Date: July 1, 2022

MISSOURI PUBLIC SERVICE COMMISSION

**CASE NO. WR-2022-0303
CASE NO. SR-2022-0304**

DIRECT TESTIMONY

OF

CHARLES B. REA

ON BEHALF OF

MISSOURI-AMERICAN WATER COMPANY

AFFIDAVIT

I, Charles B. Rea, under penalty of perjury, and pursuant to Section 509.030, RSMo, state that I am Senior Regulatory, Rates & Regulatory for American Water Works Service Company, Inc., that the accompanying testimony has been prepared by me or under my direction and supervision; that if inquiries were made as to the facts in said testimony, I would respond as therein set forth; and that the aforesaid testimony is true and correct to the best of my knowledge and belief.

Charles B. Rea

DIRECT TESTIMONY

CHARLES B. REA

I. INTRODUCTION

1 **Q. Please state your name and business address.**

2 A. My name is Charles B. Rea. My business address is 5201 Grand Avenue, Davenport, IA
3 52801.

4 **Q. By whom are you employed and in what capacity?**

5 A. I am employed by the American Water Works Service Company, Inc. (“AWWSC”). My
6 title is Senior Director, Rates & Regulatory.

7 **Q. Please summarize your educational background and business experience.**

8 A. I received a Bachelor of Arts degree in Computer Science from the University of Illinois
9 at Springfield in 1986 and a Master of Science degree in Statistics and Operations Research
10 from Southern Illinois University at Edwardsville in 1990.

11 I have been employed by AWWSC since January 2018 in my role as Senior
12 Director, Rates and Regulatory. Previous to my employment with AWWSC, I was
13 employed by MidAmerican Energy Company from June 1990 through January 2018. I
14 have more than thirty years of utility experience covering a wide range of issues including
15 electric system planning, sales and revenue forecasting, electric load research, marketing,
16 rates, class cost of service, and energy efficiency. Most recently at MidAmerican, I was
17 Director, Energy Efficiency and Regulatory Analytics. In that position, I had responsibility
18 for planning, evaluation, and operational management of MidAmerican’s energy efficiency
19 and demand response programs in Illinois, Iowa, and South Dakota, as well as direct
20 responsibility for electric and natural gas sales and revenue forecasting, electric peak

1 demand forecasting, load research, retail pricing of electric and natural gas products, and
2 electric and natural gas cost of service and rate design.

3 **Q. What are your current employment responsibilities?**

4 A. My primary responsibility in my role as Senior Director, Rates and Regulatory is to serve
5 as a subject matter expert on rate design, revenue, and affordability of service issues for
6 AWWSC's operating company affiliates, including Missouri-American Water Company
7 ("MAWC" or the "Company"). I am responsible for the development and preparation of
8 rate design analyses and filings, as well as rate design proposals to our internal and external
9 stakeholders. I am also responsible for projections of revenues for rate case purposes, and
10 I am responsible for developing and presenting information on the affordability of our
11 water and wastewater service to our customers.

12 **Q. Have you previously testified before a regulatory body?**

13 A. Yes. During my employment with AWWSC, I have provided testimony regarding the cost
14 of service, rate design proposals, revenue projections, and affordability analyses for New
15 Jersey-American Water Company, Virginia-American Water Company, Pennsylvania-
16 American Water Company, Maryland-American Water Company, West Virginia-
17 American Water Company, Iowa-American Water Company, Missouri-American Water
18 Company, Indiana-American Water Company, and Illinois-American Water Company. I
19 also have testified on numerous occasions in Iowa, Illinois, and South Dakota on issues
20 regarding energy efficiency and electric and natural gas cost of service and rate design.

21 **Q. What is the purpose of your Direct Testimony in this proceeding?**

22 A. The purpose of my Direct Testimony is to sponsor MAWC's rate design proposals,
23 affordability analyses, revenue projections including adjustments to MAWC's historical

1 billing determinants, and the policy reasons supporting MAWC’s proposed Revenue
2 Stabilization Mechanism (“RSM”). Specifically, I will address the following issues:

- 3 - Rate Design
- 4 - Affordability
- 5 - Analysis of MAWC Water Consumption
- 6 - Revenue Calculations
- 7 - Revenue Stabilization Mechanism (Policy)

8 **Q. Please identify the schedules you will be sponsoring and for which you will be**
9 **providing testimony.**

10 A. I am sponsoring the following Company Schedules attached to my Direct Testimony:

- 11 - Schedule CBR-1: Water Rate Design
- 12 - Schedule CBR-2: Wastewater Rate Design
- 13 - Schedule CBR-3: Water Affordability Analysis
- 14 - Schedule CBR-4: Residential Usage Analysis
- 15 - Schedule CBR-5: Commercial Usage Analysis
- 16 - Schedule CBR-6: Public Authority Usage Analysis
- 17 - Schedule CBR-7: NARUC Resolution

18 **II. RATE DESIGN**

19 **Q. Please discuss some of the important guiding principles associated with sound rate**
20 **design.**

21 A. There are a number of important principles that pricing analysts and policymakers consider
22 when developing appropriate rate design mechanisms for retail water and sewer service:

- 23 - **Cost Basis:** An important goal of rate design is to develop prices for water service

1 to retail customers that are intended to recover the Company's approved revenue
2 requirement and that reflect the cost of providing service to retail customers. Cost
3 of service results inform pricing decisions and guide how rates should be set such
4 that each customer class contributes to the revenue requirement commensurate with
5 their cost to serve. Company witness Wesley Selinger presents the Company's cost
6 of service studies in this case.

7 - **Revenue Stability:** Rates should be designed in a way that provides revenue
8 stability to the utility and that can be reasonably expected to recover the utility's
9 revenue requirement over the long run. Consistent recovery of the approved
10 revenue requirement through well-designed rates helps the utility to prudently
11 manage and invest in the water delivery system, while poor rate design decisions
12 can hamper the utility's ability to make investments, operate, and maintain the
13 water delivery system in a manner consistent with the long-term interest of its
14 customers.

15 - **Efficiency of Use:** Rates should be designed to encourage the efficient use of water
16 resources by customers. The volumetric charges for water service should
17 appropriately reflect the variable cost of providing water service while also
18 providing customers an appropriate incentive to conserve water and manage their
19 bills. Rates should communicate to customers the full cost of providing water
20 service.

21 - **Gradualism:** Changes in rate design should be made in a manner that avoids
22 inappropriate levels of rate shock. Rate shock can come both from general increases
23 in revenues that can affect all customers and from changes in rate designs that can

1 cause large increases to specific pockets of customers. Drastic changes in rates can
2 cause customer confusion and dissatisfaction and have adverse effects on the
3 utility's ability to provide quality customer service.

4 - **Avoidance of Discrimination:** Rates should not unduly discriminate between
5 particular customer groups or provide different price signals to similarly situated
6 customers taking similar services from the utility.

7 - **Simplicity and Feasibility:** Rate designs should be relatively simple and easy to
8 understand and easy to communicate, manage, and should result in bills that are
9 clear and understandable.

10 **Q. Please describe the Company's current rate design for water service.**

11 A. MAWC's current rate design for water service primarily consists of a two-part rate design
12 that features a flat volumetric rate (in most cases) with a monthly fixed charge that varies
13 with the size of the meter.

14 **Q. Does the Company have different pricing structures in different geographic
15 locations?**

16 A. Yes. Currently, rates are split into two primary pricing districts:

17 - St. Louis County

18 - Non-St. Louis County

19 **Q. Please describe the rate structures currently in place for St. Louis County and non-
20 St. Louis County customers.**

21 A. The Company offers the following rates to St. Louis County and non-St. Louis County
22 customers:

1 - **Rate A:** Rate A is a volumetric rate with fixed monthly charges for residential and
2 most non-residential customers.

3 - **Rate J:** Rate J is a volumetric rate with fixed monthly charges for certain customer
4 types defined as large water users. This rate applies to:

- 5 - customers using more than 450,000 gallons per month, where
- 6 - usage is fairly constant throughout the year (language per tariff), and
- 7 - usage is not for residential, irrigation, or construction use.

8 In every month, the amount of water billed to each customer under Rate J is the
9 maximum of a) 450,000 gallons, b) the customer's actual metered use for the
10 month, or c) 60% of the customer's highest summer period monthly use in the
11 twelve months before the current month's billing. Customers are removed from the
12 rate for a period of twelve months if their monthly metered usage falls below
13 450,000 gallons per month twice during a twelve-month period.

14 - **Rate B:** Rate B is a volumetric rate with fixed monthly charges for customers that
15 are sales for resale customers.

16 For all of the above rates, the monthly meter charges are the same. The volumetric charges
17 are lower for St. Louis County customers than for other customers for Rate A and Rate J,
18 but are identical for Rate B. In addition, the Company has an inclining block rate
19 structure in its Mexico service territory for residential customers, where volumetric prices
20 increase as the amount of water purchased every month increases (the "Pilot Program").
21 The Company's volumetric rates for Rates A, B, and J, as well as the inclining block rate
22 structure for Mexico is shown below.

<i>Volumetric Rates</i>	St. Louis County	Other
Rate A	\$0.56290	\$0.62469
Rate J	\$0.17797	\$0.28268
Rate B	\$0.26194	\$0.26194

<i>Mexico Inclining Block</i>	Volumetric Rate
1 st 3,000 gal. per month	\$0.57266
Next 7,000 gal. per month	\$0.71583
Over 10,000 gal. per month	\$0.79027

1 **Q. Does the Company offer rates for fire protection service to St. Louis County and non-**
2 **St. Louis County customers?**

3 A. Yes. The Company offers private fire protection service to all districts under Rate F. This
4 rate provides for monthly service charges by size of service and provides for monthly
5 charges for private fire hydrants. Monthly service fees and hydrant fees are the same for
6 all customers. Volumetric charges for water used for private fire service are charged at the
7 applicable rate for Rate Schedule A. The Company does not charge separate rates for
8 public fire protection service. Public fire protection costs are reallocated back to general
9 service customer classes in the Company's water service rate design and are recovered
10 through general service rates.

11 **Q. Does MAWC have any customers on special contract rates?**

12 A. Yes. MAWC has two large industrial customers on special contract rates with separate
13 volumetric rates specific to those customers. In addition, there are three Sales for Resale
14 customers that take service under special contract rates. In total, these customers account
15 for approximately \$3.6 million in revenue.

1 **Q. What changes is the Company proposing to make to its rate design for water service**
2 **in this case?**

3 A. The Company is not proposing any significant changes to its water service rate design in
4 this case other than to propose the elimination of the inclining block rate Pilot Program in
5 Mexico and return Mexico residential rates to the standard Rate A offering for non-St.
6 Louis County customers. Also, the Company is proposing to equalize volumetric rates for
7 Rate A between St. Louis County and non-St. Louis County customers and to move
8 volumetric rates for St. Louis County and non-St. Louis County customers closer together
9 in the Rate J offering.

10 **Q. Please describe the Mexico inclining block Pilot Program.**

11 A. The Mexico inclining block Pilot Program was approved by the Commission through the
12 Stipulation and Agreement Regarding Inclining Block Pilot Program filed jointly by the
13 Company, the Staff of the Missouri Public Service Commission, and the Missouri Division
14 of Energy in Case No. WR-2017-0285 (“the Stipulation”) with rates taking effect on May
15 28, 2018. The purpose of the Pilot Program was to determine if residential customers in
16 the Mexico service territory that previously took service at a rate that was the same
17 regardless of how much water they used would modify their monthly consumption pattern
18 in response to a rate design that charges more for water as they use more water. To aid the
19 effort to encourage customers to use less water in response to the inclining block rate, the
20 Stipulation allowed for water conservation kits to be offered at no charge to residential
21 customers participating in the Pilot Program. In Case No. WR-2020-0344, the Commission
22 ordered a change in the inclining block rate structure to increase the price differentials
23 between the steps that results in the volumetric rates I outlined earlier in my testimony.

1 **Q. Why is the Company proposing to eliminate the inclining block rate Pilot Program in**
2 **Mexico and return Mexico residential rates to the standard Rate A offering for non-**
3 **St. Louis County customers?**

4 A. An analysis of usage data going back to the beginning of the Pilot Program has failed to
5 demonstrate any significant changes in usage over time either in total or between the three
6 different usage blocks in the Pilot Program. In addition, the Mexico service territory is one
7 of the least seasonal areas the Company serves in terms of the amount of seasonal non-
8 discretionary water usage and is one of the lowest income areas served by the Company as
9 shown in the Company's affordability analysis discussed in detail later in Section III of my
10 testimony. Also, the largest residential customer in Mexico that uses the most water in the
11 over 10,000 gallons per month block is a master-metered apartment complex where the
12 ability of individual tenants to change water consumption in response to price changes may
13 be minimal or non-existent. These facts, coupled with the non-response of water usage
14 after implementation of the inclining block rate structure, suggest that it is unlikely there
15 will be significant changes in residential water consumption patterns in response to an
16 inclining block rate structure in Mexico absent more dramatic changes in the rate structure.
17 For these reasons, the Company is proposing to eliminate the inclining block rate Pilot
18 Program in Mexico and return Mexico residential rates to the standard Rate A offering for
19 non-St. Louis County customers.

20 **Q. Why is the Company proposing for the St. Louis County and non-St. Louis County**
21 **groups to equalize the volumetric rates for Rate A and to move the volumetric rates**
22 **for Rate J closer together?**

23 A. The Company is proposing to equalize the volumetric rates for Rate A between St. Louis

1 County and non-St. Louis County customers to complete the process of single tariff pricing
2 for those rates that the Commission has considered over the last two rate cases. It is
3 noteworthy that volumetric rates for these groups are nearly identical today, so moving
4 these rates to a single statewide rate does not impose significant additional rate increases
5 or rate shock for either of these groups of customers. The Company is also proposing to
6 move Rate J rates closer together by increasing Rate J for St. Louis County customers by
7 200% of the increase for non-St. Louis County customers. This is also an attempt to move
8 closer to single tariff pricing for these customers while recognizing the significant
9 differences in those rates that currently exist.

10 **Q. In Case No. WR-2020-0344, the Company proposed significant changes to the Rate J**
11 **service offering, proposing to create a new large user rate and a transitional rate for**
12 **customers that would not have been eligible for the new large user rate. Those**
13 **changes were not included in the settlement agreement concluding that case. Is the**
14 **Company proposing any changes to the Rate J offering in this case?**

15 A. No. The Company is not proposing any significant changes to its Rate J offering in this
16 case, other than movement in volumetric rates for St. Louis County and non-St. Louis
17 County that I described earlier in this testimony.

18 **Q. Monthly meter charges are the same for all customers regardless of the rate schedule**
19 **under which they take service with the exception of fire service. Is the Company**
20 **proposing to change the monthly meter charges in this case?**

21 A. Yes. The Company is proposing to increase the 5/8" monthly meter charge from \$9.00 per
22 month to \$12.00 per month, which is a 33% increase and is still less than the 5/8" monthly
23 meter charges supported in the class cost of service studies provided in the Direct

1 Testimony of Company witness Mr. Selinger. Percentage increases for meter charges for
2 meters larger than 5/8” are also approximately 33%.

3 **Q. What acquisitions are included in the Company’s water rate design and how are they**
4 **treated?**

5 A. As explained in the Direct Testimony of Company witness Brian LaGrand, the Company
6 is including the following acquisitions that are anticipated to close by the end of 2022 in
7 its revenue requirements and in its proposed rate design:

- 8 - Eureka
- 9 - Monsees Lake
- 10 - Purcell
- 11 - Stewartsville
- 12 - Smithton

13 The Monsees Lake, Purcell, Stewartsville, and Smithton acquisitions are all included in the
14 non-St. Louis County rate design for both present rates and proposed rates. The Eureka
15 acquisition is included in present rates and proposed rates under the St. Louis County rate
16 design.

17 **Q. Please describe how the Company is proposing to allocate its proposed revenue**
18 **increase for water service to its customer classes.**

19 A. The Company is proposing to allocate its proposed increase in water service revenues
20 according to the following guidelines:

- 21 - Increases to Rate J in total are capped at 150% of the overall water revenue increase
22 requested in this case to bring those customers gradually toward cost of service.

- 1 - Increases to Private Fire rates likewise are capped at 150% of the overall water
2 revenue increase requested in this case to bring those customers gradually toward
3 cost of service.
- 4 - Rate B proposed revenues are set at cost of service.
- 5 - The remaining revenue requirement, after calculation of specific contract rates, is
6 spread to Rate A customers by increasing the volumetric rate for Rate A.

7 **Q. Do you have a schedule that provides the Company's complete proposed rate design**
8 **in this case?**

9 A. Yes. Schedule CBR-1 provides the Company's proposed rate design, which is based on
10 the current rate design as modified by the proposals discussed above.

11 **Q. Please describe the Company's current rate design for wastewater service.**

12 A. The Company currently offers wastewater service under five different rate schedules
13 applicable to five different wastewater districts:

- 14 - Tariff RT 1.1 (Arnold)
15 - Tariff RT 2.1 (Various communities)
16 - Tariff RT 3.1 (Various communities)
17 - Tariff RT 3.2 (Taos)
18 - Tariff RT 4.1 (Hallsville)

19 The Arnold tariff consists of a monthly flat fee of \$37.23 per month for all customers plus
20 a volumetric charge of \$7.140 per thousand gallons for usage above 5,000 gallons per
21 month. Tariffs RT 2.1 and RT 3.1 both offer a flat fee for residential customers (\$61.64
22 per month for RT 2.1 and \$44.03 per month for RT 3.1) and a graduated monthly charge
23 by meter size for commercial customers with a volumetric charge for commercial

1 customers that applies to all usage above 6,000 gallons per month. Tariff RT 3.2 applicable
2 to customers in Taos consists of a \$65.00 per month flat fee for all customers. Tariff RT
3 4.1 applicable to customers in Hallsville consists of a \$38.750 per month flat fee for all
4 residential customers and a bifurcated flat fee of either \$48.75 or \$159.75 depending on
5 usage.

6 **Q. Is the Company proposing to make any significant changes to its rate design for**
7 **wastewater service?**

8 A. No.

9 **Q. Is the Company proposing to collect its entire proposed wastewater service revenue**
10 **requirement through its wastewater rates?**

11 A. Yes. The Company is proposing to recover its entire proposed wastewater revenue
12 requirement through wastewater rates and does not propose any recovery of wastewater
13 revenue requirements through its water service rates.

14 **Q. What acquisitions are the Company including in its water rate design and how are**
15 **those acquisitions treated?**

16 A. The Company is including the same acquisitions for wastewater service as it is for water
17 service as I have previously described in my testimony, which are:

- 18 - Eureka
- 19 - Monsees Lake
- 20 - Purcell
- 21 - Stewartsville
- 22 - Smithton

23 The Monsees Lake acquisition is included in present rate revenues under their current rate,

1 which is a flat unmetered fee of \$58.00 per customer per month. The Purcell acquisition
2 is included in present rate revenues and proposed rates under Tariff Schedule 2.1. The
3 Eureka, Stewartsville and Smithton acquisitions are all included in present rates revenues
4 and proposed rates under Tariff Schedule 3.1.

5 **Q. Do you have a schedule that provides the Company's complete proposed rate design**
6 **for wastewater service in this case?**

7 A. Yes. Schedule CBR-2 provides the Company's proposed rate design for wastewater
8 service.

9 **III. AFFORDABILITY**

10 **Q. How would you define affordable water and wastewater service?**

11 A. The concept of affordability for water and wastewater service is based on the idea that
12 everyone should have access to drinking water and wastewater service that is: (1) safe,
13 meaning it complies with EPA regulations and Safe Drinking Water Act standards; (2)
14 reliable, so that it is resilient in the face of floods, droughts, and other climate risks; and
15 (3) affordable. An assessment of affordability generally compares monthly or annual bills
16 for water or wastewater service to measures of household income.

17 **Q. How can one assess the affordability of water and wastewater service and what**
18 **information is needed to complete such an assessment?**

19 A. A common way to assess affordability is to compare annual bills for water and/or
20 wastewater service to some measure of household income in the communities that the
21 utility serves. Such an assessment requires two data points – the average monthly or annual
22 bill for water and wastewater service and some measure of household income for the target
23 customer population. For the broader residential customer base, the most common

1 household income measure is Median Household Income (“MHI”), which can be measured
2 at a community level and is paired with a data set that provides the number of customers
3 served in each community to arrive at a weighted number that represents MHI for the
4 Company’s entire service territory. Alternative measures of income, such as disposable
5 income or hours of labor at minimum wage needed to cover the cost of water and/or
6 wastewater service have also been suggested.¹

7 When an appropriate measure (or measures) of household income is determined,
8 affordability can then be assessed for the average customer, low-income customers, and a
9 full range of households based on their various income levels and bills for water and/or
10 wastewater service. A variety of household income data is readily and publicly available
11 from the U.S. Census Bureau through the American Community Survey (“ACS”) at the
12 state, county, and community levels.

13 **Q. What can different measures of affordability for water and wastewater service**
14 **expressed as a percentage of MHI tell you?**

15 A. Assessing affordability information of water and wastewater service for the entire MAWC
16 residential customer population can tell you whether customers in general are having or
17 would have difficulty paying their water bills under the Company’s current or proposed
18 tariff structure. Assessing affordability information of water and wastewater service for
19 lower-income customers can tell you the number of customers that may be having trouble
20 paying their utility bills, where the customers are located in the Company’s service
21 territory, and the extent to which those bills are causing customers economic distress. This

¹ Teodoro, Manuel P. “Measuring Household Affordability for Water and Sewer Utilities.” Journal AWWA, 2018, doi:10.5942/jawwa.2018.110.0002

1 can, in turn, inform the utility about the size and scope of low-income assistance programs
2 that may be needed to help these vulnerable customers better afford water and wastewater
3 service, both in terms of rate design proposals and customer assistance programs that may
4 include customer grants, tariff discounts, levelized billing, and outreach programs.

5 **Q. Have you completed an affordability study regarding bills that would arise from**
6 **proposed rates in this case?**

7 A. Yes. My affordability study for water service is provided in Schedule CBR-3

8 **Q. What information does your affordability study provide?**

9 A. My affordability study is actually two different analyses and provides two basic types of
10 information. This information includes:

- 11 • Historical comparisons of average monthly bills to MHI are shown in actual terms and
12 shown in terms of Bill-to-Income (“BTI”) Ratio, which is defined as annual water bills
13 divided by estimated annual household income.
- 14 • Current information on the estimated number of customers in the service territory, and
15 estimated BTI Ratios for various income levels stated in terms of household income
16 and multiples of the Federal Poverty Level (“FPL”). BTI Ratios are calculated for
17 proposed rates in this case.

18 **Q. What is the result of your historical comparison of average monthly water bills to**
19 **median household income in the MAWC service territory?**

20 A. The charts below compare historical average monthly water bills to MHI for Missouri-
21 American customers from 2012 through 2021 stated in absolute terms and stated in terms
22 of BTI Ratio, along with estimated average monthly bills under the Company’s proposed

1 rates in this case and estimated MHI for Missouri-American customers during 2023. The
2 data shows that the BTI Ratios for water service for Missouri-American customers have
3 held steady from 2012 to 2021 generally between 0.5% and 0.6%, meaning that on average
4 MAWC’s customers in total have steadily paid between 0.5% and 0.6% of their household
5 income over the last 10 years for water service from Missouri-American. Based on the
6 Company’s proposed rates in this case, MAWC expects the BTI Ratio for water service in
7 2023 to be 0.79%.

1 **Q. What conclusions can you draw from these historical comparisons?**

2 A. The charts above show that average residential monthly bills have risen at approximately
 3 the same rate from 2010 to 2021 as median household income has risen for customers. This
 4 results in a BTI Ratio that has remained steady over that timeframe within a range of 0.50%
 5 to 0.65%. Under the Company’s proposed rates, the BTI Ratio in 2023 is expected to be
 6 0.79%.

7 **Q. Is there a generally accepted standard for the affordability of water and wastewater
 8 expressed as a percentage of MHI?**

9 A. A benchmark for affordability expressed as a total bill’s percentage of MHI is a policy
 10 decision; however, bills less than 2.0% or 2.5% of MHI for water and 4.0% to 4.5% of
 11 MHI for combined water/wastewater are considered “affordable” by some.² An
 12 affordability benchmark for water service of 3.0% to 4.5% of household income has also

² Teodoro, Manuel P. “Measuring Household Affordability for Water and Sewer Utilities.” Journal AWWA, 2018, doi:10.5942/jawwa.2018.110.0002.

1 been proposed specifically for lower-income groups.³

2 **Q. What impact does the Company’s proposed rate design have on the affordability of**
3 **the Company’s water service in this case?**

4 A. As shown above, the affordability of MAWC’s residential water service has been and is
5 expected to remain affordable under the Company’s proposed rates in this case.

6 **Q. What information can support a more focused assessment of affordability of water**
7 **service for the Company’s most vulnerable customers?**

8 A. A more focused assessment of affordability targeted at the Company’s more vulnerable
9 customers can compare annualized bills for “basic water service” (i.e., service that is
10 necessary and reasonable to meet basic household needs for drinking, cooking, sanitation,
11 and general health service that does not include seasonal discretionary water use) to
12 measures of household income for lower-income groups. A more focused affordability
13 assessment requires a much more detailed information set that includes:

14 *1. Standard measure of what constitutes low-income customers*

15 Typically, a standard measure of income for lower-income centers around various
16 multiples of the FPL, which is set by the federal government and varies depending on the
17 number of persons in the household. For the calendar year 2020, 100% of FPL for a three-
18 person household in the lower 48 states was \$21,720 per year. Multiples of FPL can then
19 be used to set low-income benchmarks (50% of FPL, 150% of FPL, 200% of FPL, etc.). It
20 is important to note that FPL is both a function of income and the number of persons in the

³ Colton, R. (2020). The Affordability of Water and Wastewater Service in Twelve U.S. Cities: A Social, Business and Environmental Concern prepared for The Guardian (U.S. Office). New York NY.
<https://www.theguardian.com/environment/2020/jun/23/full-report-read-in-depth-water-poverty-investigation>.

1 household, so the estimation of the number of households at different levels of FPL is more
2 complicated than simply understanding income level.

3 2. Number of households in the service territory that qualify as low-income customers

4 The number of households that fall within different levels of income or different intervals
5 of FPL can best be found through the previously mentioned U.S. Census Bureau data,
6 which provides this information at a community level. As previously stated, this data can
7 be paired with a data set that provides the number of customers served by community to
8 determine the estimated percentage of households at different income levels in the service
9 territory. The number of customers at different multiples of FPL can also be estimated by
10 pairing households at different income levels in the service territory with the number of
11 persons per household by income level, which is also available through U.S. Census
12 Bureau data.

13 3. Number of low-income households that are customers of the utility

14 The number of low-income households in a service territory does not necessarily equate to
15 the number of low-income customers of the utility, because lower-income customers are
16 more likely to rent and less likely to own homes than higher-income customers. Water and
17 wastewater service provided to apartment buildings and other multifamily housing units
18 are often in the name of the building owner, and tenants are generally not the utility
19 customers of multifamily housing units. To determine the number of low-income
20 households that are actually low-income customers of the utility, one needs to determine
21 a) the level of home ownership in the community by income level, and b) the percentage
22 of renters in a community that rent single-family homes (for which those renters are likely
23 the paying customer of record) versus renters that live in apartment buildings and other

1 multifamily units.

2 4. Common understanding of what constitutes basic water service

3 When looking at the appropriate usage levels to determine affordability for lower-income
4 groups, it is not appropriate to rely solely on average usage levels for a residential customer
5 class in total. A better approach is to identify a usage level that reflects water consumption
6 provided for basic human services (cooking, cleaning, sanitation, and general health
7 requirements), which is then assumed to be constant from month-to-month and not subject
8 to significant seasonality or weather conditions. This standard can be expressed in terms
9 of gallons per resident per day. An advantage of this approach is that a basic water service
10 metric stated in terms of gallons per resident can be paired with the fact that lower-income
11 households tend to have lower occupancy rates in terms of persons per household. This
12 information, which is available from U.S. Census Bureau data, can be used to customize a
13 level of usage that accurately reflects basic water service for lower-income households.

14 An alternative approach to the more focused affordability assessment described
15 above is to look at individual customer billing records and identify a median monthly water
16 consumption for all customers with relatively flat non-seasonal usage across the year. The
17 use of a median statistic in this case reduces the impact of very high usage customers.
18 Another alternative is to choose a consecutive period of time during the year (February
19 through April for example) that tends to have the lowest average use per customer over the
20 course of the year and has the least amount of discretionary seasonal water usage, if any at
21 all. This method helps to ensure that the monthly usage used in an affordability analysis
22 represents the least amount of discretionary water use, and therefore is most representative
23 of basic water usage in a given service territory.

1 **Q. What does the affordability study show in terms of the estimated number of**
2 **customers in Missouri by household income and how bills for basic water service**
3 **compare for these customers in terms of BTI Ratios?**

4 **A.** Charts 3 and 4 below show the estimated number of customers by multiples of FPL for the
5 Company’s residential customers and the BTI Ratios for bills for basic water service for
6 each income group under the Company’s proposed rates in this case.

1 For most of our customers, BTI Ratios are less than 2% for basic water service at the
2 Company's proposed rates. The Company estimates that there are approximately 62,000
3 residential water customers with household incomes at or below 150% of FPL, which
4 represents approximately 14% of the Company's residential water customer base. For
5 these customers, the average BTI Ratio is approximately 2.5% for Basic Water Service,
6 which we define to be 40 gallons of water per household per day.

7 **Q. If you are able to discern the affordability of water service for an average customer,**
8 **are you able to discern the affordability of water service at differing levels of income?**

9 A. Yes, we are.

10 **Q. Please describe the analysis that estimates the Company's residential customer**
11 **population for different levels of income.**

12 A. The United States Census Bureau, through ACS, provides detailed information at the zip
13 code level on the number of households, both those that own homes and those that rent, at
14 different levels of income. From that data:

- 15 • We develop for each zip code an estimated profile of households that are customers
16 of the Company by income level (\$0k to \$5k annual income, \$5k - \$10k, etc.)
- 17 • Within each increment of income, we can estimate the number of households with
18 one person, two persons, etc. that can then yield estimates of the number of
19 customers in each zip code by multiple of FPL.
- 20 • We can then calculate bills for basic water service for each combination of
21 household income and household size based on the rates applicable to that location
22 and estimate BTI Ratios for each combination of household income, household
23 size, and multiple of FPL within each zip code.

- This information can then be rolled up to any aggregated level, which might be at a county level, district level, tariff group, or for the service territory in total.

Q. What conclusions do you draw based on the Company’s affordability study?

A. There are three conclusions that can be drawn from Company’s affordability study:

- The affordability of the Company’s water service has remained steady from 2010 through the present time, with a modest uptick expected overall in 2023 under the Company’s proposed rates.
- The Company’s water service has been, is, and is expected to continue to be affordable for the vast majority of its residential customers, including under the final rates proposed in this case.
- There are groups of customers for whom affordability of water service may be an issue.

Q. Is the affordability of the Company’s water service uniform across all of the areas the Company serves?

A. No, it is not. Both bills and household income vary significantly across the Company’s service territory. The Company has a very diverse service territory and serves customers in urban, suburban, and rural communities with household incomes that range from well over \$150,000 MHI in parts of St. Louis County to as low as \$45,000 in Mexico and less than \$40,000 in other parts of the Missouri service territory. The Company’s water affordability analysis is provided in Schedule CBR-3. These exhibits provide a breakdown by community of the number of customers served in each community, the median household income for each community, and the BTI Ratios for basic water service in each

1 community.

2 **IV. ANALYSIS OF MAWC WATER CONSUMPTION**

3 **Q. Are there revenue adjustments the Company is proposing in this case that require a**
4 **quantitative analysis of water consumption by MAWC’s customers?**

5 A. Yes. I will explain the modeling used to develop the revenue forecasts for residential,
6 commercial and public authorities (“OPA”) customers, and thereafter, I will discuss the
7 development of the revenue projections for all customer classes (residential, commercial,
8 industrial, OPA, and sales for resale). For residential, commercial, and OPA customers,
9 the Company is proposing adjustments for the normalization of the actual billing
10 determinants for the 12-month period ended June 2022, related to trends in declining use,
11 weather normalization, and the impact of the COVID-19 public health emergency on water
12 consumption for MAWC’s water customers. These adjustments require the Company to
13 analyze water consumption and determine (1) if there is a significant and pervasive rate of
14 decline in water use per customer over time, (2) if there are significant relationships
15 between water consumption and weather conditions in the Company’s service territory,
16 and if weather was different from normal in the 12-month period ended June 2022, and if
17 so, a weather normalization adjustment to usage is appropriate to reflect more normal
18 weather conditions for the 12-month period ended May 2023, and (3) if the COVID-19
19 public health emergency has had a significant impact on water consumption for MAWC’s
20 customers, to determine if a COVID-related adjustment to usage is appropriate for the 12-
21 month period ended May 2023.

22 **Q. How do you determine the parameters and relationships necessary to analyze**
23 **declining water use, weather impacts on water consumption, and the impact of**

1 **COVID-19 on water consumption for MAWC’s customers?**

2 A. The parameters and relationships necessary to analyze declining use, weather, and COVID-
3 19 on water consumption for MAWC’s customers are estimated using statistical linear
4 regression modeling.

5 **Q. What is a statistical linear regression model?**

6 A. Statistical linear regression modeling is a commonly used type of mathematical predictive
7 analysis. The overall idea of regression modeling is to examine two things: (1) does a set
8 of independent explanatory variables do a good job of predicting an outcome (dependent)
9 variable, and (2) which independent explanatory variables, in particular, are significant
10 predictors of the dependent variable, and in what way do they help predict the results of
11 the dependent variable.

12 There are three major uses for statistical linear regression analysis. These major
13 uses are: (1) determining the predictive power of independent explanatory variables; (2)
14 forecasting the effect that independent variables have on a dependent variable; and (3) trend
15 forecasting. First, the regression analysis can be used to identify the strength of the effect
16 that independent explanatory variables have on a dependent variable. A typical question is:
17 “What is the strength of the relationship between summer heat, precipitation, and water
18 sales?” Second, the regression analysis can be used to forecast the effects or impacts of
19 changes. That is, the regression analysis helps us understand how much the dependent
20 variable changes with a change in one or more of the independent variables. A typical
21 question is: “How much water sales can the Company expect to lose for each inch of
22 rainfall above normal in any given period?” Third, regression analysis can predict trends
23 and future values. The regression analysis can be used to get point estimates of future

1 values of the dependent variable based on assumed values for the independent variables.
2 A typical question can be: “Given current trends in water sales, what can we expect water
3 sales to be each month next year assuming normal weather?”

4 **Q. What does a statistical model produce?**

5 A. A statistical linear regression analysis is a way of mathematically validating which
6 independent variables have a significant impact on the dependent variable – the main
7 factor, the one you are trying to better understand or predict. A statistical linear regression
8 model produces an equation that describes a historical relationship between a set of
9 independent variables and a single dependent variable that can be used to forecast future
10 values of the dependent variable based on assumed values of the independent variables. An
11 example of such an equation is shown below:

$$\text{UPC}_n = a_0 + (a_1 \times \text{RAIN}_n) + (a_2 \times \text{CDD}_n) + (a_3 \times \text{COVID-19}_n) + (a_4 \times \text{TIME}_n)$$

- 14 Where: $\text{UPC}_n =$ Use per customer in month n
15 $\text{RAIN}_n =$ Rainfall in month n
16 $\text{CDD}_n =$ Cooling Degree Days (“CDD”) in month n
17 $\text{COVID}_n =$ COVID-19 effect in month n (0% to 100%)
18 $\text{TIME}_n =$ Year/Month for month n

- 19 and: $a_0 =$ constant term
20 $a_1 =$ coefficient for RAIN
21 $a_2 =$ coefficient for CDD
22 $a_3 =$ coefficient for COVID-19 impact per customer
23 $a_4 =$ coefficient for TIME (declining use value)

1 In this example, use per customer is the dependent variable (outcome) and all other
2 variables are independent variables (predictors).

3 **Q. Can statistical linear regression models be used to weather normalize historical water**
4 **sales for different customer classes?**

5 A. Yes. In the statistical model in the example above, the a_1 coefficient for RAIN can be used
6 to estimate the impact of rainfall on use per customer in any given historical period and
7 estimate the impact of what use per customer would have been if rainfall had been different,
8 especially when actual precipitation was higher or lower than normal. Below is a sample
9 calculation of how weather normalization works with a statistical regression model that
10 uses the weather as a strong predictive independent variable that affects the use per
11 customer dependent variable.

$$12 \quad \text{IMPACT}_n = a_1 \times (\text{ACTUAL RAIN}_n - \text{NORMAL RAIN}_n)$$

13 Where: $\text{IMPACT}_n =$ Weather impact due to abnormal rainfall in period n

14 $\text{ACTUAL RAIN}_n =$ Actual Rainfall (in inches) in period n

15 $\text{NORMAL RAIN}_n =$ Average Rainfall (in inches) in period n

16 If the value of the a_1 coefficient for rainfall is -0.30 in this example, actual rainfall for the
17 period is 6 inches and normal rainfall for the period is 4 inches, the weather impact for the
18 period due to higher-than-normal rainfall is a negative 600 gallons per customer meaning
19 that the Company sold 600 fewer gallons per customer of water than it otherwise would
20 have $[-0.30 \times (6 - 4) = -0.60]$. If there are multiple weather variables in the statistical
21 regression analysis, this calculation is completed separately for each variable and the sum
22 of the calculations is rolled up into a single weather impact. This approach to weather
23 normalization allows an analyst to independently assess the impact of each weather

1 component, and also allows an analyst to state the weather impacts over time both in terms
2 of consumption and in terms of revenues by multiplying the consumption impact by a
3 volumetric price.

4 **Q. Can statistical linear regression models be used to estimate the impacts of COVID-19**
5 **on water sales for different customer classes?**

6 Yes. In the statistical model example above, the a3 coefficient for COVID-19 is the
7 estimate of the impact of the COVID-19 public health emergency on monthly use per
8 customer. The historical data set contains a variable for each month that indicates the
9 assumed qualitative level impact of COVID-19 in that month. In all months prior to April
10 2020, that value was set at 0%. From April 2020 on, that value is set at 100% when
11 maximum COVID-19 impacts are observed, or at a level less than 100% where we see
12 reduced COVID-19 impacts on usage. The coefficient for the COVID-19 impact variable
13 estimates the average monthly use per customer based on the months that have been
14 designated as COVID-19 months. This coefficient can then be used to (1) identify a normal
15 level of usage that is not influenced by the impact of COVID-19, in a manner similar to a
16 normalization calculation that adjusts for the influence on water usage associated with
17 weather conditions that depart from normal, and (2) reflect estimates of future impacts of
18 the COVID-19 public health emergency.

19 **Q. Can these models be used to estimate trends in declining use per customer for**
20 **different customer classes?**

21 A. Yes. In the same statistical model example represented above, the a5 coefficient for TIME
22 is the estimate of declining use per customer per month. This coefficient measures the rate
23 of decline in use per customer over the historical data set independent of the effect of any

1 other variable in the model. The historical data set contains a variable for each month
2 which is a timestamp that starts at 1 for the first month in the dataset and increases by 1 for
3 every month going forward. This acts as a trend variable for both historical periods in the
4 dataset and future forecast periods. The coefficient for this trend variable is applied to
5 future increasing values of the trend which results in decreasing forecasts of use per
6 customer.

7 **Q. How does one assess the accuracy of a statistical linear regression model?**

8 A. A statistical linear regression model produces a set of statistics that can be used to judge
9 the accuracy and fitness of the model. The most common statistics are (1) the “R-Squared”
10 value, which is a statistical measure in a regression model that determines the proportion
11 of variance in the dependent variable that can be explained by the independent variables,
12 and (2) values and standard deviations for the coefficients, which can be used to determine
13 “t-statistics” and “p-values” which tell how accurately and precisely the different
14 coefficients are being calculated and whether the associated independent variables are
15 strong predictors of the dependent variable.

16 In the equation described above, the “R-Squared” value is a statistic that measures
17 the percentage of variation from time period to time period in the dependent variable (water
18 use per customer) that is explained by the mathematical relationship with the independent
19 variables. The R-Squared can range from 0% (no explanatory ability) to 100% (perfect
20 explanatory accuracy). In general, the higher the R-squared, the better the predictive value
21 of the model.

22 The second major test involves comparisons of the values of each of the model
23 coefficients and their associated standard errors. Because a statistical regression model

1 estimates an explanatory relationship between a dependent variable and a set of
2 independent variables, there will always be some degree of uncertainty around what that
3 explanatory relationship actually is. As a result, each model coefficient has a level of
4 uncertainty around it, and this level of uncertainty is represented by measuring how many
5 standard errors each coefficient is away from zero, which the model also calculates.

6 Dividing the value of each coefficient by its standard error yields a t-statistic which
7 can be used to judge the predictive power of the independent variable that the coefficient
8 represents. For example, in the case of the generic statistical model described above, if the
9 value of the a_1 coefficient for rainfall is -0.30 and the standard error for that coefficient is
10 0.05 (meaning that the real value of the coefficient could be anywhere between -0.35 and
11 -0.25 with -0.30 being the most likely value), the value of the t-statistic is -6.0 (-0.30
12 divided by 0.05 = 6.0). Generally speaking, t-statistic values greater than 2.0 for positive
13 coefficients or less than -2.0 for negative coefficients indicate an acceptable predictive
14 relationship between that independent variable and the dependent variable of interest. The
15 higher the t-statistic value, the greater the confidence we have in the coefficient as a
16 predictor. Values between 2.0 and -2.0 indicate that the predictive power of that
17 independent variable may not be very strong.

18 **Q. Are there other more qualitative ways to determine whether a statistical linear**
19 **regression model is accurate and produces reasonable results?**

20 A. Yes. There are also several qualitative ways to determine whether a statistical regression
21 model accurately describes the relationship that a chosen set of independent variables has
22 with the dependent variable:

- 1 • **Does the model represent reality?** If it is generally known that water consumption
2 is seasonal and is driven in the summertime by heat and precipitation, it is logical
3 to assume that a statistical model that attempts to describe and predict seasonal
4 water consumption would have explanatory variables related to summer heat and
5 precipitation, and those explanatory variables would be shown to have a strong
6 predictive value in the model. Models that attempt to accurately describe the
7 drivers behind water consumption that do not contain statistically significant
8 coefficients for independent variables that are logically known to drive water
9 consumption are likely not strong predictive models.
- 10 • **Are the signs of the coefficients for major independent variables correct?** If
11 water consumption increases in the summertime with increasing heat and decreases
12 in the summertime with increasing precipitation, it is logical to expect that the
13 coefficients for the independent variables that represent summertime heat and
14 summertime precipitation would be positive and negative, respectively.
- 15 • **Is the model based on a robust data set?** It is easy for a statistical model with
16 many independent variables and relatively few observations of the dependent
17 variable to accurately explain variation in the dependent variable, but that does not
18 mean that the model has strong predictive power if the data set being analyzed is
19 small in scope. A statistical model that attempts to describe water consumption that
20 has good predictive explanatory power over multiple years of monthly historical
21 data is very useful and accurate in projecting future trends and in explaining how
22 changes in strong predictive independent variables will affect levels of the
23 dependent variable.

- 1 • **Do the impacts on the dependent variable that the model describes make**
2 **logical sense?** It is possible outside of a statistical linear regression model to make
3 ballpark estimates of other facts like the impact of COVID-19 on water
4 consumption and long-term trends in declining use. This can be done with a simple
5 linear plot of annual usage data by year. For example, if a linear plot of annual
6 usage data suggests that there is a downward trend of approximately 1,000 gallons
7 per customer per year, one would expect that a statistical model that is measuring
8 that impact would yield a result that is similar. The same is true when looking at
9 the potential impacts of COVID-19 on water consumption. If a visual examination
10 of data suggests that water use per customer for a commercial class has decreased
11 by 2,000 gallons per customer in 2020 due to the COVID-19 emergency, it is
12 logical to expect a statistical regression model that attempts to statistically measure
13 that impact to yield estimates consistent with that expectation.

14 **V. DECLINING USE AND WEATHER ADJUSTMENTS**

15 **Q. Please describe the statistical linear regression model you are using to analyze water**
16 **consumption data for MAWC.**

17 A. In this proceeding, we are using multiple regression statistical models to analyze use per
18 customer for the residential, commercial, and OPA classes that relate the dependent
19 variable (i.e., water use per customer) to a collection of independent variables. Separate
20 models are developed for St. Louis County customer usage and usage for non-St. Louis
21 County customers. The models use 120 months of monthly data beginning in April 2012
22 and running through March 2022. Each regression model uses independent variables that

1 can be broken down into four categories to explain monthly use per customer. The four
2 categories are:

- 3 • **Weather:** The weather variables used in the models are Cooling Degree Days
4 (“CDDs”) and precipitation. These weather variables are a weighted average of
5 current month and lagged month weather readings taken by the National Oceanic
6 and Atmospheric Administration at St. Louis Lambert International Airport. This
7 weighted average lagged approach is used to account for the differences between
8 billing month sales and calendar month weather. Coefficients from these variables
9 show the impact of weather on monthly use per customer over the 10-year period.
10 Weather variables are modeled as monthly deviations from normal for each month
11 in the data set (actual weather for the month less normal weather for the month for
12 each individual weather variable). Normal weather is calculated for each month of
13 the year based on the weather over the ten-year period that the historical data spans.
- 14 • **Time:** The time variable is a trending variable that notes the passage of time in the
15 model and produces a coefficient that estimates the monthly decline in usage per
16 customer over the 10-year model. The time variable captures the range of
17 conservation efforts that have been implemented by customers over time, such as
18 the installation of more water-efficient fixtures and appliances. Time on its own is
19 of no consequence, but it is a powerful variable because it is the medium for
20 capturing the conservation effect.
- 21 • **COVID-19 indicator:** The COVID-19 indicator variable is set at 0% for months
22 prior to April 2020 and 100% for the months of April 2020 through December 2021.
23 The effect of this variable in the model is to look specifically for increases or

1 decreases in use per customer for the April 2020 through December 2021 timeframe
2 that may have happened due to systemic changes in the amounts of water customers
3 use as a result of the COVID-19 public health emergency.

- 4 • **Monthly indicators:** The monthly indicator variables in the model measure
5 structural monthly and/or seasonal changes in use per customer that cannot be
6 explained by any of the other variables in the model.

7 **Q. What information do these models provide that is useful for developing pro forma
8 adjustments to revenues that you are sponsoring in your testimony?**

9 A. Each model produces a set of weather coefficients that can be used to weather-normalize
10 historical sales, a coefficient that indicates the monthly trend in declining use per customer
11 for each class, and a coefficient that shows for each class the average use per customer
12 impact associated with changes in usage due to COVID-19.

13 **Q. You mentioned that you have developed models for customer usage relating to the
14 residential, commercial, and OPA classes. Are you also modeling usage for the
15 industrial and sales for resale customer classes, and for fire service classes?**

16 A. No. The statistical modeling in this case is only for the residential, commercial, and OPA
17 classes. Usage estimates for the industrial and sales for resale classes are developed using
18 a simple multi-year average and are described later in the revenue section of my testimony.

19 **Q. Is this modeling approach different from the modeling approaches that have been
20 used by the Company in previous rate cases in Missouri?**

21 A. Yes. The modeling approach proposed in this case is a monthly model with 12 monthly
22 data points for each of the 10 years covered in the model, which results in models with
23 120 historical data points. Modeling approaches in previous rate cases relied on ten years

1 of data but used an annual modeling approach where there was only one data point for each
2 year which resulted in models with 10 historical data points.

3 **Q. Why is the Company proposing to move from an annual model with one data point**
4 **for each year to a monthly model with 120 historical data points?**

5 A. The Company is moving to a monthly modeling approach to improve the accuracy of the
6 modeling process. Monthly modeling that incorporates monthly weather information and
7 that allows for monitoring of customer usage from month to month significantly improves
8 the Company's ability to understand the impacts of weather on customer usage.
9 Additionally, this approach allows for a more detailed analysis of other factors that affect
10 customer usage like the COVID-19 emergency. This approach to modeling significantly
11 improves the accuracy of the Company's analysis of customer usage.

12 **Q. You previously discussed the various statistical tests used for accuracy and**
13 **predictability. Please discuss the results of these tests for your models and why they**
14 **are appropriate to use in this proceeding.**

15 A. As shown in Schedules CBR-4, CBR-5, and CBR-6, the Adjusted R-Squared statistics for
16 the residential usage model is 87% and 89% for St. Louis County and non-St. Louis County
17 customers respectively, the Adjusted R-Squared statistic for the commercial usage model
18 is 92% and 89% for St. Louis County and non-St. Louis County customers respectively,
19 and the Adjusted R-Squared statistic for the OPA model is 85% and 80% for St. Louis
20 County and non-St. Louis County customers respectively. This indicates that in all models,
21 the explanatory variables (weather, COVID-19 impacts, declining use, etc.) strongly
22 explain the variability in use per customer over time. The values of the coefficients,

1 standard errors, and t-statistics for the major explanatory variables in the models are as
 2 follows:

**St. Louis County
 Residential Model Major
 Explanatory Variables**

	Coefficient	Standard Error	t-Statistic
Declining Use Trend	-.0096	.0024	-4.0971
Precipitation	-.2360	.0570	-4.1401
CDD	.0017	.0017	1.0271
COVID-19 Impact	.1309	.2062	.6349

**Non-St. Louis County
 Residential Model Major
 Explanatory Variables**

	Coefficient	Standard Error	t-Statistic
Declining Use Trend	-.0082	.0015	-5.6620
Precipitation	-.2358	.0388	-6.0778
CDD	.0064	.0011	5.8139
COVID-19 Impact	.3305	.1270	2.6030

**St. Louis County
 Commercial Model Major
 Explanatory Variables**

	Coefficient	Standard Error	t-Statistic
Declining Use Trend	-.0104	.0135	-.7686
Precipitation	-1.3041	.2534	-5.1457
CDD	.0430	.0109	3.9349
COVID-19 Impact	-3.4180	1.1809	-2.8945

**Non-St. Louis County
 Commercial Model Major
 Explanatory Variables**

	Coefficient	Standard Error	t-Statistic
Declining Use Trend	.0077	.0064	1.2068
Precipitation	-.5815	.1321	-4.4005
CDD	.0234	.0054	4.3045
COVID-19 Impact	-.6231	.5496	-1.1337

St. Louis County OPA Model Major Explanatory Variables	Coefficient	Standard Error	t-Statistic

COVID-19 Impact	-3.7743	1.8691	-2.0193

1 Apart from the declining usage variables (which I discuss later in my testimony), the
2 statistics for the individual explanatory independent variables above show a high degree of
3 explanatory power with most parameters having t-statistics all outside of the +/- 2.00 range.
4 Signs for the precipitation variables are all negative as expected, meaning that more rainfall
5 over a summer period results in less seasonal water usage from our residential customers.
6 Signs for the CDD variables are positive, which indicates that the hotter the weather gets
7 in the summer, customers use more water, which is expected, and the COVID-19 impact
8 variables generally indicate that residential usage went up as a result of COVID-19 and
9 usage for commercial and OPA customers went down.

10 **Q. Your regression models show a trend of declining use per customer. What is the**
11 **amount of declining use your models have identified?**

12 A. The annual amount of declining use identified for residential customers is approximately
13 1,400 gallons per year per customer for St. Louis County customers and 1,200 gallons per
14 year for customers outside of St. Louis County. The annual amount of declining use

1 identified for commercial customers is approximately 1,500 gallons per year per customer
2 for St. Louis County with a gain of approximately 1,100 gallons per year for customers
3 outside of St. Louis County. The annual amount of declining use identified for OPA
4 customers is approximately 2,000 gallons per year per customer for OPA customers in St.
5 Louis County and 2,500 gallons per year for non-St. Louis County customers.

6 **Q. Are these declining usage trends you have identified significant?**

7 A. For residential customers, these declining usage trends are statistically significant as I have
8 outlined in my discussion of the levels and significance of the declining use model statistics
9 previously in my testimony. For commercial and OPA customers these trends are not
10 statistically significant, and therefore we do not propose to include any declining use
11 adjustment for commercial and OPA customers in this proceeding and instead use a five-
12 year average of use per customer as I describe later in my testimony.

13 **Q. Why do you believe that declining use is a valid trend for residential customers that**
14 **will continue?**

15 A. Consumption patterns for the Company's customers are similar to those for other American
16 Water operating companies which have experienced a decline in residential consumption
17 per customer averaging approximately -2.0% per year over the last 10 years. According to
18 the 2010 Water Research Foundation report, "many water utilities across the United States
19 and elsewhere are experiencing declining water sales among households." The report
20 further states: "A pervasive decline in household consumption has been determined at the
21 national and regional levels."⁴

22 **Q. What is causing the decline in residential customers' usage?**

⁴ Coomes, Paul et al., North America Residential Water Usage Trends Since 1992 – Project #4031, page 1 (Water Research Foundation, 2010).

1 A. Several factors drive the decline in residential customers' usage. These factors include the
2 incremental introduction of low-flow fixtures and appliances, new regulations that lead to
3 further reductions in fixture flow rates, conservation programs, and public initiatives that
4 have led to greater consumer water conservation awareness.

5 Plumbing fixtures such as toilets, showerheads, and faucets available to consumers
6 today are more water-efficient than were those fixtures manufactured in the past. Similarly,
7 appliances such as dishwashers and washing machines are also more water efficient. When
8 a customer replaces an older toilet, washing machine, or dishwasher with a new unit, the
9 new unit will almost certainly use less water than the one it replaced. Similarly, the
10 construction of new homes results in the installation of water-efficient fixtures meeting
11 new, more efficient, regulatory standards.

12 **Q. How much water do the new fixtures and appliances save?**

13 A. The Energy Policy Act of 1992 mandated the manufacture of water-efficient toilets,
14 showerheads, and faucet fixtures. For example, a toilet manufactured after 1994 must use
15 no more than 1.6 gallons per flush, compared to a pre-1994 toilet, which typically used
16 from 3.5 to 7 gallons per flush. In fact, toilets using only 1.28 gallons per flush or less are
17 becoming more prevalent in the marketplace. Replacing an old toilet with a new one,
18 therefore, can save from 2 to nearly 6 gallons per flush. The United States Environmental
19 Protection Agency estimates that there are more than 220 million toilets in the United
20 States and that approximately 10 million new toilets are sold each year for installation in
21 new homes and businesses or replacement of aging fixtures in existing homes and
22 businesses.

1 The Energy Independence & Security Act of 2007, which established stringent
2 efficiency standards for dishwashers and washing machines, has further reduced indoor
3 water consumption. Dishwashers manufactured after 2009 and washing machines
4 manufactured after 2010 must use 54% and 30% less water, respectively. All other factors
5 being equal, a typical residential household in a new home constructed in 2015, with water-
6 efficient toilets, washing machines, dishwashers, and other fixtures, uses approximately
7 35% less water for indoor purposes than a non-retrofitted home built prior to 1994.

8 **Q. Are there other factors contributing to the continued decline in water consumption**
9 **patterns?**

10 A. Yes. Programs to raise customer awareness and interest in the benefits of conserving water
11 and energy continue to increase. As awareness of water and energy efficiency increases,
12 customers may decide to replace a fixture or appliance even before it has broken.
13 Additionally, customers may further reduce consumption by changing their household
14 water use habits in other various ways.

15 **Q. Do you expect the trend of declining customer usage to continue in the future?**

16 A. Yes. Water-efficient fixtures and other drivers such as conservation education and
17 government-mandated standards will continue to drive further efficiency into residential
18 and nonresidential usage per customer. In fact, the trend is well established and continues
19 to affect water usage on the MAWC system as well as most water utilities across the United
20 States. The rate of the continued trend is dependent on the pace of fixture replacement
21 within the Company's footprint as well as the broadening acceptance of a conservation
22 ethic through raised customer and business awareness programs, government conservation
23 policy, and similar behavior modification-related programs.

1 Technology is now available for newer, more water-efficient products that further
2 improve on Energy Policy Act levels, and there has been a growing movement to codify
3 these more stringent specifications. The introduction of progressive code modifications –
4 such as the International Code Council’s International Green Construction Code and the
5 International Association of Plumbing and Mechanical Officials Green Plumbing and
6 Mechanical Code Supplement (2011) – support uniform implementation of increased water
7 efficiency standards. An article in the June 2012 issue of the American Water Works
8 Association (“AWWA”) Journal entitled “Insights into declining single-family residential
9 water demands” recognizes this decline in water consumption: “[r]educed residential
10 demand is a cornerstone of future urban water resource management. Great progress has
11 been made in the last 15 years and the industry appears poised to realize further demand
12 reductions in the future.”⁵ The trend of declining water consumption based on improved
13 water efficiency has continued over time.

14 **Q. Normalizing historical usage for weather and the COVID-19 emergency, what has the**
15 **overall trend been for use per customer for the residential, commercial, and OPA**
16 **classes?**

17 A. The statistical analysis of residential, commercial, and OPA usage shows that once weather
18 effects and the one-time effects of COVID-19 have been accounted for, there is a
19 significant downward trend for residential customers and fairly stable usage for
20 commercial and OPA customers over time. Charts 5 through 10 below show use per
21 customer for residential, commercial, and OPA customers respectively for the ten years

⁵ DeOreo, William and Mayer, Peter. American Water Works Association Journal. Vol. 104. Issue 6.
http://apps.awwa.org/WaterLibrary/showabstract.aspx?an=JAW_0076117. June 2012

1 ending March 2022, adjusted for the weather impacts and COVID-19 impacts I previously
2 described in my testimony.

Chart 7 Missouri Commercial Use per Customer
Normalized for Weather and COVID-19 Impacts
St. Louis County

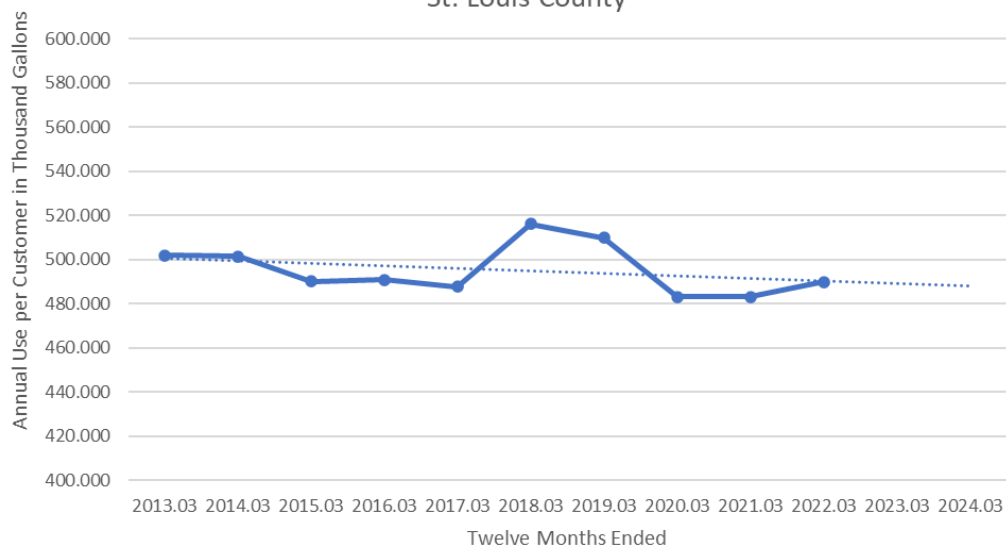

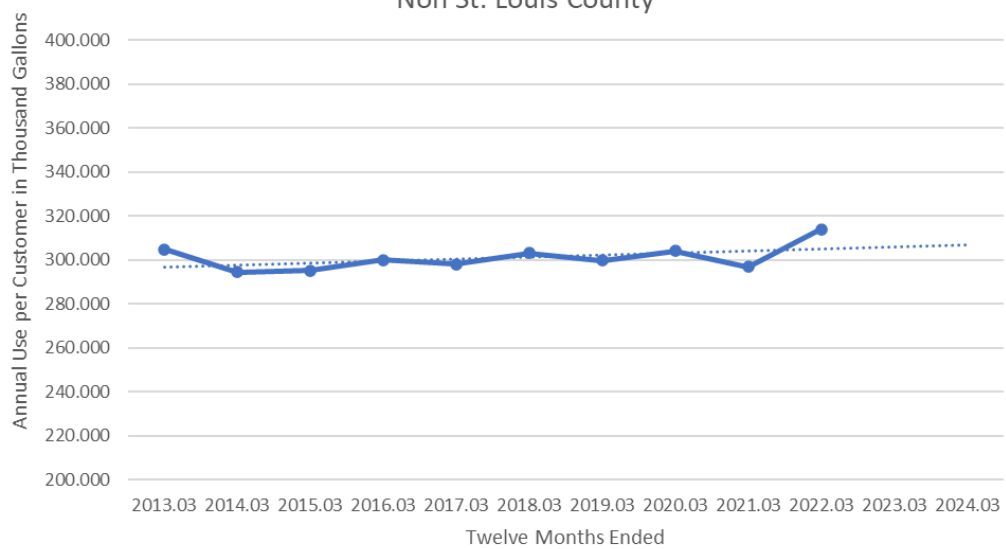

Chart 8 Missouri Commercial Use per Customer
Normalized for Weather and COVID-19 Impacts
Non St. Louis County

1 **Q. What conclusions do these charts reveal?**

2 A. Extending the historical trends in adjusted usage going forward, these charts and the
3 supporting analysis demonstrate that there has been a significant and pervasive decline in

1 normalized use per customer for residential customers both in St. Louis County and non-
2 St. Louis County service territories. There has not been a significant movement over time
3 in normalized use per customer in either the St. Louis County or non-St. Louis County
4 service territories for commercial or OPA customers.

5 **VI. REVENUE CALCULATIONS**

6 **Q. Please explain the development of MAWC's pro-forma revenues as set forth in the**
7 **revenue related Schedules (CAS-8, CAS-11 and CAS-12).**

8 A. The process of developing the Company's revenue requirement begins with revenues
9 recorded on the Company's books of account on June 30, 2022, to which various
10 adjustments were made. A summary of the development of pro forma revenues for
11 MAWC's water and sewer operations under present and proposed rates are set forth on
12 Schedules CAS-11 and CAS-12, which show operating revenues by customer
13 classification for the twelve months ending June 30, 2022 (normalized), twelve months
14 ended December 31, 2022, and twelve months ended May 31, 2023 under present rates and
15 proposed rates. CAS-11 shows a summary by revenue class, and CAS-12 shows the detail
16 by revenue class. In addition to pro forma revenues at current rates, Schedules CAS-11
17 and 12 show pro forma revenues at proposed rates. These rates are based on the rate design
18 discussion previously outlined in my Direct Testimony.

19 **Q. Please explain the adjustments to the Company's book revenues that were made to**
20 **develop pro forma revenues under present rates as shown on Schedule CAS-8.**

21 A. Schedule CAS-8 begins with test year revenues for the 12 months ended June 30, 2022. At
22 the time of filing, the test year is based on 9 months of actual revenues through March 31,
23 2022, and 3 months of estimates through June 30, 2022. Three adjustments are made to

1 present a pro forma revenue for the 12 months ended June 30, 2022. First, unbilled revenue
2 is eliminated. Second, all revenue related to Water & Sewer Infrastructure Replacement
3 Surcharge (“WSIRA”) is eliminated. Lastly, the per books revenues were adjusted for the
4 bill analysis normalization as shown in Schedules CAS-11 and 12.

5 **Q. Please explain the adjustments to determine the Company’s pro forma revenues as**
6 **shown on Schedules CAS-8 and CAS-11 and 12.**

7 A. The revenue adjustments are primarily for customer growth and for customer usage. We
8 project customer counts and use per customer for residential, commercial, industrial, OPA,
9 sales for resale, and fire service classes for St. Louis County and non-St. Louis County
10 service territories for water service. These include projections specifically for Rate J
11 customers and any special contracts. These projections also include any customers and
12 sales associated with acquisitions. We also project customer counts and usage data for
13 wastewater customers that include both existing customers and acquisitions. The Company
14 also projects miscellaneous revenues for both water and wastewater service to complete
15 the calculation of revenues for the relevant periods.

16 **Q. Please describe the methods used for estimating customer counts, use per customer,**
17 **and billing determinants for residential water sales.**

18 A. Customer growth for residential customers was projected using a 5-year historical growth
19 pattern from 2017 through 2021 applied to customer counts as of March 31, 2022.
20 Residential use per customer was developed based on the normalized values from the usage
21 modeling previously discussed in my Direct Testimony.

22 **Q. Please describe the methods used for estimating customer counts, use per customer,**
23 **and billing determinants for Commercial, Industrial, OPA and Other Water Utilities**

1 **(OWU) water sales.**

2 A. Commercial and OPA customer counts are based on organic growth using the 5-year
3 historical growth pattern for these classes from 2017 through 2021. No customer growth
4 was projected for the Industrial class and the Sales for Resale class. Usage for all these
5 non-residential classes is projected using a 5-year annual average usage per customer
6 multiplied by the projected number of customers. Because there is not a significant trend
7 in use per customer for these classes as I have previously discussed in my testimony, the
8 Company is using a 5-year average of water usage (2017-2021) for these customer classes,
9 which is an appropriate period to use for normalizing sales when there is no strong
10 underlying trend in usage. This time period eliminates short-term fluctuations in usage
11 while still reflecting normal water consumption levels for these customers.

12 **Q. Please describe how projections were made for Rate J customers and sales.**

13 A. Non-residential customers excluding Sale for Resale customers constantly using large
14 quantities of water not less than 450,000 gallons per month are classified as Rate J
15 customers. Usage for Rate J customers was projected using a 5-year average annual usage
16 per customer for the time period 2017-2021.

17 **Q. Did you also compute the total estimated gallons of production that correspond to**
18 **your revenue forecast and that were used by Company witness Michael Schwarzell**
19 **for purposes of the system delivery adjustments that he proposes for water service?**

20 A. Yes, I did. System deliveries are calculated separately for St. Louis County and non-St.
21 Louis County operations and are based on the five-year average from 2017 through 2021
22 of non-revenue water percentages, which is the percentage of total system deliveries in a
23 year that is not attributable to metered sales. This average non-revenue water percentage is

1 applied to total sales for the 12- month period ending May 2023 to arrive at system
2 deliveries for the same period.

3 **Q. Please describe the methods used for estimating revenue for private fire service.**

4 A. Revenue for private fire was calculated using nine months of actual historical counts of
5 service connections and hydrants in service through March 31, 2022, and three months of
6 estimated counts through June 30, 2022. Organic growth was projected using the 5-year
7 average change in counts for the years 2017-2021.

8 **Q. Please describe how customer count and sales information was developed for
9 wastewater customers.**

10 A. Organic growth for residential and commercial classes were calculated using the 5-year
11 average growth patterns from 2017-2021. No customer growth was projected for the OPA
12 class. Water usage/flow for the City of Arnold was projected using a 5-year average water
13 usage/flow per customer.

14 **Q. How was this information developed for the acquisitions the Company is including in
15 this case for wastewater service.**

16 A. The billing determinants for the City of Taos and the City of Hallsville used the actual
17 billing determinants through March 2022 and then annualized for a full 12-month billing
18 period. The billing determinants for the City of Eureka were taken from the billing register
19 provided to the Company for the twelve months ended March 2022. The billing
20 determinants for Monsees Lake, City of Purcell, City of Stewartville, and the City of
21 Smithton are all estimated based on estimates from the acquisition information.

22 **Q. Please describe how miscellaneous revenues were developed.**

23 A. Revenue for rents and usage data are projected based on known and measurable changes

1 in agreements from the Test Year period. Revenues for late payment fees are based on a 3-
2 year average ratio of actual late payment fees charged to customers to actual billed
3 revenues. Revenue projection for Returned Check Charges, Reconnect Fees, After Hours
4 Charges, Application Fees, Frozen Meter and Miscellaneous Services revenues are based
5 on 5-year average historical revenues from 2017 through 2021.

6 **VII. REVENUE STABILIZATION MECHANISM**

7 **Q. What is a Revenue Stabilization Mechanism?**

8 A. A Revenue Stabilization Mechanism (“RSM”) is an accounting and ratemaking tool that is
9 designed to align the Company’s revenues going forward (i.e., beyond the conclusion of
10 this proceeding) with the level of authorized revenue ultimately approved by the
11 Commission. This mechanism stabilizes changes in revenues resulting from changes in
12 volumes of water sold to customers on an ongoing basis due to factors largely beyond the
13 control of the Company.

14 **Q. How does an RSM work?**

15 A. The mechanics of the Company’s proposed RSM are discussed in greater detail in the
16 Direct Testimony of Company witness John Watkins. Generally speaking though, the
17 Company’s proposed RSM will adjust rates up or down over time so that the revenue the
18 Company collects is consistent with the revenue requirement approved by the Commission
19 for water service in this proceeding. The RSM affords the Company with the ability to
20 collect an annual revenue amount consistent with the authorized revenue amount in this
21 case and that customers in total pay the revenue level found appropriate to produce just and
22 reasonable rates.

23 **Q. Which customer classes are included in the RSM?**

1 A. As described in Section 386.266.4, RSMo, the RSM would be applicable to water
2 customers in the residential, commercial, OPA, and sale for resale classes.

3 **Q. Which customer classes would be excluded from the RSM?**

4 A. Industrial water customers and water customers taking service under contract rates. All
5 wastewater customers would also be excluded.

6 **Q. Do the revenues the Company collects under the WSIRA factor into the RSM?**

7 A. No. The RSM only compares the water revenues for eligible customer classes authorized
8 to be collected through base rates in the Company's rate case to the actual base rate water
9 revenue collected from those customers in the eligible customer classes. The WSIRA
10 mechanism already includes a reconciliation that essentially functions as an RSM.
11 Revenues authorized and collected via WSIRA are not part of the RSM.

12 **Q. How will the RSM that the Company is proposing generally function?**

13 A. As explained in greater detail in the Direct Testimony of Company witness Mr. Watkins,
14 the RSM will compare water revenues for eligible customers authorized in a rate case to
15 actual base water revenues collected from eligible customers, net of applicable production
16 costs, and net of acquisitions that have not yet been through a general rate case.

17 **Q. Why is the Company proposing that new acquisitions be excluded from the RSM?**

18 A. As described in Section 386.266.5(1), RSMo, the Commission may approve RSM rate
19 schedules provided it finds the adjustment mechanism "is reasonably designed to provide
20 the utility with a sufficient opportunity to earn a fair return on equity." When the Company
21 acquires new systems, there are many costs incurred that are offset, sometimes only
22 partially, by the revenues collected from those customers. If the revenues from acquisitions
23 are included in the adjustment mechanism, the Company will incur these costs with no

1 revenues to offset them. These incremental costs will reduce the Company's opportunity
2 to earn a fair return on Equity.

3 **Q. Why is the Company proposing that the incremental production costs be included in**
4 **the RSM?**

5 A. Similarly to the discussion about acquisitions in the RSM above, excluding the incremental
6 production costs would reduce the Company's opportunity to earn a fair return on equity.
7 In the instance where the Company's eligible revenues are more than what was authorized,
8 this amount would be returned to the customers. However, that additional revenue will be
9 generated by increased water sales, and treating and pumping that additional water creates
10 incremental additional production costs. If the additional revenues went to the RSM, the
11 Company would be left with additional costs and no revenues to offset them. In the
12 opposite example, where the Company's eligible revenues are less than what was
13 authorized, this amount would be collected from customers via a surcharge. The shortfall
14 of revenue will be generated by decreased water sales, and the Company will likewise
15 experience lower production costs as a result. It would not be fair to customers to collect
16 the revenue shortfall from them, while not also including the benefit of the reduced
17 expense.

18 **Q. Of the total revenues collected under your proposed water rates, how much revenue**
19 **is being collected through fixed charges and how much revenue is being collected**
20 **through volumetric charges?**

21 A. Total proposed water revenues equals \$468,757,639. Of this amount, \$90,955,000 is
22 collected through fixed charges (19.4% of the total) \$372,556,606 is collected through
23 volumetric charges (79.5% of the total), and \$5,246,033 is collected through miscellaneous

1 fees (1.1% of the total).

2 **Q. Is ongoing revenue volatility a significant concern?**

3 A. Yes. Approximately 79.5% of the Company's water service revenues will be collected as
4 volumetric rates pursuant to the Company's proposed rate structure in this case, which
5 means that revenues will vary up or down depending on how much water our customers
6 use. At the same time, over 90% of the Company's costs are fixed costs, which do not vary
7 depending on how much water our customers use. If water sales are less than the levels
8 used to set the Company's water service rates in this proceeding, the Company's revenues
9 will be less than the authorized level in this proceeding, and as a result, the Company's
10 ability to recover the costs that the Commission determines to be prudent will be
11 diminished. Likewise, if revenues exceed the authorized level in this proceeding due to
12 higher than anticipated water sales, the Company will recover more than the authorized
13 level in this proceeding. The RSM will permit the Company to recover the level of revenue
14 authorized in this case, as the difference between that amount and actual revenues will be
15 charged or credited back to customers in the subsequent year.

16 **Q. What are the external factors that cause revenues to be volatile from year to year?**

17 A. There are two primary factors that cause revenue volatility from year to year -- seasonal
18 weather conditions and the ongoing trend of declining use for residential, commercial, and
19 municipal customers.

20 Seasonal weather conditions can cause water sales to either increase or decrease
21 from expected going-forward levels, which, in turn, cause revenues to increase or decrease
22 from expected going levels. Hot dry summers tend to increase water sales, and cooler

1 wetter summers tend to decrease water sales. Weather volatility in either direction causes
2 volatility in revenues.

3 Continuing trends in declining use per customer in the residential, commercial, and
4 OPA classes also cause volatility in revenues. I have previously testified to both the impact
5 of weather conditions on annual water sales and on the continuing trends in declining use
6 and the associated impact of declining use on water sales. It is expected that water
7 consumption per customer will continue to decline over the next several years. Both of
8 these conditions cause declines in revenues, and it is expected that both total consumption
9 on a per customer basis, and revenue on a per customer basis will continue to decline well
10 beyond the period of time for which a revenue requirement is approved and rates are set in
11 this case.

12 **Q. Does the Company have any control over either seasonal weather conditions or the**
13 **drivers that are causing declining usage?**

14 A. No, it does not.

15 **Q. Are there other factors that can cause the Company's revenue to deviate from**
16 **expected levels?**

17 A. Yes. The COVID-19 pandemic situation is a prime example of an external event that can
18 cause the Company's revenues to vary from expected or approved levels. Since March of
19 2020, the Company has seen increased sales volumes for residential customers beyond
20 expected levels due to the COVID-19 pandemic, as more people were staying home from
21 work and school. Over the same period, the Company saw decreases in sales volumes from
22 expected levels in the commercial and OPA classes. These changes in volumes, whether
23 temporary or permanent, cause changes in revenues from expected or authorized levels and

1 increase the Company's revenue volatility. Implementation of a well-structured RSM can
2 stabilize customer bills over time and mitigate the Company's revenue volatility due to
3 circumstances beyond the customer or Company's control.

4 **Q. Does the Company have the ability to reduce its costs when water sales are lower than**
5 **expected to compensate for the reductions in revenues?**

6 A. To some extent, the Company experiences a reduction in variable costs associated with the
7 reduced cost of treating and pumping less water. For the most part, however, the
8 Company's ability to reduce its fixed costs during periods when water sales are lower is
9 limited, and it is generally not in the long-term best interests of our customers for the
10 Company to do so. One simple example of this is employee counts. The Company can
11 hardly hire and fire its well-trained workforce based on short-term trends in weather or
12 economic conditions simply to keep expenses in line with revenues. Similarly, although
13 maintenance may be deferred in a period of reduced revenue, that merely forestalls the
14 inevitable, could degrade the quality of service provided to MAWC's customers, and
15 increase the cost of service over time.

16 **Q. Beyond changes in variable cost, does the continuing trend in declining use per**
17 **customer reduce the revenue requirement needed to invest in, maintain, and operate**
18 **the water system for the long-term benefit of the Company's customers?**

19 A. No, it does not.

20 **Q. Isn't the possibility of reduced revenues for the Company a good thing for customers**
21 **because it means customers' water bills are lower than they otherwise would have**
22 **been?**

1 A. In the short term, that may appear to be the case. Ultimately, however, a decreasing
2 revenue stream is not in the long-term best interest of our customers if revenue
3 requirements are not reduced to match the decreasing revenue stream.

4 **Q. How is a volatile and decreasing long-term revenue stream not in the long-term best**
5 **interests of the Company's water service customers?**

6 A. The Company is committed to helping customers use water efficiently and to provide
7 quality water service that is affordable. As I explain below, the Company's ability to
8 reliably recover its revenue requirement over the long term through rates is an important
9 part of the Company's ability to properly operate, maintain, and invest in the water system
10 at a reasonable cost. This ability to prudently manage the systems at a reasonable cost is in
11 the long-term best interests of our customers.

12 **Q. Does Missouri law allow the Commission to approve the Company's proposed RSM?**

13 A. Yes. It is my understanding that Section 386.266.4, RSMo, provides as follows:

14 Subject to the requirements of this section, a water corporation with more
15 than eight thousand Missouri retail customers may make an application to
16 the commission to approve rate schedules authorizing periodic rate
17 adjustments outside of general rate proceedings to ensure revenues billed
18 by such water corporation for regulated services equal the revenue
19 requirement for regulated services as established in the water corporation's
20 most recent general rate proceeding or complaint proceeding, excluding any
21 other commission-approved surcharges and gross receipts tax, sales tax, and
22 other similar pass-through taxes not included in tariffed rates, due to any
23 revenue variation resulting from increases or decreases in residential,
24 commercial, public authority, and sale for resale usage.

25
26 (emphasis added).

27 **Q. What did the General Assembly identify when authorizing the Commission to**
28 **approve the adoption of alternative recovery mechanisms such as the RSM?**

1 A. I believe that purpose is found within the statute itself. Section 386.266.4, RSMo states
2 that “. . . to ensure revenues billed by such water corporation for regulated services equal
3 the revenue requirement for regulated services as established in the water corporation's
4 most recent general rate proceeding or complaint proceeding . . . **due to any revenue**
5 **variation** resulting from increases or decreases in residential, commercial, public
6 authority, and sale for resale usage.” (emphasis added).

7 **Q. Is the approach to water corporations different for the mechanism applicable to**
8 **electric and gas corporations in Missouri?**

9 A. Yes. Electric and gas corporations are limited to “variations in either weather,
10 conservation, or both.” Section 386.266.4. The General Assembly appears to have
11 recognized that there are issues that cause fluctuations in usage that are unique to water
12 corporations.

13 **Q. How does a properly structured RSM address this purpose and benefit MAWC’s**
14 **customers?**

15 A. It is in the long-term best interests of customers for the Company to be able to reliably
16 recover its revenue requirement on an ongoing basis. The authorized water revenue
17 requirements approved by the Commission in this case represent the amount of revenue
18 the Commission determines that the Company needs to operate, maintain, and invest in its
19 water system in a prudent and efficient manner. The ability to reliably recover the
20 Company’s approved revenue requirement improves the Company's ability to plan,
21 manage, maintain, and invest in the facilities necessary to continue providing safe, reliable,
22 and high-quality water service at a reasonable cost to customers, and a properly structured
23 RSM does just that.

1 **Q. Are there other benefits to customers from the approval of an RSM?**

2 A. Yes. An RSM will eliminate the throughput incentive – the Company’s financial incentive
3 to sell more water. Under the current rate structure (without an RSM), the more water
4 customers use, the more water the Company sells, the more revenue the Company collects,
5 and the better the Company’s financial performance. Currently, from a public policy
6 perspective, any actions taken by the Company or the government (local, state, or Federal)
7 to encourage conservation, no matter how beneficial to society, creates a disconnect
8 between the public policy goal of more efficient use of water resources and the Company's
9 legitimate financial objectives.

10 The Company is engaged in a broad array of efforts to become more efficient, and
11 an RSM supports more consistent planning and deployment of the most efficient resources.
12 Improving water efficiency also reduces withdrawals from limited freshwater supplies,
13 leaving more water for future use and improving the ambient water quality and aquatic
14 habitat. Improving water efficiency is a “win/win/win” providing a wide range of benefits
15 for consumers, utilities, businesses, and for communities as a whole. Approving an RSM
16 opens the path to achieving that winning combination.

17 **Q. Are there other policy concerns among public utility regulators that an RSM**
18 **addresses?**

19 A. Yes. The National Association of Regulatory Utility Commissioners (“NARUC”) has been
20 at the forefront of this issue. At its November 2013 annual meeting, NARUC adopted a
21 resolution that supports the consideration of alternative recovery mechanisms for water and
22 wastewater utilities, attached hereto as Schedule CBR-7. The NARUC resolution
23 recognizes declining use per customer, a shift to non-revenue producing infrastructure

1 replacement, and that the traditional cost of service model is not well adapted to this new
2 environment. It states, in part:

3 WHEREAS, Traditional cost of service ratemaking, which has worked
4 reasonably well in the past for water and wastewater utilities, no longer
5 adequately addresses the challenges of today and tomorrow. Revenue,
6 driven by declining use per customer, is flat to decreasing, while the nature
7 of investment (rate base) has shifted largely from plant needed for serving
8 new customers to non-revenue producing infrastructure replacement and
9 compliance with new drinking water standards; and

10 WHEREAS, The traditional cost of service model is not well adapted to a
11 no/low growth, high investment utility environment and is unlikely to
12 encourage the necessary future investment in infrastructure replacement;
13 and

14 WHEREAS, Compared to the water and wastewater industry, the electric
15 and natural gas delivery industries have in place a larger number and a
16 greater variety of alternative regulation policies, such as multiyear rate
17 plans and rate stabilization programs, and those set forth in the 2005
18 Resolution; and

19 WHEREAS, The U.S. water industry is the most capital intensive sector of
20 regulated utilities and faces critical investment needs that are expected to
21 total \$335 billion to \$1 trillion over the next quarter century, as noted in the
22 American Society of Civil Engineers 2013 Report Card for America's
23 Infrastructure...

24 The NARUC resolution goes on to recommend the adoption of alternative recovery
25 mechanisms such as the RSM. It states that:

26 Alternative regulatory mechanisms can enhance the efficiency and
27 effectiveness of water and wastewater utility regulation by reducing
28 regulatory costs, increasing rates for customers, when necessary, on a more
29 gradual basis; and providing the predictability and regulatory certainty that
30 supports the attraction of debt and equity capital at reasonable costs and
31 maintains that access at all times.

32 **Q. Are alternative regulatory mechanisms such as the RSM recognized in the regulatory
33 community as an effective means of addressing these policy concerns?**

34 **A.** Yes. RSMs have been adopted in many states to eliminate the throughput incentive,
35 support energy efficiency initiatives and investment, and align actual revenue collection

1 with authorized revenue. Clauses similar to the RSM proposed here have been successfully
2 used for some time for water utilities in New York and California and have been more
3 recently adopted for water utilities in Connecticut, Nevada, Maine, and Illinois. In
4 addition, similar revenue stabilizing mechanisms have been approved for gas utilities in 23
5 states and an additional two states plus the District of Columbia have mechanisms pending
6 according to the December 2016 report from the American Gas Association entitled
7 “Innovative Rates, Non-Volumetric Rates, and Tracking Mechanisms: Current List.”⁶ This
8 report also states that Weather Normalization Adjustments are allowed in 22 states. A
9 December 2017 report by the Institute for Electric Innovation lists 32 states and the District
10 of Columbia that have an approved fixed cost recovery mechanism for electric utilities with
11 an additional state pending approval.

12 **Q. Please summarize why adoption of an RSM for the Company and its customers is**
13 **appropriate in this proceeding.**

14 A. Adoption of an RSM is in the long-term best interest of the Company and its customers.
15 Rate designs that tie a utility's revenue recovery directly to sales volume have prompted
16 two widespread concerns in modern utility regulation. First, rewarding a water utility for
17 selling more water implicitly encourages water use and penalizes a water utility for
18 encouraging end use water efficiency and conservation. This misalignment is unfortunate
19 because utilities can play an important role in helping to improve water efficiency and
20 promote conservation. Second, because of seasonal variability and declining use per
21 customer, volumetric rates do not give water utilities a reasonable opportunity to recover

⁶ An earlier 2013 study by the Brattle Group entitled “Alternative Regulation and Ratemaking Approaches for Water Companies: Supporting the Capital Investment Needs of the 21st Century,” prepared for the National Association of Water Companies, (September 30, 2013) found that 27 states for electricity, 30 states for natural gas delivery, and 5 states for water have this kind of mechanism.

1 their authorized revenues. By allowing the Company to collect the revenues authorized
2 by the Commission, the RSM: 1) makes the Company indifferent to selling less water;
3 2) promotes water efficiency and conservation; 3) reduces the adverse impact of weather
4 variability for both the utility and its customers; and 4) reasonably provides that revenues
5 for continued water efficiency investments are available. In addition, the revenue
6 volatility that has been caused by the COVID-19 pandemic and that may continue as our
7 customers continue to recover from the economic effects of the pandemic provides
8 another strong argument for adoption of the RSM and makes the present case a
9 particularly appropriate time to implement such a mechanism. The result is a better
10 alignment of all stakeholder interests, and the Company respectfully requests the
11 Commission to authorize its proposed RSM.

12 **Q. Does this conclude your Direct Testimony?**

13 **A. Yes.**

Resolution Endorsing Consideration of Alternative Regulation that Supports Capital Investment in the 21st Century for Water and Wastewater Utilities

WHEREAS, Through the *Resolution Supporting Consideration of Regulatory Policies Deemed as “Best Practices”* (2005), the National Association of Regulatory Utility Commissioners (NARUC) has previously recognized the important role of innovative regulatory policies and mechanisms in facilitating the efforts of water and wastewater utilities to address their significant infrastructure investment challenges; *and*

WHEREAS, Traditional cost of service ratemaking, which has worked reasonably well in the past for water and wastewater utilities, no longer adequately addresses the challenges of today and tomorrow. Revenue, driven by declining use per customer, is flat to decreasing, while the nature of investment (rate base) has shifted largely from plant needed for serving new customers to non-revenue producing infrastructure replacement and compliance with new drinking water standards; *and*

WHEREAS, The traditional cost of service model is not well adapted to a no/low growth, high investment utility environment and is unlikely to encourage the necessary future investment in infrastructure replacement; *and*

WHEREAS, Compared to the water and wastewater industry, the electric and natural gas delivery industries have in place a larger number and a greater variety of alternative regulation policies, such as multiyear rate plans and rate stabilization programs, and those set forth in the 2005 Resolution; *and*

WHEREAS, The U.S. water industry is the most capital intensive sector of regulated utilities and faces critical investment needs that are expected to total \$335 billion to \$1 trillion over the next quarter century, as noted in the *American Society of Civil Engineers 2013 Report Card for America’s Infrastructure*; *and*

WHEREAS, Tap water is physically ingested and the quality of the service must be maintained to protect the health and economic well-being of communities across our Nation and comply with current and future regulations covering the control of a number of contaminants from nitrosamines to chromium, at a cost estimated at \$42 billion by the EPA as part of their April 2013 Report to Congress; *and*

WHEREAS, Alternative regulatory mechanisms can enhance the efficiency and effectiveness of water and wastewater utility regulation by reducing regulatory costs, increasing rates for customers, when necessary, on a more gradual basis; and providing the predictability and regulatory certainty that supports the attraction of debt and equity capital at reasonable costs and maintains that access at all times; *now, therefore be it*

RESOLVED, That the National Association of Regulatory Utility Commissioners, convened at its 125th Annual Meeting in Orlando, Florida, supports consideration of alternative regulation plans and mechanisms along with and in addition to the policies and mechanisms outlined in the
