Exhibit No.: Issue: Steam Production Cost Modeling Witness: Timothy M. Nelson Type of Exhibit: Direct Testimony Sponsoring Party: Aquila, Inc. dba KCP&L Greater Missouri Operations Company Case No.: HR-2009-____ Date Testimony Prepared: August 1, 2008

MISSOURI PUBLIC SERVICE COMMISSION

CASE NO.: HR-2009-____

DIRECT TESTIMONY

OF

TIMOTHY M. NELSON

ON BEHALF OF

AQUILA, INC. dba KCP&L GREATER MISSOURI OPERATIONS COMPANY

Kansas City, Missouri September 2008

Certain Schedules Attached To This Testimony Designated "(HC)" Have Been Removed Pursuant To 4 CSR 240-2.135.

DIRECT TESTIMONY

OF

TIMOTHY M. NELSON

CASE NO. HR-2009-____

1	Q.	Please state your name and business address.
2	А.	My name is Tim M. Nelson. My business address is 1201 Walnut, Kansas City, Missouri
3		64106.
4	Q.	By whom are you employed and in what capacity?
5	А.	I am employed by Kansas City Power & Light Company ("KCP&L") and as Resource
6		Planning Engineer.
7	Q.	What are your responsibilities as Resource Planning Engineer?
8	A.	I am responsible for providing research and analysis in support of the long range resource
9		planning needs including identifying the timing and technology mix of the Company's
10		future resource requirements for KCP&L and Aquila, Inc., dba KCP&L Greater Missouri
11		Operations Company's ("GMO" or the "Company"). GMO includes the former Missouri
12		Public Service territory ("GMO-MPS") and the former St. Joseph Light and Power
13		territory ("GMO-L&P") and the industrial steam sales system ("GMO-Steam").
14	Q.	Please briefly describe your education, work experience, and participation in
15		professional associations.
16	A.	In 1993 I received a Bachelor of Science degree in Mechanical Engineering from Iowa
17		State University - Ames. Since graduation from Iowa State the majority of my work has
18		been in the field of electric utility power supply and delivery. In 1994 I joined St. Joseph

1

1		Light & Power Company as a production engineer at the Lake Road Generating Station.
2		In that position I was responsible for engineering projects concerning electric and steam
3		production. As Results Engineer, I was responsible for all plant operating and
4		performance data for six boilers, four steam turbines, three combustion turbines, and
5		external steam customers. In 2001, St. Joseph Light & Power Company was acquired by
6		Aquila, Inc. (formerly UtiliCorp United Inc). My last position at Aquila, Inc. was as
7		Senior Electric Systems Analyst where I was responsible for developing and running
8		production cost fuel and purchase power models and for preparing the fuel and purchase
9		power budgets for two electric systems and a steam system.
10	Q.	What is the purpose of your testimony in this case before the Missouri Public
11		Service Commission ("Commission")?
12	A.	The purpose of this testimony is to present the RealTime® production cost model used to
13		calculate the fuel expense for the production and sale of continuous process steam from
14		the Lake Road Generating Facility for GMO-Steam.
15	Q.	How is your testimony organized?
16	A.	My Direct Testimony is organized as follows:
17		I. Lake Road Generating Station Operating Description;
18		II. Production Modeling Description;
19		III. Natural Gas Pricing; and
20		IV. Steam Sales Load Forecast.
21	Q.	Are you sponsoring any schedules?
22	A.	Yes. I am sponsoring the following schedules:

1		Schedule TMN-1: Lake Road 900# Steam System Diagram;
2		Schedule TMN-2: Missouri Steam/Electric Production Model Process; and
3		Schedule TMN-3(HC): Lake Road Natural Gas Burner Tip Calculation.
4		I. Lake Road Generating Station Operating Description
5	Q.	Please describe the Lake Road generating facilities.
6	A.	The plant is located in south St. Joseph, Missouri, on the east bank of the Missouri River.
7		The plant consists of four steam turbine-generators, three combustion turbines, and six
8		steam boilers. The plant's generating units have a net electric generating capability of
9		268.8 MW. In addition to generating electricity, the plant also supplies steam in the form
10		of continuous process steam for sale to industrial steam customers. The steam sales are
11		provided at a nominal pressure of 150-PSI. Steam sales are also provided to one
12		customer at a nominal pressure of 850-PSI. When I refer to PSI, as in 150-PSI, I mean
13		pressure measured in pounds per square inch.
14	Q.	Please explain the Lake Road steam system.
15	A.	The 900-PSI steam header operates at a nominal steam pressure of 900 PSI and is used to
16		provide steam for the 900-PSI turbine-generators (Turbines 1 and 2), one industrial steam
17		customer, and to the 200-PSI headers. The 900-PSI header is fed by Boilers 1, 2, 4 & 5. The
18		200-PSI headers are fed by Boilers 3 and 8, the 900-PSI header, and by Turbine 1 extraction.
19		The 200-PSI headers provide steam for Turbine 3 and the industrial steam sales.
20		Boilers 1, 2, 3, 4, and 8 burn natural gas as their primary fuel. Boilers 1, 2, 4, and 8
21		use #2 fuel oil as a back-up fuel. Much of the 900-PSI system energy is produced by
22		Boiler 5, which burns coal for its primary fuel, and natural gas for its back-up fuel.

1		Therefore, in the 900-PSI system there are multiple boilers providing steam to a common
2		header system which in turn can drive three turbine-generators (1, 2, and 3) and also supply
3		steam for industrial steam sales.
4	Q.	Which fuels and production systems are dedicated to providing services to the steam
5		customers?
6	A.	There is no dedicated fuel source and there are no dedicated production systems for these
7		customers. The configuration of this plant has common facilities used for both electric
8		and steam production. Schedule TMN-1 entitled "Lake Road 900# Steam System
9		Diagram," is attached. By inspection of this diagram, it is evident that the 900-PSI
10		system is common to multiple inputs and produces steam for multiple turbines as well as
11		the steam customers. The 200-PSI system also has multiple steam sources and delivers
12		steam to a turbine and steam customers.
13		II. Production Modeling System
14	Q.	For modeling purposes, what method is used to allocate Lake Road's operating costs
15		between the electric and steam customers?
16	A.	GMO uses production costing modeling software to simulate the electric system and
17		steam customer loads. Schedule TMN-2 entitled "Missouri Steam/Electric Production
18		Model Process" is a diagram that describes the process flow for the calculation method.
19	Q.	What is a production costing model?
20	A.	GMO uses the production costing model, RealTime®, to perform an hour-by-hour
21		chronological simulation of the Company's electric system, where the generators are

1	"dispatched" to meet the hourly system electric load, to determine the energy costs and
2	fuel consumption.

3	Q.	What is meant by "hour-by-hour chronological simulation"?
4	A.	RealTime® solves each hour's demand chronologically before moving onto the next
5		hour. Using this methodology, RealTime® can more accurately simulate real world
6		operating conditions and constraints.
7	Q.	How are the fuel expenses associated with the operation of the 900-PSI and 200-PSI
8		systems allocated between GMO-L&P and GMO-Steam?
9	A.	GMO allocates fuel expense between GMO-L&P and GMO-Steam using the allocation
10		methodology used in Case No. HR-2005-0450.
11	Q.	What was the fuel expense adjustment for GMO-Steam?
12	A.	Please see Schedule RAK-4 in the Direct Testimony of GMO witness Ronald Klote.
13	Q.	Please describe the steam/electric fuel and purchase power expense model used by
14		GMO.
15	A.	GMO created two models in RealTime®, one for electric and one for steam, and two
16		Microsoft Excel® spreadsheets to determine the annualized fuel and purchase power
17		expense costs for the electric system. The RealTime® "electric" model is used first to
18		dispatch the electric system to meet the system load.
19		After the electric model has been run, the 900-PSI electric turbines' hourly MW
20		load is exported to a text file. This text file is then imported into the "Unit 123 to Steam"
21		spreadsheet where the steam input necessary for each of the three generators is calculated
22		using the respective unit heat rate curves. In this spreadsheet, the total steam required for

the turbines is calculated and then exported to a comma separated value ("CSV") file.
 The CSV file is imported into the RealTime® steam model as another steam load for the
 steam system.

In the RealTime® steam model the electric turbine steam input from above is combined with the hourly steam sales loads to produce 900-PSI boiler hourly steam load input to the model. Boilers 1, 2, 3, 4, and 8 are modeled as burning natural gas and Boiler 5 burns coal as its base fuel. Boiler 5 can also burn natural gas as a supplemental fuel. The RealTime® steam model is then run using these steam loads to determine the total fuel burn and fuel cost for the Lake Road 900-PSI boilers.

After running the RealTime® steam model the fuel allocation is performed on a daily basis in the "Steam electric model" spreadsheet. To perform the allocation several inputs are required. From the steam model: 1) daily fuel quantity burned, by fuel type, 2) daily fuel cost by fuel type, and, 3) industrial steam sales mmBtu. From the electric model: 1) daily MW generated by the 900-PSI electric turbines, and, 2) the 900-PSI electric turbines steam mmBtu from the "Unit to Steam" spreadsheet.

16 The fuel allocation is performed on a daily basis as is done in actual operations at 17 the Lake Road Generating Station. Fuel expense is allocated based on the following 18 equations:

19	$\mathbf{F}_{\mathbf{S}} = \left[\begin{array}{c} \mathbf{S} \\ \end{array} \right] \left(\begin{array}{c} \mathbf{E} + \mathbf{S} \\ \end{array} \right) \left[\begin{array}{c} \mathbf{x} \\ \end{array} \right] \mathbf{F}$
20	$F_E = F - F_S$
21	Where,

22

F is total 900-PSI boiler fuel

6

1		F_S is 900-PSI boiler fuel allocated to industrial steam sales
2		F_E is 900-PSI boiler fuel allocated to the electric turbines
3		S is industrial steam sales steam mmBtu from boilers
4		E is 900-PSI electric turbine steam mmBtu from boilers
5		The remaining fuel not allocated to the industrial steam sales system in the first equation
6		is allocated to the electric system as shown in the second equation. Because the variable
7		"F" shown above includes fuel burned for Lake Road plant auxiliary steam, fuel
8		consumed for that purpose is properly allocated between the electric and industrial steam
9		sales systems.
10	Q.	Has the significant increase in steam load caused fuel costs charged to steam to
11		change?
12	A.	Yes.
13	Q.	Why?
14	A.	The steam capacity from Boiler 5 that burns coal for it fuel source has reached its
15		maximum output. Boilers 1, 2, 3, 4 and 8, which use gas as the primary fuel, have to be
16		used to supply any additional steam load. Steam from Boilers 1, 2, 3, 4 and 8 cost per
17		mmBtu is significantly higher than Boiler 5 causing the cost of service to increase.
18		III. Natural Gas Pricing
19	Q.	What does GMO propose as the price of natural gas?
20	A.	Attached is Schedule TMN-3(HC). This schedule shows the 3-Month average of the
21		2009 strip of NYMEX contract month prices for the period from January 1, 2008 to

1		March 31, 2008. GMO proposes to use this average of actual market settlements as the
2		estimate for market prices.
3	Q.	Does the NYMEX price include basis or transportation charges to bring the gas to
4		the generating plant?
5	A.	No. The NYMEX price reflects the market price for the commodity only of that
6		delivered to Henry Hub. For this reason, the burner tip price, which is the price delivered
7		to the plant, is also shown in schedule TMN-3.
8	Q.	Does the burner tip price include adjustments for GMO's hedging program?
9	A.	No. For a discussion of GMO's hedging program, please refer to the Direct Tstimony of
10		H. Davis Rooney.
11		IV. Steam Sales Load Forecast
12	Q.	Please describe the methodology used in creating the hourly Steam Load Forecast.
12 13	Q. A.	Please describe the methodology used in creating the hourly Steam Load Forecast. The Steam Load Forecast is based on the original 2008 Budget Forecast. This provides
12 13 14	Q. A.	Please describe the methodology used in creating the hourly Steam Load Forecast. The Steam Load Forecast is based on the original 2008 Budget Forecast. This provides the expected monthly steam mmBtu usage for each customer. The monthly steam

 12 13 14 15 16 17 18 19 20 21 	Q. Q. A.	Please describe the methodology used in creating the hourly Steam Load Forecast.The Steam Load Forecast is based on the original 2008 Budget Forecast. This providesthe expected monthly steam mmBtu usage for each customer. The monthly steammmBtu is then distributed over the hours in each month using an hourly load shape foreach customer.Please explain the process used to create the monthly steam load forecast.The starting point for the monthly steam load forecast is the 2008 budget forecast.Several steam customers' usage levels increased significantly in January 2008, thereforesome adjustment of the forecast is necessary. For the months available at the time, 2008actuals were used. Actuals were available for January, February, and March. For the

1		were estimated based on 2007 actuals. For those customers that increased their usage
2		levels recently, the new steam load was estimated consistent with those increases. The
3		new steam load forecast was then reviewed for reasonableness and compared to the
4		customers historical usages. The steam load forecast was also reviewed by GMO's steam
5		customer representative.
6	Q.	Please describe the basis for the hourly load shape.
7	A.	The hourly load shape used is the hourly pattern from the 12-month period ending April
8		30, 2008. This was the most recent 12-month period available at the time. Customer
9		specific hourly load shapes were used since each customer has their own pattern of
10		usage.
11	Q.	Does this conclude your direct testimony?

12 A. Yes.

BEFORE THE PUBLIC SERVICE COMMISSION OF THE STATE OF MISSOURI

In the Matter of the Application of Aquila, Inc. dba KCP&L Greater Missouri Operations Company to Modify Its Steam Tariffs to Effectuate a Rate Increase)

Case No. HR-2009-____

AFFIDAVIT OF TIMOTHY M. NELSON

) ss

)

STATE OF MISSOURI

COUNTY OF JACKSON

Timothy M. Nelson, being first duly sworn on his oath, states:

My name is Timothy M. Nelson. I work in Kansas City, Missouri, and I 1.

am employed by Kansas City Power & Light Company as Resource Planning Engineer.

Attached hereto and made a part hereof for all purposes is my Direct 2.

Testimony on behalf of Aquila, Inc. dba KCP&L Greater Missouri Operations Company consisting of n/n = (9) pages, having been prepared in written form for introduction into evidence in the above-captioned docket.

I have knowledge of the matters set forth therein. I hereby swear and 3.

affirm that my answers contained in the attached testimony to the questions therein propounded, including any attachments thereto, are true and accurate to the best of my knowledge, information and belief.

MND

Timothy M. Nelson

Subscribed and sworn before me this **3**th day of September 2008.
