten-year period from 1997 to 2006?

16 A. In response to the Commission Staff's  
17 (Staff's) Data Request (DR) #1, UE stated that the fuel  
18 costs in its production cost model run from 1997 to 2006,  
19 were approximately \*\*\_\_\_\_\_\*\*. Thus, the \$74 million  
20 savings from joint dispatch represents approximately  
21 \*\*\_\_\_\_\_\*\* of the total fuel costs over the ten-year period.

22 Q. What is the JDA?

23 A. It is a written agreement that specifies how  
24 UE and CIPS intend to operate their combined system  
25 generating units and transmission facilities to meet load

Rebuttal Testimony of  
Tom Y. Lin

1 requirements. UE and CIPS would unite their generating  
2 resources and transmission facilities on a single control  
3 area basis, through the centralized, economic commitment and  
4 dispatch of the combined system's generating resources  
5 (including off-system purchases) to serve the combined  
6 system load requirements and sale obligations.

7 Q. What is your responsibility in this case with  
8 regard to the determination of the joint dispatch savings?

9 A. I am responsible for 1) evaluating the joint  
10 dispatch savings, which were calculated by UE by a  
11 computerized production cost model simulation, and 2)  
12 reviewing and assessing the reasonableness of input data  
13 used in Staff's model. The input data includes each  
14 generating unit's fuel prices, heat rates, variable O&M,  
15 maintenance outage schedules, and forced outage rates, as  
16 well as UE and CIPS native system loads over a ten-year  
17 period from 1997 to 2006. The purchased power data was  
18 obtained from Staff witness, David Elliott.

19 Q. How did you calculate the joint dispatch  
20 savings?

21 A. I ran the production cost model for three  
22 different simulations. The first two simulations assumed  
23 that the UE and CIPS generating systems would be operated as  
24 stand alone systems. The third simulation assumed that the  
25 combined generation resources of the two systems would be

Rebuttal Testimony of  
Tom Y. Lin

1 operated as a single system. Annual energy (or fuel) costs  
2 for the three simulations were collected. The UE and CIPS  
3 stand alone system simulation results were added together  
4 and compared to the results for the combined UE and CIPS  
5 system operation simulation. The difference in the two  
6 results was identified as joint dispatch savings excluding  
7 other savings mentioned above.

8 Q. What savings from joint dispatch did you find  
9 in this case?

10 A. I found that the joint dispatch savings would  
11 be approximately \$91 million excluding \*\*\_\_\_\_\_\*\*  
12 mentioned above over the period, from 1997 to 2006.

13 Q. What is the percentage of the joint dispatch  
14 savings calculated by the Staff compared to the total fuel  
15 costs in the UE and CIPS combined system over the ten-year  
16 period from 1997 to 2006?

17 A. It is approximately \*\*\_\_\_\_\_\*\*.

18 Q. What is the difference of joint dispatch  
19 savings, excluding the \*\*\_\_\_\_\_\*\* additional savings  
20 for coordinating maintenance schedules, sharing non-spinning  
21 reserves, improved heat rates and other items over the  
22 period from 1997 to 2006, between the Staff and UE?

23 A. It is approximately \$16,810,000.

24 Q. Which calculation of the joint dispatch  
25 savings between Staff and UE do you believe is more

Rebuttal Testimony of  
Tom Y. Lin

1 accurate?

2 A. Since both Staff and UE used projected input  
3 data and different production cost models, it is very  
4 difficult to determine if one result is more accurate than  
5 another. The actual joint dispatch savings will be different  
6 from the results of the production cost model run in the  
7 projected years, from 1997 to 2006.

8 Although the joint dispatch savings calculated by  
9 Staff and UE are different, the conclusions are identical.  
10 Based on the production cost model run, the JDA would result  
11 in a fuel savings in both Staff and UE analyses.

12 Q. What is a production cost model?

13 A. A production cost model is a computer program  
14 used to perform an hour-by-hour chronological simulation of  
15 a utility's generation and net power purchase, determining  
16 energy costs, fuel consumption, and emissions outputs to  
17 meet a utility's "native load."

18 Q. What is meant by the phrase "native load?"

19 A. For purposes of this case, "native load"  
20 means the firm load that a utility is obligated to serve. It  
21 includes retail, but not wholesale loads.

22 Q. Did you review UE's and CIPS' "native load"  
23 data?

24 A. Yes.

25 Q. Did you modify UE's and CIPS' "native load"

Rebuttal Testimony of  
Tom Y. Lin

1 data?

2 A. No, the "native load" data over a ten-year  
3 period from 1997 to 2006 used in this analysis is the same  
4 as that furnished by UE and CIPS in response to Staff DR's  
5 #2901 and 2904.

6 Q. Did you review the projected fuel prices,  
7 heat rates, variable O&M, maintenance outage schedules, and  
8 forced outage rates of each generating unit?

9 A. Yes.

10 Q. Did you change any projected fuel prices,  
11 heat rates, variable O&M, maintenance outage schedules, or  
12 forced outage rates data of any generating unit, which UE  
13 and CIPS provided in response to Staff DR's?

14 A. No, the projected fuel prices, heat rates,  
15 variable O&M, maintenance outage schedules, and forced  
16 outage rates of each generating unit over a ten-year period  
17 from 1997 to 2006 used in this analysis were the same as  
18 that furnished by UE and CIPS in response to Staff DR's  
19 #2901 and 2907.

20 Q. Did you consider similar scenarios to  
21 simulate the actual dispatch and system coordinated  
22 operations in the production cost model?

23 A. Yes, I did. Under Commission Rule 4 CSR 240-  
24 20.080, UE submitted monthly generating unit information.  
25 For the UE system, I considered the Callaway nuclear

Rebuttal Testimony of  
Tom Y. Lin

1 generating unit and Labadie 1, 2, 3, and 4, Sioux 1 and 2,  
2 Rush Island 1 and 2 coal-fired generating units as the "must  
3 run" generating units, based on 20.080 data. For the CIPS  
4 system, I considered the Coffeen 1 and 2, Newton 1 and 2,  
5 and Meredosia 3 coal-fired generating units as the "must  
6 run" units, based on CIPS in response to Staff DR's #2901  
7 and 2907. "Must run" means that a "must run" unit must be  
8 run or dispatched even though other more economic power is  
9 available in the production cost model simulations.

10 Q. . Did UE's analysis also consider some UE and  
11 CIPS owned generating units to be "must run" units in its  
12 production cost model run?

13 A. Yes. For the UE system, Meramec 1, 2 and 4  
14 coal-fired generating units and other generating units which  
15 were the same as Staff used in the production cost model  
16 were regarded as the "must run" generating units. For the  
17 CIPS system, Coffeen 1 and 2, and Newton 2 coal-fired  
18 generating units as well as a Meredosia generating unit  
19 (three coal-fired generating units and one combustion  
20 turbine were combined as a single Meredosia generating unit  
21 in Meredosia plant) were considered as the "must run" units  
22 by UE, based on CIPS public information.

23 Q. Why did the Staff not consider Meramec  
24 generating units as "must run" generating units?

25 A. For the Meramec generating units, since there

Rebuttal Testimony of  
Tom Y. Lin

1 were many reserve shutdowns shown in 20.080 data, these  
2 generating units were not considered as the "must run" units  
3 in the production cost model.

4 Q. What production cost model did you use?

5 A. I used REAL TIME.

6 Q. What computer program did UE use?

7 A. UE used the EPRI MIDAS computer model.

8 Q. What in your opinion, should the Commission  
9 require of UE/Ameren so that the Energy Engineering Section  
10 can perform appropriate fuel and energy cost simulation  
11 after the merger?

12 A. The following conditions would be necessary:

13 1. UE/Ameren must provide the historical hourly  
14 generation, purchase power data, and sales power data  
15 required under Commission Rule 4 CSR 240-20.080 in  
16 electronic format accessible by a spreadsheet program.

17 2. Acknowledgment and agreement that the  
18 Commission may access and require without subpoena the  
19 production of all accounts, books, contracts, records,  
20 documents, memoranda, papers, and employees of Ameren  
21 Corporation and any affiliate or subsidiary of Ameren  
22 Corporation.

23 The above language includes access to all data,  
24 records and calculations required for the analysis of fuel  
25 and energy costs.

Rebuttal Testimony of  
Tom Y. Lin

1                   It would be detrimental to Missouri ratepayers if  
2 the Commission did not have the above information because  
3 the Commission's ability to set just and reasonable rates  
4 would be impaired.

5                   Q.    Would you summarize your rebuttal testimony?

6                   A.    The projected fuel prices, heat rates, O&M  
7 costs, maintenance outage schedules, and forced outage rates  
8 of each generating unit, as well as native system loads and  
9 purchase power data were included in the production cost  
10 model run. The joint dispatch savings which were calculated  
11 in the simulation amounted to approximately \$91 million.

12                  Q.    Does this conclude your rebuttal testimony?

13                  A.    Yes, it does.

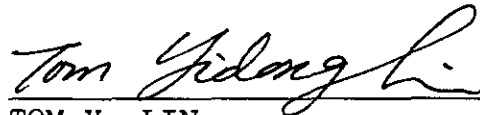

BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI
