Rate Impact

Sponsoring Party: Praxair, Inc.

Case No.: ER-97-81

MISSOURI PUBLIC SERVICE COMMISSION

UTILITY DIVISION

THE EMPIRE DISTRICT ELECTRIC COMPANY

CASE NO. ER-97-81

PREPARED DIRECT TESTIMONY OF

DAVID MEADE

February 20, 1997

FILED
FEB 20 1997
MISSOURI
PUBLIC SERVICE COMMISSION

BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MISSOURI

In the matter of The Empire Dis-
trict Electric Company for authori-
ty to file tariffs increasing rates
for electric service provided to
customers in the Missouri service
area of the Company.

ER-97-81

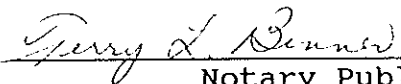

AFFIDAVIT OF DAVID MEADE

STATE OF NEW YORK)
) ss
COUNTY OF ERIE)

David Meade, of lawful age, on his oath states: That he has reviewed the attached written testimony in question and answer form to be presented in the above case, that the answers in the attached written testimony were given by him; that he has knowledge of the matters set forth in such answers; that such matters are true to the best of his knowledge, information and belief.

David Meade

Subscribed and sworn to before me this 18th day of February, 1997.

Notary Public

[SEAL] TERRY L. BENNER
Notary Public, State of New York
Qualified in Erie County
My Commission Expires Apr 30, 1997

My Commission expires: Apr. 30, 1997

PREPARED DIRECT TESTIMONY OF
DAVID MEADE

1 Q. Please state your name and business address.

2 A. David Meade, Praxair, Inc., 175 East Park Drive, Tonawanda,
3 New York, 14151
4

5 Q. What is your professional employment?

6 A. I am regional energy manager of Praxair, Inc.
7

8 Q. What is your educational background?

9 A. I graduated from Cornell University, Ithaca, New York, in 1981
10 and received a Bachelor of Science degree in Operations
11 Research and Industrial Engineering. In 1986 I received a
12 Master of Business Administration degree with a major in
13 Finance from New York University, New York, New York.
14

15 Q. What is your prior experience?

16 A. Upon graduation from college in 1981, I joined Praxair, then
17 known as the Linde Division of Union Carbide Corporation, as
18 an operations engineer in the National Logistics Center. My
19 responsibilities included conducting performance audits and
20 developing projects and systems to reduce distribution costs
21 and improve customer service. In 1986, I joined Linde's
22 energy management department as a senior analyst, and managed
23 an information systems and analysis group responsible for

1 competitive assessment and modelling, verifying, analyzing,
2 planning and forecasting energy use and costs. In 1990, I
3 became an energy manager and took on additional responsibilities
4 to currently include management of electricity use and
5 procurement in Missouri, Illinois, Indiana, Ohio, Oklahoma,
6 West Virginia, Kentucky, and Minnesota. In that capacity, I
7 am actively involved in seeking appropriate electricity
8 pricing and the development of innovative power supply
9 agreements. I am also responsible for optimizing plant
10 tactical and operating strategies to minimize electricity
11 costs. I have spoken at various conferences and seminars on
12 topics of energy management and procurement, most recently in
13 1996 at events organized by Infocast and International
14 Business Communications.

15
16 Q. Who is Praxair?

17 A. Praxair is the largest producer of industrial gases in North
18 and South America, third largest on a worldwide basis.
19 Formerly the industrial gases division of Union Carbide, known
20 in North America as Linde, Praxair was spun off as a separate,
21 independent company in June, 1992. In 1996, the company
22 completed the acquisition of Liquid Carbonic making it the
23 world's largest producer of carbon dioxide. Praxair began

1 operations in 1907 with its first plant in Buffalo, New York
2 and now has a worldwide network of plants.
3

4 Q. What is the nature of Praxair's products?

5 A. Praxair's major products include the products of air separa-
6 tion: oxygen, nitrogen and argon. These products are manu-
7 factured by separating air into its component parts. These
8 gases are used in production and to improve efficiency,
9 quality, and environmental compliance in a variety of indus-
10 tries, including steel, chemicals, metals, electronics, paper,
11 food, glass and medical care. Customers generally receive
12 Praxair's products in one of three ways: (1) by truck delivery
13 from regional bulk liquid production plants into tanks at the
14 customer site, (2) by pipeline from large bulk production
15 plants, or (3) from smaller "on-site" non-cryogenic production
16 facilities dedicated to an individual customer (vacuum
17 pressure swing adsorption plants for oxygen supply, membrane
18 plants for nitrogen supply). Praxair also produces and
19 distributes carbon dioxide, hydrogen, helium and specialty
20 gases, and operates a surface technologies business.
21

22 Q. Please describe Praxair's operations in the Empire District
23 Electric Company ("Empire") service area.

1 A. Praxair has operated a bulk production plant and distribution
2 center in Neosho, Missouri since 1960. The plant produces
3 liquid oxygen and nitrogen for the regional industrial gas
4 merchant market, and has a liquid production capacity of 325
5 tons per day. Praxair's Neosho plant provides nitrogen and
6 oxygen to the food processing, metal fabrication, steel,
7 health care and petroleum industries in Missouri, Oklahoma,
8 Arkansas and Kansas. A \$6 million expansion and modernization
9 completed in 1992 doubled plant capacity. The expansion was
10 done with long-term expectations of competitively priced
11 power. This facility has 26 employees and an annual payroll
12 of \$1.3 million. In the state of Missouri, Praxair has a
13 total of 328 employees and a payroll of over \$18 million.
14 Praxair recently paid over \$160,000 in property taxes,
15 collected and paid to Missouri over \$200,000 in sales and use
16 taxes from its Missouri customers and paid over \$300,000 in
17 sales and use taxes on its own purchases.

18
19 Q. What is the general nature of competition which Praxair faces
20 in the industrial gas industry?

21 A. The industrial gases business is an extremely competitive
22 business, with several large companies operating with pro-
23 duction networks throughout North America and the world.
24 There are also many regional companies and distributors adding

1 to the competition in specific markets. The distribution
2 radius of a plant is generally within a range of 250 miles.
3 Industrial gases prices are held to competitive levels due to
4 increased overall supply and the demands of customers, many of
5 whom face intense and relentless competition in national and
6 global markets. The development of alternative non-cryogenic
7 industrial gas production technologies is providing more
8 supply options and adding to competitive pressures.
9

10 Q. What competitive challenges does Praxair face at its Neosho
11 plant in particular, and how are these challenges evolving?

12 A. The competition is intense and growing. There are several
13 other industrial gas companies and facilities capable of
14 competitively serving the same customers as our Neosho plant.
15 In many cases they do. These include facilities located in
16 Missouri, Arkansas, Oklahoma, Illinois, and Tennessee. Due to
17 the competitive situation, our Neosho plant is no longer fully
18 loaded as evidenced by our operations over the past year. Of
19 further concern is the prospect of higher power prices at
20 Neosho while prices at our other facilities and those of our
21 competitors are generally declining. It is also noteworthy
22 that Praxair has electrical pricing at or below the levels at
23 our Neosho plant at several other of our Midwest locations.
24

1 Q. Is there potential for expansion or contraction of Praxair's
2 business at Neosho?

3 A. There is potential for either expansion or contraction at
4 Neosho, based upon the relative competitiveness of our costs
5 here vis-a-vis those of our other current and future produc-
6 tion facilities and those of our competitors. Operations at
7 Neosho have actually contracted over the past year. On the
8 other hand, there is the opportunity to recapture this load
9 and even expand through upgrades and additions at our existing
10 plant site. Growth and retention opportunities are dependent
11 upon the extent that current and potential customers choose to
12 use industrial gases, the extent they choose to use our
13 products instead of those of our competitors, and the extent
14 that we source our requirements from our Neosho plant.

15
16 Q. What is the significance of electricity to Praxair and how is
17 it used in the Neosho plant?

18 A. The industrial gas business is extremely electricity-inten-
19 sive, more so than any other industry. The production of
20 liquid oxygen and nitrogen at Neosho is accomplished by the
21 filtering, liquefaction and separation of large volumes of
22 air, followed by liquefaction of nitrogen through a compres-
23 sion/expansion process. The entire process utilizes three
24 large compressors, which are powered by large electric motors.

1 Over 96% of the electricity at Neosho is consumed in the
2 production process by these large motors. Electricity
3 comprises over 70% of our operating costs. Since our
4 expansion in 1992, we are Empire's largest customer.
5 Nationally, we spend over \$220 million per year on
6 electricity.

7
8 Q. Are there unique aspects to your Neosho operation which relate
9 to electricity use?

10 A. Our Neosho operation has been designed to operate with great
11 flexibility in its power consumption. While capable of
12 running at a very high load factor, the Neosho plant can
13 quickly adjust its production output while maintaining
14 efficiency, and change power demand by over two thousand kilo-
15 watts. Our Neosho plant has also been designed to interrupt
16 over 95% of its demand load on very short notice.

17
18 Q. How is Praxair dealing with its competitive challenges?

19 A. There is a renewed emphasis on customers and marketing
20 throughout the company. We are developing a better under-
21 standing of our customers and what is important to them.
22 Determining and providing for customers' needs and wants has
23 become even more of a priority. The demands of our customers
24 are often unique and varied, but if we do not accommodate

1 them, someone else will. One general theme we see is that
2 virtually all customers want options and choices.

3
4 It is important to realize that Praxair does not operate in a
5 "cost plus" business environment. We must meet market
6 clearing prices for our products or lose sales and ultimately
7 our markets to competitors. Our prices are set, not with
8 respect to our costs, but rather with respect to our markets.
9 The business of particular customers may be won, retained or
10 lost often on differences of mere pennies per 100 cubic feet
11 of product. Our costs do not determine the market or the
12 prices we charge. The market is insensitive to our cost of
13 production. Thus cost of production is extremely relevant,
14 not from a pricing standpoint, but as to whether we can make a
15 profit or even continue our business. This is quite different
16 from how regulation has historically functioned.

17
18 It follows from this that another theme is the key Praxair
19 strategy of cost minimization. Note that adequate quality is
20 a given, otherwise one would go out of business in a
21 competitive marketplace. Low costs are thus imperative to
22 success in the industrial gas industry, and we must give
23 constant attention to the reduction of costs in all areas.
24 Work processes have been re-engineered and overhead reduced.

1 Continuous improvement is demanded, as it is for most
2 industries today. For the years preceding 1996 and our
3 acquisition of Liquid Carbonic, our worldwide and U.S.
4 employment had declined by more than 6500 and 2200 respec-
5 tively, a proportion of over 25%. Competitive pressures have
6 forced significant cuts in our management, operational and
7 clerical staff at Neosho as well.

8
9 Many supplier agreements have been renegotiated with lower
10 pricing and better terms. Competitive bidding is being
11 actively employed. In fact, electricity is the one major cost
12 input in our business which can not yet be competitively
13 sourced on a universal basis even though the overall economic
14 benefits of doing should be apparent.

15
16 In other areas, competition for our business had assured us
17 wide choices of products and services at attractive pricing.
18 Competitive marketplaces have also resulted in a great deal of
19 useful innovation on the part of suppliers. This has always
20 been the case in competitive markets. As an example, with
21 regard to our substantial natural gas and long-distance
22 telephone usage (industries which were more recently
23 deregulated), we now enjoy much greater customer focus and
24 innovation on the part of suppliers. Deregulation in these

1 industries as well as others has resulted in a plethora of
2 appropriate products and services at competitive prices. We
3 have every reason to believe that similar benefits will be
4 realized in a competitive retail market for electricity.
5

6 Q. Are there other steps that Praxair has taken to better meet
7 its markets?

8 A. We also employ a process that we term "economic dispatch."
9

10 Q. Please explain.

11 A. Economic dispatch refers to our approach to track overall
12 costs and hold them to a minimum on a national basis.
13 Combining Praxair's incremental production and distribution
14 costs determines how much and when to produce at each plant
15 and how to distribute to customers in order to minimize
16 overall costs. Changes in power prices of one mill per kWh
17 can affect our distribution radius by many miles. We do this
18 through a process of tactical planning performed on a monthly
19 basis. A sophisticated program consisting of rigorous models
20 of customer demands and of our efficiencies, distribution
21 costs, and electricity costs for each of our production
22 facilities is utilized to perform this optimization. This
23 process results in assigning customers to plants and indicates

1 how much (and when) to produce at each location in order to
2 minimize our total cost over the specified planning period.

3
4 More frequent operational planning is done still within the
5 context of the monthly tactical plan. We adjust plant
6 operations and power consumption on a daily or hourly basis as
7 dictated by revised customer demands, inventory levels,
8 vehicle and driver availability, and real time electricity
9 prices where such information is available, all with the
10 objective of cost minimization.

11
12 Q. What is the role of electricity in Praxair's strategy for
13 addressing its competitive challenges?

14 A. Given electricity's strategic importance to us, it is mandato-
15 ry that we use and manage it well. High energy efficiencies
16 and competitively priced power are essential for us to
17 compete. Improving the efficiencies of our equipment,
18 processes, and technologies is an ongoing process. With
19 regard to competitive power sourcing, strategies which play a
20 role for us include:

21
22 (1) Development of innovative rates and contracts with
23 utilities, including interruptible rates, economic

1 development incentives, time-of-use and incremental
2 pricing, market-indexed pricing.

3
4 (2) Location of plants and expansion based upon
5 electricity considerations. We have shut down old
6 plants and started new ones a few miles away on
7 several occasions.

8
9 (3) Economic dispatch among plants based on production
10 and delivery costs to minimize total supply costs to
11 serve our customers. Even small power price changes
12 will affect distribution radius. The equivalent of
13 over 7 million kWh per day are distributed by truck
14 in North America.

15
16 (4) Use of alternative customer production technologies
17 which minimize the cost of the product.

18
19 (5) Large-scale cogeneration plants have been installed
20 by us in California and Texas. Small-scale options
21 are becoming more economical.

22
23 (6) Use of real-time pricing; further development of our
24 operating responsiveness, implementation of real-

1 time metering and communications, centralized
2 operations management and optimization.

3
4 (7) Load aggregation and the use of umbrella agreements
5 which cover multiple facilities.

6
7 (8) Participation in direct access and market pricing
8 pilot projects. Development of alternative
9 suppliers, including marketers, developers and other
10 utilities.

11
12 Q. Please elaborate on the use of direct access and market
13 pricing options by Praxair in its electricity sourcing.

14 A. The evolution in the retail electricity marketplace to
15 competition and choice is unquestionable as even the majority
16 of utility leaders will now attest. Regulatory studies,
17 legislative initiatives and direct access programs are now
18 progressing or under consideration in most states. Whatever
19 one calls it, be it "direct access," "retail wheeling," or
20 "market pricing," the ability of customers to source
21 generation competitively is resulting in increased options and
22 more favorable pricing.

1 Praxair is an advocate of a competitive retail marketplace in
2 electricity and is or will be participating in a variety of
3 "retail wheeling" and "market priced" programs. In Sterling,
4 Texas, Texas-New Mexico Power will source our incremental
5 usage from the competitive marketplace according to our
6 specifications. In Alberta, Canada, we have been buying
7 electricity under unbundled rates and an hourly generation
8 price based on power pool pricing. We are also served under a
9 variety of real-time pricing programs in North America
10 including Economy Surplus Power from TVA for our plant in
11 Memphis and Economy Power Service from the South Carolina
12 Public Service Authority for our plant in Camden.
13 Appropriately designed real time pricing (RTP) programs
14 without so-called access charges or guaranteed revenue levels
15 are often a good proxy for market prices.

16
17 At our Fife, Washington facility we have issued a request for
18 proposals for "non-portfolio" power. We are one of several
19 customers who will be negotiating with generation suppliers
20 for sale-for-resale arrangements through the local utility,
21 Tacoma Public Utilities. The use of non-portfolio power by
22 these retail customers will have the effect of displacing some
23 of TPU's wholesale electricity purchases. Also in Washington,
24 we expect to take service at Ferndale, Washington under Puget

1 Sound Power & Light's Optional Large Power Sales Rate. This
2 rate will provide power pricing that is indexed to the
3 Mid-Columbia power delivery point. We are also talking to
4 suppliers of risk management services to evaluate appropriate
5 hedging mechanisms for such market pricing.

6
7 For several of our facilities in Pennsylvania, we are
8 currently talking with potential suppliers and plan to take
9 service under Pennsylvania Power and Light's Retail
10 Competition Pilot Rider (Experimental). This program is
11 scheduled to commence on April 1, 1997. If approved, we also
12 expect to utilize interruptible buy-through tariffs in Ohio
13 which will enable customers to buy this service from
14 third-party suppliers. The availability of direct access and
15 market pricing options is growing rapidly, and we expect this
16 trend to continue.

17
18 Q. In addition to your experience, can you comment on the
19 experiences of others customers in direct access programs?

20 A. Yes, my counterparts in industrial user groups who are also
21 participating in pilot projects such as the ones in Illinois
22 (Illinois Power and Central Illinois Light Company) have
23 expressed their enthusiastic support of and satisfaction with
24 the programs. Administration of the programs is manageable,

1 there is a great deal of interest on the part of potential
2 suppliers in participating, and the terms, options and pricing
3 received by customers have been competitive.
4
5

6 Q. What would Praxair like to see happen with regard to its
7 electricity supply at Neosho?

8 A. The regional industrial gas marketplace demands that Praxair's
9 cost of electricity at Neosho be as low as possible. We need
10 to price power to be consistent with what we would find in a
11 competitive market for our business. This can best be
12 achieved through a "retail wheeling" or "market priced" option
13 through Empire which would provide us the opportunity to
14 source generation competitively while paying appropriate and
15 fair prices for transmission, distribution, and ancillary
16 services. A sale-for-resale arrangement in which Empire takes
17 title to the power would be acceptable. Such a program would
18 also have the benefit of enabling Empire to reduce its
19 substantial off-system purchases at often-times relatively
20 high marginal costs, and would give Empire valuable experience
21 with a competitive retail marketplace. Our consultant, Don
22 Johnstone, is preparing testimony which generally outlines a
23 proposal for a direct access pilot program for Empire.
24

1 Q. Does this conclude your testimony?

2 A. Yes it does at this time.

3

4 F:\DOCS\SWC\24428.2
