Exhibit No. Issue: Depreciation Witness: Donald S. Roff Type of Exhibit: Direct Testimony Sponsoring Party: Empire District Case No.

Before the Public Service Commission of the State of Missouri

Direct Testimony

of

Donald S. Roff

April 2004

DIRECT TESTIMONY OF DONALD S. ROFF THE EMPIRE DISTRICT ELECTRIC COMPANY BEFORE THE MISSOURI PUBLIC SERVICE COMMISSION CASE NO.

Q. PLEASE STATE YOUR NAME, TITLE, BUSINESS AFFILIATION AND ADDRESS.

- 3 A. My name is Donald S. Roff and I am a Director with the public accounting firm
- 4 of Deloitte & Touche LLP ("Deloitte"). My business address is JP Morgan Chase
- 5 Tower, 2200 Ross Avenue, Suite 1600, Dallas, Texas 75201-6778.

6 Q. WHAT ARE YOUR QUALIFICATIONS AND EXPERIENCE?

- 7 A. My qualifications and experience are described on Schedule DSR-1.
- 8 Q. HAVE YOU EVER TESTIFIED BEFORE THIS OR ANY OTHER

9 **REGULATORY BODY**?

- 10 A. Yes. A listing of my regulatory appearances is contained on Schedule DSR-2.
- 11 1. **PURPOSE**

12 Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

- 13 A. I have been asked by The Empire District Electric Company ("Empire" or "the
- 14 Company") to present to The Missouri Public Service Commission
- 15 ("Commission") the results of a depreciation study that I conducted as of
- 16 December 31, 2003. I have also been asked to provide a discussion of the basics
- 17 of depreciation principles and practices as applies to a regulated entity.
- 18 Q. HAVE YOU PREPARED ANY ADDITIONAL SCHEDULES?

1	A.	Yes, Schedule DSR-3 is t	he formal report of 1	ny depreciation study. The
2		depreciation study was co	onducted to fulfill the	e requirements of generally accepted
3		accounting principles, as	well as following the	e depreciation definitions of the
4		Federal Energy Regulator	ry Commission ("FE	RC") Uniform System of Accounts
5		("USOA"). The report pr	esents a summary of	f the results and recommendations, a
6		description of the study a	pproach and process	, some fundamental depreciation
7		definitions and a Schedul	e of recommended d	epreciation rates. Schedule DSR-4
8		presents a comparison of	depreciation rates of	other utilities and will be addressed
9		later in my testimony.		
10	Q.	WERE THESE SCHED	ULES PREPAREI) BY YOU, OR UNDER YOUR
11		DIRECTION AND SUP	ERVISION?	
12	A.	Yes.		
13		2. <u>SUMMARY OF</u>	<u>RESULTS</u>	
14	Q.	WHAT ARE THE RES	ULTS OF YOUR D	DEPRECIATION STUDY?
15	A.	As shown on Schedule 1	of Schedule DSR-3	and summarized by function, my
16		study results in the follow	ving comparison of c	lepreciation rates:
17			Existing	Recommended
18		Function	Rate (%)	Rate (%)
19				
20		Steam Production	1.85	6.18
21		Hydraulic Production	1.62	3.27
22		Other Production	2.47	3.62
23		Transmission Plant	1.88	2.44
24		Distribution Plant	2.60	5.65
25		General Plant	6.90	4.48
26				
27		Total Electric Plant	2.53	4.72
28				

1		As shown on Schedule 1 of Schedule DSR-3, application of my recommended
2		depreciation rates to the December 31, 2003, depreciable balances results in an
3		increase in annual depreciation expense of about \$25.6 million.
4	Q.	WHAT FACTORS ARE DRIVING THIS INCREASE IN ANNUAL
5		DEPRECIATION EXPENSE?
6	A.	There are three primary elements which account for the substantial increase in
7		annual depreciation expense indicated by my study. The first element, and most
8		significant, is the effect on annual depreciation expense of the relatively low
9		existing depreciation rates. The second element is the retirement dates used to

The third element is the effect of negative net salvage. Each of these elements
will be addressed separately in later sections of my testimony.

calculate the depreciation rates for Production Plant coupled with new investment.

13 Q. WHAT ARE THE RESULTS OF YOUR DEPRECIATION STUDY

14 FOR PRODUCTION PLANT?

10

15 A. For Steam Production Plant, there is an increase in the accrual rate from 16 the existing depreciation rate of 1.85% to the recommended depreciation 17 rate of 6.18%. The increase is primarily due to the use of retirement dates 18 consistent with current Company plans, the effect of net salvage, and the 19 effect of book reserve position. For Hydraulic Production Plant, the 20 composite depreciation rate increased from 1.62% to 3.27%. For Other 21 Production Plant, there is an increase in the depreciation rate from the 22 existing rate of 2.47% to the recommended depreciation rate of 3.62%.

1	This is due primarily to estimated life spans and reserve position. The net
2	dollar impact of the change in depreciation rate is an increase in annual
3	depreciation expense of approximately \$12.0 million.

4 Q. WHAT ARE THE RESULTS OF YOUR DEPRECIATION STUDY 5 FOR TRANSMISSION PLANT?

A. For the Transmission Plant function, the depreciation rate increases from
1.88% to 2.44%. The composite average service life increases from 55.2
years to 56.5 years. Net salvage decreases from 0% to negative 37% and
is the primary reason for the depreciation expense increase. The net dollar
impact of the change in depreciation rate is an increase in annual
depreciation expense of approximately \$904 thousand.

12 Q. WHAT ARE THE RESULTS OF YOUR DEPRECIATION STUDY 13 FOR DISTRIBUTION PLANT?

A. For the Distribution Plant function, the depreciation rate increases from
2.60% to 5.65%. The composite average service life increases from 39.9
years to 45.1 years. Net salvage decreases from 0% to negative 118%. A
portion of the rate increase is attributable to the reserve position. The net
dollar impact of the change in rate is an increase in annual depreciation
expense of approximately \$13.9 million.

20 Q. WHAT ARE THE RESULTS OF YOUR DEPRECIATION STUDY 21 FOR GENERAL PLANT?

1	А.	For the General Plant function, the depreciation rate decreases from 6.90%
2		to 4.48%. The composite average service life increases from 18.2 years to
3		21.7 years. Net salvage changes from 0% to 4%. A portion of the rate
4		decrease is attributable to the reserve position. The net dollar impact of
5		the change in rate is a decrease in annual depreciation expense of
6		approximately \$1.2 million.
7		3. DEPRECIATION RATE COMPARISONS
8	Q.	HAVE YOU MADE ANY COMPARISONS OF DEPRECIATION RATES
9		WITH OTHER COMPANIES WHICH SUPPORT YOUR RESULTS?
10	A.	Yes. While it is not my general practice to make comparisons with other
11		companies due to the variety of factors which affect mortality characteristics and
12		related depreciation rates, I have made a comparison of depreciation rates to
13		demonstrate how low the existing composite depreciation rate of Empire appears
14		to be.
15	Q.	WHAT TYPES OF FACTORS AFFECT MORTALITY
16		CHARACTERISTICS AND DEPRECIATION RATES?
17	А.	These factors include, but are not limited to, capitalization policy, growth,
18		location, construction standards, retirement reporting, pricing conventions, market
19		circumstances, regulatory actions, field conditions, cause of retirement and
20		accounting practices.

1 Q. WHAT ARE MORTALITY CHARACTERISTICS?

2 A. Mortality characteristics are the basic parameters necessary to calculate 3 depreciation rates. They encompass average service life, retirement 4 dispersion (the various ages at which assets within a group retire) defined 5 by Iowa type curves or interim activity ratios, and net salvage allowance. 6 Interim activity ratios encompass interim retirement ratios and interim 7 addition ratios. Net salvage is the difference between salvage and cost of 8 removal. If cost of removal exceeds salvage, negative net salvage occurs.

9

Q. WHAT DOES YOUR COMPARISON REVEAL?

10 A. I have included Schedule DSR-4 to illustrate the range of depreciation 11 rates used by other Companies. My selection of Companies was based 12 upon those utilities generally surrounding Joplin and Missouri, as well as 13 utilities of reasonably the same size. This Schedule shows that only two 14 Companies out of the sample of twenty-six (26) had a composite 15 depreciation rate within 25 basis points of Empire's existing computed 16 composite depreciation rate of 2.53%. I have conducted no extensive 17 evaluation of the factors influencing any particular company composite 18 depreciation rate. The two conclusions that I can reasonably reach are: 1.) 19 a composite depreciation rate of at least 3.00% seems to be an adequate 20 average composite depreciation rate for an electric utility and 2.) Empire's 21 existing composite depreciation rate(s) is dramatically below this 22 aggregate average. I will point out that my recommended composite 23 depreciation rate is dramatically above this "minimum" rate.

1 4. **DEPRECIATION CONCEPTS**

2 Q. WHAT IS DEPRECIATION?

3 A. The most widely recognized accounting definition of depreciation is that

4 of the American Institute of Certified Public Accountants, which states:

5 Depreciation accounting is a system of accounting which aims to 6 distribute the cost or other basic value of tangible capital assets, 7 less salvage (if any), over the estimated useful life of the unit 8 (which may be a group of assets) in a systematic and rational 9 manner. It is a process of allocation, not of valuation.¹

10 Q. WHAT IS THE SIGNIFICANCE OF THIS DEFINITION?

11 A	. This definition of depreciation accounting forms the accounting
12	framework under which my depreciation study was conducted. Several
13	aspects of this definition are particularly significant. Salvage (net salvage)
14	is to be recognized. The allocation of costs is over the useful life of the
15	assets. Useful life must be estimated. Grouping of assets is permissible.
16	Depreciation accounting is not a valuation process. And the cost
17	allocation must be both systematic and rational.

18 Q. PLEASE EXPLAIN THE IMPORTANCE OF THE TERMS 19 "SYSTEMATIC AND RATIONAL".

A. Systematic implies the use of a formula. The formula used for calculating
the recommended depreciation rates is shown on page 13 of Schedule
DSR-3. Rational means that the pattern of depreciation, in this case, the

¹ Accounting Research Bulletin No. 43, Chapter 9, Paragraph 5 (June 1953).

1	depreciation rate itself, must match either the pattern of revenues produced
2	by the asset, or match the consumption of the asset. Since revenues are
3	determined through regulation (versus produced by the asset), and for this
4	study, revenues are projected to continue to be determined through
5	regulation, asset consumption is directly measured and reflected in the
6	calculation of depreciation rates. This measurement of asset consumption
7	is accomplished by conducting a depreciation study.

8 Q. ARE THERE OTHER DEFINITIONS OF DEPRECIATION?

9 Yes. The FERC USOA provides a series of definitions related to A. 10 depreciation as shown on page 3 of Schedule DSR-3. These definitions of 11 depreciation make reference to asset consumption, and therefore relate 12 very well to the accounting framework for depreciation. These definitions 13 form the regulatory framework under which my depreciation study was 14 conducted. It is my understanding that the Commission has adopted the 15 FERC USOA.²

16 Q. WHY IS THIS CITING SIGNIFICANT?

A. This reference is significant because of the importance of GeneralInstruction Number 11 of the USOA:

*"Accounting to be on Accrual Basis, A. The utility is required to*keep its accounts on the accrual basis. This requires the inclusion in its
accounts of all known transactions of appreciable amount which affect the
accounts. If bills covering such transactions have not been received or

² 4 CSR 240-20.030.

2 made when the bills are received. B. When payments are made in advance 3 for items such as insurance, rent, taxes or interest the amount applicable to 4 future periods shall be charged to account 165, Prepayments, and spread 5 over the periods to which applicable by credits to account 165 and charges to the accounts appropriate for the expenditure."³ 6 7 Thus the Company is required to maintain its books on an accrual basis. 8 This requirement has particular significance to depreciation accounting 9 and the inclusion of net salvage in the depreciation rate formula. Accrual 10 accounting embodies the accounting principle of matching, which is the 11 correlation between revenues and expenses. With respect to depreciation 12 expense, we are concerned with the allocation of total cost over time. 13 Q. DO YOU HAVE ANY AUTHORITATIVE SOURCE THAT

rendered, the amounts shall be estimated and appropriate adjustments

14 ADDRESSES THIS TOPIC?

1

15 A. Yes. The following quotation directly addresses this topic:

16 Under presently accepted concepts, the amount of depreciation to be 17 accrued over the life of an asset is its original cost less net salvage. Net 18 salvage, as the name implies, is the difference between the gross salvage 19 that will be obtained when the asset is disposed of and the cost of 20 removing it. Positive net salvage occurs when gross salvage exceeds cost 21 of removal, and negative net salvage occurs when cost of removal exceeds 22 gross salvage. Thus the intent of the present concept is to allocate the net 23 cost of an asset to annual accounting periods, making due allowance for 24 the net salvage, positive or negative, that will be obtained when the asset 25 is retired. This concept carries with it the thought that ownership of 26 property entails the responsibility for its ultimate abandonment or 27 removal. Hence if current users of the property benefit from its use, they 28 should pay their pro rata share of the costs involved in the abandonment or 29 removal of the property.

³ 18 CFR Part 101.

DONALD S.ROFF DIRECT TESTIMONY

3 4 5 6 7 8	accounting practices and tends to remove from the income statement fluctuations caused by erratic, although necessary, abandonment and uneconomical removal operations. It also has the advantage that current consumers pay a fair share, even though estimated, of costs associated with the property devoted to their service. ⁴
9	This quotation addresses several key accounting and ratemaking issues. First and
10	foremost, net salvage is an appropriate component of depreciation. Second,
11	inclusion of net salvage into depreciation results in a fair and equitable allocation
12	of cost. Third, from a ratemaking perspective, inclusion of net salvage in
13	depreciation expense fulfills the regulatory precept of having customers pay their
14	fair share of costs over the life of the property devoted to their service. By
15	properly including net salvage, the potential for intergenerational cross subsidy is
16	eliminated. As a matter of sound public policy, there is no reason to impose the
17	costs of net salvage on future electric customers. This produces an economically
18	inefficient allocation of resources across time to the detriment of all customers.
19	So such treatment is both good accounting and good ratemaking. The USOA
20	instructions clearly intended cost of removal and salvage to be components of
21	depreciation as they must be charged to Account 108, Accumulated Provision for
22	Depreciation. ⁵

This treatment of salvage is in harmony with generally accepted

1 2

⁴ <u>Public Utility Depreciation Practices</u>, NARUC, 1968 Edition, page 24.

⁵ 4 CSR 240-20.030, Paragraph 3(H). Charge original cost less net salvage to account 108., when implementing the provisions of Part 101 Electric Plant Instructions 10.F. and paragraph 15.060.10.F. The book cost less net salvage of depreciable electric plant retired shall be charged in its entirety to account108. Accumulated Provision for Depreciation of

1

5. **<u>NET SALVAGE CONCEPTS</u>**

2 Q. WHAT IS NET SALVAGE?

A. Net salvage is the difference between salvage and cost of removal. If cost of
removal exceeds salvage, negative net salvage occurs.

5 Q. WHY IS NET SALVAGE SIGNIFICANT TO THIS PROCEEDING?

- 6 A. Net salvage is significant to this proceeding because, in my view, it has been
- improperly recognized in the past. Thus the existing depreciation rates are
 understated because of how net salvage has been treated by this Commission in
- 9 prior proceedings.
- 10 Q. YOU HAVE INDICATED THAT YOU BELIEVE THE APPROACH
- 11 TAKEN BY THIS COMMISSION HAS BEEN INCORRECT WITH HOW

12 IT HAS RECOGNIZED NET SALVAGE FOR EMPIRE IN THE PAST.

13 CAN YOU ELABORATE ON THIS VIEW?

- 14 A. Yes. We first must start with an understanding of regulatory accounting
- 15 principles and the regulatory rules that must be followed by Empire with respect
- 16 to depreciation. Empire is required to follow the USOA of the FERC. Empire is
- 17 required to practice accrual accounting. Under the USOA, Empire is required,
- 18 upon retirement of an asset to credit plant in service and debit accumulated
- 19 depreciation. If salvage is received, Empire is required to credit accumulated
- 20 depreciation. If cost of removal is incurred, Empire is required to debit
- 21 accumulated depreciation. The clear intent of these requirements is to recognize

Electric Plant in Service (Account 110, Accumulated Provision for Depreciation and Amortization of Electric Utility Plant, in the case of Nonmajor utilities).

DONALD S.ROFF DIRECT TESTIMONY

1	net salvage (salvage less cost of removal) in annual depreciation expense.
2	Depreciation, within the USOA, is defined as loss in service value, and service
3	value is defined as the difference between original cost and net salvage value.
4	Thus net salvage is supposed to be included as a component of depreciation.
5	Second, the recent requirement for Empire by this Commission to treat net
6	salvage on a cash basis is absolutely in violation of its own rules and
7	requirements, first with respect to being inconsistent with accrual accounting and
8	second with respect to not including a net salvage component with the
9	depreciation rate. Third, such a treatment effectively defers the recovery of such
10	costs from the generation of customers that benefited from the use of the retired
11	assets to the last generation of customers that happen to being utilizing the asset at
12	the time of its retirement. Deferral is improper and unfair. Common sense would
13	reveal that any deferral is improper, and the unfairness rests with charging the
14	wrong generation of customers. Staff's recommendation to recognize net salvage
15	costs only on a cash basis is simply a cross subsidy of current customers who
16	benefit from these assets at the expense of future customers who will need to pay
17	these costs for retiring plant at a point in time when the plant is no longer used
18	and useful. Fourth, Empire is continually retiring and removing plant. As such,
19	the proper accrual for net salvage should be over the life of the asset, not at the
20	end of the life of the asset. The effect of accrual accounting is to allocate a
21	portion of the asset's total cost to each accounting period. As discussed above,
22	the total cost includes net salvage in the depreciation base. The effect of cash
23	accounting is not such an equitable cost allocation. Rather, Staff's methodology

1	will lead to more volatile depreciation rates as salvage/removal related cash flows
2	will spike whenever a major plant or asset is retired. Fifth, the use of a cash basis
3	for net salvage is a practice of exception, whereas accrual accounting has
4	widespread usage and authorization. I know of only three jurisdictions that have
5	accepted a cash basis approach for net salvage compared with over 45
б	jurisdictions that utilize accrual accounting.

7 Q. HOW DOES YOUR DEPRECIATION STUDY RECOGNIZE 8 ASSET CONSUMPTION?

9 A. Asset consumption in my depreciation study is recognized in two different 10 ways, depending upon the type of asset. For mass property (Transmission, 11 Distribution and General Plant), asset consumption (retirement dispersion) 12 is defined by the use of Iowa type curves and related average service lives. 13 For life span property (power plants), asset consumption is recognized 14 through the use of interim addition and interim retirement ratios, which 15 provide a form of retirement dispersion, by estimated capital replacement 16 amounts over the life of the facility.

17 Q. WHAT IS RETIREMENT DISPERSION?

A. Retirement dispersion merely recognizes that groups of assets have
individual assets of different lives, i.e., each asset retires at differing ages.
Retirement dispersion is the scattering of retirements by age around the
average service life for each group of assets.

1

6. **DEPRECIATION STUDY CONCEPTS**

2 Q. PLEASE DESCRIBE HOW THESE ELEMENTS WERE 3 DETERMINED AND UTILIZED IN YOUR DEPRECIATION 4 STUDY.

5 A. A depreciation study consists of four distinct, yet related phases - data 6 collection, analysis, evaluation and rate calculation. Data collection refers 7 to the gathering of historical accounting information for use in the other 8 phases. Company personnel were responsible for this effort. Analysis 9 refers to the statistical processing of the data collected in the first phase. 10 There are two separate analysis procedures, one for life, and one for 11 salvage and cost of removal, and were conducted by Deloitte personnel. 12 The evaluation phase incorporates the information developed in the data 13 collection and analysis phases to determine the applicability of the 14 historical relationships developed in these phases to the future, and was 15 conducted jointly by Deloitte and Company personnel. The rate 16 calculation phase merely utilizes the parameters developed in the other 17 phases in the computation of the recommended depreciation rates, and was 18 accomplished by Deloitte personnel.

 19
 7.
 PRODUCTION PLANT LIFE ANALYSIS

20 Q. PLEASE DISCUSS THE LIFE ANALYSIS PROCESS UTILIZED 21 FOR PRODUCTION PLANT.

1	A.	There were two separate life analyses performed for Production Plant -
2		the first was based upon historical accounting activity, performed by
3		Deloitte personnel, and the second was a forecast of projected investment
4		activity, also performed by Deloitte personnel under my direction and
5		supervision.

6 Q. PLEASE DESCRIBE THE HISTORICAL ANALYSIS 7 PERFORMED FOR PRODUCTION PLANT.

A. The historical analysis performed for Production Plant consisted of the
development of a worksheet of additions, retirements and plant balances
for each plant site (e.g., Riverton) and primary account (e.g., Account 312
– Boiler Plant Equipment). Original additions were identified separate
from interim additions and interim retirements were identified separate
from terminal retirements.

14 Q. WHAT ARE ORIGINAL ADDITIONS, INTERIM ADDITIONS, 15 INTERIM RETIREMENTS AND TERMINAL RETIREMENTS?

A. Original additions refer to the initial construction cost of a plant or unit.
Interim additions refer to replacements of initial equipment or the addition
of new equipment. Interim retirements refer to retirements of components
throughout the life of a plant or unit. Terminal retirements refer to the
final retirement of a plant or unit.

21 Q. WHY IS THIS DISTINCTION IMPORTANT?

1 A. One purpose of this analysis is to determine interim activity ratios (both 2 interim addition and interim retirement ratios) for use in the second life 3 analysis (i.e., forecast of projected investment activity) mentioned above. 4 An interim retirement ratio was determined by dividing the sum of interim retirements by the sum of beginning plant or unit balances for each 5 6 account. When expressed as a depreciation rate, this interim retirement 7 ratio is the depreciation rate that would accrue the level of cost related to 8 interim retirements over the life of the facility. An interim addition ratio 9 was also determined by dividing the sum of the interim additions by the 10 sum of the interim retirements. Thus this ratio is the number of dollars of 11 new capital for each dollar of interim retirement. These ratios are 12 important because they provide a measure of capital cost that must be 13 included in the depreciable base of each asset category in order to develop 14 an appropriate depreciation rate. Thus there is a relationship between the 15 life used for depreciation purposes and the investment necessary to 16 achieve that life.

17 Q. FOR PRODUCTION PLANT, WHAT LIFE ARE YOU 18 REFERRING TO?

A. Utility companies Production Plant facilities are unique in that all assets
 tend to retire at one point in time, in this case the estimated retirement
 date. Company engineers provided an estimated retirement date for each
 Production unit. This retirement date effectively defines the period over

which depreciation is to be accomplished. These estimated retirement
 dates assume normal maintenance and routine capital replacements, but do
 not include major investments that may be required for environmental
 regulations.

5 Q. HOW WERE THE RETIREMENT DATES AND INTERIM 6 ACTIVITY RATIOS UTILIZED IN YOUR DEPRECIATION 7 STUDY?

A. For each primary account, a forecast worksheet was prepared showing the existing investment and accumulated depreciation, and a projection of interim retirements, as well as the terminal retirement amount. These amounts were utilized in the development of a depreciation rate that provides for full recovery of these surviving and retiring amounts over the life of the facility. Interim and terminal net salvage amounts were also incorporated and will be discussed later in my testimony.

Q. WHY SHOULD INTERIM ADDITIONS AND RETIREMENTS BE INCLUDED IN THE CALCULATION OF DEPRECIATION RATES FOR PRODUCTION PLANT?

A. Interim retirements occur over the life of a production unit as capital items
 are replaced or retired. This is clearly evident from a review of historical
 retirement experience. Recognition of the effect of these interim
 retirements in the depreciation rate calculation is necessary to ensure that

1		these interim retirements are fully depreciated by the time they occur.
2		Similarly, interim additions occur over the life of a production unit as
3		items are replaced or new items are installed. This activity is also clearly
4		evident from a review of historical investment experience. While I believe
5		that recognition of the effect of these interim additions in the depreciation
6		rate calculation is highly preferable, such inclusion would create an even
7		greater increase in annual depreciation expense. Therefore, in an effort to
8		limit the annual depreciation expense change in this proceeding, <u>I have not</u>
9		included interim additions in the depreciation rate calculation.
10	Q.	WHAT INTERIM ACTIVITY RATIOS WERE DEVELOPED IN
11		YOUR DEPRECIATION STUDY?
12	A.	The interim addition ratios and interim retirement ratios developed in my
13		depreciation study are shown in Columns 6 and 7, on page 14 of Schedule
14		2 of Schedule DSR-3.
15	Q.	WERE THESE RATIOS USED IN DEVELOPING YOUR

16 **RECOMMENDED DEPRECIATION RATES**?

- 17 A. Yes. The interim retirement ratios were utilized. I have not included18 interim additions in my calculations.
- 198.**PRODUCTION PLANT NET SALVAGE**

Q. PLEASE DISCUSS HOW NET SALVAGE WAS ADDRESSED IN YOUR STUDY OF PRODUCTION PLANT.

A. Net salvage occurs in two forms for Production Plant: interim net salvage
and terminal net salvage. Interim net salvage refers to the salvage and
removal costs associated with interim retirements. Terminal net salvage
refers to the ultimate dismantlement of plant facilities, which includes
both salvage and removal cost.

8 Q. HOW WERE THE INTERIM NET SALVAGE FACTORS 9 DETERMINED?

A. Interim net salvage factors were determined by an analysis of historical
retirement, salvage and cost of removal activity. The interim net salvage
factor was calculated by subtracting cost of removal from salvage and
dividing by retirements. An interim net salvage factor was determined for
each primary asset account and is shown in Column 8 of Schedule 2 of
Schedule DSR-3.

16 Q. HOW WERE TERMINAL NET SALVAGE FACTORS 17 DETERMINED?

A. The Company has limited experience with the dismantlement of power
plants. Reliance was placed on the dismantlement estimates of other
utilities. Recognition was given to the type of facility and its relative
capacity. We have a collection of the dismantlement estimates of other

1	utilities. This collection contains the Company, plant/unit, capacity, study
2	date, cost estimate and dismantlement cost per unit of capacity (\$/kW). In
3	general, the larger the facility, the lower the unit cost to dismantle. A
4	figure of \$50/kW was utilized in my study to estimate the dismantlement
5	cost for Empire's Steam Production units. A figure of \$13/kW was used
6	for the Other Production units, with the exception of the State Line
7	Combined Cycle Unit. A figure of \$20/kW was utilized for it. As the
8	terminal retirement dates approach, adjustments can be made, if necessary.

9 Q. HOW DID YOU UTILIZE THIS FIGURE TO DETERMINE THE 10 TERMINAL NET SALVAGE FACTOR?

A. This unit cost per kilowatt was applied to the capacity of each of Empire's units to arrive at an estimate of the current cost to dismantle these units.
This amount was divided by the plant balances to determine the terminal net salvage percentage, which is shown in Column 9 of Schedule 2 of Schedule DSR-3.

16 Q. DID YOU ESCALATE THE CURRENT DISMANTLEMENT 17 COST?

A. No, although I believe that such escalation should be included in the
depreciation rate calculation. This is true for two reasons. The first
reason is to develop an estimate of the amount that will actually be spent
at the time of dismantlement. The second reason is that the Company

1		practices accrual accounting and this is the correct amount to be accrued
2		over the life of the generating unit. Thus my preferred approach is
3		consistent with accounting principles. There is only one reason why I did
4		not include an escalated net salvage figure in my study recommendations,
5		namely, to mitigate the depreciation expense increase developed in my
6		study
7		9. <u>NON-PRODUCTION PLANT LIFE ANALYSIS</u>
8	Q.	PLEASE DISCUSS THE LIFE ANALYSIS PROCESS UTILIZED
9		FOR TRANSMISSION, DISTRIBUTION AND GENERAL PLANT.
10	A.	Retirement experience was collected basically from inception through
11		2003 updating the historical data files used for the prior depreciation
12		study. These data were arrayed into a format suitable for life analysis.
13		Life tables were developed and Iowa type curves were fitted to the
14		historical summaries.

15 Q. PLEASE DESCRIBE THE LIFE ANALYSIS PHASE OF YOUR 16 DEPRECIATION STUDY FOR TRANSMISSION, DISTRIBUTION AND 17 GENERAL PLANT.

A. Life analysis measures history and results in the determination of an estimate of
 average service life for each asset category. The actual analysis involves
 "converting" historical accounting data into mortality tables. In very simple
 terms, one is looking at the portion surviving at each age for every asset category.

1 Q. HOW IS THIS "CONVERSION" ACCOMPLISHED?

- A. Because the age of retirement is known, as well as the age of the surviving
 balances, retirements of like ages are related to the asset amounts available to be
 retired at the same age. These retirement ratios are then related to the portion
 surviving at the beginning of each successive age, thus building what is known as
 the observed life table. When converted to a graphical format, this plot becomes
 the observed survivor curve.
- 8 Q. W

WHAT IS AN OBSERVED SURVIVOR CURVE?

9 A. An observed survivor curve is a plot, or graph of the recorded retirement and
10 survivor history as a function of age. This observed curve is essentially a
11 graphical representation of history.

12 Q. HOW IS THE OBSERVED CURVE USEFUL?

A. The observed curve is useful for two reasons. The area underneath the survivor
curve is, by definition, equal to average service life. First, if one could find a
matching empirical curve, such as the Iowa-type curves, an estimate of average
service life can be made. Second, this estimate then becomes the starting point in
the evaluation phase of a depreciation study.

18 Q. WHY DO YOU SAY THAT THIS OBSERVED CURVE IS ONLY THE 19 STARTING POINT IN THE EVALUATION PROCESS?

A. The observed curve is only the starting point in the evaluation process because it
only represents a pictorial view of history. In order to develop appropriate

- average service lives for depreciation rate calculation purposes, this history must
 be understood, and combined with expectations for the future.
- 3

Q. HOW IS THE SURVIVOR CURVE USED IN YOUR STUDY?

A. The observed survivor curve derived from the Company history is matched to
generalized known curves, such as the Iowa-type curves to provide an estimate of
average service life.

7 Q. WHAT ARE IOWA-TYPE CURVES?

8 A. The Iowa-type curves were devised empirically over 60 years ago by the 9 Engineering Research Institute at what is now Iowa State University to 10 provide a set of standard definitions of retirement dispersion. Retirement 11 dispersion merely recognizes that groups of assets have individual assets 12 of different lives, i.e., each asset retires at differing ages. Retirement 13 dispersion is the scattering of retirements by age around the average 14 service life for each group of assets. Standard dispersion patterns are 15 useful because they make calculations of the remaining life of existing 16 property possible and allow life characteristics to be compared.

17 The Engineering Research Institute collected dated retirement information 18 on many types of industrial and utility property and devised empirical 19 curves that matched the range of patterns found. A total of 18 curves were 20 defined. There were six left-skewed, seven symmetrical and five right-21 skewed curves, varying from wide to narrow dispersion patterns. The

1	Iowa-curve naming convention allows the analyst to relate easily to the
2	patterns. The left-skewed curves are known as the "L series", the
3	symmetrical as the "S series" and the right-skewed as the "R series." A
4	number identifies the range of dispersion. A low number represents a
5	wide pattern and a high number a narrow pattern. The combination of one
6	letter and one number defines a unique dispersion pattern.

7 Q. HOW DO IOWA-TYPE CURVES PROVIDE AN ESTIMATE OF 8 AVERAGE SERVICE LIFE?

9 A. Iowa-type curves and average service lives are inseparable. That is, the shape of
10 the survivor curve defines the average service life. As mentioned above, the area
11 underneath the survivor curve is equal to average service life. Thus the average
12 service life cannot be described without also defining an Iowa-type curve, i.e.,
13 shape. An example is shown below:

2 3

4 Q. WHAT DOES THIS CHART ILLUSTRATE?

A. This chart illustrates that Iowa type survivor curves are composed of two
elements, the curve shape and the average service life. Each of the above
survivor curves (R1, S3 and L4) has the same average service life, in this
case 50 years.

9 Q. HOW WERE THE IOWA CURVE SHAPES AND AVERAGE 10 SERVICE LIFE SELECTIONS MADE?

1	A.	Summaries of the individual asset category life analysis indications were
2		prepared and discussed with Company personnel. Anomalies and trends
3		were identified and engineering and operations input were requested
4		where necessary. A single average service life and Iowa curve was
5		selected for each asset category reflecting the combination of the historical
6		results and the additional information obtained from the engineering,
7		accounting and operations personnel. This process is a part of the
8		evaluation phase of the depreciation study.

9 Q. WHAT IS THE EVALUATION PHASE OF A DEPRECIATION 10 STUDY?

11 The evaluation phase of a depreciation study combines the results of A. 12 historical analyses with information regarding the age of property retired, 13 the age of property surviving, knowledge of the types of assets surviving 14 and being retired, and Company experience and expectations, all coupled 15 with the knowledge, experience and judgment of the depreciation analyst. 16 The goal is to give recognition to these factors and their influence upon 17 historical indications and the applicability of such historical indications to 18 plant surviving into the future. Both Empire and Deloitte personnel 19 participated in this process.

20 Q. WHAT TYPES OF INFORMATION ARE DISCERNED IN THIS 21 PHASE OF THE DEPRECIATION STUDY?

	A.	Information discerned includes the specific types of equipment being
2		retired and added, the relative age of property surviving and retiring and
3		Company plans and expectations regarding the property being evaluated,
4		as well as forces influencing the salvage obtainable and removal costs
5		associated with retired assets.
6	Q.	CAN YOU PROVIDE SPECIFIC EXAMPLES OF THE
7		INFORMATION THAT WAS UTILIZED IN YOUR STUDY?
0		
8	A.	Yes. One example would be the impact of the transfer of the State Line
9		facility in 2001. The recoding of this transaction had a significant impact
10		on the salvage and cost of removal analysis for Other Production Plant

1 Q. WHAT ARE SHRINKING AND ROLLING BAND ANALYSES?

2 A. These are two techniques to help discern trends in the historical data. A 3 shrinking band begins with the full experience period and successively 4 eliminates the oldest year's activity, thus illustrating trends as one moves 5 through time. Rolling bands are useful because salvage, cost of removal 6 and retirements are not always recorded in the same accounting period. 7 Rolling band analysis combines activity for fixed periods, in the case of 8 this study, three years. Three years was selected because virtually all 9 salvage and cost of removal activity occurs within three years of the 10 recording of the retirement. These three-year combined activities are then 11 "rolled" forward one year at a time, and similarly aid in identifying trends 12 as with the shrinking bands. Examples of rolling bands would be 1992-13 1994, 1993-1995, 1994-1996, etc.

14 Q. WERE THERE ANY TRENDS EVIDENT FROM THE DATA 15 CONTAINED IN THE SALVAGE AND COST OF REMOVAL 16 ANALYSYES?

17

A. In general, salvage is declining and cost of removal is increasing.

18 Q. WHY IS THIS THE CASE?

A. I believe that there are two reasons for this occurrence. First, both salvage
and cost of removal are a function of the age of property retired. Younger
property is more valuable as it can be reused. In general, we have seen

longer lives for most of the mass assets contained in the Transmission and
 Distribution Plant functions. Older property retirements have less salvage
 value and cost more to remove relative to their original cost due to cost
 escalation over time. The second reason is there are just more
 environmental requirements that impact the level of cost of removal. This
 creates an additional cost not reflected in the existing depreciation rates.

7 11. THEORETICAL RESERVE CONCEPTS

8 Q. PLEASE EXPLAIN WHAT YOU MEAN WHEN YOU SAY THAT THE 9 CHANGE IN ANNUAL DEPRECIATION EXPENSE IS DUE TO THE 10 IMPACT OF RESERVE POSITION.

11 A. My study developed recommended depreciation rates utilizing the remaining life 12 technique. A remaining life depreciation rate is actually a whole life depreciation 13 rate plus an adjustment for the difference between a theoretical reserve and the 14 actual book reserve. This is shown in the second formula shown on page 5 of 15 Schedule DSR-3. When the theoretical reserve exceeds the book reserve, past 16 depreciation accruals have been inadequate compared with those annual 17 depreciation accruals projected by the new study mortality characteristics. For 18 example, in the case of Distribution Plant, the theoretical reserve is approximately 19 \$106 million higher than the accumulated depreciation balance on the books at 20 December 31, 2003. This suggests that past depreciation accruals have been 21 inappropriate, and the use of revised mortality characteristics would produce a 22 different level of annual depreciation expense. It is important to utilize the

1	remaining life technique so that any "over" or "under" accruals are appropriately
2	charged to the customer to maintain intergenerational equity. Past depreciation
3	has been exactly what has been authorized by this Commission, although I would
4	disagree with the methodology that has been approved.

5

CONCLUSIONS

12.

6 Q. PLEASE SUMMARIZE YOUR TESTIMONY.

7 I recommend that Empire adopt the depreciation rates shown in Column 8 of A. 8 Schedule 1 of Schedule DSR-3, and that this Commission approve their use. I 9 base this recommendation on the fact that I have conducted a comprehensive 10 depreciation study, giving appropriate recognition to historical experience, recent 11 trends, Empire expectations, accounting principles, regulatory requirements and 12 professional judgment. I have appropriately recognized net salvage, consistent 13 with traditional depreciation accounting and the rules of this Commission. This 14 study and underlying workpapers support my recommendations. My study results 15 in a fair and reasonable level of depreciation expense, which will provide Empire 16 with adequate capital recovery until such time as a new depreciation study 17 indicates a need for change.

18

8 Q. DOES THIS COMPLETE YOUR TESTIMONY?

19 A. Yes.
