**DIRECT TESTIMONY**

**OF**

**PATRICK E. JUSTIS**

**FILE NO. ET-2021-0020**

**I. INTRODUCTION**

1

**Q. Please state your name and business address.**

2

3 A. My name is Patrick E. Justis. My business address is One Ameren Plaza,  
4 1901 Chouteau Avenue, St. Louis, Missouri 63103.

4

**Q. By whom are you employed?**

5

6 A. I am employed by Union Electric Company d/b/a Ameren Missouri  
7 ("Ameren Missouri" or "Company").

7

**Q. What is your position with Ameren Missouri?**

8

9 A. I am the Manager of Efficient Electrification Development.

9

10 **Q. Please describe your educational background and employment**  
11 **experience.**

11

12 A. I received a Bachelor of Science in Mechanical Engineering from the  
13 University of Missouri-Columbia ("University of Missouri") in 1989. During that time I  
14 worked one semester as a co-op student at Union Electric's Callaway Nuclear Plant in the  
15 Systems Engineering Group. After graduating from University of Missouri, my first  
16 professional position was with a small manufacturing company in the St. Louis area,  
17 Turmatic Systems, Inc., which designs and manufactures rotary transfer machines. While  
18 working there I enrolled in graduate school to study environmental science, and graduated  
19 from Indiana University's School of Public and Environmental Affairs in Bloomington

12

13

14

15

16

17

18

19

1 with a Master of Science in Environmental Science and Policy in 1993. The summer  
2 between graduate school years and after graduation, I was hired by Shannon and Wilson,  
3 Inc. where I worked as an environmental consultant on a variety of remediation projects.  
4 In 1994, I was hired by the Missouri Department of Natural Resources ("MDNR") and held  
5 a few different positions over 14 years. Initially, my work at MDNR was as an  
6 Environmental Specialist with oversight responsibilities over the dioxin remediation of the  
7 Times Beach Superfund site in Eureka, Missouri. That project was completed and I moved  
8 to MDNR's St. Louis Regional Office in 1997 to work as an Environmental Engineer on  
9 Missouri's implementation of Clean Air Act section 112(r), which is essentially an  
10 extension of The Emergency Planning and Community Right-to-Know Act of 1986. In  
11 2000, I transferred to MDNR's Outreach and Assistance Center in the City of St. Louis as  
12 an Energy Engineer where I collaborated with utilities, businesses, schools, colleges, local  
13 governments, the federal government, code officials, and the general public on energy  
14 efficiency, renewable energy, and green building projects and issues. I received my  
15 Missouri Professional Engineer license in 2007, and then joined Ameren Missouri in 2008  
16 as a Senior Program Manager. My initial responsibilities included launching the  
17 Company's first formal portfolio of energy efficiency programs for business customers and  
18 I managed that area for six years. The next two years I focused primarily on Ameren  
19 Missouri's solar rebate program, natural gas energy efficiency program, and some limited  
20 electric vehicle ("EV") promotion. In March of 2016, my primary duties shifted to electric  
21 vehicles and I now work entirely on efficient electrification with a focus on electric  
22 transportation, including overall management responsibility for the Charge Ahead

1 incentive programs that were approved by the Commission in 2019 and are successfully  
2 operating today.

3 I am a founding member of the Missouri Gateway Chapter of the U.S. Green  
4 Building Council, having chaired the Chapter in 2008, and am currently the Chair of the  
5 City of St. Louis Clean Energy Development Board that has oversight responsibility for  
6 the City's Set the PACE St. Louis program.

## 7 **II. PURPOSE OF TESTIMONY**

### 8 **Q. What is the purpose of your direct testimony in this proceeding?**

9 A. My testimony describes the benefits of efficient electrification, and the  
10 rationale for a pilot program that would modestly expand upon our current efforts in  
11 transportation electrification. In combination with the testimony of Steve Wills, my  
12 testimony will explain why implementing these programs, that cost-effectively increase  
13 the use of efficient electrification technologies, is in the interest of all Ameren Missouri  
14 customers as well as all Missourians. Given the increasing concerns and focus, nationally  
15 and internationally, on climate change impacts and mitigation, our state should encourage  
16 the contributions that efficient electrification technologies bring to immediately address  
17 this great challenge.

18 I address the historical context of this proposal in contrast with our original  
19 Business Solutions proposal in File No. ET-2018-0132 (that case commonly referred to,  
20 and in this testimony, as "Charge Ahead"). Specifically, I describe how we have addressed  
21 the concerns raised in that matter and describe how the proposed programs would operate.

## 22 **III. EFFICIENT ELECTRIFICATION BENEFITS AND THIS PROPOSAL**

### 23 **Q. What is efficient electrification?**

1           A.       Efficient electrification is the conversion of powered equipment from a less-  
2 efficient non-electric energy source to a more-efficient electric energy source. A fairly  
3 well-known example of this is the electric vehicle ("EV"). According to the latest figures  
4 provided by the U.S. Department of Energy, EVs convert over 77% of grid energy to power  
5 at the wheels, while conventional gasoline vehicle convert only 30% or less of energy  
6 stored in gasoline to power at the wheels.<sup>1</sup> Similarly, there are many other efficient  
7 electrification technologies that are available now that are far more efficient than  
8 incumbent combustion technologies. These efficiencies are key to unleashing the two key  
9 benefits that are foundational in this case: downward pressure on electric rates and  
10 improved environment health. While not detailed in this case, efficient electrification also  
11 provides economic benefits to industrial competitiveness in that such technologies also  
12 offer the advantage of performance in terms of process precision, and controllability in  
13 many instances.<sup>2</sup>

14           Ameren Missouri is proposing to incentivize two efficient electrification  
15 technologies in this proposal: High Capacity Lift Trucks and Electric Ports for Truck  
16 Refrigeration Units ("TRU Ports").

17           **Q.       What are the benefits of Ameren Missouri engaging the marketplace to**  
18 **encourage adoption of efficient electrification technologies?**

19           A.       The benefits of efficient electrification are fundamentally the same as those  
20 of EVs and transportation electrification. Really, anytime we electrify an internal  
21 combustion engine, such as in this proposed program, the benefits are the same as those

---

<sup>1</sup> <https://www.fueleconomy.gov/feg/evtech.shtml>

<sup>2</sup> Description of Electrification in Electric Power Research Institute, Overview found on  
<https://www.epri.com/research/programs/105741>

1 attributed to EVs, and fall into three categories: Economic, Environmental, and  
2 Performance.

3 Economic benefits occur in many ways:

- 4 • The end user experiences lower overall fuel and maintenance costs;
- 5 • The utility experiences increased utilization of existing infrastructure;
- 6 • The utility's customers experience downward rate pressure--as  
7 demonstrated in Mr. Wills' testimony, the RIM test for the proposed  
8 programs is in the range of 1.3-1.8;
- 9 • Given that Missouri is not a petroleum-producing state, the Missouri  
10 economy benefits from reduced fuel imports and more use of "home grown"  
11 electric generation;
- 12 • Modernizing through electrification enhances Missouri's business climate  
13 profile as Missouri competes nationally for business and job growth.

14 Environmental benefits occur in several ways:

- 15 • Health and safety of workers is enhanced due to zero emissions at ground  
16 level, and also for residential neighborhoods adjacent to warehouses and  
17 docks where there is a lot of material handling and/or refrigerated trucks  
18 idling;
- 19 • NOx emissions, a precursor to smog, are greatly reduced and CO<sub>2</sub> emissions  
20 are also reduced based on Ameren Missouri's generating fleet today;
- 21 • There is a promise of even more reductions in NOx and CO<sub>2</sub> emissions over  
22 time as Ameren Missouri transitions its generating fleet to renewable  
23 sources per our 2020 Integrated Resource Plan;<sup>3</sup>
- 24 • Reduced reliance on fossil fuels translates into fewer spills on water and  
25 land.

26 Performance benefits are specific to measure types, and are significant for this  
27 program:

- 28 • Electric lift trucks are more responsive, and have better torque, less  
29 vibration and noise, and much less waste heat. In addition, computerized  
30 controls offer better traction in snow and ice and programmability options  
31 specific to the driver;
- 32 • Electrically powered TRUs are less noisy as they allow diesel engines that  
33 would normally power the refrigeration system to shut down.

---

<sup>3</sup> <https://www.ameren.com/missouri/company/environment-and-sustainability/integrated-resource-plan>

1           **Q.     Has Ameren Missouri previously filed a proposal that was considered**  
2 **by the Commission and that is similar to this new proposal?**

3           A.     Yes, though the previous proposal was significantly larger in scope than the  
4 current proposal. In 2018, Ameren Missouri filed a proposed Business Solutions program  
5 under the Company's broader "Charge Ahead" filing that included changes to the  
6 Company's line extension policy as well as EV charging station incentives for business  
7 customers.

8           The three programs that were filed together under the Charge Ahead umbrella –  
9 line extension policy, EV charging station incentives, and the Business Solutions efficient  
10 electrification incentives – were thematically linked by the concept that new load  
11 introduced on to the Company's system, under the right conditions, can be economically  
12 beneficial for all customers. This is because many of the costs of the system are fixed, and  
13 do not vary with the amount of electricity delivered. Therefore, increased usage of the  
14 system improves utilization of those assets and spreads their fixed costs over more  
15 kilowatt-hours, driving down unit costs and ultimately customer rates.

16           The Commission approved the line extension policy changes relatively early in the  
17 process based on a Stipulation and Agreement among the parties. After a hearing, the  
18 Commission approved a portion of the EV charging program related to the development of  
19 charging stations in strategic locations along Missouri's highway corridors, and referred  
20 the remainder of the Company's proposal for additional local EV charging station  
21 incentives to a workshop process. Eventually, several parties submitted another Stipulation  
22 and Agreement in the Charge Ahead case that advanced these additional EV charging

1 station incentives. Ameren Missouri has implemented the revised line extension policy,  
2 and the charging station incentive programs are underway.

3 In approving these portions of the Charge Ahead filing, the Commission affirmed  
4 the underlying premise that the Company has a role to play in advancing the adoption of  
5 efficient electrification in the form of electric vehicles, and also specifically acknowledged  
6 the potential of efficient electrification to benefit all customers by spreading the fixed costs  
7 of the system over more usage.

8 The Business Solutions proposal, which is the predecessor to this proposal, was  
9 rejected at that time. This was not due to any conceptual dispute as to the potential benefits  
10 of efficient electrification; but the rejection was related to specific concerns about the  
11 details of that proposal and how it was to be implemented. In particular, the Commission  
12 was concerned with the potential for free ridership under the program, about the level of  
13 administrative costs estimated for delivering the program, and finally about cost  
14 effectiveness of the program given the mix of measures offered and the uncertainty  
15 regarding which measures would be ultimately delivered. In this revised proposal, the  
16 Company has made adjustments that should alleviate Commission's concerns. This new  
17 proposal is also smaller in scope and budget, as described in more detail, below.

18 **Q. In general terms, how is this proposal different from the Charge Ahead**  
19 **Business Solutions proposal that the Commission previously considered?**

20 A. Ameren Missouri's Business Solutions program filed in the Charge Ahead  
21 case included the following efficient electrification measures:

- 22 • Lift trucks (forklifts) in Classes 1 and 2 (there are several varieties of lift
- 23 trucks even within these two classes)
- 24 • Truck Refrigeration Unit Electric Ports (TRUs)
- 25 • Truck Stop Electrification

- 1                   • Airport Ground Support Equipment, including:  
2                    ○ Push-backs  
3                    ○ Tug/Tow Tractors  
4                    ○ Belt Loaders  
                    ○ Ground Power Units

5 Business Solutions had a proposed budget of \$7 million, with about 44% for  
6 administrative/marketing costs and 56% for incentives. In contrast, the new pilot program  
7 proposal is of a much smaller scale, with a total proposed budget of \$1.9 million, and  
8 allocates 25% for administrative/marketing costs and 75% for customer incentives. The  
9 proposal also offers only two measures, with limited risk of free ridership:

- 10                   • TRU Electric Ports  
11                   • Class I Electric Lift trucks having capacity >6,000 lbs. (a narrow segment  
12                   of the market)

13 Additionally, the current proposal is for a term of three years, as compared to five years  
14 in the original proposal.

1 The following table summarizes these differences:  
2

	<b>Current Proposal</b>	<b>Previous Proposal</b>
<b>Number of Measures</b>	2	8+ <sup>4</sup>
<b>Budget</b>	\$1.9 million	\$7 million
<b>Admin/Marketing portion</b>	25%	44%
<b>Incentives portion</b>	75%	56%
<b>Term</b>	3 years	5 years

3 **Q. Please describe in more detail the proposed measures: High Capacity**  
4 **Electric Lift Trucks (6,000-12,000 lb.) and Truck Refrigeration Unit Electric Ports**  
5 **(TRU).**

6 A. First, I will describe the lift truck proposal, and then the TRU Port proposal.

7 **High Capacity Lift Trucks**

8 Commonly referred to as fork lifts, lift trucks are designed for a variety of tasks and  
9 can be powered by internal combustion engines or electric technologies. Because of the  
10 many varieties of end uses, lift trucks have been sorted by classes, as set out in the table  
11 below. Note that all classes have been listed below to emphasize the small portion of the  
12 lift truck universe that has been targeted in this proposal, namely, Class 1 lift trucks of  
13 capacity > 6,000 lbs.

	<b>Lift Truck Class</b>	<b>Description</b>
<b>Eligible Lift Truck Class</b>	Class 1	A counter balance electric lift designed to do a variety of indoor and outdoor lifts. These lift trucks come in a wide range of capacities, but <b>only those considered "high capacity"—with a capacity of more than 6,000 lbs.--will be eligible for the program incentives.</b>
<b>Ineligible Lift Truck Classes</b>	Class 2	An electric specialty lift truck found in most warehouse applications. The design is specific for narrow isle high reaching applications.

---

<sup>4</sup> The "+" designation is to be clear that the previous proposal included Class 1-2 forklifts, while the current proposal includes only a limited portion of Class 1 forklifts that has very low electric market saturation, namely those having capacity >6,000 lbs.

	Class 3	An electric walk behind lift truck commonly referred to as a "walkie." Normally low lifting, light load applications.
	Class 4	A combustion engine lift truck with cushion tires. This type of lift truck works warehouse dock doors, loading and unloading trailers.
	Class 5	A combustion engine lift truck with pneumatic tires. The tire composite make them ideal for outdoor use on uneven terrain but it is not uncommon to see them indoors at very large warehouses.
	Class 6	Both combustion and electric versions, a class 6 truck is commonly referred to as a tow motor. They can be found pulling carts of supplies through an assembly plant or tugging luggage carts at an airport.
	Class 7	Today, this lift truck is available only with internal combustion engines. This class is properly suited with telescoping booms and outriggers in order to hoist building materials for construction projects.

1

2 Electric lift trucks are commonplace throughout Europe, with lifting capacities as high as

3 25 tons. The United States has been much slower to adopt electric technology, especially

4 in the Midwest. While electric lifts have ~62% market share below capacities of 6,000

5 lbs., there is just an 18% market share up to 8,000 lbs. and insignificant share at 12,000 lbs.

6 However, today's electric lift trucks in this 6,000-12,000 lbs. capacity range operate more

7 efficiently, are safer, and are less costly to maintain than the internal combustion engine

8 options. Because the greater sales volumes occur in the less than 6,000 lbs. units,

9 manufacturers choose to focus market efforts there where they can realize the greatest

10 return. For this reason, Ameren Missouri proposes to focus this pilot program on the

11 extremely low-penetration market of >6,000 lbs. capacity lift trucks.

1           **Q.     What incentives is the Company proposing to offer to encourage the**  
2 **use of high capacity lift trucks?**

3           A.     The proposed incentives are the same as in the original proposal, which is  
4 \$2,500 per eligible lift truck purchased, and \$1,250 per eligible lift truck leased. The  
5 proposed budget would support incentivizing 375 lift trucks. To ensure that one large  
6 company with many locations does not consume all of the allocated incentives for this  
7 measure, there is a proposed limit of 20 incentivized lift trucks for affiliated entities.

8 **Truck Refrigeration Unit Electric Ports**

9           Truck refrigeration units, commonly referred to as TRUs, are a part of either a box  
10 truck or an enclosed semi-trailer that keeps products chilled or frozen while in transport.  
11 Traditionally, TRUs are powered only by a small auxiliary diesel engine during transport  
12 and while at idle, waiting to be loaded or unloaded. Two alternatives to the diesel engine  
13 have been developed but acceptance of these technologies has been slow, primarily due to  
14 up front infrastructure cost: All-electric and hybrid electric/diesel options (eTRUs). Both  
15 of these alternative options are relevant here because they require TRU electric ports to be  
16 available at the docks or in a holding area; these TRU electric ports are what Ameren  
17 Missouri proposes incentivizing. Use of this electric technology can offer operational  
18 savings to customers in terms of fuel costs and reduced run time and wear on the diesel  
19 engines.

20           The hybrid eTRU, while en route, operates on the auxiliary diesel powered engine  
21 whenever it is moving and at idle when an electric port is not available. While at rest, the  
22 truck/trailer has an option to plug into a 240v or 480v electric port and terminate the diesel  
23 operation. This conserves fuel while eliminating refrigeration system engine emissions and

1 noise. The use of electric standby reduces operating costs by 40-70%.<sup>5</sup> The fully electric  
2 option uses a generator, fixed to the axle, to power the eTRU while en route. The unit can  
3 then plug into TRU electric ports at the dock while at rest.

4 **Q. What incentives is the Company proposing to offer to encourage the**  
5 **use of electric TRUs?**

6 A. The proposed incentives are the same as in the original proposal, which is  
7 \$1,600 per port that supports electric TRUs. The proposed budget would support  
8 incentivizing 300 ports. To ensure that one large company with many locations does not  
9 consume all of the allocated incentives for this measure, there is a proposed limit of 45  
10 incentivized ports for affiliated entities.

11 **Q. What does Ameren Missouri expect to learn from this pilot program?**

12 A. This pilot program seeks not only to drive increased adoption of the two  
13 measures, but also to inform Ameren Missouri about several questions related to customer  
14 attitudes and behavior regarding these electrification technologies:

- 15
- 16 • Are small incentives sufficient, when combined with customer education,  
to drive measure adoption?
  - 17 • What are the primary barriers to adoption of these technologies?
  - 18 • What is the best way to target incentives to encourage customers to electrify  
19 this equipment?
  - 20 • What are the actual load shapes of the measures (depends on ability to  
21 monitor);

22 **Q. Has Ameren Missouri addressed the specific issues cited in the**  
23 **Commission order<sup>6</sup> in the previous Charge Ahead – Business Solutions case?**

---

<sup>5</sup> From a recent conversation with David Brondum of Carrier Transicold, a manufacturer of TRUs.

<sup>6</sup> Report and Order for File No. ET-2018-0132, issued February 6, 2019

1           A.     Yes, this proposal responds to the concerns the Commission previously  
2 raised about the Business Solutions proposal from the Charge Ahead case. Specifically,  
3 we have addressed the following concerns:

- 4                     • Free ridership
- 5                     • Administrative Costs
- 6                     • Cost effectiveness calculations

7     **Free Ridership**

8           The proposed pilot program is inherently low-risk in terms of free ridership due to  
9 the current market status of the specific measures incentivized. As described above, the  
10 limited portion of the Class I lift trucks eligible in the program are those having lift capacity  
11 >6,000 lbs. Electric-powered lift trucks are a modest 18% of the market today for Class 1  
12 lift trucks between 6,000 and 8,000 lbs. capacity, and the electric market share is virtually  
13 non-existent for capacities higher than 8,000 lbs., far from a saturated market.<sup>7</sup> Also,  
14 customers must get preapproval from the program *before purchasing or leasing* the  
15 equipment and, as stated in the proposed tariff, the program design is such that the purchase  
16 or lease of a new lift truck "...must be replacing a gasoline, diesel or propane unit OR be  
17 a new addition OR expansion to an existing fleet." All three of these program elements  
18 contribute to limiting free ridership.

19           Similarly, according to staff at the Electric Power Research Institute, TRU electric  
20 ports are relatively uncommon, with a high-end estimate of approximately 5% of trucking  
21 docks having been outfitted with such equipment. Given the low price of diesel fuel and

---

<sup>7</sup> The saturation level for the high capacity Class I lift trucks was provided during conversation between Ameren Missouri staff and the Material Handling Equipment Distributors Association ("MHEDA") and the Industrial Truck Association ("ITA").

1 the fact that the vast majority of refrigerated trucks include diesel-fueled auxiliary engines  
2 to power the truck's refrigeration units, the cost of upgrading docks to include the TRU  
3 Electric Ports is a barrier, despite the overall cost-effectiveness of the measure being  
4 positive in terms of Ratepayer Impact Measure ("RIM") and modified Total Resource Cost  
5 tests ("mTRC").

6 **Administrative Costs**

7 The administrative costs associated with this program will include the costs of  
8 managing the program through implementation contractors as needed, database and web  
9 portal management costs, and marketing and education costs. As stated earlier in this  
10 testimony, the costs for administering the program has been limited to 25%. This is a very  
11 reasonable administrative allocation for a relatively small program that will require  
12 significant outreach through trade allies as well as hands-on consultations with customers,  
13 and is substantially lower than the 44% from the Business Solutions program that gave rise  
14 to Commission concerns related to that proposal.

15 **Cost Effectiveness Calculations**

16 Unlike the previous case having more measures, the much simpler two-measure  
17 proposal has straightforward calculations, as explained in Mr. Wills' testimony. The two  
18 proposed measure types are cost-effective for both the mTRC and RIM tests, even when  
19 including the administrative costs. Previously, the Commission concluded that "...because  
20 the analysis hinged on assumptions regarding the number of pieces of electric equipment  
21 installed under various incentive types and the evidence shows that the incentive costs and  
22 kWh saved vary greatly depending on which measure is utilized, the Commission finds it

1 is not reasonable to rely on this analysis."<sup>8</sup> The Company's new proposal is far simpler  
2 because it is limited to just two measures, and the calculations demonstrate that, regardless  
3 of varying uptake of the two measures, the program is cost-effective as long as  
4 administrative costs are limited to 25% of the program. For this reason, the Company  
5 requests flexibility in the program budget allocations between the two measures so that if  
6 the market responds more to one measure over the other, Ameren Missouri has the  
7 discretion to allocate more of the total incentive funds to the more popular measure.

#### 8 **IV. NEW BUSINESS SOLUTIONS PILOT PROGRAM DETAILS**

9 **Q. How would the new pilot incentive program operate in terms of**  
10 **customer engagement and processing customer applications?**

11 A. Ameren Missouri plans to manage this program in a similar way as our other  
12 business customer programs such as Charge Ahead – Local Incentives (for EV charging  
13 stations) and Business Energy Efficiency, though with very limited support from outside  
14 implementation contractors. Internal staff will largely run the program with the potential  
15 for some level of assistance from outside contractors to support marketing materials  
16 development, educational webinar administration, portal and database development for  
17 intake and management of applications (if determined necessary), and load measurement  
18 (as feasible).

19 Marketing efforts will focus on industry trade allies that are engaged in  
20 manufacturing, sales, installation and service of the eligible measures and that already have  
21 trusted relationships with customers. By enabling these trade allies through education and  
22 incentives, we are able to develop a "sales force" that more actively engages with customers

---

<sup>8</sup> Report and Order for File No. ET-2018-0132, issued February 6, 2019, p. 42.

1 on the electrification options. Additionally, we will work with our internal customer-facing  
2 staff that have relationships with our customers to introduce the program and solicit  
3 meetings with our internal program staff.

4 As stated in the proposed tariff, customers will be required to get pre-approval for  
5 incentives prior to purchasing or installing the equipment. Our application process will  
6 require the necessary information to define the customer (address and contact information,  
7 Ameren Missouri account number), the proposed equipment and quantities, and address  
8 where the equipment would be utilized. Ameren Missouri will review the application and  
9 respond to the customer via email with either pre-approval or another response, such as  
10 requesting clarifying information or informing the customer why the application cannot be  
11 pre-approved.

12 **Q. How will customers receive their incentive payments?**

13 A. Customers will have three choices for receiving their incentives: 1) Check  
14 payment direct to the customer; 2) bill credit direct to the customer's Ameren Missouri  
15 electric bill, or; 3) via the application process, assign the incentive to a contractor working  
16 on the project. These are the same options available to customers under the existing Charge  
17 Ahead – Local Incentives program.

18 **V. SUMMARY AND CONCLUSIONS**

19 **Q. In summary, why do you think the Commission should approve this**  
20 **proposal?**

21 A. There are three primary reasons that the Commission should approve this  
22 proposal. First, Ameren Missouri has proposed a pilot program that offers new options for  
23 customers, is small scale, and addresses Commission concerns raised in the previous case.

1           The second reason is economics. The program's cost-effectiveness is beneficial not  
2           only to participating customers, but for all Ameren Missouri customers as well as Ameren  
3           Missouri. Moreover, offering additional cost-effective programs can help Missouri's  
4           business climate as the State competes for new business growth as well as retention of  
5           existing business. Similar to the case for EVs, this is an economic win-win-win.

6           Finally, this proposal is a win for community health and the greater environment. I  
7           would encourage the Commission to consider Ameren Missouri's commitment to a clean  
8           energy future, as demonstrated in the Company's recently filed 2020 Integrated Resource  
9           Plan, and recognize the value that efficient electrification, especially when coupled with  
10          renewable energy, brings to our local efforts to create an environmentally sustainable  
11          future. Again, given the increasing concerns and focus by experts, nationally and  
12          internationally, on climate change impacts and mitigation, our state should encourage,  
13          whenever possible, the contributions that efficient electrification technologies bring to  
14          immediately address this great challenge.

15           **Q.     Does this conclude your direct testimony?**

16           A.     Yes, it does.

**BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI**

In the Matter of the Application of Union	)	
Electric Company d/b/a Ameren Missouri	)	File No. ET-2021-0020
for Approval of Efficient Electrification Program.	)	

**AFFIDAVIT OF PATRICK E. JUSTIS**

**STATE OF MISSOURI**     )  
                                          ) **ss**  
**CITY OF ST. LOUIS**     )

Patrick E. Justis, being first duly sworn on her oath, states:

1.     My name is Patrick E. Justis. I work in the City of St. Louis, Missouri, and I am employed by Ameren Services Company as Manager of Efficient Electrification Development.
2.     Attached hereto and made a part hereof for all purposes is my Direct Testimony on behalf of Union Electric Company d/b/a Ameren Missouri consisting of 17 pages, of which have been prepared in written form for filing in the above-referenced docket.
3.     Further, under the penalty of perjury I hereby swear and affirm that the information contained in the attached testimony to the questions therein propounded is true and correct.
