Transport Issue No. 4: Oversized Transmission Equipment and Costs	80
Transport Issue No. 5: Unnecessary Inclusion of Dedicated Transport Costs	84
Correction of the Petitioner Cost Studies	85
Analysis of ISUP Signaling Costs	
Description of Costs	86
Signaling Issue No. 1: Overstatement of Signaling Link Costs	87
Correction of Petitioner Cost Studies	88
Conclusions and Recommendations	89

1 **INTRODUCTION**

2 **Personal Background**

3 **Q. PLEASE STATE YOUR NAME, BUSINESS ADDRESS AND EMPLOYER.**

4 A. My name is W. Craig Conwell. My business address is 405 Hammett Road,  
5 Greer, South Carolina. I am self employed as an independent consultant,  
6 specializing in telecommunications cost analysis.

7 **Q. ON WHOSE BEHALF ARE YOU TESTIFYING IN THIS CASE?**

8 A. I am testifying as the cost witness for T-Mobile USA ("T-Mobile") and Cingular  
9 Wireless ("Cingular").

10 **Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.**

11 A. I have a Bachelors degree (1972) and Master of Science degree (1974) in  
12 Industrial Engineering from Auburn University in Auburn, Alabama.

13 **Q. PLEASE DESCRIBE YOUR WORK BACKGROUND.**

14 A. I have over 30 years of experience with cost analysis in the telecommunications  
15 industry. From 1974 to 1979, I was employed by South Central Bell Telephone  
16 Company, now part of BellSouth, where I prepared cost studies for the pricing of  
17 telephone services. From 1979 to 1987, I worked for AT&T in New York and  
18 Northern New Jersey. Initially, I participated in operations reviews of service  
19 costing and ratemaking procedures across the Bell Operating Companies (BOCs).  
20 In 1981, I was promoted to division manager as a member of the AT&T planning  
21 and financial management staff that analyzed business plans for AT&T's Office  
22 of the Chairman. Later, I served as a division controller in AT&T Information

1 Systems and a division manager in AT&T General Business Systems responsible  
2 for marketing and sales channel support.

3  
4 From 1989 to 1996, I was with Arthur Andersen & Co. in its telecommunications  
5 consulting practice in New York and Atlanta. I served as a firm-wide expert in  
6 telecommunications cost accounting, and I managed or provided advice on  
7 domestic and international consulting projects for telephone companies. These  
8 projects included:

- 9 • Performing cost studies for pricing telecommunications services.
- 10 • Designing cost accounting systems and databases for measuring service  
11 costs.
- 12 • Developing cost performance measures for cellular and wireline carriers.
- 13 • Performing reviews of cost models for regulators.
- 14 • Benchmarking service costs among telephone companies.

15  
16 I managed two important cost reviews for regulators while at Arthur Andersen.  
17 One was a comparison of U.S. and Canadian toll costs for the Canadian Radio-  
18 television and Telecommunications Commission (CRTC), and the other was a  
19 review of Bellcore's Switching Cost Information System (SCIS) for the Federal  
20 Communication Commission (FCC).

21  
22 While with Arthur Andersen, I developed and taught for six years a course in  
23 service costing for the United States Telephone Association (USTA) given to  
24 telephone company employees, regulatory staff and others. I have been an  
25 independent consultant since late 1996.

1   **Q.   PLEASE DESCRIBE YOUR WORK AS AN INDEPENDENT**  
2   **CONSULTANT.**

3   A.   From 1997 to 2001, much of my work was in assisting the SBC local exchange  
4       companies – Southwestern Bell, Pacific Bell, Nevada Bell and Ameritech – in  
5       developing and supporting cost studies for unbundled network elements,  
6       collocation and reciprocal compensation. My role was to analyze cost models  
7       produced by competitive local exchange carriers (CLECs), to perform ad hoc  
8       analyses to address specific cost issues and to assist in cost model development.  
9       In recent years, I have developed cost models for new data services, including  
10      digital subscriber line (DSL) service, Voice over Internet Protocol (VoIP) and  
11      others. More recently, I have begun reviewing for Commercial Mobile Radio  
12      Service (CMRS) Providers the cost studies of smaller incumbent LECs for  
13      compliance with the FCC’s Total Element Long Run Incremental Cost (TELRIC)  
14      requirements and assisting them in negotiations or arbitrations of proposed  
15      reciprocal compensation rates. I have testified as a cost witness in California,  
16      Nevada, Texas, Arkansas, Kansas, Oklahoma, Missouri, Ohio, Wisconsin and  
17      Tennessee on UNE costing, collocation costs or costs for reciprocal  
18      compensation.

19   **Q.   HAVE YOU PARTICIPATED IN OTHER ARBITRATIONS BETWEEN**  
20   **INCUMBENT LECS AND CMRS PROVIDERS?**

21   A.   Yes, I was the cost witness for CMRS Providers in two arbitrations in Oklahoma  
22       (Cause Nos. PUD 200200150 and PUD 200300771), an arbitration in Tennessee  
23       (Docket No. 03-00585), and an arbitration in Missouri (Case No. IO–2005-0468).

1 I now am involved in cases in Missouri, Tennessee and Michigan. In each case,  
2 my role is to review ILEC cost studies, their methods and input data to determine  
3 whether they meet the FCC requirements for establishing reciprocal compensation  
4 rates.

5 **Q. WHAT IS YOUR CONSULTING ENGAGEMENT WITH T-MOBILE AND**  
6 **CINGULAR WIRELESS IN THIS CASE?**

7 A. I was engaged to review the transport and termination cost studies produced by  
8 the ILEC Petitioners in this arbitration. The purpose of the review is to determine  
9 whether the studies meet the FCC requirements for establishing transport and  
10 termination rates. The review determines whether the study results fairly  
11 represent the Petitioners' *forward-looking economic costs* to transport and  
12 terminate telecommunications traffic originated by T-Mobile and Cingular  
13 customers – that is, mobile-to-land traffic.

14 **Summary of Testimony**

15 **Q. PLEASE SUMMARIZE THE MAIN POINTS OF YOUR TESTIMONY.**

16 A. As the cost witness for Cingular and T-Mobile, my testimony will review the  
17 requirements of the Communications Act with respect to reciprocal compensation.  
18 I will describe the rules the FCC has established to implement the Act's  
19 requirements, especially those for establishing cost-based rates for the transport  
20 and termination of traffic exchanged between carriers. These rules relate to the  
21 determination of an incumbent LEC's Total Element Long Run Incremental Costs  
22 (TELRIC). The FCC rules are not new or unfamiliar to this Commission. But  
23 they determine the appropriate compensation each Petitioner is permitted to

1 receive for transporting and terminating my clients' mobile-to-land traffic. The  
2 FCC's rules, therefore, deserve careful consideration.

3  
4 On a superficial level, this arbitration is similar at first blush to the earlier *Alma*  
5 arbitration between T-Mobile and four rural ILECs in Missouri, IO-2005-0468.  
6 Just as in the previous arbitration, the Petitioners have proposed a uniform rate of  
7 \$0.035 per minute. They contend that this rate does not exceed their forward-  
8 looking economic costs, as required by the FCC rules. And they support this  
9 contention based on cost studies produced using the HAI Model, version 5.0a.

10  
11 There are, however, important differences between this arbitration and the *Alma*  
12 case. In this proceeding, Cingular and T-Mobile charged me to examine the  
13 Petitioners' claimed costs in much greater detail than in the *Alma* proceeding, and  
14 the CMRS Providers acquired much more detailed information by submitting  
15 more extensive data requests (although the Petitioners still have not responded  
16 fully to all of the requests).

17  
18 We received the most information from Cass County Telephone Company.  
19 Accordingly, in my testimony, I use Cass County as a concrete example to  
20 illustrate the types of problems with the Petitioners' cost studies. The Petitioners'  
21 cost expert acknowledged at his December 12, 2006 deposition that he used for all  
22 Petitioners the same HAI model input values and assumptions that he used for  
23 Cass County.  
24

1       There are numerous flaws in the Petitioners' cost studies, and my testimony  
2       addresses nine of the most important, which are identified below in the issues  
3       table. Several of the flaws involve the Petitioners' use of default input values in  
4       the HAI 5.0a model, which was developed in 1998 and which derived its plant  
5       and other cost data from the mid-1990's. I demonstrate in my testimony that  
6       these outdated values for certain key data bear little relationship to today's  
7       technology and costs, or to the reality of small ILECs in Missouri and the  
8       Petitioners in particular. By using these default values, the Petitioners are able to  
9       grossly overstate their claimed forward-looking costs of transport and termination.  
10      Other more fundamental flaws deal with the HAI 5.0a model itself. After  
11      extensive analysis of the model, its methods and assumptions, it is clear that the  
12      model does not accurately represent the network architectures and costs of small  
13      ILECs in Missouri.

14  
15      As I discuss below, FCC Rule 505(e) is clear that an incumbent LEC "must prove  
16      to the state commission that the rates for each element it offers do not exceed the  
17      forward-looking economic cost per unit of providing the element." The FCC has  
18      further ruled that all assumptions in an ILEC cost study must be "verifiable" and  
19      based on "objective data" – that is, "[a]ny data used to estimate costs should  
20      either be derived from public sources, or capable of verification and audit without  
21      undue cost or delay." *Virginia Arbitration Cost Order*, 18 FCC Rcd 1772 at  
22      ¶¶ 37, 48 and 515 (2003). The ILEC Petitioners here have utterly failed to meet  
23      their burden of proof under these governing standards, and the Commission

1 should accordingly reject the Petitioners' costs studies for not being TELRIC-  
2 compliant.

3  
4 In discussing each of the nine flaws I identify, I also propose more realistic cost  
5 estimates or methods that the Commission can use to ensure that the Petitioners'  
6 reciprocal compensation rates do not exceed their respective forward-looking  
7 economic costs. I propose corrected transport and termination costs for twenty  
8 Petitioners, and corrected switching and signaling costs (but not transport costs)  
9 for the remaining seven companies. These costs are consistent with TELRIC  
10 methodology. At present, seven Petitioners have not produced enough data for  
11 me to make accurate corrections of their transport costs. Cingular and T-Mobile  
12 are endeavoring to obtain the necessary data from these Petitioners, as well as  
13 more complete information from others. In my rebuttal testimony, I will propose  
14 transport and termination costs for each Petitioner (based upon the total data  
15 available to me at that time). These costs will be suitable for establishing  
16 transport and termination rates consistent with FCC Rules. In the meantime, the  
17 costs provided for twenty Petitioners represent sound measures of their costs and  
18 are representative of the other Petitioners, for whom full corrections cannot yet be  
19 made.

## Nine Petitioner Cost Study Issues and Proposed Corrections

<i><b>Issue</b></i>	<i><b>Description</b></i>	<i><b>Proposed Correction</b></i>
1. Overstatement of the current cost to purchase and install new switches.	Petitioners have inflated their forward-looking termination costs by using an unsupported value for the investment per line they claim they would incur today to place new switches. The proposed per-line investment defies cost trends in the industry; is unsubstantiated by any vendor or other bona fide switch price data; is based on an incorrect comparison to embedded investments; and is contradicted by switch cost data produced by the FCC and the Rural Utility Service.	Modify Petitioners' switching investments using FCC cost data (in current dollars).
2. Overstatement of usage-sensitive portion of switching.	Petitioners have overstated the portion of switching costs that are caused by usage (70%) versus the costs that are not usage sensitive (30%). They base this on outdated assumptions in the 1998 HAI 5.0a model. Newer versions of the model assume 0% usage-sensitive switching. Moreover, the FCC and several state commissions in recent years have decided end office switching is non-usage sensitive, based on changes in technology and vendor pricing. These changes in technology and pricing dramatically lower termination costs.	Treat only the portion of end office switching costs associated with interoffice trunks as usage-sensitive. Lower all Petitioner end office switching costs to approximately \$0.0012 / minute.
3. Excessive land and building space requirements.	HAI 5.0a's default value assumes floor space for switches generally much greater than those actually required by the Petitioners, resulting in inflated central office building and land costs.	Replace HAI 5.0a's default value with space requirements that reflect the Petitioners' actual floor space usage directly attributable to switching.
4. Overstatement of interoffice cable length.	HAI 5.0a assumes a network design for the Petitioners that is completely unrealistic; substantially overstates the lengths of cabling connecting their switches; and inflates transport costs. HAI 5.0a measures cable lengths as though, on a forward-looking basis, the Petitioners would construct cable routes from each of their switches to the nearest Bell Operating Company switch, and have no direct connections within their own networks. This completely ignores the fiber ring technology employed today by many small LECs in Missouri.	Measure interoffice cable lengths based on most efficient network design for each Petitioner. This is assumed to be the existing Petitioner network architectures with one or more fiber rings, or point-to-point interoffice links, as necessary.
5. Oversized interoffice cable.	HAI 5.0a assumes 24 fiber cables for all interoffice cables, even though a	Efficiently size interoffice cables

	Petitioner's capacity requirements may be far less and do not justify such a large cable.	reflecting a mix of 8, 12 and 24 fiber cable based on each Petitioner's anticipated demand for fibers.
6. Failure to reflect sharing of interoffice cable.	HAI 5.0a assumes that interoffice cables are used solely for interoffice transport of voice traffic and dedicated circuits. It fails to recognize that the Petitioners use of portions of these same cables for other purposes, including digital loop carrier systems and lease of fibers to other carriers. The Petitioners thus ignore the economies they realize by sharing interoffice cables.	Per FCC Rule 51.511, compute transport cable costs based on total demand for interoffice fibers and the fiber capacity consumed by interoffice transport systems and trunks in service (DSO equivalents including dedicated circuits).
7. Oversized Transmission Equipment and Costs.	HAI 5.0a assumes sizes and quantities of transmission equipment (e.g. OC-48 add/drop multiplexers, digital cross connect systems and optical regenerators) that are unnecessary for small Missouri ILECs. This results in the transport transmission equipment costs of the small Petitioners being substantially overstated.	Size transmission equipment to meet the interoffice transport requirements of individual Petitioners.
8. Unnecessary Inclusion of Dedicated Transport Costs.	The Petitioners include two different transport cost elements from HAI 5.0a – common transport and dedicated transport. Doing this is unnecessary and duplicative.	When transport cable costs are correctly calculated (Issues 4, 5 and 6), the resulting costs will accurately represent the costs of the Petitioner. Dedicated transport costs should be excluded.
9. Overstatement of signaling link costs.	HAI 5.0a overstates the number of signaling links required by the Petitioners, except those few companies with a single switch. It also overstates signaling link costs by making the same errors identified in Issues 4, 5 and 6.	Use the actual, current charges paid by the Petitioners for SS7 interconnection to compute signaling link costs, assuming a lower cost alternative is not available to the Petitioner.

1 Q. HAVE YOU PREPARED A SUMMARY OF THE CORRECTED  
2 TRANSPORT AND TERMINATION COSTS FOR THE PETITIONERS?

3 A. Yes, the graph on the following page shows the transport and termination costs  
4 per minute for twenty of the Petitioners, after corrections to their studies were made for  
5 the nine issues I described in the table above.<sup>1</sup> The resulting costs range from \$0.0046  
6 per minute for Granby Tel. Co. to \$0.0147 per minute for Le-Ru Tel. Co. It is important  
7 to note that the proposed rate of \$0.035 per minute exceeds the forward-looking  
8 economic cost of each company, which is not permitted by FCC Rules. When I have  
9 more complete cost data for the other Petitioners, I will correct their cost studies and add  
10 them to the graph. I expect their costs, though, to be in the range of these companies.  
11 This concludes my summary. I will now describe the requirements for reciprocal  
12 compensation and follow this with my analysis of the Petitioners' cost studies.

---

<sup>1</sup> See Exhibit WCC-1 for details of the corrected transport and termination costs.

# Corrected Petitioner Transport and Termination Costs

1                   **REQUIREMENTS FOR RECIPROCAL COMPENSATION**

2           **Requirements of Federal Law**

3   **Q.    WHAT ARE THE FEDERAL LAW REQUIREMENTS FOR**  
4           **RECIPROCAL COMPENSATION?**

5   A.    Congress, in Section 251(b)(5) of the Communications Act, imposed on “each  
6           local exchange carrier” the “duty to establish reciprocal compensation  
7           arrangements for the transport and termination of telecommunications.”

8   **Q.    ARE THERE OTHER REQUIREMENTS OF THE COMMUNICATIONS**  
9           **ACT THAT ARE RELEVANT TO RECIPROCAL COMPENSATION?**

10 A.    Yes, there are three statutes. The first is Section 252(d)(2) which establishes how  
11           incumbent LECs and State commissions are to set reciprocal compensation rates.

12           This statute provides in pertinent part:

13                   (A)   For the purposes of compliance by an incumbent local  
14                           exchange carrier with section 251(b)(5) of this title, a State  
15                           commission shall not consider the terms and conditions for  
16                           reciprocal compensation to be just and reasonable unless –

17                           (i)   such terms and conditions provide for the mutual  
18                                   and reciprocal recovery by each carrier of the costs  
19                                   associated with the transport and termination on  
20                                   each carrier’s network facilities of calls that  
21                                   originate on the network facilities of the other  
22                                   carrier; and

23                           (ii)   such terms and conditions determine such costs on  
24                                   the basis of a reasonable approximation of the  
25                                   additional costs of terminating such calls.

26           The second relevant statute is Section 252(c), where Congress specified that in  
27           arbitrating an interconnection dispute, “a State commission shall – “

28                   (1)   ensure that such resolution and conditions meet the  
29                           requirements of section 251 of this title, including the  
30                           regulations prescribed by the [FCC] pursuant to section 251  
31                           of this title; [and]

1 (2) establish any rates for interconnection, services, or network  
2 elements according to subsection (d) of this section.

3 The third statute is Section 251(d)(1), where Congress directed the FCC to adopt  
4 rules implementing these provisions of the Communications Act.

5 **Q. HAS THE FCC ADOPTED IMPLEMENTING RULES?**

6 A. Yes, it adopted rules in 1996 in an order in Docket No. 96-98. See *Local*  
7 *Competition Order*, 11 FCC Rcd 15499 (1996). These rules are codified in Part  
8 51 of the FCC Rules.

9 **Q. HAVE THE FCC RULES BEEN CHALLENGED ON APPEAL?**

10 A. Yes, incumbent LECs challenged the rules on appeal, but were unsuccessful. In  
11 1999, the U.S. Supreme Court ruled that the FCC has “jurisdiction to design a  
12 pricing methodology.” *AT&T v. Iowa Utilities Board*, 525 U.S. 366, 384 (1999).  
13 In 2002, the Supreme Court “reverse[d] the Eighth Circuit’s judgment insofar as it  
14 invalidated TELRIC as a method for setting rates under the Act.” *Verizon*  
15 *Communications v. FCC*, 535 U.S. 467, 523 (2002).

16 **FCC Rules**

17 **Q. ARE YOU FAMILIAR WITH THE FCC RULES RELATED TO**  
18 **RECIPROCAL COMPENSATION AND THE COSTS TO BE USED IN**  
19 **DETERMINING COST-BASED RECIPROCAL COMPENSATION?**

20 A. Yes, I have worked extensively with the FCC rules related to reciprocal  
21 compensation in the past several years. I also have worked with the FCC rules for  
22 TELRIC consistently since they were adopted over nine years ago.

23 **Q. ARE RECIPROCAL COMPENSATION RATES SUPPOSED TO BE**  
24 **SYMMETRICAL?**

1 A. FCC Rule 51.711(a) specifies that reciprocal compensation rates “shall be  
2 symmetrical” unless the competitive carrier submits its own cost study.  
3 Symmetrical rates are defined in Rule 51.711(a)(1) as “rates that a carrier other  
4 than an incumbent LEC assesses upon an incumbent LEC for transport and  
5 termination of telecommunications traffic equal to those that the incumbent LEC  
6 assesses upon the other carrier for the same services.” Accordingly, wireless  
7 carriers use for land-to-mobile traffic the same rate that an incumbent LEC uses  
8 for terminating mobile-to-land traffic.

9 **Q. HOW DO THE FCC RULES DEFINE “TRANSPORT AND**  
10 **TERMINATION” AS REFERRED TO IN SECTION 251(B)(5) OF THE**  
11 **COMMUNICATIONS ACT?**

12 A. FCC Rule 51.701(c) defines transport as “the transmission and any necessary  
13 tandem switching of local telecommunications traffic subject to section 251(b)(5)  
14 of the Act from the interconnection point between the two carriers to the  
15 terminating carrier’s end office that directly serves the called party, or equivalent  
16 facility provided by a carrier other than an incumbent LEC.” Since wireless  
17 carriers and the Petitioners interconnect indirectly, transport includes the  
18 interoffice cable and transmission equipment connecting a Petitioner’s end office  
19 to the “meet point” where it connects to a transit carrier’s network.<sup>2</sup> The

---

<sup>2</sup> FCC rules define a “meet point” as “a point of interconnection between two networks, designated by two telecommunications carriers, at which one carrier’s responsibility for service begins and the other carrier’s responsibility ends.” 47 C.F.R. § 51.5.

Petitioners in this case do not provide tandem switching in transporting telecommunications traffic.

FCC Rule 51.701(d) defines termination as “the switching of local telecommunications traffic at the terminating carrier’s end office switch, or equivalent facility, and delivery of such traffic to the called party’s premises.”

**Q. SECTION 252(D)(2)(A)(II) OF THE ACT STATES THAT AN ILEC’S RECIPROCAL COMPENSATION CHARGES ARE TO BE BASED ON “A REASONABLE APPROXIMATION OF THE ADDITIONAL COSTS OF TERMINATING SUCH CALLS.” HOW DO THE FCC RULES ADDRESS THIS REQUIREMENT?**

A. The FCC has held that the “additional cost” standard in Section 252(d)(2)(A)(ii) should use the same “forward-looking economic cost-based pricing standard that we are establishing for interconnection and unbundled elements.” *Local Competition Order*, 11 FCC Rcd at 16023 ¶ 1054.

The FCC also held that under the “additional cost” standard, only usage-sensitive costs may be recovered and that non-traffic sensitive costs (such as the cost of the local loop) may not be included in reciprocal compensation rates:

[T]he “additional cost” to the LEC of terminating a call that originates on a competing carrier’s network primarily consists of the traffic-sensitive component of local switching. The network elements involved with the termination of traffic include the end-office switch and local loop. The costs of local loops and line ports associated with local switches do not vary in proportion to the number of calls terminated over these facilities. We conclude that such non-traffic sensitive costs should not be considered “additional costs” when a LEC terminates a call that originated on

1 the network of a competing carrier. Local Competition Order, 11  
2 FCC Rcd at 16025 ¶ 1057.

3  
4 **Q. WHAT IS THE SPECIFIC FCC RULE GOVERNING RECIPROCAL**  
5 **COMPENSATION?**

6 A. The rule governing ILEC transport and termination rates is provided at 47 C.F.R.  
7 § 51.705(a):

8 (a) An incumbent LEC's rates for transport and termination of  
9 telecommunications traffic shall be established, at the election of  
10 the state commission, on the basis of:

11 (1) the forward-looking economic costs of such  
12 offerings, using a cost study pursuant to §§ 51.505 and  
13 51.511 of this part;

14 (2) default proxies, as provided in § 51.707 of this part;  
15 or

16 (3) a bill-and-keep arrangement, as provided in  
17 § 51.713 of this part.  
18

19 Transport and termination rates, if cost-based, are to be based on forward-looking  
20 economic costs, which the FCC defines in Rule 51.505(a) as "the sum of: (1) The  
21 total element long-run incremental cost of the element, as described in paragraph  
22 (b); and (2) A reasonable allocation of forward-looking common costs, as  
23 described in paragraph (c)." Rule 51.505(e) states that ILEC rates shall not  
24 exceed forward-looking economic costs:

25  
26 (e) Cost study requirements. An incumbent LEC must prove  
27 to the state commission that the rates for each element it  
28 offers do not exceed the forward-looking economic cost per  
29 unit of providing the element, using a cost study that  
30 complies with the methodology set forth in this section and  
31 §51.511 of this part.  
32

33 The FCC's forward-looking economic cost rules are commonly referred to as the  
34 TELRIC rules.

1   **Q.   WHAT ARE THE SPECIFIC REQUIREMENTS FOR DETERMINING**  
2       **THE TELRIC OF TRANSPORT AND TERMINATION AND A**  
3       **REASONABLE ALLOCATION OF FORWARD-LOOKING COMMON**  
4       **COSTS?**

5   A.   FCC Rules 51.505(b) and (c) define total element long-run incremental cost and  
6       forward-looking common costs. The FCC has described specific requirements  
7       related to calculating transport and termination costs. Among these are the  
8       following:

- 9  
10       • *Plant is to reflect forward-looking technology and costs.* The costs of  
11       switching, transmission and cable plant are to reflect currently available  
12       equipment, at current vendor prices and company-specific discounts. FCC  
13       Rule 51.505(d)(1) specifically prohibits the use of embedded or historical  
14       costs. For example, the cost study should reflect today's cost to construct a  
15       new end office switching system, representing the prices the ILEC would  
16       currently pay its switch vendor to engineer, furnish and install the new switch.  
17       The study should not reflect switch costs that are either outdated or based on  
18       the original cost of existing switches. This requirement is especially relevant  
19       in light of declining switch costs over the past ten years.

- 20  
21       • *Plant capacity is to reflect an efficient network configuration.* FCC Rule  
22       51.505(b)(1) specifies that the transport and termination technologies in the  
23       cost study should use “the most efficient telecommunications technology  
24       currently available and the lowest cost network configuration, given the

1 existing location of the incumbent LEC's wire centers." In addition, the  
2 capacities of switching, transmission and cable plant in the study should be  
3 sized for efficient forward-looking utilization. Transmission equipment and  
4 cables used for interoffice transport, for example, should not be sized so large  
5 in the cost study as to produce excessive spare capacity and costs. This would  
6 cause transport costs to exceed forward looking economic costs, which Rule  
7 51.505(e) prohibits.

- 8  
9 • *Support asset costs and operating expenses are to be forward-looking,*  
10 *efficiently sized and directly attributable to transport and termination.*

11 Support assets include land, buildings, power equipment and other plant used  
12 to house and operate switching systems and transport equipment. In a  
13 TELRIC study, these assets are to be sized to support today's technologies,  
14 rather than representing existing land, buildings and other assets acquired to  
15 support operations and plant in the past. At the same time, support asset costs  
16 are to reflect current, rather than embedded land, building and other costs.  
17 Similarly, operating expenses for repair and maintenance of switching and  
18 transport equipment, engineering, network administration, etc. are to reflect  
19 today's business processes, productivity and labor costs. To the extent  
20 support assets or various workgroups are employed in producing other  
21 products, their costs should be attributed to those products and not to transport  
22 and termination.

- 1       • *Common costs allocated to transport and termination are to be forward-*  
2       *looking and costs that are efficiently incurred.* Common costs typically  
3       include executive, legal, accounting and other general and administrative  
4       costs. These costs are shared among all products and services. FCC rules call  
5       for a reasonable allocation of these costs to be added to the TELRIC of  
6       transport and termination in setting reciprocal compensation rates.

7   **Q.   SHOULD TRANSPORT AND TERMINATION RATES REFLECT**  
8   **COMPANY-SPECIFIC COSTS?**

9   A.   Yes, rates should be based on each ILEC's forward-looking economic costs,  
10       determined by a company-specific cost study. The study should reflect its unique  
11       serving area, forward-looking network architecture, business processes and  
12       current resource costs.

13   **Q.   DOES THIS MEAN THAT EACH PETITIONER SHOULD ESTABLISH**  
14   **ITS OWN SEPARATE TRANSPORT AND TERMINATION RATE IN**  
15   **THIS PROCEEDING?**

16   A.   Yes. Under FCC regulations, a "blanket rate" for multiple carriers is not  
17       permitted.

18  
19  
20   **Burden of Proof and Effect of Baseball Arbitration**

21   **Q.   WHO HAS THE BURDEN OF PROVING THAT PROPOSED**  
22   **RECIPROCAL COMPENSATION RATES DO NOT EXCEED**  
23   **FORWARD-LOOKING ECONOMIC COSTS?**

1 A. FCC rules are very clear that the burden of proof lies with the ILEC. FCC Rule  
2 51.505(e) provides unequivocally that an incumbent LEC “must prove to the state  
3 commission that the rates for each element it offers do not exceed the forward-  
4 looking economic cost per unit of providing the element, using a cost study that  
5 complies with the methodology set forth in this section and § 51.511 of this part.”

6 **Q. HOW IS THE BURDEN OF PROOF AFFECTED BY THE USE OF**  
7 **“BASEBALL ARBITRATION”?**

8 A. The burden of proof is not affected. The FCC uses “final offer” arbitration in the  
9 arbitrations it conducts. Under FCC Rule 51.807(f), each “final offer shall”:

- 10 (1) Meet the requirements of section 251, including the rules  
11 prescribed by the Commission pursuant to that section;  
12 [and]  
13 (2) Establish rates for interconnection, services, or access to  
14 unbundled network elements according to section 252(d) of  
15 the Act, including rules prescribed by the Commission  
16 pursuant to that section.

17 The Missouri Commission’s rules are to the same effect. 4 CRS 230.040(5)(D)  
18 provides:

19 Each final offer submitted by the parties to the arbitrator shall:

- 20 1. Meet the requirements of section 251 of the Act,  
21 including the rules prescribed by the commission  
22 and the [FCC] pursuant to that section; [and]  
23 2. Establish interconnection, services, or access to  
24 unbundled network elements according to section  
25 252(d) of the Act, including rules prescribed by the  
26 commission and [FCC] pursuant to that section.

27 If the Petitioners make a final offer that exceeds their forward-looking economic  
28 costs, the Commission has no choice but to reject their proposed rate.

29  
30 Commission Rule 4 CRS 230.040(5)(E) gives the Arbitrator a second alternative:

1 If a final offer submitted by one (1) of the parties fails to comply  
2 with the requirements of this section . . . , the arbitrator has  
3 discretion to take steps designed to result in an arbitrated  
4 agreement that satisfies the requirements of section 252(c) of the  
5 Act, including requiring the parties to submit new final offers  
6 within a time frame specified by the arbitrator, or adopting a result  
7 not submitted by any party that is consistent with the requirements  
8 of section 252(c) of the Act, and the rules prescribed by the [FCC]  
9 pursuant to that section.  
10

11 **Q. FCC RULE 51.505(E) REQUIRES INCUMBENT LECS TO SUBMIT “A**  
12 **COST STUDY THAT COMPLIES WITH THE [TELRIC]**  
13 **METHODOLOGY.” WHAT DOCUMENTATION MUST AN ILEC**  
14 **INCLUDE IN ITS COST STUDY?**

15 A. FCC Rule 51.505(e) requires an incumbent LEC to submit “a cost study that  
16 complies with the methodology set forth in this section and Sec. 51.511” – in  
17 order words, a cost study that complies with the TELRIC rules. The FCC has  
18 held that such a study “must explain with specificity why and how specific  
19 functions are necessary to provide network elements and how the associated costs  
20 are developed.” *Local Competition Order*, 11 FCC Rcd at 15850 ¶ 691.  
21 Specifically, an incumbent LEC “must prove to the state commission the nature  
22 and magnitude of any forward-looking costs that it seeks to recover in the prices  
23 of interconnection and unbundled network elements.” *Id.* at 15847 ¶ 680. *See*  
24 *also id.* at 15852 ¶ 695 (“[I]n the arbitration process, incumbent LECs shall have  
25 the burden to prove the specific nature and magnitude of these forward-looking  
26 common costs.”).

27 **Q. WHAT ARE THE COMMISSION’S OBLIGATIONS IN DEVELOPING A**  
28 **RATE FOR TRANSPORT AND TERMINATION?**

1 A. As noted above, FCC Rule 51.505(e) specifies that an ILEC reciprocal  
2 compensation rate “not exceed” its forward-looking economic costs of transport  
3 and termination. In addition, FCC Rule 51.505(e)(2) specifies that the  
4 Commission shall create “a written factual record that is sufficient for purposes of  
5 review.” The cost study and its documentation must be sufficient for the CMRS  
6 Providers to verify that the study results represent a company’s forward-looking  
7 economic costs. Consequently, the documentation must show that the  
8 requirements I described earlier are met – namely, costs are company-specific,  
9 forward-looking, reflective of current technology and efficient plant utilization,  
10 directly related to transport and termination, and include a reasonable allocation  
11 of common costs.

12 **OVERVIEW OF THE ANALYSIS OF PETITIONER COST STUDIES**

13 **Q. WHAT WAS THE PURPOSE OF YOUR ANALYSIS OF THE**  
14 **PETITIONERS’ COST STUDIES?**

15 A. My analysis was to determine whether the Petitioners’ cost studies produced  
16 reasonable estimates of their forward-looking economic costs of transport and  
17 termination as defined by the FCC Rules and to determine whether their proposed  
18 rate of \$0.035 per minute exceeds these costs.

19 **Q. WHAT COST STUDY DOCUMENTATION WAS PROVIDED TO THE**  
20 **CMRS PROVIDERS ON WHICH TO BASE YOUR ANALYSIS?**

21 A. T-Mobile and Cingular were each provided a computer disk containing several  
22 items of cost information, which I understand was included as an Attachment to  
23 the Arbitration Petition. These items of information included a summary of the

1 Petitioners' transport and termination costs and an average transport and  
2 termination cost. HAI 5.0a model results used to prepare the summaries also  
3 were provided. The computer disk contained copies of the HAI 5.0a model,  
4 model documentation and other related material. In addition to this material, T-  
5 Mobile obtained responses by the Petitioners to data requests, which I used in  
6 analyzing the cost studies and later in making corrections to the studies.<sup>3</sup>

7 **Q. DID YOU ATTEMPT TO INSTALL AND RUN THE HAI MODEL?**

8 A. Yes. However, I was not able to successfully install the model. HAI 5.0a was  
9 developed and released in 1998 and runs on outdated versions of Microsoft Excel  
10 and Access software. The model does not readily install and run on current  
11 versions of the Microsoft software. I had to abandon attempts to run the model  
12 and instead analyzed work files provided by the Petitioners' cost expert, Mr.  
13 Schoonmaker, and the model documentation. While this made the analysis more  
14 difficult and time-consuming, I was able to reproduce the HAI model cost  
15 calculations and perform the necessary detailed analysis of costs for one of the  
16 Petitioners, Cass County Telephone Company ("Cass County"). The use of Cass  
17 County as an illustration of the shortcomings of the Petitioners' cost justification  
18 is particularly relevant, as that company has been managed since March 2005, by  
19 the GVNW consulting firm of which the Petitioners' cost witness, Robert  
20 Schoonmaker, is president.

---

<sup>3</sup> "Respondent's Discovery / Data Requests to Petitioners," T-Mobile USA, Case No. TO-2006-0147, 10/17/05.

1    **Q.    YOU SAY YOU ANALYZED THE COSTS OF CASS COUNTY. CAN**  
2    **YOU FURTHER EXPLAIN THIS?**

3    A.    I wanted to analyze the Petitioners' cost studies using HAI 5.0a at a very detailed  
4    level in order to understand how costs were being determined. Normally, in a  
5    cost study produced using Excel or a similar spreadsheet model, it is relatively  
6    straightforward to trace cost calculations from the model input to the output. The  
7    HAI model uses Excel and other software; however, it is not a simple matter to  
8    trace calculations through the model, even when the model can be installed and  
9    run. The model is not transparent. For this reason, I selected Cass County, which  
10   is a Petitioner to both T-Mobile and Cingular, to analyze the HAI model  
11   calculations. Since the same methodology and, with a few exceptions, the same  
12   input data are used for all Petitioners, the findings for Cass County applied to all  
13   the companies. As I describe the HAI model and the Petitioners' cost studies  
14   produced using the model, I will use Cass County to illustrate the issues with the  
15   studies.

16   **Q.    PLEASE DESCRIBE THE APPROACH YOU USED TO ANALYZE THE**  
17   **PETITIONERS' COST STUDIES?**

18   A.    I used the following approach:

- 19       •   Identify most important cost components. I first identified the most important  
20       components of the Petitioners' transport and termination costs. These  
21       included end office switching, common transport and dedicated transport.  
22       Signaling – specifically, ISDN User Part (ISUP) messages over a Signaling  
23       System No. 7 (SS7) network – is a relatively small cost item. Common

1 transport costs have two important sub-components – cable costs and  
2 transmission equipment costs.

- 3 • Reproduce HAI 5.0a cost calculations for Cass County. For each cost  
4 component, I replicated the cost calculations used by HAI 5.0a to produce  
5 Cass County's costs. This enabled me to understand the assumptions made by  
6 the model regarding network configuration and the methods used to compute  
7 plant investments, capital costs and operating expenses.
- 8 • Identify issues. I identified several severe flaws in HAI 5.0a as used by the  
9 Petitioners. These are instances in which the model is unrealistic in accurately  
10 representing the Petitioners' networks. I also identified methods and cost data  
11 that led to the Petitioners' costs being dramatically overstated and failing to  
12 comply with FCC Rules for TELRIC and forward-looking economic costs.
- 13 • Make corrections. I corrected Cass County's transport and termination costs  
14 for the major issues. I believe the results more accurately represent the  
15 Company's current cost to transport and terminate mobile-to-land traffic. The  
16 results also satisfy the FCC rules. These costs are significantly lower than  
17 those claimed by Cass County.
- 18 • Develop recommendations for correcting the costs of all Petitioners. Finally, I  
19 developed recommendations for correcting the cost studies of the other  
20 Petitioners. The corrections do not involve elaborate cost model development  
21 or extensive data gathering. I also corrected the transport and termination  
22 costs for twenty Petitioners.

1 In the remainder of my testimony, I will describe my analysis of the Petitioners'  
2 transport and termination costs. I will identify nine fundamental issues in the cost  
3 studies that cause the Petitioners' transport and termination costs to be overstated  
4 and not TELRIC-compliant. I will begin with the analysis of end office switching  
5 costs.

## 6 7 **ANALYSIS OF END OFFICE SWITCHING COSTS OF THE PETITIONERS**

### 8 **Description of Costs**

#### 9 **Q. WHAT TERMINATION COSTS MAY THE PETITIONERS RECOVER** 10 **IN RECIPROCAL COMPENSATION?**

11 A. Section 252(b)(5) of the Act and FCC Rule 51.701 call for reciprocal  
12 compensation to recover the costs of transporting and terminating  
13 telecommunications traffic exchanged between a LEC and a CMRS Provider.  
14 The FCC defines termination in Rule 51.701(d) as "the switching of local  
15 telecommunications traffic at the terminating carrier's end office switch, or  
16 equivalent facility, and the delivery of such traffic to the called party's premises."  
17 However, Section 252(d)(2)(A)(ii) limits cost recovery to "a reasonable  
18 approximation of the additional costs of terminating calls." The FCC has  
19 interpreted the "additional cost" standard of Section 252(d) as limiting recovery to  
20 the usage-sensitive costs. In the case of end office switching, these are the costs  
21 of switch components whose capacity is determined by the quantity of calling, or  
22 minutes of use, handled by the switch. The portions of the switch that are not  
23 usage-sensitive are not recoverable in transport and termination rates, and an

1 ILEC must recover these non-usage sensitive switch costs from other sources  
2 (e.g., end user customers). In addition, the costs of loops from the end office to a  
3 customer's premises are not usage-sensitive and therefore are not recoverable in  
4 reciprocal compensation.<sup>4</sup>

5 **Q. PLEASE GIVE AN EXAMPLE OF END OFFICE SWITCHING.**

6 A. \*\* \_\_\_\_\_  
7 \_\_\_\_\_  
8 \_\_\_\_\_  
9 \_\_\_\_\_  
10 \_\_\_\_\_  
11 \_\_\_\_\_.

12 **Q. WHAT DO FCC RULES FOR TELRIC AND FORWARD-LOOKING**  
13 **ECONOMIC COSTS REQUIRE IN COMPUTING END OFFICE**  
14 **SWITCHING COSTS?**

15 A. FCC Rules 51.505 and 51.511 require the following for properly computed end  
16 office switching costs:

- 17 • Switch investments are supposed to reflect the cost today to purchase and  
18 install switches using currently available technology and at current prices. In  
19 Cass County's cost study, the costs to purchase and install a new switch to  
20 replace the Peculiar host and each of its remotes are supposed to be  
21 determined based on a specific switch vendor and available switches.

---

<sup>4</sup> Loop plant capacity and costs are determined by the number of access lines or other local channels required to provide connections between customer premises and serving wire centers.

- 1       • Switch investments may not consider an ILEC's embedded costs of existing  
2       switches. End office switching costs may not be calculated in order to  
3       produce a termination rate that recovers past investments in existing switch  
4       hardware and software or the costs of operating outdated switching  
5       technology.
- 6       • End office switches are to be sized to reflect total demand for switched lines,  
7       trunks and other variables affecting switch capacity. Demand must be current  
8       or at levels expected over a reasonable planning period.
- 9       • End office switching costs must reflect only the usage-sensitive portion of  
10      switching plant. The ILEC must determine the portion of the costs of  
11      purchasing and installing new switching systems caused by the minutes of  
12      use, or call attempts, handled by the switches. This requires analyzing the  
13      hardware, software and other charges for new switches, identifying fixed  
14      charges versus charges affected by the volume of demand (lines, interoffice  
15      minutes of use, etc.), and categorizing the charges accordingly. The portion of  
16      the total cost of a new switch attributable to usage is included in end office  
17      switching costs.
- 18     • The ILEC is obliged to show that these requirements are met. It does this by  
19      taking reasonable steps to obtain necessary information on current switching  
20      technology, current vendor pricing and installation charges, the cost structure  
21      of switches, etc.

22   **Q.   IS IT PRACTICAL FOR SMALL ILECS TO MEET THESE**  
23   **REQUIREMENTS?**

1 A. Yes, it is. In order to meet these requirements, a Petitioner would obtain a valid  
2 vendor quote to purchase and install a new switch. Typically, the vendor quote is  
3 based on a specification of the quantity of lines to be served, interoffice trunk  
4 requirements, software requirements and other. The quote provides a breakdown  
5 of hardware and software, quantities, material prices, and estimates of charges for  
6 vendor engineering, installation and other items. These details can be used to  
7 determine the usage-sensitive portion of total switch costs. Some vendors provide  
8 software that enables telephone company engineers to develop their own  
9 estimates for budgetary purposes. I expect the Petitioners or their engineering  
10 consultants have these capabilities.

11 **Q. WHAT WERE THE PETITIONER COST STUDY RESULTS FOR END**  
12 **OFFICE SWITCHING?**

13 A. Exhibit WCC-2 shows the end office switching cost per minute for each  
14 Petitioner. They range from \$0.0077 to \$0.0131 per minute. The average for the  
15 T-Mobile Petitioners is \$0.0092 per minute. I have shaded Cass County's end  
16 office switching cost of \$0.0091 per minute. I will show how HAI 5.0a calculates  
17 this cost and describe the three fundamental issues related to the Petitioners'  
18 claimed end office switching costs.

19 **Q. WHAT ARE THESE THREE ISSUES?**

20 A. First, the Petitioners have failed to determine the current costs they would incur to  
21 purchase and install new end office switches. Instead, they based their switching  
22 investment and costs on an incorrect analysis of embedded switch investment.  
23 This results in an overstatement of the current cost of switching.

1  
2 Secondly, the Petitioners have failed to demonstrate that any portion of the costs  
3 they would incur today for new switches are usage-sensitive. They did not  
4 analyze current switching costs, but instead based the usage-sensitive portion of  
5 switching (70%) on the default value of the HAI model and on assumptions used  
6 during the FCC's Universal Service Fund proceedings. The FCC has since ruled  
7 that little, if any, of end office switching is usage-sensitive, as have several state  
8 commissions.

9  
10 Third, the Petitioners have reflected excessive land and building space  
11 requirements in the studies, by simply using the default values of the HAI model  
12 rather than using their own anticipated space usage.

13  
14 Primarily because of these three issues, the Petitioners have failed to meet their  
15 obligation to determine their forward-looking costs of switching per the FCC  
16 rules.

17 **Switching Issue No. 1: Overstatement of Current Cost to Purchase and Install New**

18 **Switches**

19 **Q. HOW DID THE PETITIONERS OVERSTATE THE COST OF NEW**  
20 **SWITCHES?**

21 A. The Petitioners used an inflated value for a key input variable in the HAI model.  
22 The input variable, called the "*constant EO switching investment term*," is used by  
23 the model to calculate the current cost to purchase and install end office switches.  
24 The Petitioners increased the model's default input value by 25 percent – from  
25 \$416.11 to \$520.14.

1 **Q. WHY DO YOU CLAIM THAT THIS INPUT VALUE USED BY**  
2 **PETITIONERS IS INFLATED?**

3 A. There are three factors causing the input value to be inflated. First, the Petitioners  
4 increased by 25 percent the HAI 5.0a default value, which is based on switch  
5 costs from 1995. It is generally recognized that switch prices have declined  
6 dramatically over the past decade, so the Petitioners should have lowered, rather  
7 than raised the default value.<sup>5</sup> Secondly, the \$520.14 value was developed by the  
8 Petitioners based on its relationship to their embedded investment in switching  
9 plant; and the analysis was incorrectly performed. Third, there is publicly  
10 available information on switch costs produced by the FCC that indicates the  
11 current cost to purchase and install switches is significantly lower than that  
12 estimated by the Petitioners. The FCC's information was partially based on  
13 switch cost data for rural telephone companies produced by the Rural Utility  
14 Service of the U.S. Department of Agriculture.

15 **Q. WHAT ESTIMATE DO YOU BELIEVE WOULD BE REASONABLE FOR**  
16 **END OFFICE SWITCHING?**

17 A. The Petitioners' end office switching investments should be based on current  
18 estimates of the cost to purchase and install new switches for the switch vendors  
19 and switch types they would use in place of their existing switches. Since the  
20 Petitioners have not sought vendor quotes or similar information, I recommend

---

<sup>5</sup> Default values refer to user-adjustable input values in the HAI model that the developers used as generally representative of ILEC costs at the time the model was released in 1998. Model users may modify the default values with more current or company-specific data.

1 the switch cost data developed by the FCC during the USF proceedings be used,  
2 adjusted to a current cost basis.

3 **Q. PLEASE DESCRIBE IN MORE DETAIL THE THREE REASONS FOR**  
4 **CONCLUDING THE PETITIONERS HAVE OVERSTATED CURRENT**  
5 **SWITCH COSTS?**

6 A. I will start by explaining why increasing the HAI model input value for the  
7 *constant EO switching investment term* from \$416.11 to \$520.14 contradicts  
8 trends in switch prices over the past decade.

9 **Increasing the HAI Model Switching Investment Per Line is Contrary to Cost Trends**

10 **Q. BEFORE DESCRIBING THE SWITCHING INVESTMENT PER LINE,**  
11 **PLEASE SUMMARIZE HOW HAI 5.0A COMPUTES END OFFICE**  
12 **SWITCHING COSTS?**

13 A. I reproduced the cost calculations for Cass County's end office switching cost of  
14 \$0.0091 per minute in Exhibit WCC-3. Following are the main steps in the model  
15 calculations:

- 16 • The calculations begin by determining the current investment that would be  
17 required to replace each of Cass County's six switches. Investments are  
18 expressed on a per-line basis.
- 19 • To determine the current switch investment per line, the model uses the  
20 *constant EO switching investment term* for small independent telephone  
21 companies. This is the input variable that has a default value of \$416.11,  
22 which the Petitioners increased to \$520.14.

- 1       • A series of calculations is made from rows 11 to 53 to obtain a switch  
2       investment per line for each switch. These range from \$437.32 for the  
3       Peculiar host switch to \$476.34 for Creighton, the smallest of the remotes.
- 4       • Total switch investments are calculated by multiplying the lines per switch  
5       times the unit investments. Additional investments in buildings, power plant  
6       and land are determined in rows 60 – 70.
- 7       • Next, annual capital costs (depreciation, cost of capital and income taxes) and  
8       operating expenses (including common overheads) are computed and summed  
9       in cell H112. The amount shown in the spreadsheet is supposed to represent  
10      the total annual costs Cass County would incur today, if it replaced its existing  
11      switches with current technology, at current prices.
- 12      • HAI 5.0a then assumes that 70% of these costs are usage-sensitive. It refers to  
13      this amount as the *end office non-port fraction*.<sup>6</sup> Seventy percent (70%) is  
14      multiplied times the total annual costs to obtain the usage-sensitive portion,  
15      and this amount is divided by Cass County's total switched minutes of use to  
16      compute \$0.0091 per minute as its cost to terminate mobile-to-land calls.

17   **Q.   YOU INDICATED THE PETITIONERS INCREASED THE HAI 5.0A**  
18   **DEFAULT VALUE FOR SWITCHING INVESTMENT PER LINE. HOW**  
19   **WAS THIS DEFAULT VALUE IN HAI 5.0A DEVELOPED?**

---

<sup>6</sup>       Ports refer to line terminations on an end office switch. Line terminating equipment is considered by HAI 5.0a to not be usage sensitive, because the amount of line equipment is determined by the number of switched lines, rather than the amount of calling on the lines. The *end office non-port fraction* is supposed to represent the portion of switch costs that are usage sensitive.

1 A. According to the HAI model documentation, \$416.11 is an average value for  
2 standalone, host and remote switches, based on typical switch prices in the 1995  
3 timeframe.<sup>7</sup> This value represents small telephone companies like the Petitioners.

4 **Q. HOW HAVE SWITCH PRICES CHANGED OVER THE PAST DECADE?**

5 A. They have declined. One indicator of this decline is the CA Turner Price Index  
6 for digital electronic switching, which measures changes in the cost to reproduce  
7 switches over time. Based on the testimony of a Sprint cost witness in the  
8 Tennessee arbitration in which I participated, switch prices have declined  
9 approximately 30% since the \$416.11 default value was determined for HAI  
10 5.0a.<sup>8</sup>

11 **Q. DOES THE PETITIONERS' COST EXPERT RECOGNIZE THAT**  
12 **SWITCH COSTS HAVE DECREASED OVER TIME?**

13 A. Yes. In his December 12, 2005 deposition, Mr. Schoonmaker was asked a series  
14 of questions on this issue, and he agreed that, in general, switching hardware costs  
15 have declined by 10 or possibly 20 percent over the past 10 to 15 years.

16 Q. Are you familiar in your business with the costs of digital  
17 switching and digital switching costs, generally?

18 A. Generally.

19 Q. How would you describe, in general terms, what happened  
20 to digital switching costs in the last 10 to 15 years?

---

<sup>7</sup> See "HAI Model Release 5.0a – Inputs Portfolio," section 4.1.9, 01/27/98. The documentation states that "The switching cost surveys were developed using typical per-line prices paid by BOCs, GTE and other independents as reported in the Northern Business Information (NBI) publication, "U.S., Central Office Equipment Market: 1995 Database," compared to switch size and data from the ARMIS 43-07 report."

<sup>8</sup> "Supplemental Consolidated Direct and Rebuttal Testimony," Talmage O. Cox, III, Sprint PCS, Tennessee Regulatory Authority, Docket 03-00585, 07/27/04.

1 A. Well, for smaller companies the costs of the hardware has  
2 decreased somewhat. The cost of the software – a portion of it has  
3 probably increased somewhat and – I mean, overall it's probably  
4 decreased a little bit, but certainly not as much for small companies  
5 as it may have for larger companies.

6 Q. You would agree with me that the hardware costs have  
7 definitely decreased even for smaller companies?

8 A. Somewhat.

9 Q. When you say –

10 A. Maybe not necessarily all smaller companies, but in general  
11 I would agree with that.

12 Q. Let's try to be a little more specific as we can – if we can  
13 about the term "somewhat." Can you give me a percentage figure  
14 – recognizing that it's just an estimate – what digital hardware  
15 switching costs are in the last 10 to 15 years, in your experience?

16 A. My impression is in the area of maybe 10 to possibly 20  
17 percent, depending on the specific circumstances and so forth.  
18 Schoonmaker Dep. at 12-13.

19  
20 **Q. MR. SCHOONMAKER INDICATED THAT THE COST OF SOFTWARE,**  
21 **OR A PORTION OF IT, "HAS PROBABLY INCREASED SOMEWHAT."**  
22 **DO YOU AGREE WITH HIS OBSERVATION?**

23 A. His response is not specific. Small ILECs have spent considerable amounts in  
24 recent years on software upgrades to their existing switches and for capabilities,  
25 such as Local Number Portability, Number Pooling, CALEA and new calling  
26 features. These types of software expenditures are not attributable to termination  
27 because most (if not all) of this software is not used in terminating mobile-to-land  
28 calls. To the extent Mr. Schoonmaker is referring to these types of software costs,  
29 they are irrelevant to the determination of termination costs. Furthermore, over  
30 the past decade there has been a shift in the accounting for switch software with a

1 greater portion of software costs being expensed rather than capitalized. A  
2 significant portion of software expenditures are no longer included in switch  
3 investment.

4 **Q. WHAT IS THE IMPACT OF USING \$520.14 PER LINE RATHER THAN**  
5 **THE \$416.11 DEFAULT VALUE?**

6 A. The Petitioners' cost expert acknowledged that using the higher, \$520.14 estimate  
7 "would have the impact of increasing the [Petitioners' reciprocal compensation]  
8 rate." See Schoonmaker Dep. at 11. By increasing the input value from \$416.11  
9 to \$520.14, Cass County was able to raise its estimate of forward-looking  
10 economic costs for end office switching by 30 percent, from \$0.0070 to \$0.0091  
11 per minute.

12 **Q. PLEASE SUMMARIZE YOUR FIRST REASON FOR DISPUTING THE**  
13 **PETITIONERS' SWITCHING INVESTMENT INPUT TO THE HAI**  
14 **MODEL?**

15 A. By changing the *constant EO switching investment term* from \$416.11 to \$520.14,  
16 the Petitioners have overstated their claimed cost to purchase and install new  
17 switches. The change is contrary to trends in declining switch prices, supported  
18 by the Turner Price Index and the opinion of the Petitioners' own cost expert.

19 **Petitioners Lack Any Basis for the Increase**

20 **Q. WHAT DID THE PETITIONERS OFFER AS EVIDENCE TO SUPPORT**  
21 **THE \$520.14 INPUT VALUE?**

22 A. In response to T-Mobile's data requests No. 9 and 21, the Petitioners provided a  
23 comparison of the switching investment for small companies as reported in their

2003 annual reports to the Missouri Commission with HAI model results using the \$416.11 default value and results using the \$520.14 value. Exhibit WCC-4 is a copy of this comparison.

**Q. HOW DID THE PETITIONERS USE THIS COMPARISON TO DEFEND THE \$520.14 INPUT VALUE?**

A. The Petitioners providing the following explanation in response to data request No. 21:

The “constant IO (EO) switching investment term, small ICO” for the Petitioners was developed based on a comparison of the central office switching investment of the small Missouri companies as shown on their annual reports to the Commission with the HAI model results using the default input. (Certain companies were removed from the analysis either because they leased their COE switch, or because the annual report results reported COE switching investment for multiple states in which certain companies operate.) This comparison showed that the model developed COE switching investment was only XX% [55%] of the actual investment for COE switching for these companies, which was deemed to be inappropriately low. The input was then modified to the current higher level which resulted in the model developing COE switching investment equal to XX% [72%] of the actual COE switching investment for the companies. This level was deemed reasonable as an estimate of forward-looking costs in view of the general belief that the current cost of digital switching may be somewhat less than it was in earlier years. (emphasis added)

Simply stated, the Petitioners increased HAI 5.0a’s default value of \$416.11 because, in comparing this estimate with their embedded switch investment, they deemed the default value to be “inappropriately low.”

**Q. DOES THE COMPARISON SUPPORT THE \$520.14 INPUT VALUE?**

A. It does not. First of all, the analysis, or comparison, is incorrect. The embedded investments in switching and the HAI model results reflect significantly different

1 switch sizes, so any comparison of the embedded investment with HAI results is  
2 meaningless.

3  
4 Second, even if the embedded investments and HAI model results were  
5 comparable, the comparison provides no basis for increasing the *constant EO*  
6 *switching investment term* from \$416.11 to \$520.14 per line – particularly when  
7 the Petitioners’ own cost expert recognizes that switch prices continue to decline.  
8 There is nothing in the comparison affirming that \$520.14 per line produces  
9 accurate estimates of the cost to purchase and install new switches.

10 **Q. HOW, THEN, DID THE PETITIONERS CONCLUDE THAT A 55%**  
11 **RATIO OF CURRENT SWITCH INVESTMENT TO EMBEDDED**  
12 **INVESTMENT, IF PROPERLY DONE, WOULD BE TOO LOW AND**  
13 **THAT A 78% RATIO WOULD BE REASONABLE?**

14 A. The Petitioners have provided no basis for this conclusion. They were asked to  
15 provide workpapers, analyses or other substantive evidence, and they provided  
16 none. The Petitioners’ cost expert conceded that the increased switching  
17 investment per line was based solely on a “judgment estimate” and that this  
18 “judgment estimate” is not based on any facts. He did not consult switch vendors  
19 to obtain current switch costs. Schoonmaker Dep. at 43. He did not consult the  
20 Turner Price Index or any other publicly available data. *Id.* at 19–20. Instead, the  
21 switching investment per line was developed solely on an incorrect comparison of  
22 HAI model results to embedded investment. The Petitioners have provided no  
23 basis for the \$520.14 *constant EO switching investment term*.

1 Q. HAS THE FCC REQUIRED THAT COST STUDY DATA BE  
2 VERIFIABLE?

3 A. Absolutely. In the *Virginia Arbitration Cost Order*, 18 FCC Rcd 17722 at ¶¶ 38  
4 and 48 (2003), the FCC held that “[a]ll data, formulas and other aspects of the  
5 models must be made available to other parties for their evaluation”:

6 [A]ny assumptions contained in the model should be verifiable.  
7 Any data used to estimate costs should either be derived from  
8 public sources, or capable of verification and audit without undue  
9 cost or delay.  
10

11 For example, in that proceeding, the FCC refused to accept the statements of the  
12 incumbent LEC’s “experts” when not supported by any “objective data.” *See id.*  
13 at ¶ 515 (“Verizon’s unsupported statements fail to demonstrate that the number  
14 of nodes per ring would increase in a forward-looking network.”).

15 The Petitioners have failed to meet their burden of proof with respect to the  
16 current cost they would incur to purchase and install new switches.  
17

18 **Comparison Used to Support the Increase is Incorrect**

19 Q. HOW IS THE COMPARISON OF THE PETITIONERS’ EMBEDDED  
20 SWITCH INVESTMENTS TO THE HAI MODEL RESULTS  
21 INCORRECT?

22 A. The embedded switch investments and the HAI model results in the Petitioners’  
23 comparison are based on significantly different switch sizes, in terms of line  
24 capacity. The Petitioners’ existing switches have more line capacity than the line  
25 capacity assumed in the HAI model. This causes the HAI results to appear even  
26 lower than the Petitioners’ embedded investments and makes the comparison of

1 current-to-embedded investment meaningless. In his deposition, Mr.  
2 Schoonmaker, agreed that if the line quantities in the HAI model were changed to  
3 be consistent with current line capacities, the HAI results would be higher. *See*  
4 Schoonmaker Dep. at 37. It is thus not surprising the embedded investments are  
5 much greater than the HAI model results.

6 **Q. HOW SIGNIFICANT IS THIS ERROR?**

7 A. It is very significant. Page one of Exhibit WCC-5 is the original comparison for  
8 21 Petitioners in arbitration with T-Mobile.<sup>9</sup> It shows that using the HAI model  
9 default value of \$416.11 for the *constant EO switching investment term* results in  
10 current switch investments that are 47% lower than the Petitioners' embedded  
11 investment. When the Petitioners' input value of \$520.14 is used, the difference  
12 is 30% – or the roughly the same difference they considered to be “reasonable.”

13  
14 Page two of Exhibit WCC-5 puts the embedded investments and HAI results on  
15 an equal basis in terms of switch capacity. Now, the HAI result is only 8% lower  
16 than the embedded investment, whereas the HAI result using the Petitioners' input  
17 value actually results in a current investment greater than the embedded  
18 investment, an outcome that the Petitioners' cost expert would even agree is  
19 unreasonable. The Petitioners' comparison of embedded investment and HAI  
20 results shows nothing other than the fact that \$520.14 is much too high and that  
21 the HAI default value also is too high.

---

<sup>9</sup> The Petitioners excluded three ILECs in arbitration with T-Mobile, because their embedded investments include plant for operations in Missouri and other states, or because of a difference in the accounting for switch investment.

1   **Q.    IF THE \$520.14 INPUT VALUE PRODUCES UNREASONABLE**  
2       **RESULTS, DOES THIS MEAN THE PETITIONER COST STUDIES**  
3       **SHOULD USE THE HAI 5.0A DEFAULT VALUE?**

4    A.   No, the default value is based on switch prices from 1995, and switch prices have  
5       declined in the past decade, as evidenced by the Turner Price Index (TPI) and as  
6       agreed to by the Petitioners' cost expert. That means that instead of increasing  
7       the default value, it should be reduced. The TPI for digital electronic switching  
8       has declined approximately 30% in the past decade. This would indicate that the  
9       HAI 5.0a default value of \$416.11 per line would be approximately \$291 today.

10   **Q.   ARE YOU RECOMMENDING \$291 BE USED IN THE HAI MODEL FOR**  
11       **SWITCHING INVESTMENT?**

12   A.   No. The Petitioners' switching investments must be reduced from the levels in  
13       their cost studies, but instead of reducing the HAI model input, I recommend that  
14       publicly available switch cost data produced by the FCC be used. As I discussed  
15       above, the FCC has ruled that all assumptions in an ILEC cost study must be  
16       "verifiable" and based on "objective data" – that is, "[a]ny data used to estimate  
17       costs should either be derived from public sources, or capable of verification and  
18       audit without undue cost or delay." *Virginia Arbitration Cost Order*, 18 FCC Rcd  
19       1772 at ¶¶ 37, 48 and 515 (2003).

20   *HAI 5.0a Switching Investment Per Line Should be Reduced based on Publicly*  
21   *Available Cost Data*

22   **Q.   PLEASE DESCRIBE THE FCC SWITCH COST DATA.**

1 A. Following its *Universal Service Order* adopted in May, 1997, the FCC issued a  
2 series of reports and orders, which dealt with the cost methodology, cost models  
3 and input values to be used in estimating forward-looking costs of services to be  
4 supported by federal universal service funds. In the “Tenth Report and Order,”  
5 CC Docket Nos. 96-45 and 97-160, 14 FCC Rcd 20156 (1999), the Commission  
6 selected input values to be used in computing forward-looking costs for supported  
7 services. The following costs were selected for switching:

8 296. Switch Cost Estimates. We adopt the fixed cost (in 1999  
9 dollars) of a remote switch as \$161,800 and the fixed cost (in 1999  
10 dollars) of both host and stand-alone switches as \$486,700. We  
11 adopt the additional cost per line (in 1999 dollars) for remote, host,  
12 and stand-alone switches as \$87. *Id.* at 20281 ¶ 296.

13  
14 In selecting these values, the FCC considered actual switch costs for both rural  
15 and non-rural telephone companies. While the costs are in 1999 dollars, they are  
16 more recent than the HAI 5.0a switch cost data and based on publicly available  
17 data. The FCC decided to not use the default input values of HAI 5.0a:

18 For reasons set forth below, we affirm our tentative conclusion to  
19 use the publicly available data from LEC depreciation filings, and  
20 to supplement the depreciation data with data from LEC reports to  
21 the RUS [Rural Utility Service]. We also affirm our tentative  
22 conclusion that we should not rely on the BCPM and HAI default  
23 values, because these values are largely based on non-public  
24 information or opinions of their experts, without data that enable  
25 us adequately to substantiate those opinions. *Id.* at ¶ 297.

26  
27 **Q. HAVE YOU ATTEMPTED TO VERIFY THE REASONABLENESS OF**  
28 **THE FCC COST DATA FOR USE IN ESTIMATING RURAL ILEC**  
29 **SWITCH COSTS?**

30 A. Yes, I compared publicly available data on actual rural telephone company switch  
31 costs with estimates based on the FCC cost data. The estimates were reasonably

1 close to the actual switch costs. The Rural Utility Service (RUS) filed comments  
2 in August, 1997 with the FCC during the proceedings in CC Docket No. 97-160  
3 on the issue of estimating rural telephone company switch costs.<sup>10</sup> The RUS  
4 provided actual costs for 21 host switches and 17 remote switches in the early  
5 1990's. These switch costs are quite outdated; however, I was interested in  
6 whether the FCC cost data (in 1999 dollars) would understate rural ILEC switch  
7 costs.

8 Exhibit WCC-6 compares the actual rural ILEC switch costs with estimated  
9 switch costs based on the FCC cost data. Page 1 compares host costs with  
10 estimated switch costs. The estimated switch costs are greater than the actual  
11 switch costs in 15 of 21 cases. Three of the six switches with actual costs greater  
12 than the estimates involved switches with very large numbers of remotes, causing  
13 unusually high costs. Page two provides a similar comparison for remote  
14 switches. In this case only two of 17 remote switches had actual cost significantly  
15 greater than the estimated costs (greater than 12%). Based on this comparison,  
16 the switch costs selected by the FCC (in 1999 dollars) do not appear to understate  
17 rural ILEC switch costs.

18 **Q. FOR CERTAIN PETITIONERS, WOULD YOU QUESTION WHETHER**  
19 **THE FCC COST DATA IS APPROPRIATE FOR ESTIMATING SWITCH**  
20 **COSTS?**

---

<sup>10</sup> "Comments of the Rural Utilities Service," In the Matter of Forward-Looking Mechanism for High Cost Support for Non-Rural LECs, CC Docket No. 97-160, August 7, 1997.

1 A. Yes, some of the Petitioners have single switches with a small number of lines.  
2 These are standalone switches. At \$486,700 for a standalone switch, the FCC  
3 cost data overstates their fixed cost of placing a new switch. I would prefer for  
4 the Petitioners with small standalone switches to produce valid estimates of the  
5 current costs to purchase and install switches suitable for their operations.<sup>11</sup>

6 **Q. SINCE THE FCC SWITCH COSTS ARE IN 1999 DOLLARS, SHOULD**  
7 **THEY BE ADJUSTED TO ESTIMATE THE COST OF PURCHASING**  
8 **AND INSTALLING SWITCHES TODAY?**

9 A. Yes, the FCC adjusted for switch price changes from the installation dates of the  
10 switches it studied to 1999. Switch costs have continued to decline in subsequent  
11 years by approximately 12% based on the Turner Price Index. To express the  
12 host and remote switch costs on a current cost basis, they should be reduced by  
13 12%. Current estimates of the cost to purchase and install switches are as  
14 follows:

15 Standalone / host switch fixed cost =  $\$428,296 = (1 - 12\%) \times \$486,700$ .

16 Remote switch fixed cost =  $\$142,384 = (1 - 12\%) \times \$161,800$ .

17 Per-line cost =  $\$76.56 = (1 - 12\%) \times \$87$ .

18 In other words, taking the FCC's estimates (in 1999 dollars) for the fixed costs of  
19 switches and lowering them by 12% for continued price decreases in subsequent

---

11

\*\*

---

\*\*

1 years results in fixed costs per switch of \$428,296 and \$142,384 for standalone /  
2 host and remote switches, respectively. Again, these fixed costs should not be  
3 used for Petitioners with very small operations; company-specific estimates of  
4 current switch replacement costs should be made. When the variable or per-line  
5 cost in 1999 is similarly adjusted, the current cost is \$76.56 per line.

6 **Q. WHAT IS THE EFFECT ON CASS COUNTY'S END OFFICE**  
7 **SWITCHING COSTS OF USING THE FCC COST DATA (IN CURRENT**  
8 **DOLLARS)?**

9 A. The end office switching cost for Cass County is reduced by 46%, from \$0.0091  
10 to \$0.0048 per minute of use. The corrected HAI 5.0a calculations are shown in  
11 Exhibit WCC-7. I substituted the FCC cost data (in current dollars) for the end  
12 office switching data in the HAI 5.0a methodology. I also made the following  
13 changes:

- 14 • Updated the lines in service to 2004 quantities based on Cass County's  
15 response to T-Mobile data requests.
- 16 • Lowered the switched port administrative fill factor from 98% to a more  
17 conservative 94% to be consistent with the FCC's choice for this value in the  
18 Tenth Report and Order. *See Tenth Report and Order* at ¶¶ 330-32.
- 19 • Removed the HAI 5.0a power plant investments, because the FCC cost data  
20 already include these costs. *See id.* at ¶¶ 291-92.

21 **Q. PLEASE SUMMARIZE YOUR TESTIMONY ON THE QUESTION OF**  
22 **THE APPROPRIATE PER-LINE INVESTMENT FOR END OFFICE**  
23 **SWITCHING.**

1 A. The Petitioners have utterly failed to meet their burden of proof that current  
2 switching investments per line should be \$520.14 – or 25 percent higher than the  
3 HAI 5.0a estimate for small telephone companies based on equipment costs in  
4 1995. Given the reduction in switch costs over the past decade, it would also be  
5 inappropriate to use the HAI estimate of \$416.11 (as it is based on 1995  
6 equipment costs). Instead, the Petitioner cost studies should be corrected using  
7 the FCC switch cost data (in current dollars). In the case of the very small ILECs,  
8 care must be taken not to overstate their costs to purchase and install new  
9 switches using the FCC data.

10 **Switching Issue No. 2: Overstatement of Usage-Sensitive Portion of Switching**

11 **Q. IS THE COMMISSION’S JOB COMPLETED ONCE IT DETERMINES**  
12 **THE FORWARD LOOKING SWITCH INVESTMENT PER LINE?**

13 A. No. As noted above, the FCC has held that under the “additional cost” standard  
14 of the Act, ILECs may recover in reciprocal compensation only the usage, or  
15 traffic sensitive, portion of their end office switch costs (and not the non-traffic  
16 sensitive portion of such costs). Accordingly, the Petitioners have the burden of  
17 demonstrating what portion of new switch costs would be allocated to usage –  
18 what the HAI model refers to as the *end office non-port fraction*.

19 **Q. WHAT IS THE DEFAULT VALUE FOR THIS INPUT VARIABLE?**

20 A. HAI 5.0a uses a 70% factor – that is, the model assumes that 70 percent of a  
21 switch’s costs are usage sensitive and 30 percent are non-usage sensitive (and  
22 therefore not included in computing reciprocal compensation rates).

1    **Q.    WHAT FRACTION DID THE PETITIONERS USE IN THEIR COST**  
2    **STUDIES?**

3    A.    They used the 70% default value contained in the HAI model. *See* Schoonmaker  
4    Dep. at 39.

5    **Q.    DO YOU AGREE THAT 70% OF SWITCHING COSTS TODAY ARE**  
6    **USAGE-SENSITIVE?**

7    A.    I do not. A 70% *end office non-port fraction* may have been appropriate based on  
8    switches sold in 1995 (the period in which HAI model developers developed the  
9    default value). However, the evidence is clear that with advances in technology  
10   and changes in the way vendors price switches, usage-sensitive costs for switches  
11   have fallen dramatically.

12   **Q.    WHAT LEADS YOU TO CONCLUDE THAT USAGE-SENSITIVE COSTS**  
13   **HAVE FALLEN DRAMATICALLY?**

14   A.    One indication is the change in the HAI model itself. Current versions of the  
15   model have a default value for the *end office non-port fraction* of zero percent  
16   (0%). The developers of the model no longer support 70% as the usage-sensitive  
17   portion of switch costs. The Petitioners' cost expert also acknowledges that both  
18   HAI model versions 5.2 and 5.3 use a zero percent (0%) *end office non-port*  
19   *fraction*. *See* Schoonmaker Dep. at 48.

20   **Q.    ARE THERE OTHER REASONS THAT LEAD YOU TO CONCLUDE**  
21   **THAT    USAGE-SENSITIVE    SWITCHING    COSTS    HAVE**  
22   **DRAMATICALLY DECREASED OVER TIME?**

1 A. Yes. The FCC determined in its 2003 *Virginia Arbitration Cost Order* that none  
2 of the getting started costs of a switch are usage-sensitive. Getting started costs  
3 represented a large portion of usage-sensitive costs years ago.

4 We conclude above, for purposes of determining the appropriate  
5 switch discount, that the “getting started” cost of the switch is a  
6 fixed cost, meaning that it does not vary with the number of ports  
7 or the level of usage on the switch. We find here that the “getting  
8 started” costs of the switch should be recovered on a per line port  
9 basis. “Getting started” costs are incurred for capacity that is  
10 shared among subscribers. Verizon incurs these costs to be ready  
11 to provide service upon demand. Given the record evidence that  
12 modern switches typically have large amounts of excess central  
13 processor and memory capacity, the usage by any one subscriber  
14 or group of subscriber is not expected to press so hard on processor  
15 or memory capacity at any one time as to cause call blockage, or a  
16 need for additional capacity to avoid such blockage. Thus, no one  
17 subscriber or group of subscribers is any more or any less causally  
18 responsible for the processor or memory capacity costs. Principles  
19 of cost causation, therefore, support a per line port cost recovery  
20 approach because, more than any other approach, it spreads getting  
21 started costs to carriers in a manner that treats equally all  
22 subscribers served by a switch. *Virginia Arbitration Cost Order* at  
23 ¶ 463.

24 Several State commissions have independently reached the same conclusion.<sup>12</sup>

25 For example, the Illinois Commerce Commission has stated:

26 Our extensive investigation of Ameritech’s ULS cost structure  
27 conclusively demonstrated that Ameritech’s switch costs are not  
28 usage sensitive, and Ameritech’s attempt to unilaterally reclassify  
29 the local switch as usage sensitive is a blatant violation of our  
30 TELRIC Order. *Investigation into the Compliance of Illinois Bell*

---

<sup>12</sup> See, e.g., *The Costs of Telecommunications Services Provided by SBC Michigan*, Case No. U-13531, 2004 Mich PUC LEXIS 315 (Sept. 21, 2004); *Investigation into the Compliance of Illinois Bell Telephone Company with the Order in Docket 96-0486/0569*, No. 98-0396, 2001 Ill. PUC LEXIS 1249 (Oct. 16, 2001); *Commission Investigation and Generic proceeding on Ameritech Indiana’s Rates for Interconnection, Service, Unbundled Elements, and Transport and Termination*, Cause No. 406-11-S1, Phase I, 2002 Ind. PUC LEXIS 219 (March 28, 2002).

1                    *Telephone Company with the Order in Docket 96-0486/0569, No.*  
2                    98-0396, 2001 Ill. PUC LEXIS 1249 at \*172 (Oct. 16, 2001).

3                    Indeed, just last week the Eighth Circuit Court of Appeals affirmed the decision  
4                    of the Minnesota Public Utilities Commission that a reciprocal compensation rate  
5                    of zero was appropriate because incumbent LECs incurred no “additional costs”  
6                    in terminating calls originating on other carriers’ networks. *See Ace Telephone v.*  
7                    *Koppendrayner*, Nos. 05-1170/1171, 2005 U.S. App. LEXIS 28885 (8<sup>th</sup> Cir., Dec.  
8                    29, 2005) (“But if no additional costs are incurred, there is nothing to pay.”).

9  
10        **Q.    THESE FCC, STATE COMMISSION AND COURT DECISIONS**  
11        **INVOLVED RBOCS. DOES THE SAME ANALYSIS APPLY TO SMALL**  
12        **ILECS?**

13        A.    I believe it does. Switch vendors have not limited the dramatic increase in switch  
14        processor and memory for switches to just large telephone companies. Switches  
15        for small ILECs have also seen large increases in processor capacity and memory  
16        (as have personal and other computers). It is just as unlikely that switch usage  
17        will exhaust small switches for small companies. Accordingly, there are no  
18        “additional costs” resulting from usage of the switch, with the exception of the  
19        interoffice trunk equipment.

20        **Q.    WHY DO YOU MAKE AN EXCEPTION FOR INTEROFFICE TRUNK**  
21        **EQUIPMENT?**

22        A.    The quantity of equipment used to interface the switch with incoming and  
23        outgoing trunks carrying traffic between switches is affected by the volume of  
24        traffic among offices. So, I believe it is appropriate to treat this relatively small  
25        portion of end office switching costs as usage-sensitive.

1   **Q.    WHAT WOULD BE THE SWITCHING INVESTMENT PER LINE FOR**  
2   **THIS USAGE-SENSITIVE TRUNK EQUIPMENT?**

3   A.    The trunk investment based on HAI 5.0a data is \$18.33 per line, which is  
4   relatively small portion of the total switch investment per line (less than 10%).<sup>13</sup>

5  
6   **Q.    WHAT PROOF DO THE PETITIONERS CITE FOR CONTINUING TO**  
7   **USE A 70 PERCENT AS THE USAGE-SENSITIVE PORTION OF END**  
8   **OFFICE SWITCHING?**

9   A.    The Petitioners have made no effort to consult with switch vendors on current  
10   switching technology or pricing. *See* Schoonmaker Dep. at 43. They have not  
11   produced any documentation concerning their proposal. *See id.* at 44.

12  
13   Their cost expert did state that he relied on “work we’ve done for other clients,  
14   not in Missouri” (*id.* at 44). The CMRS Providers requested copies of this  
15   information with the confidential portions of the document protected.

16   **Q.    WHAT DID THIS INFORMATION SHOW?**

17   A.    The information contained a series of estimates of new switch costs and the  
18   associated lines of capacity. There was very little detail to indicate whether the  
19   estimates were limited to switching equipment and what hardware and software  
20   was included in the estimates. Switch costs per line were calculated, and it is my  
21   understanding from the *Alma* case that Mr. Schoonmaker has inferred that the  
22   variance in costs per line across the switches means usage is driving switch costs.

---

<sup>13</sup>    \$18.33 / line = (\$100 switch investment / trunk X 1.1 installation factor) / 6 lines  
per trunk. (Per HAI 5.0a.)

1           However, this is not a valid conclusion from the data. The reason is that total  
2           switch costs include substantial fixed or getting started costs. As the size of  
3           switches vary in terms of lines, so does the average fixed cost per line. (Larger  
4           switches with more lines have lower fixed costs per line, and vice versa.) This  
5           does not mean that usage is causing differences in switch costs.

6  
7       **Q.    PLEASE SUMMARIZE YOUR TESTIMONY CONCERNING THE**  
8       **PROPORTION OF SWITCHING THAT IS USAGE-SENSITIVE?**

9       A.    The Petitioners have not begun to meet their burden of proof. The situation  
10           facing the Commission is similar to that faced by the Indiana Commission, which  
11           held:

12                   [T]he level of detail in Ameritech's evidence is not remotely  
13                   sufficient to allow us to resolve those issues. Ameritech has  
14                   assumed numerous facts not in evidence; we need not, and we will  
15                   not, base our decision on the rate structure or rate levels for the  
16                   ULS-ST offering on Ameritech's highly speculative arguments  
17                   about the relative usage of Ameritech's switches, cost causation  
18                   and allocation, and subsidization. \* \* \* The burden is on  
19                   Ameritech in this proceeding to support the inclusion of a usage-  
20                   sensitive rate element in the rate structure for ULS-ST. For the  
21                   reasons discussed in the previous paragraphs, Ameritech has not  
22                   met that burden. Accordingly, we find that Ameritech's request to  
23                   assess a usage-sensitive switching charge for ULS-ST should be  
24                   denied and that the switching costs (including usage costs, if any)  
25                   for the ULS-ST offering should be recovered from CLECs on a  
26                   flat-rate basis. *Commission Investigation and Generic proceeding*  
27                   *on Ameritech Indiana's Rates for Interconnection, Service,*  
28                   *Unbundled Elements, and Transport and Termination*, Cause No.  
29                   406-11-S1, Phase I, 2002 Ind. PUC LEXIS 219 at \*110-11 (March  
30                   28, 2002).

31  
32           Given the Petitioners' failure to meet their burden of proof, I believe the  
33           Commission is required to assume no more than \$18.33 per line as the usage-  
34           sensitive portion of end office switching investment.

1 **Switching Issue No. 3: Excessive Land and Building Space Requirements**

2 **Q. WHY ARE LAND AND BUILDING SPACE REQUIREMENTS IN THE**  
3 **PETITIONER COST STUDIES EXCESSIVE?**

4 A. The land and building investment necessary for switching in HAI 5.0a is quite  
5 high. The model assumes 500 square feet of floor space for switches with up to  
6 1,000 lines, and 1,000 square feet of space for switches up to 5,000 lines. These  
7 equate to areas of approximately 22' X 22' (or 484 square feet) and 32' X 32' (or  
8 1,024 square feet), respectively, \*\* \_\_\_\_\_

9 \_\_\_\_\_  
10 \_\_\_\_\_  
11 \_\_\_\_\_  
12 \_\_\_\_\_.

13  
14 **Q. WHAT IS THE EFFECT ON CASS COUNTY'S SWITCHING COSTS OF**  
15 **CORRECTING ITS LAND AND BUILDING SPACE REQUIREMENTS?**

16 A. I rounded Cass County's floor space to the next 50 square foot increment, which  
17 is the space provided by Southwestern Bell in Missouri for a single bay of  
18 equipment in its Caged Collocation tariff.<sup>14</sup> I also allowed for a minimum of 100  
19 square feet of area, resulting in switch equipment floor spaces of 100 square feet  
20 for the remotes and 200 square feet for the Peculiar switch. Substituting these  
21 floor spaces in Exhibit WCC-7 reduces the end-office switching cost from  
22 \$0.0048 to \$0.0040 per minute.

<sup>14</sup> Local Access Tariff, P.S.C. Mo. – No. 42, Section 2, para. 20.3, original sheet 51, effective 10/21/01.

1 **Correction of Petitioner Cost Studies**

2 **Q. YOU HAVE IDENTIFIED THREE FUNDAMENTAL ISSUES IN THE**  
3 **PETITIONERS COST STUDIES FOR END OFFICE SWITCHING. HAVE**  
4 **YOU CORRECTED THE CASS COUNTY COST FOR THESE ISSUES?**

5 A. Yes, when Cass County's costs are corrected using the FCC switch cost data (in  
6 current dollars) and its land and building space requirements are properly sized,  
7 its end office switching or termination cost is reduced from \$0.0091 to \$0.0040  
8 per minute of use. These calculations are shown in Exhibit WCC-8. This corrects  
9 for the first and third issue. To correct for the second issue relating to the usage-  
10 sensitive portion of switching, I use only the switch trunk investment of \$18.33  
11 per line (rather than the FCC cost data). This results in a termination cost of  
12 \$0.0012 per minute of use.<sup>15</sup>

13 **Q. WHAT WOULD BE THE CORRECTED END OFFICE SWITCHING**  
14 **COSTS FOR OTHER PETITIONERS?**

15 A. While there presumably would be slight differences in the Petitioner costs due to  
16 differences in annual cost factors and minutes of use per line, the corrected end  
17 office switching costs for all companies would be approximately \$0.0012 per  
18 minute, after correcting for all three issues. This is a fraction of the average end  
19 office switching costs of \$0.0092 per minute for the T-Mobile Petitioners and  
20 \$0.0010 for Cingular Petitioners.

21  
22 **ANALYSIS OF TRANSPORT COSTS**

---

<sup>15</sup> \$0.0012 = \$18.33 / line X (1 + 2.9% land and building loading) X 28.7% annual cost factor / (11,542 MOU / line X 40% interoffice traffic fraction).

1    Description of Costs

2    **Q.    WHAT TRANSPORT COSTS MAY THE PETITIONERS RECOVER IN**  
3    **RECIPROCAL COMPENSATION?**

4    A.    The FCC defines transport as the “transmission and any necessary tandem  
5           switching of telecommunications traffic subject to section 251(b)(5) of the Act  
6           from the interconnection point between the two carriers to the terminating  
7           carrier’s end office switch that directly serves the called party, or equivalent  
8           facility provided by a carrier other than an incumbent LEC.” 47 C.F.R.  
9           § 51.701(c).

10           In this case, transport begins at the meet point with the intermediate carrier  
11           (typically, Southwestern Bell), which delivers the mobile-to-land traffic to the  
12           Petitioner’s network. A Petitioner then assumes responsibility for transporting  
13           mobile-to-land calls from the meet point to its end office serving the called party.  
14           This may involve the call being transported over one or more interoffice links.<sup>16</sup>  
15           The telephone plant used in providing transport includes transmission equipment  
16           and cables. Tandem switching is not used by the Petitioners in transporting  
17           wireless originated traffic. Reciprocal compensation recovers the forward-  
18           looking economic costs of the transmission equipment and interoffice cables used  
19           for transport.  
20           for transport.

---

<sup>16</sup>    An interoffice link refers to the cables and associated transmission equipment connecting two nodes in an ILEC network. Although network nodes may not involve switching at each end of the interoffice link, as in the case of private lines or special access circuits, the network nodes for the transport of CMRS Provider traffic refers to either switches or the meet point with the intermediate carrier.

1   **Q.     CAN YOU GIVE AN EXAMPLE OF TRANSPORT?**

2   A.     Yes, Exhibit WCC-9 illustrates the interoffice network of Cass County, based on  
3           a network diagram provided by the Company. Suppose a wireless customer calls  
4           a Cass County customer located in the Peculiar exchange. The call is delivered  
5           by Southwestern Bell to a meet point with Cass County's network. From this  
6           point, the call is transported over fiber cable for a short distance to the Peculiar  
7           switch (PCLRMOXA). The switch then connects the call to the called party's  
8           access line or local loop. Transport costs include the costs of the fiber cable  
9           between the meet point and the Peculiar switch and the transmission equipment at  
10          the end of the cable. Transport does not include the Peculiar switch, which is part  
11          of termination, or the called party's local loop.<sup>17</sup>

12  
13          Another call might be to a customer served by the East Lynn switch  
14          (ELYNMOXA), which is a remote switch subtending to the Peculiar host switch.  
15          The call is transported from the meet point to the Peculiar switch. There, the call  
16          is transported from the Peculiar host to the East Lynn remote. This transport is  
17          provided using transmission equipment and several miles of fiber cable between  
18          the two switches. Again, the cost of switching at Peculiar and East Lynn are part  
19          of termination rather than transport.

20  
  

---

<sup>17</sup>     As I discuss above, the costs of the local loop are not usage or traffic-sensitive. In other words, there are no additional costs for loop plant caused when the ILEC transports and terminates wireless traffic. Loop costs are attributable to ILEC end-users and are recovered through local service rates and other mechanisms.

1 Each Petitioner's network is different. Some companies employ one or more  
2 fiber rings to connect their switches, \*\* \_\_\_\_\_  
3 \_\_\_\_\_.\*\* Others have only  
4 one switch, in which case transport involves a relatively simple fiber connection  
5 from the switch to the meet point with the intermediate carrier. \*\* \_\_\_\_\_  
6 \_\_\_\_\_.\*\*

7 **Q. HOW IS TRANSPORT DEFINED IN THE HAI 5.0a MODEL?**

8 A. The HAI model defines three types of transport – common transport, direct  
9 transport and dedicated transport – as follows:

10 g) Common Transport -- A switched trunk between two  
11 switching systems on which traffic is commingled to include LEC  
12 traffic as well as traffic to and from multiple IXCs. These trunks  
13 connect end offices to tandem switches. Results are provided on a  
14 per-minute basis for the central office terminating equipment  
15 associated with the UNE, and for the transmission medium.

16 h) Dedicated Transport -- The full-period, bandwidth-specific  
17 interoffice transmission path between LEC wire centers and an  
18 IXC POP (or other off-network location). It provides the ability to  
19 send individual and/or multiplexed switched and special services  
20 circuits between switches. Results are provided on a per-minute  
21 basis and per-channel basis for the central office terminating  
22 equipment and entrance facilities associated with the UNE, and on  
23 a per-minute and per-channel basis for the transmission medium.

24 i) Direct Transport -- A switched trunk between two LEC  
25 end offices. Results are provided on a per-minute basis for the  
26 central office terminating equipment associated with the UNE, and  
27 on a per-minute basis for the transmission medium.<sup>18</sup>  
28

29 The definitions are unclear in terms of which type of transport applies to land-to-  
30 mobile traffic. It is not even clear that any one accurately represents transport in

---

<sup>18</sup> "HAI Model Release 5.0a – Model Description," HAI Consulting, Inc., Revised 02/16/98, pp. 71-72.

1 this case. In fact, the Petitioners have attempted to estimate their transport costs  
2 by summing the HAI model costs for both common and dedicated transport.

3  
4 **Q. HOW DID YOU DEAL WITH THIS AMBIGUITY?**

5 A. I analyzed the HAI model cost calculations for common and dedicated transport  
6 to understand what they actually represent. I did this by reproducing the HAI  
7 model results for the two types of transport using the model algorithms and cost  
8 data. This allowed me to understand the model's assumptions regarding a  
9 Petitioner's network configuration and its calculations of interoffice distances,  
10 cable costs and ultimately the transport cost per minute of use. I could then ask,  
11 "Does this make sense? Does it reflect the Petitioner's network? Does it comply  
12 with the FCC rules for TELRIC and forward-looking costs?" I was able to get  
13 around terms used by the HAI model and focus on the real meaning of the model  
14 results.

15 **Q. WHAT DO FCC RULES FOR TELRIC AND FORWARD-LOOKING**  
16 **ECONOMIC COSTS REQUIRE IN COMPUTING TRANSPORT COSTS?**

17 A. There are several important aspects of FCC Rules 51.505 and 51.511 that affect  
18 properly computed transport costs. These include the following:

- 19 • The network architecture, or the arrangement of switches, interoffice  
20 cabling and the types of transport systems used, is supposed to reflect each  
21 Petitioner's existing switch locations. Then, a forward-looking interoffice  
22 network is supposed to be designed to carry the total demand for voice,  
23 data and other traffic in the most efficient, least-cost means possible. For  
24 purposes of its cost model, an ILEC's transport network should reflect

1           what “would exist in a competitive market (i.e., the most efficient network  
2           using currently available technology).” *Virginia Arbitration Cost Order* at  
3           ¶ 505. In fact, FCC Rule 51.505(b)(1) specifies that ILEC cost studies  
4           should use “the lowest cost network configuration, given the existing  
5           location of the incumbent LEC’s wire centers.”

- 6           • Transport network elements – transmission equipment and cabling – are  
7           supposed to be sized to efficiently serve total demand over a reasonable  
8           planning period. While network elements have spare capacity, the amount  
9           of spare capacity and the associated cost should not be excessive.
- 10          • The cost of transport elements should be attributed to all the users of the  
11          network elements. Thus, transport costs are recovered from all the  
12          services and customers using them. FCC Rule 51.511 requires that the  
13          total cost of a network element be divided by its total demand, so that each  
14          user bears a share of the network element cost in proportion to capacity  
15          consumption.

16          As I describe the HAI 5.0a model and the Petitioners’ cost studies, I will point out  
17          how they fail to adhere to these requirements and how the dramatic overstatement  
18          in transport costs caused by their failure to follow FCC Rules.

19   **Q.    IN WHAT ORDER WILL YOU DESCRIBE THE TWO TYPES OF**  
20   **TRANSPORT INCLUDED IN THE PETITIONER’S COST STUDIES?**

21   **A.**    I will start with common transport costs and describe these in detail. After this, I  
22          will describe dedicated transport costs and the reason including these, as the

Petitioners have done, is duplicative and overstates their costs and reciprocal compensation requirements.

**Q. WHAT HAVE THE PETITIONERS DETERMINED THEIR COMMON TRANSPORT COSTS TO BE?**

A. Exhibit WCC-10 shows the common transport costs per minute for each Petitioner. The costs were determined by HAI 5.0a. The ILEC costs range from a low of \$0.0099 per minute for Fidelity Telephone and Granby Telephone to a high of \$0.2716 per minute for Peace Valley Telephone, which is an incredibly high figure.

Exhibit WCC-11 shows the same common transport costs split between the costs of fiber and transmission equipment. Fiber costs are the predominant portion of common transport costs representing on average 88% of the total. For this reason, my analysis primarily focuses on interoffice cable.

Cass County's costs are shaded, because I used this company as the example in the following discussion of transport cost issues. HAI 5.0a estimates Cass County's forward-looking cost to transport a minute of wireless traffic is \$0.0163, of which \$0.0138 is for cable and the remainder is for transmission equipment. I will now describe the first issue related to transport costs – the overstatement of interoffice cable lengths.

***Transport Issue No. 1: Overstatement of Interoffice Cable Length***

**Q. HOW DOES HAI 5.0A OVERSTATE INTEROFFICE CABLE LENGTH?**

1 A. HAI 5.0a, as used by the Petitioners, reflects a network architecture that is  
2 completely unrealistic. The model assumes that if a small ILEC in Missouri were  
3 to rebuild its local network, it would place fiber cables from each of its switches  
4 to the nearest Bell Operating Company switch (or Southwestern Bell, in this  
5 case). There would be no direct connections between the ILEC's own switches  
6 (e.g., between a host and one of its subtending remotes). This would mean that  
7 every time a subscriber makes a local call to another subscriber served by a  
8 different switch within a Petitioner's network, the call would be transported to  
9 Southwestern Bell's network and then back to the called party's switch. This  
10 modeling assumption overstates interoffice cable lengths.

11  
12 The Petitioners would have the Commission believe that they would build new  
13 interoffice networks that would require use of a third-party network  
14 (Southwestern Bell) to complete local calls between their subscribers. This would  
15 dramatically increase the their own costs of providing local service, because not  
16 only would they have to transport local calls over greater distances, but they  
17 would also have to pay Southwestern Bell to transport every local call. This  
18 network architecture is completely inconsistent with TELRIC principles, where  
19 the FCC has said that cost models should use the "most efficient" network  
20 architecture. *Virginia Arbitration Cost Order* at ¶ 505. *See also id.* at ¶ 496  
21 (architecture should be "the least-cost, most-efficient and reasonable"); 47 C.F.R.  
22 § 51.505(b)(1)(ILEC cost studies must use "the lowest cost network  
23 configuration").

1   **Q.   WHAT DID HAI 5.0a COMPUTE AS THE INTEROFFICE CABLE**  
2       **LENGTH FOR CASS COUNTY?**

3   A.   The HAI model estimated 169.5 miles of fiber cable would be required to connect  
4       Cass County's six end office switches to the nearest Southwestern Bell switches.  
5       This is shown in Exhibit WCC-12. For example, the Creighton central office  
6       (CGTNMOXA) is 20.2 miles from Southwestern Bell's Archie office  
7       (ARCHMOAX). This is the length of a single cable between the two offices.  
8       HAI 5.0a assumes two separate cables are required to provide a diverse route in  
9       the event one of the cables is cut or otherwise taken out of service. The resulting  
10      total cable length for CGTNMOXA is 40.5 miles (cell E9). The same  
11      assumptions and method are used by HAI 5.0a for the other switches, yielding a  
12      total cable length of 169.5 miles.

13   **Q.   CAN YOU GIVE A PRACTICAL EXAMPLE OF HOW THIS**  
14       **OVERSTATES THE CABLE LENGTH?**

15   A.   Suppose a customer served by the East Lynn office called another served by the  
16       Peculiar office. The HAI model estimates that the call would travel 14.9 miles  
17       from ELYNMOXA to Southwestern Bell switch, ARCHMOAX (cell B12). The  
18       call apparently would then travel over Southwestern Bell's network from  
19       ARCHMOAX to KSCYMO40 for an unknown distance. Finally, the call would  
20       return to Cass County's network over a 10.4 mile cable from KSCYMO40 to  
21       PCLRMOXA. Excluding the Southwestern Bell network, HAI 5.0a estimates a  
22       transport distance over Cass County's network of 25.3 miles.

1 Q. WHAT IS THE ACTUAL CABLE DISTANCE BETWEEN EAST LYNN  
2 AND PECULIAR?

3 A. \*\* \_\_\_\_\_  
4 \_\_\_\_\_  
5 \_\_\_\_\_.\*\*<sup>19</sup> This compares with 50.6 miles  
6 assumed by HAI 5.0a (cells E12 and cell E14).

7 Q. DO YOU KNOW THE ACTUAL TOTAL INTEROFFICE CABLE  
8 LENGTH FOR CASS COUNTY?

9 A. \*\* \_\_\_\_\_\*\* versus 169.5 miles  
10 in the HAI model.<sup>20</sup>

11 Q. DO YOU BELIEVE THE HAI MODEL HAS REFLECTED THE  
12 "LOWEST COST NETWORK CONFIGURATION" AS REQUIRED BY  
13 FCC RULE 51.505 (b) (1)?

14 A. Certainly not. It is unbelievable that Cass County would consider a forward-  
15 looking network design like the one assumed by HAI 5.0a. It would increase the  
16 Company's investment in interoffice cable by \*\* \_\_\_\_ \*\*, not to mention having it  
17 rely entirely on Southwestern Bell's network for completion of its own local calls  
18 (which, in turn, would needlessly increase its cost of providing local services).  
19 This is a fundamental flaw in HAI 5.0a model as used by the Petitioners.

19 \*\* \_\_\_\_\_  
\_\_\_\_\_  
\*\*  
20 \*\* \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\*\*  
\_\_\_\_\_.

1    **Q.    IS THE SAME APPROACH USED FOR THE OTHER PETITIONERS?**

2    A.    Yes. In his December 12 deposition, Mr. Schoonmaker was asked whether the  
3    same approach is used for all companies, and he responded as follows:

4            Q.    Okay. Does HAI 5.0a use the same model as we've  
5            discussed here for determining transport distances for all the  
6            petitioners; in other words, all of the other companies [besides  
7            Cass County]?

8  
9            A.    Yes.

10  
11           Q.    So in effect it measures the distance to the nearest BOC  
12           wire center for each office and then it doubles the distance; is that  
13           correct?

14  
15           A.    Yes. *See* Schoonmaker Dep. at 67-68.  
16

17   **Q.    GIVEN THIS, DOES HAI 5.0A AS USED BY THE PETITIONERS**  
18   **OVERSTATE CABLE LENGTHS FOR OTHER PETITIONERS?**

19   A.    Yes. The responses to T-Mobile's data request No. 32 for twelve  
20   Petitioners were sufficient to estimate actual cable lengths. In every case, HAI  
21   5.0a overstated the lengths by amounts ranging from \*\* \_\_\_\_\_

22   \_\_\_\_\_  
23   \_\_\_\_\_ \*\*.

24  
25   This is a good example of the issue. Peace Valley's cost study indicates the cable  
26   portion of its common transport cost is \$0.2610 per minute, a very high cost by  
27   any benchmark. As it turns out, HAI 5.0a estimated that Peace Valley is 86 miles  
28   from the nearest BOC office and would require 172 miles of interoffice cable (2  
29   cables X 86 miles). Peace Valley does not require nearly this amount of cable.  
30   Here is Peace Valley's response to data request No. 32:

1  
2                   \*\* \_\_\_\_\_  
3                   \_\_\_\_\_  
4                   \_\_\_\_\_  
5                   \_\_\_\_\_  
6                   \_\_\_\_\_.\*\*  
7

8           Even if Peace Valley placed a second cable to the meet point for diversity for a  
9           total of six miles of cable, the HAI model has overstated the cable length by a  
10          factor of \*\* \_\_\*\* (186 miles proposed vs. \*\* \_\_\*\* miles actual). The 26.1 cent  
11          per minute transport cost for Peace Valley is clearly wrong. The Petitioner is  
12          attempting to recover from wireless carriers costs it does not incur. Transport  
13          costs for the other Petitioners also are wrong in varying degrees due to this error.

14  
15          In summary, HAI 5.0a assumes network architectures for all Petitioners that are  
16          unrealistic and in doing so substantially overstates interoffice cable distances and  
17          transport costs. This error is common to all Petitioners. Thus, combining study  
18          results to produce an average transport cost for the Petitioners, as they may  
19          suggest, cannot alleviate the problem. Interoffice cable distances must be based  
20          on realistic, forward-looking network designs to determine reasonable costs  
21          consistent with TELRIC principles.

22       ***Transport Issue No. 2: Oversized Interoffice Cable***

23       **Q.    WHAT IS THE ISSUE WITH RESPECT TO THE SIZE OF**  
24       **INTEROFFICE CABLES?**

25       A.    HAI 5.0a always assumes that 24 fiber cables are used for interoffice transport.  
26            The cable size is “hardwired” in the model, so the Petitioners cannot change this  
27            assumption by modifying input values, even though on a forward-looking basis

1 they might employ smaller (or even larger) cable sizes to serve their anticipated  
2 demand for cable fibers. For the small rural ILECs in Missouri this often results  
3 in larger cables being assumed by the model than are necessary, resulting in  
4 overstated transport costs.

5 **Q. HOW WOULD AN ILEC DETERMINE THE NECESSARY CABLE SIZE?**

6 A. For each cable route between two network nodes, the ILEC would forecast the  
7 needed cable fibers based on total anticipated demand for transport over the cable  
8 route.<sup>21</sup> The total demand for fibers would include those needed for transport  
9 systems, digital loop carrier systems, leased fibers and others.<sup>22</sup> Based on the  
10 total anticipated demand, the ILEC would purchase and install the next larger  
11 cable size. There may be practical, lower limits on available cable sizes, so in  
12 some cases the ILEC might expect to only use a fraction of the total fibers. There  
13 would be no economic reason, though, to place a fiber cable several sizes greater  
14 than the ultimate demand expected for the cable route.

15 **Q. DOES CABLE SIZING AFFECT TRANSPORT COSTS?**

---

<sup>21</sup> A cable route is a run of cable of a particular fiber size. There may be one cable route or run of cable of a particular size running the full distance between two network nodes (or switches), or there may be several routes of varying cable sizes, which together provide a fiber connection between the nodes.

<sup>22</sup> A digital loop carrier (DLC) system is used to provide "loops" to ILEC customers located far from their serving end office. A remote terminal is placed near the remote customer locations, and voice grade circuits are provided from the remote terminal to the serving end office switch over cable fibers. The cable fibers may be in the same cable route containing fibers used for interoffice transport.

1 A. Yes. Based on HAI 5.0a fiber cost data, eight fiber and twelve fiber cables cost  
2 16% and 12% less, respectively, than 24 fiber cable.<sup>23</sup> Anytime a Petitioner's  
3 forward-looking network calls for a smaller cable size than 24 fibers, there is a  
4 significant reduction in costs.

5 **Q. IN YOUR ANALYSIS OF CASS COUNTY'S TRANSPORT COSTS DID**  
6 **YOU FIND ANY CABLE ROUTES REQUIRING MORE THAN 24 FIBER**  
7 **CABLE?**

8 A. \*\* \_\_\_\_\_  
9 \_\_\_\_\_.\*\*

10 **Q. WHAT ARE CASS COUNTY'S CURRENT INTEROFFICE CABLE**  
11 **SIZES?**

12 A. Cass County currently has interoffice cable sizes ranging from \*\* \_\_\_\_\_  
13 \_\_\_\_\_.\*\*<sup>24</sup> Exhibit WCC-13 shows the interoffice links  
14 in the Company's network and the cable routes making-up each link. It also  
15 shows the current fiber cable size, the number of fibers in service and the cable  
16 length or route distance. \*\* \_\_\_\_\_  
17 \_\_\_\_\_  
18 \_\_\_\_\_  
19 \_\_\_\_\_.\*\*

20

<sup>23</sup> 16% = ((24 fibers – 8 fibers) X \$0.05 / fiber-foot) / (\$3.50 / foot for 24 fiber cable + 95% X \$1.68 / foot for buried fiber trenching + 5% X \$0.07 / foot for poles for aerial fiber). 12% = ((24 fibers – 12 fibers) X \$0.05 / fiber-foot) / \$5.10 / foot for 24 fiber cable, including structures.

<sup>24</sup> \*\* \_\_\_\_\_ \*\*

1 For each cable route, I have estimated an adequate cable size to serve existing  
2 demand and allow for future growth.<sup>25</sup> This is labeled, "Forward-Looking Cable  
3 Size." \*\* \_\_\_\_\_ \*\*, the  
4 minimum cable size assumed on a forward-looking basis is eight fibers. The  
5 other possible cable sizes are 12 and 24-fiber. The minimum number of fibers  
6 allowed for future growth is two fibers, with some routes having as many as 12  
7 fibers for growth.

8 **Q. WHAT IS THE IMPACT OF THE HAI MODEL ASSUMING 24 FIBER**  
9 **CABLE THROUGHOUT CASS COUNTY'S INTEROFFICE NETWORK?**

10 A. Keep in mind that HAI 5.0a estimated Cass County needs 169.5 miles of cable for  
11 its interoffice network, when the company actually has only \*\* \_\_\_\_\_ \*\* of  
12 cable. The model incorrectly calculated interoffice cable investment of \$4.57  
13 million, assuming 100% 24 fiber cable. Had the model accurately reflected Cass  
14 County's interoffice distances, the cable investment would have been \*\* \_\_\_\_\_  
15 \_\_\_\_\_ \*\* less (again assuming 24 fiber cable) than what Cass County is  
16 proposing. Using the forward-looking cable sizes of eight, twelve and 24 fiber  
17 cable, the forward-looking investment would be \*\* \_\_\_\_\_ \*\*  
18 than the model result.<sup>26</sup>

19 **Q. DID MR. SCHOONMAKER CONFIRM IN HIS DEPOSITION THAT 24**  
20 **FIBER CABLE IS USED FOR ALL PETITIONERS?**

25 \*\* \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_. \*\*

26 Exhibit WCC-14 shows the calculation of the \*\* \_\_\_\_\_ \*\* investment.

1 A. Yes, he was asked about this issue on page 76 of his deposition. The questions  
2 and his answers are as follows:

3 Q. I think you verified earlier that HAI 5.0a assumes a 24-  
4 fiber cable and its basic workings; is that correct?

5  
6 A. For interoffice facilities, yes.

7  
8 Q. Is that a user input that can be modified in the system?

9  
10 A. That number of fibers, no, but the cost per foot can be  
11 modified.

12  
13 Q. But the number of fibers cannot be modified?

14  
15 A. Well, the input is in a cost per foot number.

16  
17 Q. So if you wanted --- if you wanted to adjust downward  
18 from the 24-fiber cable, could you do that by varying the costs per  
19 foot?

20  
21 A. Sure.

22  
23 Q. Did --- in your runs for Cass County or the other  
24 petitioners, did you change the default cost per foot number?

25  
26 A. I did not.

27  
28 Interoffice cable size is an important factor in determining transport costs. The  
29 Petitioners are likely to argue that the additional costs of larger fiber sizes is not  
30 significant, due to the fact that a significant portion of fiber cable costs are for  
31 trenching, engineering and installation. However, anytime a small ILEC can  
32 satisfy its total demand with an eight fiber cable versus twenty-four fiber cable,  
33 there is a 16% savings in costs. When twelve fiber cable can be used, the savings  
34 is 12%. These are not insignificant amounts. The CMRS Providers should not  
35 have to pay inflated transport rates because of inaccurate cable sizing in HAI 5.0a.

36 ***Transport Issue No. 3: Failure to Reflect Sharing of Interoffice Cable***

1   **Q.    WHAT DO YOU MEAN BY SHARING INTEROFFICE CABLE?**

2   A.   Fibers in a Petitioner's interoffice cable network are used for many purposes,  
3       including transport systems, digital loop carrier systems and others. These uses  
4       "share" the cable, and each should bear a proportionate share of the cable cost.

5   **Q.    PLEASE GIVE AN EXAMPLE USING CASS COUNTY?**

6   A.   Take for example cable route 1c shown in Exhibit WCC-13. \*\* \_\_\_\_\_  
7       \_\_\_\_\_  
8       \_\_\_\_\_  
9       \_\_\_\_\_  
10      \_\_\_\_\_  
11      \_\_\_\_\_  
12      \_\_\_\_\_. \*\*

13       Another example is cable route 2b. \*\* \_\_\_\_\_  
14       \_\_\_\_\_  
15       \_\_\_\_\_  
16       \_\_\_\_\_. \*\*

17   **Q.    WHAT ARE FCC RULES FOR COMPUTING COSTS OF SHARED**  
18       **NETWORK ELEMENTS, SUCH AS INTEROFFICE CABLES?**

19   A.   FCC Rule 51.511(a) specifically addresses the calculation of costs for shared  
20       network elements. It states as follows:

21               The forward-looking economic cost per unit of an element equals  
22               the forward-looking economic cost of the element, as defined in  
23               Sec. 51.505, divided by a reasonable projection of the sum of the  
24               total number of units of the element that the incumbent LEC is  
25               likely to provide to requesting telecommunications carriers and the  
26               total number of units of the element that the incumbent LEC is

likely to use in offering its own services, during a reasonable measuring period.

In this case, the cost of the interoffice cable would be divided by the total number of fibers in service. The resulting unit cost would be attributed to each user based on the number of fibers required.

**Q. HOW DOES HAI 5.0a FAIL TO REFLECT THE SHARING OF INTEROFFICE CABLE?**

A. The model assigns the entire cost of interoffice fiber cable to transport. None of the cost is assigned to digital loop carriers, leased fibers or other uses of the fiber. HAI 5.0s does assign a portion of the cost of structures – trenching and poles – to feeder cable used for digital loop carrier systems, recognizing that interoffice cables and feeder cables share trenches and poles for a portion of their routes.

**Q. PLEASE ILLUSTRATE THIS WITH AN EXAMPLE FOR CASS COUNTY?**

A. I will use cable route 2a shown in Exhibit WCC-13, \*\* \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

\_\_\_\_\_.\*\* This amount would be entirely allocated to interoffice transport.

HAI 5.0a fails to realistically model Cass County's network, and in doing so, fails to comply with the FCC rule. \*\* \_\_\_\_\_

1 \_\_\_\_\_  
2 \_\_\_\_\_.\*\* The FCC Rule requires that the  
3 cost per fiber be calculated by dividing the total cable cost of \*\* \_\_\_\_\_  
4 \_\_\_\_\_  
5 \_\_\_\_\_

6 \_\_\_\_\_\*\*<sup>27</sup> The Petitioners fail to recognize the efficiencies  
7 gained by sharing fiber cable. Wherever small ILECs in Missouri have cable  
8 routes shared by interoffice transport systems, digital loop carrier systems, leased  
9 fibers and other users, the HAI model dramatically overstates their costs.

10 **Q. WHAT PERCENTAGE OF CASS COUNTY'S INTEROFFICE FIBER**  
11 **CABLE IS SHARED AMONG THE INTEROFFICE TRANSPORT**  
12 **SYSTEM AND OTHER USERS?**

13 A. \*\* \_\_\_\_\_  
14 \_\_\_\_\_  
15 \_\_\_\_\_  
16 \_\_\_\_\_\*\*, whereas the HAI model assumes 100% of the interoffice cable is used  
17 by the interoffice transport system. HAI 5.0a is clearly wrong as applied to the  
18 Petitioners' transport networks.

19 **Q. HOW DOES HAI 5.0a COMPUTE COMMON TRANSPORT CABLE**  
20 **COSTS, IF IT DOES NOT REFLECT INTEROFFICE CABLE SHARING?**

27 \*\* \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_.\*\*

1 A. Exhibit WCC-15 shows how the \$0.0138 per minute common transport cable  
2 cost for Cass County is calculated by the HAI model. These are the primary  
3 steps.

- 4 • Calculations begin with the miles of interoffice fiber cable for each wire  
5 center (col. E) based on the erroneous assumption of two fibers from each  
6 Cass County wire center to the nearest Southwestern Bell wire center.
- 7 • HAI 5.0a also determines the total number of interoffice trunks required  
8 for the traffic and special access (SA) circuits at each wire center.<sup>28</sup>
- 9 • The model calculates the fiber cable investment for each wire center based  
10 on the interoffice cable mileage and a 24 fiber cable cost of \$3.50 per foot.  
11 Example: \$748,018 in col. J for Creighton (CGTNMOXA) = 40.5 miles  
12 X (5,280' X \$3.50 / foot).
- 13 • An additional, modest investment is calculated for the sheath in which  
14 buried cable is placed (col. K).
- 15 • Cass County and the other Petitioners indicated 95% of interoffice cable  
16 would be buried on a forward-looking basis, and 5% aerial. Therefore,  
17 HAI 5.0a treats 95% of the fiber cable and sheath investments (cols. J and  
18 K) as buried. The buried amounts appear in cols. L and M. The  
19 remaining fiber cable investment is considered aerial cable (col. S).

---

<sup>28</sup> In the HAI model, an interoffice trunk is a voice grade or DS0 equivalent circuit. HAI 5.0a calculates the quantity of trunks required to handle common, direct and dedicated transport, plus Operator Services and Special Access circuits. This quantity is shown in column I of Exhibit WCC-15.

- Next, the model calculates the investment for buried cable placement. This is based on the interoffice cable mileage for each wire center and a buried structures or trenching cost of \$1.68 per foot. Example: \$359,369 in col. N for Creighton = 40.5 miles X (5,280' X \$1.68 / foot).
- The model similarly calculates pole investment using \$0.07 per foot (of cable) for pole costs.
- HAI 5.0a has a set of algorithms that determine the portion of buried cable placement and pole investments shared with feeder cable used to provide loops to Cass County customers. An adjustment is made to allocate approximately 36% of these costs to feeder cable. These adjustments appear in cols. O and Q. Note that none of the 24 fiber cable investment is allocated to feeder cable.
- The total investment in buried cable, aerial cable and poles (cells R15, S15 and T15) equals \$4.2M for 169.5 miles of 24 fiber cable.

This is a good point to pause and put in perspective the three transport issues that I have described.

**Q. PLEASE DO.**

A. HAI 5.0a estimated that Cass County would spend today \$4.2 million, after adjusting for structure sharing, to build 169.5 miles of 24 fiber buried and aerial cable. As described earlier, had the model not overstated the interoffice cable mileage and assumed all 24 fiber cable, the cable investment would be \*\*\_\_\_\_\_

\_\_\_\_\_\*\*.

1 Now the question is, "How much of this inflated cable investment is borne by  
2 Cass County's interoffice transport system versus other users of interoffice  
3 cable?" The answer is 100%. Cass County's cost study fails \*\* \_\_\_\_\_  
4 \_\_\_\_\_  
5 \_\_\_\_\_  
6 \_\_\_\_\_ \*\*.

7 Instead, the full burden is placed on 871 interoffice trunks (cell I15), resulting in  
8 grossly overstated costs per trunk and per minute of use. If a reciprocal  
9 compensation rate is set based on HAI 5.0a costs, the CMRS Providers would be  
10 subsidizing Cass County local services, which use the \*\* \_\_\_\_\_  
11 \_\_\_\_\_ \*\*.

12 **Q. AFTER COMPUTING THE TOTAL INVESTMENT IN BURIED CABLE,**  
13 **AERIAL CABLE AND POLES, WHAT DOES HAI 5.0A DO?**

14 A. The model allocates the investments to common, direct and dedicated transport in  
15 proportion to the quantity of trunks for each. In Exhibit WCC-15, I do this by  
16 dividing the total cable plant investments (cols. R - T) by total trunks (col. I) to  
17 calculate unit investments per trunk (cols. U - W). I then multiply the unit  
18 investments times the HAI model quantity of common transport trunks (col. X) to  
19 compute common transport investments in buried cable, aerial cable and poles.

20  
21 In the next step, HAI 5.0a calculates the annual costs associated with the plant  
22 allocated to common transport. These include capital costs (depreciation, cost of  
23 capital and income taxes) and operating expenses (cable network expenses,  
24 support expenses, common overheads and others). The annual costs represent

1 HAI 5.0a's estimate of *forward-looking economic costs* for common transport  
2 cable.

3  
4 In the final step, annual costs are divided by annual minutes of use to calculate the  
5 common transport cost per minute. The result is \$0.0138, the same figure  
6 appearing in the summary of costs in Exhibit WCC-11 and the same figure  
7 derived by the Petitioner from HAI model output.

8 ***Correcting for Transport Issues No. 1, 2 and 3.***

9 **Q. IS IT POSSIBLE TO MODIFY THE INPUT VALUES TO HAI 5.0a TO**  
10 **CORRECT FOR TRANSPORT ISSUES NOS. 1, 2 AND 3?**

11 A. It may be possible, but I think it is very difficult to make HAI 5.0a work for small  
12 ILECs. Keep in mind that reciprocal compensation rates are to be based on  
13 company-specific costs. With respect to Transport Issues Nos. 1 – 3, this means  
14 the following:

- 15 • Interoffice mileages must reflect cable route distances among each  
16 company's network nodes based on a forward-looking design of fiber  
17 rings and point-to-point interoffice links. Some Petitioners have single  
18 fiber rings and others have multiple rings. The smallest companies with  
19 single switches only have a point-to-point connection to the meet point  
20 with the intermediate carrier.
- 21 • Cable sizes must be based on total anticipated fiber demand for interoffice  
22 transport systems, digital loop carrier systems, leased fibers and others.  
23 Forward-looking cable sizes will vary by Petitioner and cable route within  
24 its network.

1           • Unit investments must reflect total demand and the sharing of cable  
2           investment among multiple users. Each Petitioner's situation is different.  
3       To develop company-specific costs using HAI 5.0a would require manipulating  
4       the input data in some fashion to account for these key factors affecting transport  
5       cable costs.

6   **Q.   IS IT PRACTICAL FOR A SMALL ILEC TO COMPUTE COMMON**  
7       **TRANSPORT CABLE COSTS THAT ARE CORRECT AND COMPLY**  
8       **WITH THE FCC RULES?**

9   A.   Yes, I believe so. I have computed corrected common transport cable costs for  
10       Cass County in Exhibit WCC-16. Cass County falls in the middle of the  
11       Petitioners in terms of network complexity. Grand River Mutual Telephone has a  
12       more complicated interoffice network, while Farber Telephone, Peace Valley  
13       Telephone and others have relatively simple networks.

14   **Q.   ARE THE CORRECTIONS TO CASS COUNTY'S COMMON**  
15       **TRANSPORT CABLE COSTS IN EXHIBIT WCC-16 BASED ON HAI 5.0a**  
16       **COST DATA AND INFORMATION PROVIDED BY THE COMPANY?**

17   A.   Yes, the corrections reflect company-specific information obtained in responses to  
18       T-Mobile data requests on cable route distances, cable sizes, cable sharing and  
19       interoffice trunks in service. HAI 5.0a cost data are used for fiber cable costs,  
20       capital cost factors, operating expense factors and the common transport minutes  
21       of use per trunk. Exhibit WCC-16 corrects only for the methodological flaws in  
22       HAI 5.0a related to the three issues.

1   **Q.    DID ALL PETITIONERS PROVIDE THE SAME INFORMATION AS**  
2   **CASS COUNTY?**

3   A.    T-Mobile's data requests sought the same information from all the Petitioners;  
4         however, the complete set of information was not produced by any of the  
5         companies. In the case of Cass County, it took several exchanges between the  
6         attorneys for T-Mobile and the Petitioners to obtain sufficient information to  
7         produce Exhibit WCC-16. I believe each Petitioner, though, should be able to  
8         provide this information.

9   **Q.    DESCRIBE THE CORRECTIONS TO CASS COUNTY'S COMMON**  
10   **TRANSPORT CABLE COSTS?**

11   A.    Exhibit WCC-16 corrects Cass County's costs using the following steps:

- 12         • First, the forward-looking cable size is determined for each cable route  
13             (col. F). The current quantity of fibers in service is "bumped-up" to the  
14             next cable size, where eight, twelve and 24 fiber cables were selected as  
15             possible choices. This complies with FCC Rule 51.505 and its  
16             requirement for an efficient network configuration. It avoids cable sizes  
17             with fiber capacity that likely will never be employed.
- 18         • The HAI 5.0a cable cost data are used to develop an installed cable cost  
19             per foot (col. G). These data are shown in cells B37 – B40.
- 20         • For simplicity, I assumed 100% buried cable versus 95% assumed in the  
21             Petitioner cost studies. The difference between assuming 100% versus  
22             95% buried cable has little impact on the result.

- 1           • Total buried cable investment is computed for each cable route based on
- 2           the cable length (col. E) and the cable cost per foot (col. G).
- 3           • Per FCC Rule 51.511, the total buried cable investment is divided by total
- 4           fibers in service to compute the unit investments shown in col. I.
- 5           • \*\* \_\_\_\_\_
- 6           \_\_\_\_\_
- 7           \_\_\_\_\_
- 8           \_\_\_\_\_
- 9           \_\_\_\_\_
- 10          \_\_\_\_\_
- 11          \_\_\_\_\_ \*\*
- 12          • Cass County provided the number of voice grade trunks or DS0s added to
- 13          the transport system at each switch. Based on the location of each switch
- 14          along the Company's interoffice ring, I estimated the cumulative DS0s on
- 15          the OC48 system along each cable route. I adjusted the total DS0s circuits
- 16          using HAI 5.0a's assumption of 90% transmission terminal fill. Example:
- 17          \*\* \_\_\_\_\_
- 18          \_\_\_\_\_ \*\* 29

29          \*\* \_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_ \*\*

- The cable investment per DS0 is computed by dividing the cable investment for the OC48 transport system by the DS0s in service along each cable route. This also complies with FCC Rule 51.511.
- Annual costs per DS0 or trunk are calculated using the same annual cost factors in HAI 5.0a (col. N), and the costs are divided by 100,539 annual minutes of use per trunk, which is the traffic volume estimated by Cass County. These calculations determine the cost for a minute of traffic to travel along each cable route.
- The last step is to weight the per-minute cable costs by the percentage of wireless traffic expected over each interoffice link. \*\* \_\_\_\_\_

And, so on.

The corrected common transport cable cost is \$0.0021 per minute versus \$0.0138 in the HAI model.

**Q. PLEASE SUMMARIZE FOR THE COMMISSION THE MAIN POINTS RELATED TO COMMON TRANSPORT CABLE COSTS.**

**A.** I would like for the Commission to be aware of and address the following:

- HAI 5.0a as used by the Petitioners does not accurately model small ILEC networks. It overstates interoffice cable lengths, overstates cable sizes,

1 fails to recognize cable sharing, and ultimately overstates common  
2 transport cable costs. In the case of Cass County, HAI 5.0a's common  
3 transport cable cost estimate is 6.6 times the Company's true forward-  
4 looking economic cost.

- 5 • Correcting for HAI 5.0a's flaws is not a matter of combining the  
6 erroneous results of all the Petitioners to produce an average cost in hopes  
7 that "errors cancel out." When the results of most, if not all, Petitioners  
8 are overstated, the average can only be overstated. Each Petitioner's cost  
9 study must be corrected.
- 10 • Transport cable costs can be properly and practically calculated per the  
11 FCC Rules using the approach I have shown for Cass County in Exhibit  
12 WCC-16. The method is straightforward and requires network  
13 information that should be available to all Petitioners. Based on  
14 information provided by some Petitioners, I have been able to correct the  
15 common transport cable costs of 20 Petitioners. These costs are used in  
16 the corrected transport and termination costs shown in Exhibit WCC-1. T-  
17 Mobile and Cingular are attempting to obtain cost information for the  
18 other seven Petitioners so that similar corrections can be made for these  
19 companies.

20 ***Transport Issue No. 4: Oversized Transmission Equipment and Costs***

21 **Q. WHY DO YOU CONSIDER THE PETITIONER TRANSMISSION**  
22 **EQUIPMENT AND COSTS TO BE OVERSIZED?**

1 A. There are two main reasons. First, the HAI 5.0a model assumes the same  
2 combination of transmission equipment is used at every central office for all  
3 Petitioners, regardless of their network architecture (fiber ring or point-to-point)  
4 and interoffice transport bandwidth requirements. This combination of equipment  
5 includes an OC48 add / drop multiplexer, an OC3 terminal multiplexer and a  
6 digital cross connect system (per DS3). \*\* \_\_\_\_\_

7 \_\_\_\_\_  
8 \_\_\_\_\_  
9 \_\_\_\_\_  
10 \_\_\_\_\_  
11 \_\_\_\_\_.\*\* HAI 5.0a cannot model a least cost, most efficient network using the  
12 same equipment combination for all companies.

13  
14 Secondly, HAI 5.0a assumes that optical regenerators are required every 40 miles  
15 along interoffice cable routes. Normally, this would not add much to transmission  
16 equipment costs, because cable route distances between network nodes generally  
17 are less than 40 miles. \*\* \_\_\_\_\_

18 \_\_\_\_\_.\*\* However, because HAI 5.0a inflates cable distances by assuming two  
19 cables connect every Petitioner switch to the nearest BOC switch, regenerator  
20 quantities and costs become substantially overstated.

21 **Q. CAN YOU ILLUSTRATE HOW HAI 5.0a COMPUTES TRANSPORT**  
22 **TRANSMISSION EQUIPMENT COSTS?**

23 A. Yes, Exhibit WCC-17 shows the cost calculations for Cass County and Peace  
24 Valley Telephone. The HAI model estimates that \$104,400 of transmission

equipment is required at each switch to multiplex and add / drop trunks, special access and other circuits to the interoffice ring for transport to another network location. In the case of Peace Valley this would be \$104,400 of transmission equipment \*\*

\*\*.

For one of Cass County's central offices, HAI 5.0a adds an additional \$15,000 for an optical regenerator, because it calculated 40 miles of fiber cable from the Creighton office (CGTNMOXA) to the nearest Southwestern Bell office. \*\*

In the case of Peace Valley, the HAI model adds \$60,000 of regenerator costs (4 regenerators X \$15,000 each), because it assumes Peace Valley has 172 miles of cable to the nearest BOC wire center – when, in fact, \*\*

\*\*.

**Q. IS IT POSSIBLE TO CORRECT THE TRANSPORT TRANSMISSION EQUIPMENT COSTS?**

A. Yes, but it requires information that is not available in the HAI model. In its data request No. 34, T-Mobile requested information on the total demand for transport for each interoffice link in a Petitioner's network, the transport system size (say, OC-3 vs. DS3 point-to-point) and the system capacity. Data request No. 33 asked for total demand – actual and modeled by HAI 5.0a – for each interoffice link. The assumption was that HAI 5.0a might be modeling each Petitioner's network in a way that bears some resemblance to reality; this, of course, turns out to not be

1 the case. Therefore, to correct the Petitioners' transmission equipment costs, this  
2 type of information is needed either for the Petitioners' existing networks, if they  
3 consider them to be representative of their forward-looking design, or for a  
4 forward-looking design. In addition, current transmission equipment costs based  
5 on currently available technology and vendor pricing are needed to estimate plant  
6 investment.

7 **Q. CAN YOU SHOW HOW THE TRANSPORT TRANSMISSION**  
8 **EQUIPMENT COSTS WOULD BE CORRECTED?**

9 A. Yes, Exhibit WCC-18 shows Cass County's cost calculations with several  
10 obvious corrections based on the issues that I have described for transmission  
11 equipment. I have removed the OC-48 add / drop multiplexer and used only the  
12 OC-3 ADM / terminal multiplexer. \*\*

13 \_\_\_\_\_ \*\* I also removed the  
14 regenerator investment, since it does not apply. The interoffice trunk quantities  
15 from the cost corrections for common transport cable are used (Exhibit WCC-16).  
16 And I reflected the number of nodes that mobile-to-land traffic would pass  
17 through depending on the destination switch. The resulting transmission  
18 equipment cost is \$0.0017 or about 70% of the value in Cass County's cost study.  
19 The cost correction, though, would be much greater for smaller ILECs, where the  
20 oversized transmission equipment causes their costs to be substantially overstated.

21 **Q. HAVE YOU MADE SIMILAR CORRECTIONS TO THE**  
22 **TRANSMISSION EQUIPMENT COSTS OF OTHER PETITIONERS?**

1 A. As in the case of common transport cable, I corrected the costs of twenty of the  
2 Petitioners, where I had enough information about their networks and demand to  
3 do so. Corrected transmission equipment costs for these companies were  
4 combined with the corrected cable costs to produce the common transport costs  
5 per minute for these twenty companies shown in Exhibit WCC-1.

6 ***Transport Issue No. 5: Unnecessary Inclusion of Dedicated Transport Costs***

7 **Q. WHY HAVE THE PETITIONERS INCLUDED DEDICATED**  
8 **TRANSPORT IN ADDITION TO COMMON TRANSPORT IN THEIR**  
9 **COST STUDIES?**

10 A. They have not explained the reason for doing this. It makes no sense whatsoever.  
11 HAI 5.0a defines dedicated transport a “full-period, bandwidth-specific interoffice  
12 transmission path between LEC wire centers and an IXC POP (or other off-  
13 network location).” And, it defines common transport as a “switched trunk  
14 between two switching systems on which traffic is commingled to include LEC  
15 traffic as well as traffic to and from multiple IXCs.” A mobile-to-land call cannot  
16 simultaneously pass over these two types of transport – it is one or the other.  
17 Likewise, a call would not go over one and then the other, because the HAI model  
18 assumes that the two types of transport are over the same cables and transmission  
19 equipment between the Petitioners’ switches and the nearest Bell Operating  
20 Company switch. A call would have to pass through a fiber cable over common  
21 transport, and then turn around a pass through the same cable over dedicated  
22 transport. It is pure fiction and an intentional duplication of costs.

1   **Q.   DOES THE METHOD YOU HAVE USED TO CORRECT CASS**  
2       **COUNTY'S COMMON TRANSPORT COSTS MAKE THIS ISSUE**  
3       **IRRELEVANT?**

4   A.   Yes, Exhibits WCC-17 and WCC-18 model the actual interoffice network of Cass  
5       County and determine the cost per minute of transport to each of the Company's  
6       switches over common transport trunks. It is not necessary to add any additional  
7       costs for dedicated transport.

8   **Q.   WHAT IS YOUR RECOMMENDATION WITH RESPECT TO THIS**  
9       **ISSUE?**

10 A.   Dedicated transport costs should be excluded entirely from all Petitioner transport  
11       and termination costs.

12   *Correction of the Petitioner Cost Studies*

13   **Q.   PLEASE SUMMARIZE THE CORRECTIONS THAT ARE NECESSARY**  
14       **TO PROPERLY COMPUTE THE PETITIONERS' FORWARD-**  
15       **LOOKING ECONOMIC COSTS FOR COMMON TRANSPORT?**

16 A.   First, common transport cable costs must be corrected for proper cable length and  
17       cable sizes. Cable sharing should be recognized through the proper calculation of  
18       forward-looking unit costs. Transmission equipment then should be sized  
19       according to each Petitioner's network requirements. Finally, dedicated transport  
20       costs should be excluded entirely. I have made these corrections for twenty  
21       companies, and I will attempt to correct the common transport costs of the  
22       remaining Petitioners as the necessary information is made available.

1                                    **ANALYSIS OF ISUP SIGNALING COSTS**

2    **Description of Costs**

3    **Q.    WHAT ARE ISUP SIGNALING COSTS?**

4    A.    Carriers use signaling to set-up and take-down interoffice calls, whether the call  
5           remains on their network or is destined to the network of another carrier. Most  
6           carriers use a Signaling System 7 (SS7) network that is separate from the network  
7           used in transporting voice or data communications. An SS7 network may be  
8           used, for example, to retrieve information from a database (and these are known  
9           as TCAP messages). Of relevance to this proceeding are ISUP messages over an  
10          SS7 network. ISUP is an acronym meaning ISDN User Part. ISUP signaling  
11          refers to the exchange of short data messages between Petitioner end offices and  
12          computers used to set-up interoffice telephone calls. The computer is referred to  
13          as a Signal Transfer Point (STP) and is part of the SS7 network. ISUP signaling  
14          costs are the capital costs and operating expenses associated with plant used to  
15          handle these messages.

16   **Q.    EARLIER YOU SAID THAT ISUP SIGNALING COSTS ARE SMALL. IF**  
17   **SO, WHY ARE YOU COMMENTING ON THE SIGNALING COSTS OF**  
18   **THE PETITIONERS?**

19   A.    Some of the Petitioners have estimated very high signaling costs. As I discuss  
20          below, HAI 5.0a's cost methodology for small ILECs is wrong, and the costs  
21          should be corrected.

22   **Q.    WHAT ARE THE PETITIONER'S ISUP SIGNALING COSTS?**

1 A. Exhibit WCC-19 shows the signaling cost per minute of use for each Petitioner.  
2 The ILEC costs range from \$0.0007 per minute for Fidelity Telephone Company  
3 to \$0.0193 per minute for Iamo Telephone Company.

4 **Q. WHAT ARE THE MAIN COMPONENTS OF THESE COSTS?**

5 A. ISUP signaling costs consist of two parts - the cost of the data link or transport  
6 between the Petitioner's end office and the STP, and the cost of the STP. Exhibit  
7 WCC-20 gives the breakdown of each ILEC's signaling cost between these two  
8 components. The link cost is the larger part of the total, representing on average  
9 90% of ISUP signaling costs. I focused on link costs for my analysis.

10 **Signaling Issue No. 1: Overstatement of Signaling Link Costs**

11 **Q. WHY ARE THE SIGNALING LINK COSTS COMPUTED BY HAI 5.0a**  
12 **WRONG?**

13 A. The HAI model generally overstates signaling link costs. It does this in two ways.  
14  
15 First, the model assumes there is a pair of signaling links for every Petitioner  
16 switch, whether it is a standalone, host or remote switch. The Petitioners do not  
17 have signaling link pairs for all their switches. For example, the HAI model  
18 assumes Fidelity Telephone has a pair of signaling links for each of eight  
19 switches, or a total of 16 links.<sup>30</sup> In reality, based on its response to T-Mobile's

---

<sup>30</sup> The HAI model indicates Fidelity Telephone has eight end office switches. \*\*

---

\*\*\* SS7 links would not be required for DLC systems or the remotes.

1 data request, \*\* \_\_\_\_\_

2 \_\_\_\_\_ \*\*.

3  
4 Secondly, the HAI model assumes that the signaling links run over the same,  
5 fictitious interoffice cable routes as common transport; i.e., a cable route from  
6 each Petitioner switch to the nearest BOC switch. Consequently, the Petitioner  
7 signaling link costs suffer from the effects of Transport Issue No. 1. They also  
8 suffer from Transport Issues No. 2 and 3.

9 **Correction of Petitioner Cost Studies**

10 **Q. HOW DID YOU CORRECT THE PETITIONER ISUP SIGNALING**  
11 **COSTS FOR THESE ERRORS?**

12 A. I used the actual, current costs the Petitioners are paying for SS7 interconnection  
13 links, which were provided in response to T-Mobile data request No. 41. \*\* \_\_\_\_\_

14 \_\_\_\_\_  
15 \_\_\_\_\_  
16 \_\_\_\_\_  
17 \_\_\_\_\_ \*\* This is the amount paid by ILECs using the Missouri Network  
18 Alliance as their service provider.

19 Then, I simply divided the monthly SS7 interconnection service charge by the  
20 HAI model estimate of ISUP and TCAP messages (on a monthly basis).<sup>31</sup> The  
21 resulting cost per message was adjusted to compute the corrected link cost per  
22

<sup>31</sup> TCAP stands for "Transaction Capabilities Application Par." TCAP messages are requests for and responses to requests for database lookups made by ILEC switches.

1 minute, using the same values as in HAI 5.0a for messages per call attempt, call  
2 completion ratio and minutes per call. I did not modify the STP costs per minute  
3 of the Petitioners. The graph in Exhibit WCC-21 shows the corrected ISUP  
4 signaling costs per minute. The corrected ILEC signaling costs range from \*\* \_\_\_\_  
5 \_\_\_\_\_  
6 \_\_\_\_\_. \*\*. The larger companies (with more than 20 million signaling  
7 messages per year) have signaling costs of \$0.001 per minute or less.

8  
9 **Q. DO YOU RECOMMEND FURTHER ADJUSTMENTS IN THE ISUP**  
10 **SIGNALING COSTS?**

11 A. No, I will accept that the "least cost, most efficient" means for Peace Valley  
12 Telephone to reach STPs is to \*\* \_\_\_\_  
13 \_\_\_\_\_.<sup>32</sup> However, if there is a lower cost alternative, the TELRIC  
14 methodology requires that its forward-looking economic costs reflect this  
15 alternative. At this point, I have no way of knowing what other alternatives the  
16 Company might have. The same comments apply to the other Petitioners with  
17 relatively high signaling link costs per minute.

18 **CONCLUSIONS AND RECOMMENDATIONS**

19 **Q. HAVING ANALYZED THE PETITIONER COST STUDIES PRODUCED**  
20 **USING THE HAI 5.0a MODEL WHAT IS YOUR OVERALL**  
21 **IMPRESSION?**

32 \*\*

\*\*

1 A. HAI 5.0a as used by the Petitioners utterly fails to accurately model the transport  
2 and termination costs of small ILECs in Missouri. Its results bear no relationship  
3 to the real world network architectures of the Petitioners; its cost data, particularly  
4 for switching, are outdated; and, it makes key assumptions, such the percentage of  
5 end office switching that is usage sensitive, that are no longer valid. Even the  
6 developers of the HAI model have recognized the need to change the model with  
7 respect to the usage-sensitive portion of switching. The current HAI model  
8 assumes that no portion of switching cost is usage-sensitive.

9 **Q. HAS THE COST EXPERT FOR THE PETITIONERS RECOGNIZED**  
10 **THESE ISSUES IN HAI 5.0a?**

11 A. Yes, in his direct testimony in the *Alma* arbitration, Mr. Schoonmaker expressed  
12 “concerns about the validity of the results of the HAI Model I am presenting.”  
13 Schoonmaker Direct Testimony, IO-2005-0468, at 7 (July 21, 2005). He went on  
14 to describe his “concerns” about “a lack of sufficient time and resources to fully  
15 explore all the proposed default inputs” and that the model’s default values “may  
16 not reflect the economic costs of the companies in all respects.” *Id.* at 7-8. He  
17 noted the “broad inputs and generalized formulas for all companies, rather than  
18 specific inputs for individual companies, [which] tend to mask unique  
19 circumstances of individual companies, which cause substantial differences in  
20 costs in the real world.” *Id.* at 8. Perhaps the most prescient of his observations  
21 was the following:

22 [The] results from the model are likely to be less accurate for  
23 smaller geographic areas, such as individual exchanges or small  
24 companies with a few exchanges, than they are for large

1 companies, such as SWBT and Verizon who have hundreds of  
2 exchanges. *Id.* at 8.

3  
4 The Commission must understand that HAI 5.0a is inaccurate for all the  
5 Petitioners in this arbitration and therefore cannot be used to determine forward-  
6 looking economic costs as the basis of reciprocal compensation rates for small  
7 ILECs in Missouri.

8 **Q. YET, MR. SCHOONMAKER SUPPORTED THE COSTS DEVELOPED**  
9 **BY HAI 5.0a, DID HE NOT?**

10 A. Mr. Schoonmaker gave the following rationale for supporting the HAI model  
11 results:

12 Given the requirements in the FCC rules to develop forward-  
13 looking costs and the current state of tools that are available to  
14 develop such cost results at a reasonable cost to the companies, I  
15 believe the costs developed are the best available forward-looking  
16 costs of these companies for meeting the requirements of the FCC  
17 rules. However, I specifically have concerns about giving too  
18 much reliance to individual company results when those results  
19 reflect a single exchange or only a few exchanges. While  
20 individual company results have been developed for each of the  
21 Petitioners, I believe it is more appropriate to use an average of the  
22 companies as a proxy for each of the individual companies rather  
23 than using the individual company rates themselves. Schoonmaker  
24 Direct, IO-2005-0468, at 9.

25  
26 **Q. DO YOU AGREE WITH HIS RATIONALE?**

27 A. Absolutely not. I have shown in my testimony for Cass County Telephone that it  
28 is not difficult or necessarily costly to compute transport and termination costs  
29 that comply with the FCC rules. Much of the complexity of the HAI model is in  
30 developing loop costs where customer locations and feeder and distribution cable  
31 design and costing are very involved. Reciprocal compensation (or recovery of  
32 transport and termination costs) does not involve loop costs, so a tool as complex

1 as HAI 5.0a, even if it was not as flawed as it is, is not necessary. The HAI model  
2 also is complex, because it models Bell Operating Company and large  
3 Independent company networks involving hundreds of switches and complex  
4 interoffice networks. The networks of the Petitioners are much simpler. Again,  
5 there is no need for the complexity of the HAI model.

6  
7 I believe it is very practical for the Petitioners to determine forward-looking  
8 economic costs using simple methods, such as those I employed for Cass County.  
9 I already have computed corrected ISUP Signaling costs using the actual rates the  
10 Petitioners are paying for SS7 network connection. If the Commission adopts the  
11 position taken by the FCC and other state commissions regarding usage-sensitive  
12 switching costs, I have computed a cost of \$0.0012 per minute for end office  
13 switching. And, I have estimated common transport for twenty of twenty-seven  
14 petitioners. The results of these corrections are shown in Exhibit WCC-1 and the  
15 graph I presented early in my testimony.

16  
17 In short, we are very close to having reasonable forward-looking economic costs  
18 for the Petitioners. There is no need to try to "fix" the HAI model.

19 **Q. IS MR. SCHOONMAKER CORRECT THAT AVERAGING THE**  
20 **PETITIONER COST RESULTS REDUCES THE CHANCES FOR**  
21 **ERROR?**

22 A. With all due respect, he is wrong about this. As I have shown, HAI 5.0a  
23 systematically overstates interoffice cable lengths and cable sizes. It does not  
24 recognize the sharing of interoffice cables. Each Petitioner's end office switching

1 cost is based on an inflated switching investment per line that Petitioners attempt  
2 to justify by an erroneous comparison of embedded investment to HAI model  
3 results. ISUP signaling costs suffer from the same interoffice cable costing errors.  
4 And dedicated transport costs should not be included for any of the companies.  
5 All of these errors result in overstating transport and termination costs and no  
6 amount of averaging will eliminate the errors.

7 **Q. What is your overall conclusion concerning Petitioners' transport and**  
8 **termination costs?**

9 A. When properly corrected through application of appropriate TELRIC principles,  
10 the costs incurred by the Petitioners are less than the 3.5 cent per minute rate  
11 which they propose. Under governing FCC rules the Petitioners have failed to  
12 prove that their rate proposal is cost-justified. In my testimony I provide  
13 corrections to the Petitioners' costs, using appropriate governing TELRIC  
14 principles, and provide a chart containing those costs for each Petitioner. See  
15 Exhibit 1. T-Mobile and Cingular propose that the Arbitrator and the Commission  
16 approve interMTA rates for each Petitioner on an individual basis (not a single  
17 collective rate, as the Petitioners propose), and that those rates be set at levels no  
18 higher than the costs set forth in Exhibit 1. For the seven Petitioners for which I  
19 cannot provide accurately redetermined costs, due to their failure to provide  
20 necessary information, their proposed rate of 3.5 cents is not supported by their  
21 costs, and for those companies the Arbitrator and the Commission should  
22 determine that traffic will be exchanged on a bill-and-keep basis unless and until

1           they respond fully to the T-Mobile data requests. If they respond promptly, I may  
2           be able to propose rates for those companies in my rebuttal testimony.

3   **Q.   WILL YOU CONTINUE TO ATTEMPT TO OBTAIN PETITIONER**  
4           **INFORMATION NECESSARY TO CORRECT TRANSPORT COSTS**  
5           **FOR THE REMAINING PETITIONERS?**

6   A.   Yes, I plan to make every attempt to obtain this information and will either  
7           provide a late exhibit for addition to my direct testimony, or I will include the  
8           corrected transport costs in rebuttal testimony.

9   **Q.   DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

10 A.   Yes, it does.

The total used for comparison purposes excludes the following companies:

Chariton Valley - No actual investment because switch is leased

Green Hills - Remote switching unit investment is recorded as circuit equipment investment rather than COE switching

Craw-Kan - Actual data includes both Missouri and Kansas exchanges, HAI only includes Missouri exchanges.

Grand River Mutual - Actual data includes both Missouri and Iowa exchanges, HAI only includes Missouri exchanges.

MoKan - Actual data includes both Missouri and Kansas exchanges, HAI only includes Missouri exchanges.
