ITC Holdings Corp. Policy on Independence

1 **I. INTRODUCTION**

2 **A. Qualifications**

3 **Q54. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

4 **A.** My name is Joseph L. Welch. My business address is 27175 Energy Way, Novi,
5 Michigan 48377.

6
7 **Q55. BY WHOM ARE YOU PRESENTLY EMPLOYED AND IN WHAT**
8 **CAPACITY?**

9 **A.** I am employed by ITC Holdings Corp. (“*ITC*”) as President and Chief Executive
10 Officer (“*CEO*”).

11
12 **Q56. PLEASE DESCRIBE YOUR RESPONSIBILITIES AS PRESIDENT AND**
13 **CEO OF ITC.**

14 **A.** As CEO of ITC, I am responsible—directly or indirectly—for the overall strategic
15 direction, vision, and all operational aspects of ITC’s holding company and its
16 subsidiaries. ITC is the nation’s first, largest and only publicly-traded
17 independent transmission company. ITC’s four transmission company
18 subsidiaries that own transmission assets are International Transmission
19 Company, d/b/a *ITCTransmission* (“*ITCT*”), Michigan Electric Transmission
20 Company, LLC (“*METC*”), ITC Midwest LLC (“*ITCMW*”), and ITC Great
21 Plains, LLC (“*ITCGP*”). I am testifying on behalf of applicant ITC Midsouth
22 LLC, ITC’s fifth subsidiary that will own additional operating subsidiaries that in

1 turn will own transmission assets as described further in my testimony. ITC
2 Midsouth is a limited liability company organized and existing under the laws of
3 the State of Delaware.

4 **Q57. WHAT ARE YOUR EDUCATIONAL BACKGROUND AND**
5 **PROFESSIONAL CREDENTIALS?**

6 **A.** I have a Bachelor of Science degree in Electrical Engineering from the University
7 of Kansas. I am also a licensed Professional Engineer in the State of Michigan.

8
9 **Q58. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.**

10 **A.** Prior to working for ITC, I had a thirty-two year career at Detroit Edison
11 Company (“*Detroit Edison*”), where I held positions of increasing responsibility
12 in the areas of electric transmission, electric distribution, rates for service, load
13 research, marketing, pricing and regulatory affairs. Immediately prior to founding
14 ITCT, I was serving as Director of Transmission, where I led Detroit Edison’s
15 electric transmission area, the development of a business plan for the company’s
16 transmission system, and the resulting formation of ITCT. I was also a member of
17 the CEO’s corporate strategy team and the Management Council, responsible for
18 implementation of corporate strategy.

19 While at Detroit Edison, I was active with Regional Transmission
20 Organization (“*RTO*”) formation and integration. For six years I led Detroit

1 Edison's initial efforts to form the Alliance RTO,¹ and then the integration of its
2 transmission assets (by that time owned by its subsidiary ITCT) into Midwest
3 Independent Transmission System Operator ("**MISO**"). Therefore, my testimony
4 is based on my thirty-two years of working for a vertically-integrated utility,
5 including six years of working at the vertically-integrated utility to establish and
6 integrate into an RTO, and now nine years of running an independent transmission
7 company. Based on this experience, I wrote a book in 2009 called "Competitive
8 Electricity Markets: The Power of Choice" with my co-author C.J. Bolling about
9 the importance of wholesale competition in electricity markets to provide lower
10 prices for retail customers and the role of the transmission grid in facilitating the
11 greatest possible market liquidity.

12
13 **Q59. ARE YOU OR HAVE YOU BEEN A MEMBER OF ANY**
14 **ORGANIZATIONS OR WORKING GROUPS?**

15 **A.** Yes. I am involved in several business groups locally and nationally as a board
16 member or advisor. For instance, I am a Director and the current Vice Chair on
17 the Board of the Detroit Regional Chamber of Commerce and will serve as Chair
18 of the 2013 Mackinac Policy Conference. This conference brings together more
19 than 1,500 attendees from business, government, entrepreneurs, and regional
20 champions from across Michigan to discuss challenges and opportunities for

¹ The Alliance RTO members were Ameren, Consumers Energy, Detroit Edison, Exelon, First Energy, American Electric Power, and Virginia Power. The original proposal for an owner/operator Transco model was filed in June 1999 but ultimately was not approved by FERC.

1 success and establish a list of to-do's for the coming year to make the region and
2 the state more competitive. I am also on the Boards of Directors for the Detroit
3 Economic Club and Lotus Bank, where I serve as Chair of the Compensation
4 Committee.

5 In addition, I am a member of the Business Roundtable, a national
6 organization that brings together CEOs from various industries to play a
7 leadership role in developing policies that expand economic opportunity for all
8 Americans and am on the Energy and Environment Committee.

9 I have also participated in government policy groups like the Great Lakes
10 Wind Council created by former Michigan Governor Jennifer Granholm which
11 was an advisory body to examine issues and make recommendations related to
12 offshore wind development in Michigan.

13 Finally, because I believe it is important to train more of our nation's
14 students to become talented engineering professionals, I serve on the Advisory
15 Board for the College of Engineering at the University of Kansas.

16

17 **Q60. HAVE YOU PROVIDED TESTIMONY IN PRIOR PROCEEDINGS**
18 **BEFORE ANY STATE COMMISSIONS?**

19 **A.** I testified in numerous cases while I was an employee of Detroit Edison, which I
20 am not listing here. More recently and relevant to this proceeding, on behalf of
21 ITC, I testified in the following cases:

- 1 • Iowa: In Re: Interstate Power and Light Company and ITC Midwest, LLC;
2 IUB Docket No. SPU-07-11.
- 3 • Minnesota: In the Matter of the Joint Petition for Approval of Transfer of
4 Transmission Assets of Interstate Power and Light Company to ITC
5 Midwest LLC, MPUC Docket No. E-001/PA-07-540.
- 6 • Illinois: Interstate Power and Light Company and ITC Midwest LLC; ICC
7 Docket No. 07-0246.
- 8 • Additionally, I am sponsoring testimony before the Federal Energy
9 Regulatory Commission (“FERC”) and am testifying in Texas, Louisiana
10 and New Orleans, Arkansas, and Mississippi regarding the transaction that
11 is the subject of this proceeding.

12
13 **Q61. HAVE YOU PROVIDED TESTIMONY IN PRIOR PROCEEDINGS**
14 **BEFORE THE FEDERAL ENERGY REGULATORY COMMISSION**
15 **(“FERC”)?**

16 **A.** Yes. Again, I testified in several FERC cases while an employee of Detroit
17 Edison. Most recently and relevant to this proceeding, on behalf of ITC, I
18 testified in the following cases: Docket Nos. EL02-111; ER03-343 and EC03-40;
19 ER06-1006; ER07-95; EC07-89 and ER07-887.

20
21 **Q62. HAVE YOU TESTIFIED BEFORE CONGRESS?**

22 **A.** Yes. In the last three years I have testified twice before the House Energy and
23 Commerce Subcommittee on Energy and Power. I also testified once before the

1 Senate Energy and Natural Resources Committee on energy policy and legislation
2 and on FERC Order No. 1000.

3 **B. Purpose and Summary of Testimony**

4 **Q63. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

5 A. On December 4, 2011, Entergy Corporation, the Entergy Operating Companies,
6 and ITC entered into agreements under which Entergy Arkansas, Inc. (“*EAI*”)
7 and the other Entergy Operating Companies² will separate and then merge their
8 electric transmission businesses into ITC’s corporate structure.³ I will generally
9 refer to this separation and merger, collectively, as the “*ITC Transaction*” or
10 “*Transaction.*”

11 This is a multi-state transaction, involving Entergy Corporation’s electric
12 transmission businesses operating in Arkansas, Louisiana, Mississippi, Texas, the
13 City of New Orleans, and a small portion of Missouri. The Transaction is subject
14 to regulatory approval requirements in each of these jurisdictions, as well as the
15 FERC. The purpose of my testimony is to support the joint application submitted
16 by ITC and EAI seeking approval of the Transaction. In addition, I also support
17 the application of Transmission Company Arkansas LLC (or as I refer to it in my

² The other Entergy operating companies are Entergy Louisiana, LLC (“*ELL*”), Entergy Gulf States Louisiana, L.L.C. (“*EGSL*”), Entergy Mississippi, Inc. (“*EMI*”), Entergy New Orleans, Inc. (“*ENO*”), and Entergy Texas, Inc. (“*ETI*”). All of Entergy’s operating companies are referred to collectively as the “Entergy Operating Companies”.

³ Publicly available at:
<http://www.sec.gov/Archives/edgar/data/1317630/000119312511332173/0001193125-11-332173-index.htm>.

1 testimony “ITC Arkansas”) to be recognized and certificated as a public utility in
2 Missouri.

3

4 **Q64. CAN YOU PROVIDE A BRIEF OVERVIEW OF THE TRANSACTION?**

5 A. Yes. This is explained in more detail in the direct testimonies of ITC witness Mr.
6 Cameron Bready. Generally, the terms of the Transaction call for each Entergy
7 Operating Company to transfer its transmission assets into a separate wires
8 subsidiary (“Wires Sub”), and for the Wires Subs to be owned under a separate
9 subsidiary of Entergy Corporation, “Mid South TransCo, LLC” (hereinafter “Mid
10 South TransCo”). In Missouri, the Wire Sub will be Transmission Company
11 Arkansas, LLC which ITC will rename post-closing of the Transaction as ITC
12 Arkansas LLC (“ITC Arkansas”).⁴ The ownership of Mid South TransCo⁵ then
13 will be distributed to the shareholders of Entergy Corporation in the form of a tax-
14 free spin-off. Mid South TransCo then will merge with the newly-created
15 subsidiary of ITC, ITC Midsouth LLC, with Mid South TransCo being the
16 surviving entity but owned by ITC as part of its corporate family. In connection
17 with the Transaction, the ownership interests of Mid South TransCo held by
18 shareholders of Entergy Corporation will convert into shares of ITC common
19 stock. As witness Bready explains, this entire set of corporate actions is called a
20 Reverse Morris Trust (“*RMT*”) transaction and is more easily understood as a

⁴ For consistency and because ITC will change the name of Transmission Company Arkansas LLC to ITC Arkansas LLC post-closing, I will simply refer to Transmission Company Arkansas, LLC in my testimony as “ITC Arkansas.”

⁵ Note: In the Merger Agreement, these are referred to as “TransCo Common Units”.

1 “spin-merge” transaction. As part of this RMT structure, the merger phase will
2 result in shareholders of Entergy Corporation receiving shares that amount to 50.1
3 percent of ITC Holdings Corp. at closing of the Transaction.

4
5 **Q65. IN SUMMARY, WHAT WILL YOUR TESTIMONY ADDRESS?**

6 **A.** My testimony explains that the Transaction serves the public interest and should
7 be approved. With this Transaction, ownership of the transmission business of
8 each Entergy Operating Company will move to ITC – a fully independent
9 transmission company. As a result, wholesale and retail customers and other
10 stakeholders in the mid-South region will benefit from ITC’s superior business
11 model for owning and operating transmission systems. In my view, the
12 Transaction is critical to developing a robust, highly interconnected electric grid
13 that will efficiently and effectively meet this region’s future electrical energy
14 needs, and to further integrating the Entergy Operating Companies’ transmission
15 systems into the national energy grid that is being developed. This opportunity
16 for customers should not be lost.

17 My testimony is organized into the following parts:

- 18 • First, I discuss the evolution of the electric industry and, given that
19 evolution, how electric transmission must be viewed and addressed in
20 a new way to unlock the full benefits of a robust and fully-capable
21 grid. I believe this context is helpful in understanding the importance
22 of this Transaction.

- Second, I describe ITC and its business model. I explain what it means to be an independent transmission company, the impact of such independence, and how we run our company as a fully-independent transmission company. In describing ITC's business model, I also will highlight the benefits ITC will bring to Missouri and the mid-South region, which include: 1) ownership and operation of the transmission system by a company structured to ensure independent business decisions that drive value for all customers and treat all generators equally in all aspects; 2) operational excellence in transmission system performance, which results from a singular focus on transmission; 3) a regional approach to identifying the most effective transmission solutions and supporting more robust competitive wholesale power markets, which ultimately benefits customers; and 4) full dedication of capital and resources to the transmission system by a financially strong and capable company.
- Third, I discuss in more detail why the Transaction makes sense and is in the public interest. I explain further how the Transaction benefits customers and stakeholders in Missouri and the region, and discuss some practical matters related to post-Transaction operations of ITC.

Q66. ARE YOU SPONSORING ANY EXHIBITS AS PART OF THIS FILING?

A. Yes. In support of my testimony, I am sponsoring the following exhibits:

Exhibit JLW-1: ITC Holdings Corp. Policy on Independence

**II. OVERVIEW AND VISION FOR THE ELECTRIC TRANSMISSION
INDUSTRY**

**Q14. ARE YOU FAMILIAR WITH THE HISTORY AND DEVELOPMENT OF
THE ELECTRICITY INDUSTRY IN THE UNITED STATES?**

A. Yes. I have spent my entire 41 year career in the electric utility industry, and I have observed and been part of an incredible evolution that is still underway. Vertically-integrated electric utilities (that provide generation, distribution, and transmission service) became a dominant model for providing electric service in the early days of the industry. Today, there are over 220 investor-owned utilities, approximately 900 cooperative utilities, and approximately 2,000 publicly-owned municipal utilities operating their own systems for providing electric service to end-use consumers.⁶

For decades, electric transmission systems were developed and used by utilities in a balkanized fashion to serve local systems and an established customer base. While this model was used in the past, it will not be sufficient (let alone optimal) to meet the energy challenges of the future. Power is now brokered across multiple states and is increasingly integral to maintaining our technology-driven lifestyles. The price and availability of generation resources are in flux and pressure from growing global markets make the future energy mix uncertain.

⁶ See <http://www.nreca.coop/members/Co-opFacts/Pages/default.aspx>.

1 At the same time, the drive for more sustainable resources make it important to
2 access more diverse forms of electric generation. These other forms – like
3 renewables – are often located far distances from where electric service is needed
4 by many businesses and homes. Mandatory grid reliability standards are in place,
5 with new and revised standards still under development and becoming more
6 stringent, and financial penalties are being assessed for non-compliance. All of
7 these challenges will require investment in the nation’s energy infrastructure. In
8 order to meet these future needs, the way we view the transmission grid must
9 evolve.

10

11 **Q15. WHAT DO YOU MEAN WHEN YOU SAY “THE WAY WE VIEW THE**
12 **TRANSMISSION GRID MUST EVOLVE”?**

13 **A.** The electric transmission grid needs to be the strong backbone of our system for
14 delivering power to customers. It can (and in my view must) tie local electric
15 utility systems together, make more generation sources available to load, and
16 vice-versa, and make the whole system stronger and more reliable. Without a
17 strong grid, however, electricity service will continue to be provided through a
18 less effective, less efficient, and less reliable patchwork of local systems. The
19 2003 Northeast Blackout, for example, showed in real terms how local electricity
20 customers are affected by the regional grid, where failure by one company to
21 properly maintain and operate its transmission system ultimately allowed an event

1 that started with a single line tripping out of service to cascade to 50 million
2 people throughout eight U.S. states and Ontario, Canada.

3 To drive full value and capability for each end-use customer, we must
4 view electric transmission as part of building and maintaining a strong regional
5 grid. In fact, I think the national highway system is a great analogy to what the
6 future electric transmission grid should look like. The highway system connects
7 population centers within states and across the country. It provides a network to
8 move commerce efficiently to many destinations across the United States. Yes,
9 state highways existed prior to the national highway system. People and
10 commerce made it to their destinations along those roads. Yet, the multi-lane,
11 high speed national highway system that was planned to interconnect entire
12 regions is significantly more efficient and now an invaluable backbone for
13 interstate commerce that continues to be built even today. It is critical to our
14 economy and lifestyle to have this efficient and reliable way of traveling and
15 exchanging commerce. Similarly, a well-planned, highly interconnected, high-
16 voltage electric transmission system is needed to provide the backbone of our
17 system for getting energy to customers. Thus, our approach to transmission must
18 be modernized to more efficiently and reliably meet current and future energy
19 needs.

20

**Q16. HAVE RECENT REGULATORY DEVELOPMENTS SUPPORTED A
TRANSITION TO VIEWING TRANSMISSION IN THIS WAY?**

A. Yes. The implementation of open-access transmission service after FERC Order Nos. 888⁷ and 2000⁸ were helpful steps in fostering an evolution of balkanized transmission assets into a more regional system. The growth of RTOs is just starting to tie transmission systems together and allow greater power flows between utility assets. The most recent step in this migration just last year was FERC Order No. 1000,⁹ which promotes further optimization of regional planning and cost allocation, and continues the process of looking for interregional efficiencies.

**Q17. IN YOUR OPINION, ARE OPEN ACCESS REGULATION AND RTOS
SUFFICIENT TO ADDRESS ELECTRIC TRANSMISSION ISSUES?**

A. No. They are a step in the right direction, but standing alone, will not achieve the evolved model for transmission that is needed to tackle our nation's future energy challenges. Even with open access rules and RTO membership, the transmission owners (as the owners of the assets) drive the development, maintenance, and management of their transmission systems. Ownership of transmission must be structured to best support the grid as the regional backbone of our electric delivery system. Specifically, transmission must be owned by an entity that is

⁷ 75 FERC ¶ 61,080.

⁸ 89 FERC ¶ 61,285.

⁹ 136 FERC ¶ 61,051.

1 solely focused on transmission and independent of ownership in generation. With
2 such independence, the transmission owner can be purely dedicated to the grid for
3 the benefit of all transmission customers (without needing to weigh transmission
4 issues against its other lines of business), while taking an appropriately regional
5 view of the grid in addressing transmission issues.

6 While open access regulations have been implemented to provide
7 increased transparency and separation between transmission and generation
8 interests, they are not a substitute for independence.¹⁰ While I have not studied
9 the Entergy transmission system's practices, based on my experience, regulation
10 does not assure market participants that the transmission provider has a fully
11 unbiased view of the grid. Only full structural separation (achieved through the
12 independent transmission company model) fully eliminates the opportunity for
13 bias in decision making. As the Federal Trade Commission noted:

14 Although operational unbundling can make a transmission owner
15 powerless to discriminate in the operation of the grid, such an
16 owner still may have incentives and the ability to hold back on
17 expanding or maintaining the grid if that would reduce the
18 competition that its generation assets will face. Regulatory efforts to
19 prevent such behavior through regional transmission planning and
20 maintenance or through reliability standards are an ongoing
21 challenge. Vertically integrated utilities' full divestiture of
22 transmission assets to entities (whether for-profit or not-for-profit)
23 that are not vertically integrated could neutralize transmission
24 owners' incentives to underinvest in transmission. By contrast, an
25 independent Transco derives revenue solely from transmission

¹⁰ See FERC Standards of Conduct, 18 CFR § 358 (2011).

1 services and thus should have incentives to increase the use of
2 transmission.¹¹

3 Full structural separation eliminates any possible real or perceived tension
4 between generation and transmission and best aligns incentives for supplying
5 generation and building needed transmission.
6

7
8 **Q18. WHAT ROLE DO YOU SEE ITC PLAYING IN THE DEVELOPMENT OF**
9 **THE STRONG REGIONAL GRID YOU HAVE DISCUSSED?**

10 **A.** Given the importance of independence to support our needed electric transmission
11 grid, ITC is the industry leader. Unlike vertically-integrated utilities, ITC is
12 totally independent of energy buyers and sellers. Unlike RTOs, we own and
13 operate our transmission systems. Thus we can see the needs of the transmission
14 grid in a fully independent and regional manner, which is necessary to unlock the
15 full benefits of building a true backbone grid. We enjoy a unique perspective
16 regarding the challenges to, and opportunities provided by, a transmission grid
17 planned and developed by a fully independent transmission company with a
18 regional view. ITC is uniquely positioned to lead the evolution of the electric
19 transmission system to form the true backbone grid that I described above.

20 Because we are independent, no other line of business can affect our view
21 of transmission system needs or our dedication to addressing those needs. For

11 Comment of the Federal Trade Commission, Standards of Conduct for Transmission Providers, Docket No. RM07-1-00, May 7, 2008, fn. 17.

1 example, our transmission system operations allow us to see inefficiencies in the
2 grid, determine where repairs or upgrades are needed, and identify available
3 lower-cost generation in the market. We act on this information to optimize the
4 value of the transmission system for customers.

5 In addition, with respect to taking a regional view, we look across utility
6 and RTO boundaries to identify solutions to system needs that provide local and
7 regional benefits. One example that I will discuss in more detail later in my
8 testimony is the Green Power Express (“*GPE*”) project. As proposed, GPE would
9 stretch across the Upper Midwest to serve load centers in Chicago and beyond.
10 The existing RTO planning process was not structured to generate this idea.
11 However, ITC developed the idea by trying to find the best way to move growing
12 power generation development that exceeded local needs in the Upper Midwest to
13 load centers and markets where more power is used. As it turns out, GPE became
14 the impetus for a number of projects that are now part of MISO’s regional
15 transmission plan across the Midwest.¹²

16
17 **Q19. IS THIS APPROACH CONSISTENT WITH THE TYPE OF PLANNING**
18 **REQUIRED BY ORDER 1000?**

19 **A.** Yes. Order No. 1000 was designed to support the construction of needed regional
20 and interregional transmission projects and included the basic tenets ITC had been
21 advocating for prior to the Order’s issuance, such as larger coordinated planning

¹² “ITC’s Green Power Express, though Unlikely to be Built, is Agent of Change”, Transmission Hub dated 7/2/12 by Rosey Lum.

1 areas between regional and inter-regional entities. As a result, the policy
2 environment will be more conducive to efficiently meeting customers' needs
3 through a regional and interregional view.
4

5 **Q20. HOW IS THIS VIEW OF THE ELECTRIC INDUSTRY'S EVOLUTION**
6 **RELATED TO THIS TRANSACTION?**

7 **A.** As I have described, most effectively, efficiently, and reliably serving customers'
8 electric needs in Missouri, now and into the future, requires transformational, not
9 incremental, solutions. This Transaction is such a transformational step, which
10 will benefit customers in Missouri by bringing ITC's independent transmission
11 company approach to the region. At the same time, separating out the
12 transmission system will also strengthen EAI's focus on generation and
13 distribution. In that way, the Transaction will improve the provision of electricity
14 to end-use customers going forward.

15
16 **III. BENEFITS OF THE ITC BUSINESS MODEL AND THE TRANSACTION**

17 **Q21. CAN YOU SUMMARIZE HOW THIS PARTICULAR TRANSACTION**
18 **SERVES THE PUBLIC INTEREST?**

19 **A.** I sum up the various benefits of the Transaction this way: it is better for ITC to
20 own and operate the transmission system. I am proud of our company and the
21 role we play as a good steward of the electric transmission grid. I believe our
22 independent transmission company model is a superior way for electric

1 transmission assets to be owned and operated. By extension, I believe the public
2 interest will be served by our independent transmission company model.

3 Specifically, through the Transaction, customers will benefit from: 1)
4 ITC's independence from all buyers and sellers of electric energy, which means
5 our pure and total dedication is to being a good steward of the electric
6 transmission grid; 2) ITC's singular focus on electric transmission, which drives a
7 dedication to transmission service, operational excellence, and expertise in
8 transmission; 3) enhancement of the benefits of the wholesale energy market,
9 through ITC's regional view, improvement of the transmission grid, and its
10 structural separation from users of the transmission grid; and 4) ownership of the
11 transmission business by a financially strong and capable entity, whose resources
12 are fully dedicated to the capability and performance of the transmission system.

13

14 **Q22. CAN YOU EXPLAIN EACH OF THESE BENEFITS IN MORE DETAIL?**

15 **A.** Yes. A good way to explain these benefits is to describe who ITC is and how we
16 operate our business. I will first describe the company's overall structure and
17 history. Then I will further explain the four beneficial attributes of our
18 independent transmission company business model that drive benefits for
19 customers.

A. Independent Business Model

Q23. PLEASE PROVIDE AN OVERVIEW OF ITC.

A. ITC is an independent transmission company. Our business is owning, planning, constructing, operating, maintaining, and investing in electric transmission infrastructure. We have a singular focus on being an excellent owner and operator of electric transmission systems.

I have a passion for electric transmission and the value it provides. I find that our employees are proud of the role they play in the energy industry. They are dedicated to making the grid strong, improving and maintaining electric reliability, economically reducing congestion, and lowering the overall cost of delivered energy for customers.

At ITC, we talk about being a solid team that stays dedicated to consistently achieving operational excellence and “doing the right thing” for the grid and its customers. A lot of companies may speak in those terms about their goals, but the difference at ITC is that all of our aspirations, goals, and efforts are focused solely on electric transmission.

Q24. HOW WAS THE COMPANY FORMED?

A. In 2001, Detroit Edison organized its transmission business as a separate corporate subsidiary named International Transmission Company. I was Director of Transmission at Detroit Edison at that time, and I led the development of a business plan for creating an independent transmission company. On February

1 20, 2003, FERC approved an order authorizing the sale of International
2 Transmission Company to ITC Holdings Corp.¹³ Upon the close of that
3 transaction, International Transmission Company (now doing business as
4 ITC*Transmission*) became a fully independent transmission company, operating a
5 transmission system in Southeast Michigan.

6

7 **Q25. HOW HAS THE COMPANY GROWN SINCE THEN?**

8 **A.** ITC is an excellent model for owning and operating transmission systems and
9 meeting the important needs of the grid so the company has grown rapidly. Also,
10 the company has looked for and implemented opportunities to grow its business
11 model into new geographic areas, where possible.

12 ITC Holdings Corp. completed an initial public offering (“*IPO*”) in July
13 2005, and became a publicly traded company listed on the New York Stock
14 Exchange. At that time, the company implemented additional measures approved
15 by FERC to assure its continuing independence.¹⁴

16 In October 2006, ITC completed the acquisition of METC.¹⁵ METC owns
17 the former transmission assets of Consumers Energy, which cover the western
18 part of Michigan’s Lower Peninsula.

¹³ 102 FERC ¶ 61,182 (“This order benefits customers because the transfer of transmission facilities to an independent entity is one of the most effective means of separating transmission interests from generation interests and achieving independence through a for-profit transmission company.”); *Order Denying Rehearing and Accepting Compliance Filing*, 104 FERC ¶ 61,033 (2003).

¹⁴ 111 FERC ¶ 61,149 (2005).

¹⁵ 116 FERC ¶61,271 (2006).

Also in 2006, ITC formed ITC Grid Development, LLC to pursue the development of regional transmission projects in new areas. As part of this effort, ITCGP was established that year to partner with local utilities in the construction of needed transmission in the Southwest Power Pool (“*SPP*”) region. Since then, ITCGP has become authorized to conduct business in Kansas and Oklahoma, owns and operates transmission facilities in those states, and is a transmission owning member of SPP.

In December 2007, a new ITC subsidiary named ITC Midwest acquired the transmission assets of Interstate Power and Light.¹⁶ ITCMW’s assets are located in parts of Iowa, Minnesota, Illinois, and a short part of a transmission line that passes through Missouri.

In 2009, ITC formed Green Power Express, LLC to build, own, and operate high-voltage regional transmission in the Upper Midwest to allow emerging renewable energy to be transported to load centers further east.

Q26. PLEASE DESCRIBE ITC’S CURRENT OPERATIONS.

A. Today, ITC’s subsidiaries own and maintain approximately 15,000 transmission line miles in seven states operating in two RTO’s. Those assets serve a combined system peak load of over 26,000 megawatts. Our corporate headquarters are located in Novi, Michigan, with regional headquarters for ITCMW in Cedar Rapids, Iowa and ITCGP in Topeka, Kansas. We also maintain a number of

¹⁶ 121 FERC ¶ 61,229 (2007).

1 warehouses, office space, and a backup control center across ITC's geographic
2 footprint to support local operations.

3 ITC's two Michigan transmission companies, ITCT and METC, operate
4 contiguous, transmission systems in Michigan's lower peninsula that transmit
5 electricity to local electricity distribution facilities from generating stations
6 throughout Michigan and the surrounding region. In total, ITCT and METC serve
7 a combined peak load of roughly 22,400 megawatts and have more than 8,300
8 miles of transmission lines.

9 ITCMW operates a contiguous system in parts of Iowa, Minnesota, Illinois
10 and Missouri that serves a peak load of roughly 3,700 megawatts. ITCMW has
11 more than 6,600 miles of transmission lines. The transmission facilities owned by
12 ITCT, METC and ITCMW are under the functional control of MISO.

13 ITCGP owns and operates two stations in Kansas and two new
14 transmission lines in Kansas and Oklahoma (known as Kansas Electric
15 Transmission Authority ("**KETA**"), Phase I and Hugo-Valliant, respectively) that
16 are under the functional control of SPP. In addition to completing KETA Phase II
17 later this year or early next year, ITCGP is engaged in constructing a portion of
18 the Kansas V-Plan project, which is due to be in service in 2014. Together,
19 ITCGP's three new high-voltage transmission projects in the SPP region will
20 result in 314 miles of new 345 kV transmission lines.

1 **B. First Beneficial Attribute: Independence**

2 **Q27. WHAT DO YOU MEAN WHEN YOU SAY THAT ITC IS AN**
3 **INDEPENDENT TRANSMISSION COMPANY?**

4 **A.** ITC's only line of business is electric transmission, and the company is structured
5 to be free from influence by entities that buy or sell energy as a commodity. ITC
6 does not own generation or distribution assets, or fuel suppliers, and it makes no
7 retail or wholesale electricity sales. In addition, unlike other companies that have
8 set up stand-alone transmission companies, ITC is not owned by utility
9 companies, the holding companies of utilities, or entities that buy or sell energy as
10 a commodity. The company also maintains corporate governance rules that
11 protect its independence.

12
13 **Q28. WHAT GOVERNANCE RULES DOES ITC MAINTAIN TO PROTECT**
14 **ITS INDEPENDENCE?**

15 **A.** First, in order to safeguard its independence and abide strictly by all conditions
16 that have been imposed by FERC in connection with its independence
17 designation, ITC has developed a Policy on Independence that is posted on the
18 Open Access website of each of its operating subsidiaries. A copy of that Policy
19 is attached to my testimony as **Exhibit JLW-1**.

20 Under the Policy on Independence, all members of the company's Board
21 of Directors and management, as well as all employees, are prohibited from
22 having any "direct financial interest in, or a financial conflict of interest with, any

1 Market Participant¹⁷, or an Affiliate of any Market Participant.” In addition,
2 contractors or consultants employed by ITC must disclose any direct financial
3 interest in any market participant, or any affiliate of a market participant. ITC
4 retains the right to disqualify a contractor should it deem such an affiliation to
5 create a conflict of interest.

6 Second, ITC’s Articles of Incorporation restrict potential ownership of
7 stock in the company by market participants to avoid any influence on the
8 company that could hinder its independence. Under the Articles of Incorporation,
9 a market participant (or a group containing a market participant) is generally
10 restricted from owning more than five percent of any class of ITC stock, and in
11 any event may not vote shares of the company in excess of 5% of ITC’s stock.

12 If a holder owns more than 5% of ITC’s stock, it is required by SEC rules
13 to make an annual disclosure to the company. The Board of Directors then starts
14 an investigation into whether each such shareholder is a market participant, and
15 the Board has the right to redeem shares in excess of 5% ownership held by any
16 such market participant. ITC also is required to inform FERC when it receives
17 notification that a market participant has acquired 5% or more of ITC’s stock so
18 that FERC may conduct its own, independent investigation of the market
19 participant status of such a shareholder.

20

¹⁷ Market Participant is defined at 18 C.F.R. § 35.34(b)(2).

1 **Q29. CAN YOU DESCRIBE THE IMPACT OF INDEPENDENCE ON HOW ITC**
2 **BEHAVES AS A COMPANY?**

3 **A.** Yes. Because our corporate family has absolutely no interest in any other line of
4 business, our pure and total dedication is to being a good steward of the electric
5 transmission system. That pure perspective starts at the top of our company and
6 flows through to employees at all levels of the company.

7 Market participants are restricted from exercising influence over the
8 company as shareholders. Each member of our Board of Directors and
9 management is individually free from market participant influence. Our
10 management team and employees are people who have chosen to dedicate
11 themselves to supporting the electric transmission grid, with no influence from
12 market participants. We are totally dedicated to being a non-discriminatory
13 provider of transmission service and view all interests related to the transmission
14 grid in a non-discriminatory manner. This is not only a function of the regulations
15 or directives applicable to ITC; it is who we are as a company and how we are
16 structured.

17 Having worked at a traditional vertically-integrated utility, I am familiar
18 with the challenges of being a generation, distribution and transmission provider
19 under one roof. A vertically-integrated utility has multiple business lines to
20 oversee, with transmission typically being the smallest. Across the electric
21 industry, transmission is typically about 10% of the asset base of a utility

1 compared to 60% for generation and 30% for distribution.¹⁸ Having spent most of
2 my career in a traditional, integrated utility model, and now leading a truly
3 independent transmission company for almost a decade, based on my personal
4 experience I believe that independence drives a stronger dedication to being an
5 open-access transmission provider for the benefit of all customers of the grid.
6 With an independent transmission company, the fact is that transmission is always
7 in the spotlight, and there is no potential for other lines of business to diminish
8 our total dedication to being a good steward of the electric transmission system.

9

10 **Q30. PLEASE PROVIDE A PRACTICAL EXAMPLE OF THE IMPACT OF**
11 **INDEPENDENCE ON ITC'S APPROACH TO TRANSMISSION.**

12 **A.** One area where independence is particularly important is transmission planning.
13 We pro-actively identify and pursue transmission projects purely based on the
14 needs of the transmission system, have more opportunity for customer and
15 stakeholder engagement, and (due to our regional focus) can take a broader view
16 of the transmission system's needs. Our planning approach is explained in ITC
17 witness Thomas Vitez's testimony, but I will discuss some aspects of it here.

18 In its transmission planning process, ITC identifies, proposes, and pursues
19 needed projects by reviewing the needs of the transmission system. Our
20 independence provides the highest assurance that these decisions cannot be

¹⁸ While the transmission component of a customer's bill may vary by customer class and by region, the U.S. Department of Energy estimates that transmission comprises eight percent of a customer's bill. *See e.g.,* Energy Information Administration, "Major Components of U.S. Average Electric Price, 2010," available at: http://www.eia.gov/energyexplained/index.cfm?page=electricity_factors_affecting_prices.

1 influenced by market impacts to a particular generating facility or owner unless it
2 has benefits for the consumer.

3 Importantly, while RTOs have regional planning processes, the results of
4 those processes depends on projects being proposed. As Mr. Vitez explains, the
5 RTO planning process is mainly “bottom-up,” meaning that the RTO evaluates
6 projects submitted by local transmission owners and stakeholders. For this
7 reason, the consideration of projects is to a large degree a function of the
8 objectives of the transmission planner.

9 Overall, as a result of our independent model, ITC looks at the
10 transmission system broadly to evaluate the most efficient, long-term solutions for
11 regional system needs. ITC looks within and outside of its own footprint for
12 solutions that will benefit customers now and in the future, and this view plays an
13 important role in defining the projects that ITC proposes in RTO planning
14 processes. In contrast, a transmission owner who views planning narrowly,
15 looking only within its footprint, may propose a project that is not regionally
16 optimized because it does not have the broader view of regional possibilities in
17 mind. Again, while RTOs have their regional planning processes, individual
18 transmission owners have a significant role in identifying and determining what
19 projects to propose in that process.

20

**Q31. DOES INDEPENDENCE IMPACT ITC'S APPROACH TO CUSTOMER
AND REGULATOR INTERACTIONS IN TRANSMISSION PLANNING?**

A. Yes. We supplement our own studies by engaging in regular communication with customers, stakeholders, and regulators to seek input on various issues, including planned projects and the needs of the transmission system. An example is our Partners in Business ("**PIB**") meetings, where we meet with stakeholders and, among other topics, gather information about the needs of customers and stakeholders, seek opportunities to improve the reliability and quality of electric transmission services and operations, and solicit economic development intelligence to guide our planning process. In fact, we have established goals for meetings with our customers, which are: 1) listen to customers and respond to their needs; 2) lead teams of subject matter experts to identify challenges, foster creative alternatives and drive solutions through implementation; 3) seek opportunities to improve the reliability and quality of stakeholders' electric transmission services and operations; 4) solicit economic development intelligence to share in planning; and 5) facilitate construction meetings and the monitoring of key activities and deliverables. The testimony of ITC witness Mr. Thomas Wrenbeck provides greater detail about ITC's stakeholder relations. This is above and beyond MISO's planning process, where we also meet with stakeholders, federal and state regulators, utility generation owners, non-utility generators, and consumer representatives to review and debate the results of the planning models and proposed projects. This MISO stakeholder group also

1 evaluates generation and demand response alternatives to proposed transmission
2 projects.

3

4 **Q32. WILL THE TRANSACTION NEGATIVELY IMPACT ITC'S**
5 **INDEPENDENCE?**

6 **A.** No, not at all. Importantly, the ITC common stock being issued in connection
7 with the Transaction will be issued directly to shareholders of Entergy
8 Corporation – not to Entergy Corporation itself. In addition, all the corporate
9 governance requirements that protect our independence will remain in place. The
10 restrictions on market participant stock ownership will continue to apply to all
11 ITC shareholders (including the Entergy Corporation shareholders that receive
12 ITC stock at closing of the Transaction). Our Board of Directors and management
13 will remain independent of market participants (including the two new Board
14 members our existing Board will add, in accordance with the Merger Agreement).
15 Also, our Policy on Independence will continue to apply to all our employees,
16 including the personnel from the Entergy Operating Companies and Entergy
17 Services, Inc. (“*ESI*”) who join ITC as part of the Transaction. As a result, these
18 employees will be required to divest any direct financial interest in a market
19 participant, including ownership of Entergy Corporation stock, within the FERC-
20 approved timeframe.

21 As part of the Merger Agreement, Entergy Corporation has an option to
22 transfer some of its ownership interests in Mid South TransCo to a trust. Upon

1 closing of the Transaction, those interests would convert into shares of ITC
2 common stock. For a period up to six months following the closing of the
3 Transaction, Entergy Corporation would be able to direct the trustee to offer
4 Entergy Corporation shareholders to exchange their shares of Entergy Corporation
5 common stock for shares of ITC common stock out of the trust. At the end of the
6 six month period, any shares remaining in the trust would be distributed to the
7 Entergy Corporation shareholders on a pro rata basis. The number of shares that
8 could be held in this trust is capped at less than 5% of ITC's outstanding shares,
9 and the trustee would be required to vote in accordance with the votes of the other
10 holders of ITC stock, not at the direction of Entergy Corporation. ITC agreed to
11 this trust exchange arrangement as part of the Transaction because it carries with
12 it sufficient restrictions to protect ITC's independence and, under the Merger
13 Agreement, it must be approved by FERC for it to be utilized.

14 **C. Second Beneficial Attribute: Singular Focus**

15 **Q33. WHAT DO YOU MEAN WHEN YOU SAY THAT ITC'S SINGULAR**
16 **FOCUS ON TRANSMISSION IS A POSITIVE ATTRIBUTE OF ITS**
17 **BUSINESS MODEL?**

18 **A.** I mean simply that ITC's only business is being an owner and operator of electric
19 transmission systems, so we strive to be the very best transmission company. Our
20 management team focuses only on transmission and our employees are specialists
21 in transmission. I doubt the CEO of a vertically-integrated utility often gets
22 significant questions from his or her Board regarding transmission performance

1 because it is such a small component of the business. However, as the CEO of
2 ITC, I wake up every morning thinking about transmission and am accountable to
3 the ITC Board of Directors for the performance of our systems. This singular
4 focus drives specialization throughout the organization and stronger performance.

5 **Q34. CAN YOU DESCRIBE THE BENEFITS DERIVED FROM THIS**
6 **SINGULAR FOCUS?**

7 **A.** Yes. Each year the company sets goals for itself, which shows where we put our
8 focus. In summary, those focus areas are: 1) operational excellence, particularly
9 in the areas of transmission system reliability, maintenance, compliance, safety,
10 and efficient operations; and 2) capital investments and improvements to the
11 transmission system. In addition, as part of our singular focus on transmission,
12 we also work hard at actively engaging with transmission stakeholders and the
13 communities where we operate, as well as being a good corporate citizen as a
14 transmission company.

15

16 **Q35. CAN YOU FURTHER DESCRIBE HOW ITC'S SINGULAR FOCUS ON**
17 **TRANSMISSION IMPACTS SYSTEM RELIABILITY?**

18 **A.** With a singular focus on electric transmission, ITC pursues operational excellence
19 which is measured by strong transmission system performance. ITC witness Mr.
20 Jon Jipping provides detailed testimony about ITC's approach to improving
21 transmission system reliability, which illustrates the value of our singular focus.
22 As Mr. Jipping explains, important elements of ITC's approach to transmission

1 system reliability include preventive maintenance, proactive investment plans to
2 improve system performance and reduce customer outages, and a strong
3 dedication to compliance with all North American Electric Reliability Corporation
4 (“*NERC*”) reliability standards. This approach pays off in measurable ways.

5 ITC has a strong track record of improving the performance of every
6 transmission system it owns. Our goal is for the transmission system of each ITC
7 operating company to achieve top decile reliability performance. We have
8 achieved that for our longest-standing operating companies, ITCT and METC,
9 and we see continued improvement toward that goal for ITCMW. As ITC witness
10 Mr. Douglas Collins explains, ITCMW performance has improved significantly
11 and continues to trend in a positive direction. Overall, for 2011, ITCMW was in
12 the third quartile for sustained outage performance and the second quartile for
13 average duration of circuit outages. In the 100 kV and above category, ITCMW is
14 top decile for average circuit momentary outages and top quartile for average
15 circuit outages and duration in 2011. In 2010, ITCMW’s overall performance was
16 in the fourth quartile for sustained outages and the third quartile for outage
17 duration so we are making great progress.

18

19 **Q36. HOW DOES ITC PRIORITIZE SAFETY?**

20 **A.** Safety must be – and is – our top priority. Given all the maintenance and capital
21 investment work we have done on our existing transmission systems, we have a

1 lot of work going on in the field. Safety comes before everything else to make
2 sure everyone makes it home safely at night.

3 Our strong commitment to safety is evident in our safety statistics. ITC
4 witness Jon Jipping explains in detail how we approach safety at ITC but I would
5 like to highlight that here again we are a top performer in the industry. All
6 employees receive regular safety training in addition to job-specific training.
7 Protective equipment is never optional and we do regular safety audits to ensure
8 compliance with safety standards. We also have safety briefings twice a day for
9 field work to make sure all safety issues are being addressed in a timely manner.
10 Even minor safety incidents are thoroughly reviewed to identify lessons learned
11 and make changes as appropriate. We like to say that everyone's first job is to go
12 home safely to their families at the end of the day. We would continue this
13 approach in our operations and work in the EAI region.

14

15 **Q37. DOES YOUR SINGULAR FOCUS AS A COMPANY TRANSLATE TO**
16 **EMPLOYEES?**

17 **A.** Yes. As a company, we have an acute focus on achieving solid transmission
18 system performance because that is our only business. As a result, we have an
19 added ability to attract and retain personnel with high levels of interest and
20 expertise in electric transmission.

21 Our focus on transmission also puts us in a better position to help address
22 the near-term shortage of skilled workers, particularly power engineers. In a 2009

1 report, the U.S. Power and Energy Engineering Workforce Collaborative noted
2 that approximately 45% of U.S. electrical engineers would be eligible for
3 retirement or could leave engineering for other reasons in the subsequent five
4 years. This translates to over 7,000 highly-skilled engineering roles which must
5 be filled if the grid is to remain functioning at its current level.¹⁹ We are driven to
6 maintain a skilled workforce to meet our performance objectives and therefore
7 focus heavily on training our force in the field and the control room.

8 Through the Transaction, ITC will add the expertise of Entergy
9 transmission employees and leverage any transmission-related and storm response
10 best practices utilized by EAI. Entergy transmission employees' knowledge of
11 the history and conditions of the Entergy transmission system will be extremely
12 valuable, especially when coupled with ITC's independent business model. These
13 experienced transmission professionals will get to work in a company where
14 transmission is the only focus. For its part, EAI will be able to focus all of its
15 attention and effort specifically on generation and distribution – which I believe
16 will similarly enhance its focus and expertise in those areas. I see this as part of
17 the benefits of the Transaction.

18

¹⁹ “Preparing the U.S. Foundation for Future Electric Energy Systems: A Strong Power and Energy Engineering Workforce”, U.S. Power and Energy Engineering Workforce Collaborative, available at: http://www.ieee-pes.org/images/pdf/US_Power_&_Energy_Collaborative_Action_Plan_April_2009_Adobe72.pdf.

1 **Q38. DOES A SINGULAR FOCUS ON TRANSMISSION HELP ITC OPERATE**
2 **EFFICIENTLY?**

3 **A.** Yes. First, we believe that a critical part of operational excellence is being a cost-
4 efficient transmission provider. We take care with the costs of our business,
5 knowing that our expenses translate to charges recovered from users of the
6 transmission system, and ultimately from end-use consumers. Thus, in
7 conducting our business and maintaining our transmission systems, we look to
8 drive the most value over time and be cost efficient. ITC witness Mr. Jon Jipping
9 describes in more detail how the singular focus drives operational efficiencies.

10 In addition, because we are dedicated to applying operational excellence
11 solely in the area of electric transmission, we are able to achieve operational
12 efficiencies in the process. This is achieved through specialization and
13 standardization. Just like Southwest Airlines flies only one type of airplane across
14 its fleet so that everyone knows the equipment well, ITC attempts to utilize
15 standard equipment when possible to drive greater efficiencies. For example, in
16 the area of maintenance, ITC has reduced the average amount of time it takes to
17 complete a breaker replacement from six weeks to two weeks. This is because we
18 have developed a consistent process with standard materials and are doing more
19 of them so we are more efficient.

20 We also have worked to develop strategic alliance relationships with our
21 vendors as ITC witness Jon Jipping discusses, which has helped us ensure that
22 needed equipment is available to meet our project timelines. We purchase a large

1 volume of transmission equipment each year to support our capital plans and have
2 leveraged that purchasing power into better pricing for equipment. With the
3 increased size resulting from the Transaction I am hopeful we could successfully
4 pursue further efficiencies.

5

6 **Q39. CAN YOU FURTHER DESCRIBE HOW ITC'S SINGULAR FOCUS ON**
7 **TRANSMISSION IMPACTS ITS APPROACH TO INVESTING IN AND**
8 **IMPROVING THE TRANSMISSION SYSTEM?**

9 **A.** As stated above, ITC studies the transmission system and engages with customers
10 and stakeholders to identify and pursue needed capital investment projects and
11 other improvements. For instance, when we first purchased ITCT, we quickly
12 began to work with the RTO to change the Available Flowgate Capacity ("**AFC**")
13 calculations to eliminate some artificial barriers in the form of excessive or
14 overlapping reliability margins. This change allowed more economic power to
15 flow on the system more often.

16 Where system investment is needed, we move aggressively to complete
17 those projects. Due to our singular focus, we champion the needs of the
18 transmission system and turning transmission project plans into reality. In
19 systems it has previously acquired, ITC has completed capital projects targeted at
20 remediating the industry-wide effects of decades of underinvestment, improving
21 reliability, providing non-discriminatory access to transmission, promoting
22 competition in electric energy markets and facilitating interconnection of new

1 generation and load. These investments have been fully vetted as part of the
2 applicable RTO planning process.

3 As documented in ITC witness Cameron Bready's testimony, from ITCT's
4 first year of operation as an independent transmission company in 2003 through
5 June 2012, the total capital investments for ITC's operating companies were
6 approximately \$3.0 billion, an amount that averaged two times cash flow from
7 operations. ITC witnesses Jon Jipping and Thomas Vitez also discuss in further
8 detail ITC's efforts to improve the transmission systems it owns and our
9 independent planning approach to identify and pursue those capital investment
10 projects.

11
12 **Q40. DID THE ITC OPERATING COMPANIES MAKE PARTICULAR**
13 **INVESTMENTS YOU WOULD LIKE TO HIGHLIGHT? IF SO, PLEASE**
14 **EXPLAIN.**

15 **A.** Yes. As ITC witness Thomas Vitez explains in detail, ITCT completed the Jewell-
16 Spokane project in 2004. That project in southeast Michigan was a one-time
17 \$10.2 million investment that is estimated to provide *annual* net benefits of over
18 \$60 million, with a benefit to the ITCT footprint alone of over \$64 million.²⁰
19 This project was originally identified in 1988 by the previous owner who decided
20 to operate around the constrained facility instead of relieving it.

²⁰ Richard D. Tabor testimony, FERC Case No. EC01-137-002, Exhibit IT-200, pg. 12.

1 Similarly, ITC witness Douglas Collins speaks to additional key
2 investments currently taking place at ITCMW. ITCMW is in the process of
3 constructing the Salem-Hazelton project, a new 80 mile 345 kV line to improve
4 reliability in eastern Iowa and improve market efficiency by reducing
5 transmission congestion. In 2006, MISO found that the construction of the
6 Salem-Hazelton line would reduce annual load and production costs by over \$108
7 million compared to an estimated total cost of the line of \$123 million. Although
8 the need for the line was recognized for several years prior to 2006 by the prior
9 owner, it was not built due to competing needs of available capital.

10 I am also proud to talk about what ITC has done in Kansas. After the state
11 government became frustrated with the pace of transmission development in
12 Kansas, it established the KETA to define, and if necessary, finance needed
13 transmission. KETA worked with stakeholders to identify and study a project
14 from Spearville, Kansas to a new substation north of Hays, Kansas and continuing
15 north to Axtell, Nebraska. KETA sought companies to make the Kansas portion
16 of this project a reality. ITC stepped up through ITCGP and was selected to build,
17 own and operate this 345 kV project. In June 2012, the 89-mile Phase I of the
18 KETA project went into service under budget. We anticipate that Phase II of the
19 KETA project will be in service by the end of 2012, also under budget and
20 delivering benefits to the region approximately 6 months ahead of the SPP
21 planned in-service date.

1 ITCGP is now working to acquire land and begin construction on its next
2 big Kansas project, the Kansas V-plan, a double-circuit 345 kV line from
3 Spearville substation south to the new Clark County substation, and east to the
4 new Thistle substation near Medicine Lodge, Kansas in Barber County. This
5 project will connect eastern and western Kansas to improve electric reliability and
6 enable energy developers to tap into the transmission grid, further establishing a
7 competitive energy market in the state. ITC witness Mr. Jon Jipping has more
8 information on these projects in his testimony.

9

10 **Q41. WITH SUCH A FOCUS ON TRANSMISSION INVESTMENT, IS THERE**
11 **A RISK OF OVERBUILDING?**

12 **A.** No. Our proposals for capital investment projects are generated by the needs of
13 the transmission system (resulting from our studies on the system and feedback
14 from customers and stakeholders). Then, through the open and transparent RTO
15 planning processes, project proposals are vetted to assure they solve an identified
16 need. As described in the direct testimony of ITC witness Mr. Thomas Vitez, the
17 MISO Transmission Expansion Plan (“*MTEP*”) process provides a forum for
18 interested parties to review MISO studies of proposed projects and propose
19 transmission and non-transmission alternatives. If conflicting solutions cannot be
20 resolved by the sponsoring parties, MISO makes the final determination as to
21 what project should be submitted for approval. Also, as discussed earlier, ITC
22 also maintains regular communications with regulators, customers and

1 stakeholders above and beyond the RTO processes to make sure we are
2 addressing their needs and concerns. Thus, capital project plans are generated
3 based on need and thoroughly vetted in various review processes before any
4 project is initiated.

5 Importantly, the avenues to stop a transmission owner from making
6 unneeded investments are much stronger than the avenues available to require an
7 owner to make needed investments. For regulators in particular, the model of ITC
8 within an RTO is significantly more effective at achieving a desired transmission
9 system than the status quo. In the RTO process, retail regulators have access to
10 existing RTO resources for planning data and inquiries and discussions with
11 independent RTO experts that are more comprehensive and cost effective than
12 each jurisdiction retaining its own experts and attempting to evaluate needs
13 individually.

14 Also, as a practical matter, the need for transmission investment remains
15 significant.²¹ Failing to make necessary transmission investments prevents
16 improvements to grid reliability and misses opportunities to economically relieve
17 congestion. The real risk for end-use consumers is failing to complete justified
18 transmission investment that would provide access to those opportunities,

²¹ See American Society of Civil Engineers, *Failure to Act: The Economic Impact of Current Investment Trends in Electricity Infrastructure* (April 2012) available at: http://www.asce.org/uploadedFiles/Infrastructure/Failure_to_Act/energy_report_FINAL2.pdf. Concludes that increased investment trends of recent years will still result in a transmission investment gap of approximately \$112 billion by 2040.

1 particularly considering that transmission is such a small part of end use
2 consumers' bills.

3 Finally, as Mr. Vitez explains, we are extremely protective of our
4 reputation and understand that it is shaped by our performance as a transmission
5 company. We know our stakeholders and regulators monitor our business, and the
6 future success of our business model to a large extent depends on our reputation.
7 We want to make sure we maintain a reputation as a prudent investor in the
8 transmission grid and review each project alternative to identify the best long-
9 term value.

10

11 **Q42. ASSUMING THE TRANSACTION CLOSES, WILL ITC ALSO BE**
12 **FOCUSED ON INVESTING IN THE TRANSMISSION SYSTEM IN THE**
13 **REGION**

14 **A.** Yes. ITC witnesses Jon Jipping and Thomas Vitez discuss our approach to future
15 investment, but generally ITC would expect to complete any in-progress
16 transmission projects and follow through on near-term planned projects. The
17 Entergy Operating Companies' current investment plans indicate that we will be
18 making significant capital investments of approximately \$500 million annually in
19 the transmission systems across the Entergy Operating Companies.

20 In the longer term, after starting with the existing Entergy Operating
21 Company capital plans as a base, ITC will apply its own independent planning
22 judgments and processes to determine the amount and timing of proposed

1 transmission investments, given our regional view and stakeholder process.
2 Consistent with our track record of improving the transmission systems we
3 currently own, we would be pro-active and focused on improving the newly-
4 acquired transmission system.

5

6 **Q43. WILL ITC WORK WITH REGULATORS IN THE ENTERGY REGION**
7 **ON PLANNING AND INVESTMENT ISSUES?**

8 **A.** Yes. Utility regulators are key participants in the transmission development
9 process for ITC. To maintain an open line of communication, ITC designates a
10 single point of contact for regulators in each of its operating company
11 jurisdictions. It is a primary responsibility for that point of contact to provide
12 information on upcoming activities, answer questions, and discuss concerns so
13 that they can be addressed effectively and efficiently.

14 In addition, regulators play a vital role in the MISO planning process by
15 providing important input on needs and concerns in their jurisdictions related to
16 the development of projects. Regardless of how the role of the Organization of
17 MISO States (“*OMS*”) is addressed in relation to the Entergy Operating
18 Companies’ MISO memberships, ITC will regularly consult with and advise each
19 regulator in the Entergy region regarding future transmission upgrade plans.

20

21

22

**Q44. HOW DOES ITC'S SINGULAR FOCUS ON TRANSMISSION
TRANSLATE TO ITS APPROACH TO CUSTOMER SERVICE AND
ENGAGEMENT WITH STAKEHOLDERS?**

A. ITC is dedicated to providing high quality customer service. This is another area where our singular focus on transmission drives excellence in our performance. Because transmission is our only business, we work hard at communicating with customers and other stakeholders, being responsive, and providing good customer service on electric transmission issues. We would bring this same philosophy to Missouri.

ITC witnesses Jon Jipping and Thomas Wrenbeck discuss in further detail how we handle stakeholder relations, so I will just highlight that ITC has several groups that focus solely on stakeholder outreach. It is important to us to make sure we understand the needs and concerns of our stakeholders. In addition to the regulatory contacts mentioned above, we have a Stakeholder Relations group that schedules regular meetings throughout the year to maintain communications with industrial customers, cooperatives, and municipal utilities to discuss any items of concern. We coordinate with these customers on planned outages to minimize impact on customer operations. We also have state and local government relations groups to provide a point of contact for government officials to learn about activities that will affect their jurisdictions and share concerns. Maintaining good stakeholder relations requires us to maintain open communication so we make it a priority to do so.

1

2 **Q45. AS A TRANSMISSION-ONLY COMPANY, DOES ITC VIEW ITS**
3 **RELATIONSHIP TO THE COMMUNITIES IT SERVES AS**
4 **IMPORTANT?**

5 **A.** Yes. We are dedicated to providing high quality transmission service in the
6 communities we serve and we view ourselves as part of each of those
7 communities. While ITC assets transmit electricity across numerous states, we
8 also know that transmission is a local issue to the communities where our assets
9 are located. We work hard to be a good neighbor and a positive part of those
10 communities. ITC will also bring this philosophy to its operations in Missouri.

11 ITC has interacted with more than 1,800 communities throughout
12 Michigan, Iowa, Minnesota, Kansas and Oklahoma, and sponsored hundreds of
13 community and charitable events. We work to understand the needs and concerns
14 of local communities and work with local leaders and residents to support
15 community improvement initiatives.

16 In one example, ITC worked with communities to grant rights to use
17 transmission corridors for bike paths and nature trails. In addition, our employees
18 began the "Right Plant, Right Place" program to help property owners understand
19 the importance of vegetation management and the proper types of low-growing
20 plants that can be safely located near transmission lines. In another recent
21 example, ITC donated and moved a house used in the construction of the Hugo-
22 Valliant project in Oklahoma to a local school. The house is now being used by

1 the school for administrative space, freeing up additional classroom space for
2 students with special needs. These examples highlight the effort we undertake to
3 be a good neighbor and support our communities.

4 ITC also responds to communities in need. The company donates and
5 matches employee contributions to support recovery efforts after local, national,
6 and international disasters. Our employees also are actively engaged in a regular
7 ongoing program to support different charitable activities, and our employees are
8 active in various community support activities. While ITC provides a wholesale
9 service and many people might not recognize the role we play in bringing
10 electricity to homes and businesses, we think it is important for our company to
11 be active in the community and be engaged with people in those communities.

12 **D. Third Beneficial Attribute: Enhancing the Benefits of Wholesale Energy**

13 **Markets**

14
15 **Q46. IN WHAT WAY DOES THE INDEPENDENT MODEL ENHANCE THE**
16 **BENEFITS OF WHOLESALE ENERGY MARKETS?**

17 **A.** As I have discussed, ITC has a broader regional perspective on the transmission
18 planning process than a traditional vertically-integrated utility. In seeking to help
19 reduce the delivered cost of energy to customers, ITC looks both inside and
20 outside its footprint to understand where transmission investment could result in
21 the greatest benefits to end-use customers.

22 An example of ITC's broader approach is the GPE project, which as
23 proposed would touch or cross two RTO regions, non-RTO regions, seven states,

1 and twenty utility service territories, in addition to ITC's current footprint. GPE
2 was proposed because it was identified by ITC as the most efficient means to
3 develop and interconnect the wind-rich Upper Midwest with load centers further
4 east.²² When initially proposed, there was no process to consider a project like
5 GPE because of its inter-regional scope and because the criteria then employed by
6 RTOs to define beneficial projects were too narrow. In significant part because of
7 GPE, and the initiatives inspired by GPE's proposal including the Midwest ISO
8 Regional Generation Outlet Study ("RGOS"), MISO developed a broader
9 planning process to address regional projects that serve multiple purposes,
10 including state policy initiatives.²³ This broader approach enhances competitive
11 wholesale electricity markets by creating a more robust regional infrastructure
12 that fosters greater market liquidity, and therefore access to the lowest possible
13 cost delivered energy.

14 Another key role that ITC plays in facilitating the wholesale market is
15 ensuring that all generation has equal access to the energy market. As an
16 independent transmission company, we are fully dedicated to making the
17 transmission grid equally accessible to all generators and customers alike. We are
18 totally independent and unbiased in the process, do not pick winners and losers,
19 and simply focus on quickly connecting any generator that has completed the
20 RTO interconnection process. Eliminating any potential for, or perception of,

²² See *Green Power Express LP*, 127 FERC ¶ 61,031 (2009).

²³ See *Midwest Independent Transmission System Operator, Inc.*, 133 FERC ¶ 61,221 (2010), *Order denying in part and granting in part rehearing* (2011) for discussion of Multi Value Projects as defined and approved by the Midwest ISO.

1 favoritism in the operation or development of the transmission grid is in itself
2 beneficial for customers. As noted by the Staff of the Federal Trade
3 Commission,²⁴

4 Discrimination or uncertainty about the terms and conditions for
5 obtaining connections to the grid will raise the risk of new
6 generation investments with respect to their commercial viability
7 and timing. Discrimination in the selection of future grid expansion
8 projects may disrupt such projects by similarly increasing
9 uncertainty about future entrants (for example, discriminatory
10 position of a new transmission line may disproportionately reduce
11 demand for power from the entrant). By eliminating or delaying
12 generation entry, or deflecting it to a different site, a transmission
13 owner may reduce the competitive pressure on its own generation
14 assets, particularly if the prospective entrant's assets are likely to be
15 more efficient. As a result of such discrimination, consumers are
16 likely to face higher electricity prices because more efficient
17 generators fail to displace less efficient generators.

18
19 When generation owners are confident they will be treated impartially,
20 they will be more willing to share information about future plans and invest to
21 increase the generation options in the market.

22 Further, as ITC witness Thomas Vitez explains, ITC's pursuit of projects
23 that support more efficient competitive markets through the economic reduction
24 of congestion is critical to lowering the delivered cost of energy for customers.
25 Beyond congestion relief, ITC identifies and pursues projects that provide other
26 benefits, such as storm hardening, reduced need for costly reliability must run
27 ("**RMR**") resources, and greater access to available generation resources.

²⁴ Comment of the Staff of the Bureau of Economics of the Federal Trade Commission, *Regional Transmission Organizations*, Docket No. RM99-2-000, Aug. 16, 1999.

Economically rational, unbiased transmission investment and increased market confidence can lead to more generation options, and therefore lower prices for end-use consumers.

Q47. WILL ITC'S BUSINESS MODEL ENHANCE WHOLESALE ENERGY MARKETS?

A. Yes. Bringing value to customers is a key to our success and allows our company to grow. Therefore, it is both in our best interest and the best interest of customers to ensure that the transmission system is robust, to pursue the economic reduction of congestion and lower the overall cost of delivered energy, and provide access to all generators. We will also look for opportunities to increase connections with other regions where such projects will bring value to customers. Similar to how we have conducted business in our current operating companies, we will apply our broad and independent transmission planning approach to identify transmission solutions that make sense for customers in the long-term. I believe this attribute of our business model will benefit customers in Missouri and the surrounding region by enhancing the benefits that stem from wholesale energy markets, and in particular further capitalize on EAI's entry into MISO's Day 2 Market.²⁵

²⁵ Day 2 Markets are centralized region-wide markets operated by RTOs that include day ahead unit commitments, a real time balancing market, and an integrated ancillary services market. In a Day 2 Market, generators are required to schedule or bid into the market, locational marginal prices are used to price the use of the transmission grid, congestion charges replace "first come, first served" transmission service, and financial transmission rights are used to hedge congestion. The "Day 2" label arose because RTOs began to implement these markets after they initially began to operate, or in the "Day 2" of their creation.

1 **E. Fourth Beneficial Attribute: Financial Capability**

2 **Q48. HOW DOES THE INDEPENDENT TRANSMISSION COMPANY MODEL**
3 **PROVIDE GREATER FINANCIAL STRENGTH FOR ITC?**

4 **A.** First and foremost, there is no internal competition or competing priorities for
5 capital or other resources among functions at ITC as there is in other utility
6 business models. All of our resources are dedicated to transmission and all of our
7 capital is invested in transmission. In addition, our singular focus has contributed
8 to stronger credit quality for ITC, which lowers the cost of capital reflected in
9 rates.

10 As explained more fully by ITC witness Cameron Bready, ITC has a
11 strong balance sheet, steady cash flow generation, and enjoys solid investment
12 grade ratings. ITC has been able to attract capital and maintain access to cost-
13 effective capital even in times of challenging market conditions. This access to
14 capital and ITC's strong credit quality allows ITC to make efficient infrastructure
15 investment and supports ITC's operational excellence. ITC intends and expects to
16 maintain its strong investment grade status after closing the Transaction. This
17 financial strength and focus has been a key driver behind ITC's record for
18 achieving high performance in reliability and interconnection of generation
19 necessary to increase access to competitive power markets and lower the
20 delivered cost of electric energy to customers.

**Q49. HOW IS THE FINANCIAL STRENGTH ATTRIBUTE OF ITC'S
BUSINESS MODEL PART OF THE BENEFITS OF THE TRANSACTION?**

A. This issue is addressed in detail by ITC witness Cameron Bready. A key element of the Transaction, however, will be bringing the current transmission businesses of each Entergy Operating Company into ownership by ITC with its strong financial capability and sole focus on transmission. At the same time, it will provide enhanced flexibility for EAI to focus its capital on generation and distribution. The separate balance sheets of ITC and EAI will more effectively deal with rising capital investment requirements facing the industry and provide a greater ability to respond to the financial challenges of storm restoration and other unforeseen events. Customers will receive the benefit of lower borrowing rates due to ITC's strong credit ratings and greater investment in the energy infrastructure for a stronger, more reliable system.

F. ITC's Beneficial Attributes Drive Benefits of the Transaction

**Q50. CAN YOU EXPLAIN WHY ITC ENTERED INTO THIS TRANSACTION
WITH ENTERGY CORPORATION?**

A. We believe our business model is an optimal way for electric transmission assets to be owned and operated for the benefit of customers, and we look for opportunities to grow our business in new areas where investment is needed. This Transaction presents an opportunity for us to grow, and bring the value of our independent transmission company approach and practices to a new region. In

1 addition, ITC is a perfect partner for the Entergy Operating Companies as they are
2 pursuing MISO membership. ITC's experience integrating and operating
3 transmission across several states inside of MISO provides a good platform to
4 assist in the transition of the Entergy transmission system into MISO. ITC is well
5 positioned to accomplish the Transaction and post-Transaction operations.

6

7 **Q51. WHY DO YOU BELIEVE THIS IS THE RIGHT TIME FOR THIS**
8 **TRANSACTION?**

9 **A.** The immense need for investment in the nation's energy infrastructure is
10 weighing on utility companies. For a vertically-integrated company, deciding
11 which line of business to allocate valuable capital to when all are in need can be
12 difficult. ITC has significant financial strength to absorb these large transmission
13 capital requirements. It also is at a stage in its growth where it has the capacity to
14 undertake a comprehensive evaluation of the Entergy transmission system and
15 upgrade it to ensure it achieves our performance expectations. As I have said, I
16 believe this Transaction represents an important opportunity in the development
17 of our needed regional backbone grid. ITC and Entergy Corporation are currently
18 at a point where they are able to enter and complete this Transaction and do so in
19 a tax-free manner, so this is the right time to complete it.

20

**Q52. WHY SHOULD THE MISSOURI PUBLIC SERVICE COMMISSION
VIEW THE TRANSACTION AS POSITIVE?**

A. The Transaction will expand ITC's business model to southern Missouri, with independence, singular focus, regional view and support of the wholesale energy market, as well as financial strength dedicated to transmission. I have explained these beneficial attributes in my testimony, and they are further illustrated in the testimony of other ITC and EAI witnesses.

I recognize that the benefits of ITC's business model may not be fully appreciated at first. After all, ITC is unique and represents evolution in the electric industry. I also recognize that there may be some skepticism about changing from the status quo without guaranteed dollar figures to rely on as the benefit. I understand based on other witnesses' testimony, however, that any rate impacts of the Transaction are modest, particularly because Transmission represents such a small part of end-use consumers' bills. Even in our most mature systems after significant investments and drastic system improvement, the transmission component of the customers' bill still remains under four percent.

More importantly, in any event, the benefits of the Transaction are substantial. In reviewing the Transaction, it is important to consider it in real terms. A good way to understand the value of the Transaction is to look at who ITC is, how our structure drives our priorities and focus, how we approach running our business, and the resulting track record. That is why I have explained those points in my testimony (and pointed to other witnesses who further explain them). ITC's

1 structure and track record illustrate how we are an excellent owner and operator
2 of transmission systems, we consistently improve the reliability and capability of
3 transmission systems, and are totally dedicated to open-access transmission and
4 serving the interests of all transmission customers and stakeholders. That is why
5 it is important to seize the opportunity of this Transaction to improve the energy
6 infrastructure in Missouri and the full region covered by the Entergy Operating
7 Companies.

8

9 **Q53. HOW WILL THE BENEFITS OF THE TRANSACTION BE DIFFERENT**
10 **THAN WHAT WOULD OCCUR PURELY AS A RESULT OF EAI**
11 **BECOMING A MEMBER OF MISO?**

12 **A.** Participation in an RTO supports transmission open-access and planning, and ITC
13 has been a member of RTOs since its inception. However, in my view, without
14 the ITC business model, no company's participation in an RTO can provide the
15 full independence, singular focus, regional view, enhancement of wholesale
16 market benefits, and the financial strength dedicated to transmission that I have
17 talked about in my testimony. The RTO is an overlay on the companies that make
18 it up. To have full access to transmission-related benefits, the difference needs to
19 be at the source – the member transmission company.

20 Obviously, an RTO does not own transmission. It does not perform local
21 operations, fund or perform maintenance on the system, fund or build capital
22 projects or generator interconnections, or respond to customer needs or concerns

1 on the ground. In fact, ITC investments represent over 60% of MISO's total new
2 in-service transmission investments (and MISO started 2 years before ITC).²⁶
3 The RTO, therefore, cannot drive the benefits that ITC can through its
4 independent transmission company model, which I explained above.

5 One notable benefit the Transaction provides that cannot be achieved from
6 EAI joining MISO alone relates to the development of transmission projects. As I
7 said, the RTO planning process starts with evaluation of projects identified and
8 submitted by transmission owners – a bottom-up process. Therefore, a
9 transmission owner's approach to planning has a big impact on what projects are
10 evaluated by MISO. ITC's broader regional approach to transmission planning
11 and independent business model result in more robust project proposals to meet a
12 variety of customer and public policy needs.

13 EAI's planned entry into MISO actually provides further rationale for why
14 this Transaction makes sense and specifically at this time. ITC has experience
15 with RTO integration processes and has been operating in MISO since its
16 inception. ITC has extensive operating experience in MISO, and with its planning
17 process, and a staff that is familiar with the MISO transmission tariffs, protocols,
18 and organization. In that sense, ITC's ownership of the transmission system will
19 help ease and ensure a smooth transition of EAI into MISO.

²⁶ MISO's total investments are \$4.3 billion.
(<https://www.midwestiso.org/Planning/TransmissionExpansionPlanning/Pages/BenefitsofMTEP.aspx>) with
almost \$2.8 billion of ITC investment in MISO (as of June 30, 2012).

1 **IV. ADDITIONAL TRANSACTION-RELATED MATTERS**

2 **Q54. ASSUMING THE TRANSACTION CLOSES, WHAT ARE SOME**
3 **IMMEDIATE PRIORITIES YOU SEE FOR A SMOOTH TRANSITION?**

4 **A.** I believe it is very important for ITC to continue building its knowledge of the
5 Entergy transmission system and the stakeholders in the local areas where EAI
6 operates. At the same time, it also is critically important to smoothly integrate
7 Entergy transmission system employees into our company so we can rely on their
8 knowledge and expertise, ensure a good continuity of operations and service, and
9 effectively apply ITC's approach to owning and operating the transmission
10 system.

11 Through our own efforts and the integration process with Entergy
12 Corporation for the Transaction, ITC is learning more and more about the
13 transmission system and local areas where EAI operates. We also are working to
14 meet and build relationships with stakeholders in the areas where EAI provides
15 service. To supplement these efforts, I also note that under Section 1.08 of the
16 Merger Agreement, ITC has committed to add two new independent directors to
17 the ITC Holding Corp. Board of Directors that will be selected by the ITC Board.
18 These will be individuals who have transmission industry knowledge and
19 familiarity with the Entergy region and like all Directors will be independent of
20 market participants.

21 As I said, we also will rely on the experience and knowledge of employees
22 coming to ITC with the transmission business. That will include retaining

1 approximately 750 Entergy transmission employees, including some individuals
2 who currently are in key transmission-related leadership positions. In addition,
3 ITC will be looking for best practices utilized in the Entergy transmission
4 business that could help enhance ITC's corporate processes as applied in that area.

5 Because the independent transmission company model is unique, it also
6 will be important to familiarize the former Entergy transmission system
7 employees with ITC's culture and business goals. To do so, we will have ITC
8 management on the ground and in the trenches to facilitate a successful transition.
9 Our integration process for the Transaction, and for the transition of employees to
10 ITC, is described in more detail by ITC witness Jon Jipping in his testimony.

11

12 **Q55. WHERE WILL THE ITC OPERATING COMPANIES RESULTING FROM**
13 **THE TRANSACTION MAINTAIN OFFICES?**

14 **A.** ITC will maintain field facilities (offices and warehouses) in Arkansas and
15 across the region. ITC will locate its regional headquarters in Jackson,
16 Mississippi (where the Entergy transmission business has its headquarters). ITC
17 witness Jon Jipping provides additional information about planned ITC offices
18 and other facility locations.

19

**Q56. WHAT ARE YOUR PLANS TO PREPARE FOR STORM RESTORATION
NEEDS?**

A. ITC has a strong record of timely restoration of service after large storms, most notably in response to severe floods and tornados. As a result, we bring with us tested experience in dealing with severe weather conditions and related transmission outages.

However, we also understand that storm restoration is a particularly high priority issue, in light of ice storms and other extreme weather. As explained in the direct testimony of ITC witness Mr. Jon Jipping, we and Entergy Corporation are taking a careful approach to ensuring we have absolute continuity in storm restoration readiness. We will be adding key storm response personnel from the Entergy transmission business to the ITC team as part of the Transaction. This is useful to ensure that on day one after the Transaction closes ITC can utilize the experience and expertise of personnel who have been addressing severe storms in the EAI region. Our plan is to adopt the Entergy transmission business' storm restoration practices that it has employed in the region, while looking for ways to improve. As part of our integration efforts, we already are conducting storm restoration drills to work toward ensuring readiness. Our plans for storm restoration include, as we do in our current service territories, working closely with municipal and electric cooperative utilities and other wholesale customers to ensure we understand their needs and concerns regarding storm restoration. Again, we understand the importance of storm restoration readiness and are

1 focused on continuing to be an excellent performer in that area after the
2 Transaction closes.

3

4

5

6 **Q57. WHAT IS THE PLAN FOR CLOSING THE TRANSACTION, AND HOW**
7 **DOES THAT RELATE TO EAI'S PENDING MISO INTEGRATION?**

8 **A.** A condition of closing the Transaction is that all Entergy Operating Companies
9 must have achieved required approvals from their respective state regulators to
10 join MISO or another "acceptable RTO." In addition, ITC and Entergy
11 Corporation obviously must obtain all required regulatory approvals for the
12 Transaction and satisfy other closing conditions of the Transaction. Once those
13 closing conditions are satisfied, we hope to close the Transaction as soon as
14 possible (commensurate with the initial termination date of ITC's agreements with
15 Entergy).

16 As explained by ITC witness Thomas Wrenbeck, ITC and Entergy
17 Corporation are prepared to close the Transaction when all regulatory approvals
18 for the Transaction and other closing conditions are satisfied, without that closing
19 being linked to the completion of the Entergy Operating Companies' integration
20 into MISO. Being able to close the Transaction upon satisfaction of all the
21 Transaction closing conditions, without additional delay, will avoid exposing the
22 Transaction to unnecessary timing uncertainty and the parties to further market

1 risk while the Transaction remains pending. It also will provide clarity to
2 employees, transmission customers, regulators and other stakeholders. Finally, it
3 will allow ITC to begin its efforts to bring the benefits of its business model to
4 customers at the earliest time possible.

5 Closing the Transaction is the point in time when ITC can begin
6 implementation of its philosophies with respect to transmission system operations,
7 maintenance, planning and other areas. With respect to system planning, for
8 example, as discussed by ITC witness Thomas Vitez, ITC's independent business
9 model features enhanced bottom up planning through collaboration and open and
10 transparent communications with regulators, customers and other stakeholders; a
11 broader regional view, and evaluation of the needs of customers in a single
12 transmission planning process that will facilitate low cost energy delivery for
13 customers. Closing the Transaction by the end of summer 2013 would enable
14 these benefits of ITC's ownership to be captured in the MISO planning process
15 that begins in September 2013. Upon its entrance into MISO, ITC will be in a
16 position to apply its unique, broader planning approach in the MISO planning
17 process a full cycle earlier than if the Transaction were to close later in the year.

18 With respect to ITC's strong credit quality, as discussed in ITC witness
19 Cameron Bready's testimony, this enhanced credit quality will benefit
20 transmission customers as debt is refinanced. Closing the Transaction
21 expeditiously will allow this refinancing to occur, and then the related credit
22 quality benefits will begin to be realized sooner rather than later.

**Q58. HOW IS THE TRANSFER OF EAI'S TRANSMISSION BUSINESS TO ITC
IN THE PUBLIC INTEREST?**

A. As I have said throughout my testimony, the public interest is served by having ITC own and operate EAI's transmission system. As a result, customers and stakeholders in the region, will get the benefits of a transmission owner and operator that is fully independent from market participants, with a singular focus on transmission, a regional view and dedication to facilitating the development of the wholesale energy market, and financial strength totally dedicated to transmission.

My testimony and that of other ITC witnesses show that ITC has a strong track record of improving the reliability of the transmission grid and reducing congestion to make energy markets more competitive. ITC plans for the future to support states' economic growth and provides flexibility to access more generation resources to utilize the most cost effective resources over time. We manage our transmission business differently and that results in a more robust electric grid for customers with the goal of lowering the delivered cost of energy. All of these benefits support a finding that the public interest is served by this transaction.

Furthermore, serving the public interest is also aligned with our ability to continue to be successful and grow. If ITC does not serve the public interest, and we do not provide value that is above and beyond what existed before ITC owned

1 and operated the system, there is no future for our company or the independent
2 business model. Serving the public interest is at the core of what we do.
3
4

5 **Q59. WILL ITC ARKANSAS PROVIDE RETAIL ELECTRIC SERVICE IN**
6 **MISSOURI?**

7 A. No. ITC Arkansas will not provide retail electric service to customers in Missouri.
8 ITC Arkansas will only provide transmission services to wholesale customers.
9 Accordingly, ITC Arkansas has requested PSC waiver of certain rules that apply
10 to public utilities providing retail electric service to customers.
11

12 **Q60. PLEASE IDENTIFY THE RULES FOR WHICH ITC ARKANSAS**
13 **REQUESTS WAIVER DUE TO INAPPLICABILITY TO THE LIMITED**
14 **TRANSMISSION FACILITIES IN MISSOURI SERVING WHOLESALE**
15 **CUSTOMERS.**

16 A. Commission Rules 4 CSR 240-3.105, 3.145, 3.165, 3.175 and 3.190(1)-
17 (3).
18

1 **VI. CONCLUSION**

2 **Q61. CAN YOU SUMMARIZE YOUR PROPOSALS AND**
3 **RECOMMENDATIONS FOR THE COMMISSION?**

4 **A.** The proposed transaction between ITC and Entergy Corporation presents a unique
5 opportunity to efficiently and effectively meet the future challenges of the electric
6 industry by bringing the benefits of the independent transmission company model
7 to the Entergy region. The RMT structure, which makes this transaction tax free,
8 is unique and may not be available in the future. Further, we are the only
9 independent, transmission-only entity that is the right size to make the Transaction
10 work and that situation may not be the same in the future. This is a
11 transformational next step in the development of a robust and highly-
12 interconnected transmission grid and for the reasons stated throughout the
13 testimony in this case, I recommend that it be approved.

14
15 **Q62. WHAT OTHER ITC WITNESSES ARE SUBMITTING TESTIMONY IN**
16 **THIS PROCEEDING IN SUPPORT OF THE REQUESTED APPROVALS?**

17 **A. Cameron Bready** – Mr. Bready is Executive Vice President and Chief Financial
18 Officer. His testimony describes the merits and benefits of the proposed
19 transaction from a financial perspective along with the benefits it will bring to
20 customers. He also discusses how ITC's rate construct and financial strength are
21 well suited to address sustained levels of capital investments to meet planned and
22 unplanned investment needs.

1 **Douglas Collins** – Mr. Collins is President of ITCMW and a Vice President of
2 ITC. His testimony explains how the ITC independent business model has been
3 applied in the ITCMW footprint and provided benefits to customers.
4 Specifically, he explains the value of investments in the ITCMW system since the
5 company began in 2007 and provides examples to demonstrate that ITC follows
6 through on the commitments it makes to the jurisdictions it serves, is responsive
7 to the transmission wants and policy objectives of its jurisdictions, and is
8 successful in meeting those objectives, including improving system reliability and
9 efficiency through proactive maintenance and investment focused on lowering
10 energy costs through removal of transmission constraints.

11 **Jon Jipping** – Mr. Jipping is Executive Vice President and ITC’s Chief Operating
12 Officer. He provides an in-depth discussion about ITC’s singular focus on
13 transmission and how that provides a platform for ITC’s stewardship of the
14 transmission networks it operates and maintains. Mr. Jipping explains ITC’s
15 proven track record of operational excellence and how that is achieved. Further,
16 he discusses the current management structure of ITC and how ITC Arkansas and
17 the other new ITC operating companies will be integrated into the ITC
18 organizational structure while ensuring business continuity of the critical
19 functions necessary for the safe and reliable operation of the EAI transmission
20 system.

21

1 **Thomas Vitez** – Mr. Vitez is Vice President of Planning for ITC. He will
2 describe ITC’s transmission planning process, how it works with the MISO
3 planning process, and the benefits of independent planning compared to
4 traditional planning within a vertically-integrated utility. In addition, he will
5 explain how ITC’s ownership of EAI’s transmission assets will provide benefits in
6 excess of what could be expected from EAI’s participation in an RTO planning
7 process and ITC’s plans with respect to EAI’s current transmission projects.

8 **Thomas Wrenbeck** – Mr. Wrenbeck is Director, Regulatory Strategy for ITC. He
9 will provide an overview of the formula rate proposed for ITC, including the
10 annual true-up adjustment and summary of the formula rate protocols through
11 which ITC will share information regarding the annual formula rate projection
12 and true-up adjustment. He will also describe how the formula rate will be
13 implemented for ITC in 2013 and 2014. Finally, Mr. Wrenbeck will describe
14 ITC’s plans for outreach to stakeholders in the Entergy footprint.

15

16

17 **Q63. WHAT FEDERAL APPROVALS ARE REQUIRED TO COMPLETE THIS**
18 **TRANSACTION?**

19 **A.** The Transaction is contingent upon obtaining approvals from the FERC under the
20 following sections of the Federal Power Act (“*FPA*”):

- 21 • Section 203 for the transfer of Entergy’s transmission assets;
- 22 • Section 204 for the issuance of debt and securities by Entergy and ITC; and

- 1 • Section 205 rate filing for the resulting new ITC public utility operating
2 companies.

3 In addition, the Transaction requires approval from the U.S. Department of
4 Justice under the Hart–Scott-Rodino Act. Entergy also is seeking a private letter
5 ruling from the U.S. Department of the Treasury Internal Revenue Services
6 (“*IRS*”) supporting the tax-free nature of the Transaction. ITC has obtained
7 approval of the Transaction from its shareholders. The rest of the Transaction
8 must be, in compliance with the Securities Act and the rules and regulations of the
9 New York Stock Exchange.

10
11 **Q64. DOES THIS CONCLUDE YOUR PREPARED DIRECT TESTIMONY?**

12 **A.** Yes.
