# DIRECT TESTIMONY OF DANE A. WATSON LIBERTY UTILITIES BEFORE THE MISSOURI PUBLIC SERVICE COMMISSION CASE NO. GR-2018-0013

1		WITNESS IDENTIFICATION AND QUALIFICATIONS				
2	Q.	PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.				
3	A.	My name is Dane A. Watson. My business address is 1410 Avenue K, Suite				
4		1105B, Plano, Texas 75074.				
5	Q.	BY WHOM ARE YOU EMPLOYED AND IN WHAT POSITION?				
6	A.	I am a Partner of Alliance Consulting Group. Alliance Consulting Group				
7		provides consulting and expert services to the utility industry.				
8	Q.	ON WHOSE BEHALF ARE YOU TESTIFYING IN THIS PROCEEDING?				
9	A.	I am filing testimony on behalf of Liberty Utilities (Midstates Natural Gas) Corp.				
10		d/b/a Liberty Utilities ("Company").				
11	Q.	PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.				
12	A.	I hold a Bachelor of Science degree in Electrical Engineering from the University				
13		of Arkansas at Fayetteville and a Master's Degree in Business Administration				
14		from Amberton University.				
15	Q.	PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.				
16	A.	Since graduation from college in 1985, I have worked in the area of depreciation				
17		and valuation. I founded Alliance Consulting Group in 2004 and am responsible				
18		for conducting depreciation, valuation, and certain accounting-related studies for				
19	clients in various industries. My duties related to depreciation studies include the					

assembly and analysis of historical and simulated data, conducting field reviews,
 determining service life and net salvage estimates, calculating annual
 depreciation, presenting recommended depreciation rates to utility management
 for its consideration, and supporting such rates before regulatory bodies.

5 My prior employment from 1985 to 2004 was with Texas Utilities Electric 6 Company and successor companies ("TXU"). During my tenure with TXU, I was 7 responsible for, among other things, conducting valuation and depreciation 8 studies for the domestic TXU companies. During that time, I served as Manager 9 of Property Accounting Services and Records Management in addition to my 10 depreciation responsibilities.

I have twice been Chair of the Edison Electric Institute ("EEI") Property 11 12 Accounting and Valuation Committee and have been Chairman of EEI's 13 Depreciation and Economic Issues Subcommittee. I am a Registered Professional 14 Engineer in the State of Texas and a Certified Depreciation Professional. I am a 15 Senior Member of the Institute of Electrical and Electronics Engineers ("IEEE") 16 and served for several years as an officer of the Executive Board of the Dallas Section of IEEE as well as national and global IEEE offices. I served as President 17 18 of the Society of Depreciation Professionals twice, most recently in 2015..

# 19Q.DOYOUHOLDANYSPECIALCERTIFICATIONASA20DEPRECIATION EXPERT?

A. Yes. The Society of Depreciation Professionals ("SDP") has established national
 standards for depreciation professionals. The SDP administers an examination

2

DANE A. WATSON DIRECT TESTIMONY

and has certain required qualifications to become certified in this field. I met all
 requirements and hold a Certified Depreciation Professional certification.

# 3 Q. HAVE YOU PREVIOUSLY TESTIFIED AT ANY REGULATORY 4 COMMISSION?

A. Yes. I have conducted depreciation studies and filed testimony or testified on
depreciation and valuation issues before more than thirty utility commissions
across the United States, including FERC. A list of proceedings in which I have
provided testimony is provided in Exhibit DAW-1.

# 9 I. <u>ASSIGNMENT AND SUMMARY OF TESTIMONY AND</u>

# 10 **<u>RECOMMENDATIONS</u>**

# 11 Q. WHAT IS YOUR ASSIGNMENT IN THIS PROCEEDING?

- 12 A. The purpose of my testimony is to:
- discuss the recent Liberty Mid States Gas State of Missouri Book
   Depreciation Accrual Rate Study at September 30, 2015, completed for
   Liberty assets ("Depreciation Study"); and
- support and justify the recommended depreciation rate changes for
   Liberty, based on the results of the Depreciation Study.

# 18 Q. PLEASE SUMMARIZE YOUR CONCLUSIONS REGARDING 19 DEPRECIATION RATE CHANGES FOR LIBERTY ASSETS BASED ON 20 THE RESULTS OF THE DEPRECIATION STUDY.

A. The Depreciation Study and analysis performed under my supervision fully
 support Liberty's proposed depreciation rates applied to September 30, 2015
 depreciable plant balances for Transmission plant, Distribution plant, and General

1 Property plant. The Depreciation Study follows regulated industry's long-2 standing precedent for Average Life Group ("ALG") straight-line depreciation. 3 In this way, all customers are charged for their appropriate share of the capital 4 expended for their benefit. In order to ensure intergenerational equities, the 5 Commission should adopt the life characteristics and net salvage parameters proposed in this study. The Depreciation Study also incorporates updated service 6 7 lives, and accounts for increased removal costs for Transmission and Distribution assets in the proposed depreciation rates. Liberty's depreciation rates should be 8 9 set at the levels supported in the Depreciation Study in order to recover Liberty's 10 total investment in property over the estimated remaining life of the assets.

# 11 Q. WHAT DEPRECIATION RATES IS LIBERTY CURRENTLY USING?

12 A. In Case No. GM-2012-0037 (the case in which Liberty's purchase of Atmos' 13 Missouri assets was approved by the Commission), Liberty agreed to utilize the 14 depreciation rates that had been approved for Atmos in Case No. GR-2006-0387. 15 See Unanimous Stipulation And Agreement, p. 8 and Appendix 1 (filed Feb. 17, 16 2012). In addition, in Liberty's last rate case, Case No. GR-2014-0152, the 17 Commission approved depreciation rates for corporate hardware and software at 18 the corporate offices in Jackson, Missouri, and allocated to its divisions in Iowa, 19 Illinois and Missouri jurisdictions. (Report and Order, Re: Liberty Utilities 20 (Midstates Natural Gas) Corp. d/b/a Liberty Utilities, File No. GR-2014-0152, pp. 37-38 (December 3, 2014). These depreciation rates have been utilized by 21 22 Liberty since the last rate case.

### 23 Q. HOW IS THE DEPRECIATION STUDY USED TO DETERMINE

### 1 LIBERTY'S DEPRECIATION EXPENSE FOR THE TEST YEAR?

A. Liberty uses depreciation rates determined in the Depreciation Study to calculate
the appropriate depreciation expense going forward. The information presented
in the Depreciation Study is based on September 30, 2015 depreciable plant
balances and all of the conclusions are based on those balances.

# 6 II. <u>DEPRECIATION ANALYSIS PHILOSOPHY</u>

# 7 Q. PLEASE DESCRIBE THE DEPRECIATION ANALYSIS PHILOSOPHY 8 REFLECTED IN THE CURRENT DEPRECIATION STUDY.

9 A. The objective of any sound depreciation philosophy should be the matching of 10 expense with revenue over the life of the asset. In general, the life of the asset is determined by several factors including the rate of physical deterioration, 11 12 obsolescence, weather, maintenance, or (in some cases) the economic usefulness 13 of an entire operating unit. The function of depreciation is to recognize the cost of an asset spread over its useful life. Book depreciation techniques should not 14 15 accelerate or defer the recovery of an asset in comparison to its appropriate useful 16 life.

# 17 Q. WHAT OBJECTIVE SHOULD THE COMMISSION STRIVE TO 18 ACHIEVE IN SETTING DEPRECIATION RATES?

A. The objective of computing depreciation is to ensure that all customers using the
assets pay their pro rata share for the investment, including the cost of retirement.
This objective is achieved by allocating the cost or depreciable base of a group of
assets over the service life of those assets, on a straight-line basis, by charging a
portion of the consumption of the assets to each accounting period.

### 1 III. LIBERTY UTILITIES BOOK DEPRECIATION STUDY

### 2 A. <u>SUMMARY OF LIBERTY'S STUDY</u>

### **3 Q. HAVE YOU PREPARED A DEPRECIATION STUDY FOR LIBERTY?**

4 Yes. I undertook a comprehensive analysis of annual depreciation for Liberty that A. 5 is based on Liberty's depreciable plant in service as of September 30, 2015. The 6 Depreciation Study combined the gas utility property of Illinois, Iowa, and 7 Missouri. After the data was combined, I analyzed the property characteristics of 8 Liberty's Transmission plant, Distribution plant, and General plant. After 9 developing common life and net salvage parameters. I computed depreciation 10 rates at the state level for each entity. The study is provided as Exhibit DAW-2.

# 11 Q. WHAT DEPRECIATION RATES ARE YOU RECOMMENDING IN THIS 12 PROCEEDING?

- A. My recommended depreciation rates for Liberty's Missouri assets are provided in
  Appendix B of the Depreciation Study. Based on updated service life and net
  salvage rates for Liberty's Missouri depreciable plant in-service as of September
  30, 2015, I derived the appropriate depreciation rates for Transmission plant,
  Distribution plant, and General plant. Below is a table summarizing the results.
- 18 19

20

### TABLE 1

# LIBERTY UTILITIES (MIDSTATES NATURAL GAS) CORP. Missouri Assets

Comparison of Existing vs Proposed Depreciation Rates					
	As of Sept	ember 30, 2015			
Depreciable Current Proposed					
	Plant	Annual	Annual	Expense	
Acct	at 9/30/15	Expense	Expense	Change	
Transmission	10,289,976	158,643	144,918	(13,726)	

### DANE A. WATSON DIRECT TESTIMONY

Distribution	104,597,284	2,929,275	3,955,236	1,025,961
General	8,389,988	580,438	700,053	119,616
Total Missouri	123,277,248	3,668,356	4,800,207	1,131,851

#### 1 **O**. WHAT ACCOUNTS **SHOW** THE LARGEST **CHANGE** IN 2 **DEPRECIATION EXPENSE BETWEEN** THE **CURRENT** AND

# **3 PROPOSED ACCRUAL RATES?**

4 A. Within the Distribution function, the largest increases are as follows:

5 Account 3760 Mains Cathodic Protection Increase of \$165 thousand

6	Account 3761 Steel Mains	Increase of \$136 thousand
7	Account 3762 Plastic Mains	Increase of \$96 thousand
8	Account 380 Services	Increase of \$91 thousand
9	Account 381 Meters	Increase of \$238 thousand
10	Account 382 Meter Installations	Increase of \$280 thousand

### 11 Q. WHAT FACTORS ARE INCORPORATED IN YOUR DEPRECIATION

### 12 STUDY THAT ARE NOT IN LIBERTY'S CURRENT MISSOURI RATES?

- A. Since the Company cannot determine the existing underlying life and net salvage
   parameters, it is first necessary to reset depreciation rates to incorporate the most
   current life expectations.
- Second, the removal costs for Transmission and Distribution plant must be
  accurately estimated. Liberty's proposed depreciation rates in this case reflect
  the most current estimates of net salvage.
- Finally, Liberty seeks to implement Vintage Group Amortization for its
   General Plant Assets in FERC Accounts 391-399. The change in depreciation

- expense in these accounts will come from updated life and net salvage estimates
   for certain accounts in that group.
- 3

### B. <u>OVERVIEW OF DEPRECIATION STUDY METHOD</u>

# 4 Q. WHAT DEFINITION OF DEPRECIATION DID YOU USE IN 5 PREPARING YOUR DEPRECIATION STUDY AND TESTIMONY?

- 6 The term "depreciation," as I use it, is a system of accounting that distributes the A. 7 cost of assets, less net salvage (if any), over the estimated useful life of the assets 8 in a systematic and rational manner. It is a process of allocation, not valuation. 9 Depreciation expense is systematically allocated to accounting periods over the 10 life of the assets. The amount allocated to any one accounting period does not 11 necessarily represent the loss or decrease in value that will occur during that 12 particular period. Thus, depreciation is considered an expense or cost, rather than 13 a loss or decrease in value. Liberty accrues depreciation based on the original 14 cost of all property included in each depreciable plant account. On retirement, the 15 full cost of depreciable property, less any net salvage amount, is charged to the 16 depreciation reserve.
- 17

### Q. PLEASE DESCRIBE YOUR DEPRECIATION STUDY APPROACH.

A. I conducted the Depreciation Study in four phases, as shown in Exhibit DAW-2.
The four phases are: Data Collection, Analysis, Evaluation, and Calculation. I
began each of the studies by collecting the historical data to be used in the
analysis. After the data had been assembled, I performed analyses to determine
the life and net salvage percentage for the different property groups being studied.
As part of the process for the study, I conferred with field personnel, engineers,
and managers responsible for the installation, operation, and removal of the assets

1 to gain their input into the operation, maintenance, and salvage of the assets. The 2 information obtained from field personnel, engineers, and managerial personnel, 3 combined with the study results is then evaluated to determine how the results of 4 the historical asset activity analysis, in conjunction with Liberty's expected future 5 plans, should be applied. Using all of these resources, I then calculated the 6 depreciation rate for each function.

#### 0. WHAT PROPERTY IS INCLUDED IN THE DEPRECIATION STUDY?

8 A. There are three distinct classes of property in this study: Transmission. 9 Distribution, and General Property. The Transmission plant functional group 10 consists of mains, regulators, structures, and communication equipment to transmit natural gas distribution system. The Distribution plant functional group 11 12 consists of structures, distribution mains, regulating equipment, services, meters, 13 regulators, and other equipment to distribute natural gas across on the distribution 14 system. The General Property plant functional group contains facilities associated 15 with the overall operation of the business such as buildings, office equipment, and 16 computers, and transportation and power operated equipment rather than with a 17 specific transmission or distribution classification.

#### 18 **Q**.

7

# WHAT DEPRECIATION METHODOLOGY DID YOU USE?

19 The ALG, straight-line, remaining-life depreciation system was employed to A. 20 calculate annual and accrued depreciation in the studies for all plant except assets 21 found in FERC Accounts 391, 393-195. 397-3995. The ALG methodology is 22 widely used across the utility industry across the United States.

9

# 1 C. TRANSMISSION, DISTRIBUTION, AND GENERAL PROPERTY

1. Life of Transmission, Distribution, and General Assets

2

# 3 Q. WHAT IS THE SIGNIFICANCE OF AN ASSET'S USEFUL LIFE IN 4 YOUR DEPRECIATION STUDY?

5 A. An asset's useful life is used to determine the remaining life over which the 6 remaining cost (original cost plus or minus net salvage, minus accumulated 7 depreciation) can be allocated to normalize the asset's cost and spread it ratably 8 over future periods.

# 9 Q. HOW DID YOU DETERMINE THE AVERAGE SERVICE LIVES FOR 10 EACH ACCOUNT?

11 A. The establishment of appropriate average service lives for each account within 12 each functional group was determined by using actuarial analysis Graphs and 13 tables supporting the actuarial analysis and the chosen Iowa Curves (which 14 represent the percentage of property remaining in service at various age intervals) 15 used to determine the average service lives for analyzed accounts are found in the 16 Liberty Depreciation Study (Exhibit DAW-2) and the work papers filed in Exhibit 17 DAW-3(CD). As detailed in the study, I relied on my judgment to incorporate 18 any differences in the expected future life characteristics of the assets into the 19 selection of lives. The objective of life selection is to estimate the future life 20 characteristics of assets, not simply measure the historical life characteristics. 21 More information can be found in the life analysis section of the Liberty 22 Depreciation Study in Exhibit DAW-2.

1	Q.	WHAT	AVERA	GE S	SERVICES	LIVES	FOR	TRAN	SMIS	SION,
2		DISTRIB	BUTION,	AND	GENERAL	FUNCTI	ON	ASSETS,	DO	YOU
3		RECOM	MEND?							

4 A. Yes. The results are shown in Appendix C of Exhibit DAW-2 as well as in Table
5 2 below.

6

2. Net Salvage Rates Transmission, Distribution, and General

# 2 Q. HOW DID YOU DETERMINE THE NET SALVAGE RATES THAT YOU 3 USED IN YOUR STUDY FOR TRANSMISSION, DISTRIBUTION, AND 4 GENERAL PROPERTY?

5 A. I examined the experience realized by Liberty by observing the average net 6 salvage rates for various bands (or combinations) of years. Using averages (such 7 as the 5-year average band) allows the smoothing of timing differences between when retirements, removal cost, and salvage are booked and smooth's the natural 8 9 variations between years. By looking at successive average bands, or "rolling 10 bands," an analyst can see trends in the data that would signal the future net 11 salvage in the account. This examination, in combination with the feedback of 12 Liberty personnel related to any changes in operations or maintenance that would affect the future net salvage of Liberty, allowed for the selection of the best
 estimate of future net salvage for each account.

# **3 Q. IS THIS A REASONABLE METHOD FOR DETERMINING NET**

4 SALVAGE RATES?

13

- 5 A. Yes. This methodology is commonly employed throughout the industry and is the
  6 method recommended in authoritative texts.
- 7 Q. WHAT ARE YOUR NET SALVAGE RECOMMENDATIONS FOR
  8 LIBERTY?
- 9 A. My net salvage recommendations are found in Appendix C of Exhibit DAW-2
- 10 and each account is discussed in the body of the report. Detailed history for each
- 11 account is shown in Appendix D of Exhibit DAW-2. Table 3 below shows a
- 12 summary of those recommendations by account.

# 1 D. <u>RESERVE REALLOCATION</u>

# 2 Q. WHAT IS RESERVE REALLOCATION?

- 3 A. Reserve reallocation when the book reserve is respread within a functional group
- 4 based on the theoretical reserve within each function.

# 5 Q. AS PART OF YOUR DEPRECIATION ANALYSIS HAVE YOU TAKEN

# 6 ANY ACTION TO PROPERLY ALIGN THE COMPANY'S

# DEPRECIATION RESERVE WITH THE LIFE AND NET SALVAGE CHARACTERISTICS OF THE TRANSMISSION, DISTRIBUTION AND GENERAL PLANT FUNCTIONS?

4 A. Yes. In the process of analyzing the Company's depreciation reserve, I observed 5 that the depreciation reserve positions of the accounts were generally not in line with the life characteristics found in the analysis of the Company's assets. To 6 7 allow the relative reserve positions of each account within a function to mirror the life characteristics of the underlying assets, I reallocated the depreciation reserves 8 9 for all accounts within each function. Since the basis of the current depreciation 10 rates is unknown. I believe reserve reallocation is the best solution to the differences in reserve position. 11

# 12 Q. DOES THE REALLOCATION OF THE DEPRECIATION RESERVE 13 CHANGE THE TOTAL RESERVE?

A. No. The depreciation reserve represents the amounts that customers have
contributed to the return of the investment. The reallocation process does not
change the total reserve for each function; it simply reallocates the reserve
between accounts in the function.

# 18 Q. IS DEPRECIATION RESERVE REALLOCATION A SOUND 19 DEPRECIATION PRACTICE?

A. Yes. The practice of depreciation reserve allocation is endorsed in the 1968
 publication of "Public Utility Depreciation Practices", National Association of
 Regulatory Utility Commissioners ("NARUC"), which explains that reallocation
 of the depreciation reserve is appropriate "...where the change in the view

1 concerning the life of property is so drastic as to indicate a serious difference 2 between the theoretical and the book reserve." Additionally, the 1996 edition of the NARUC publication states that "theoretical reserve studies also have been 3 4 conducted for the purpose of allocating an existing reserve among operating units 5 or accounts." My depreciation study demonstrates that there have been significant changes in the life of the property since the approved accrual rates 6 7 were authorized. These changes have created a significant difference between the theoretical and the book reserve in each functional group that make the 8 9 reallocation of the depreciation reserve appropriate in this instance.

# 10 Q. WHY IS IT IMPORTANT FOR THE DEPRECIATION RESERVE TO 11 CONFORM TO THE THEORETICAL RESERVE?

12 A. This is important because it sets the reserve at a level necessary to sustain the 13 regulatory concept of intergenerational equity among Liberty's Missouri 14 customers, as well as set the depreciation rates at the appropriate level based on 15 current parameters and expectations.

# 16 Q. HOW WILL THE COMPANY IMPLEMENT THE REALLOCATION OF

17 ITS DEPRECIATION RESERVE IF ITS PROPOSED RATES ARE

# 18 **APPROVED?**

A. When the proposed depreciation rates are approved, the Company will reallocate
the reserves on its books to match the allocation performed in this study.

# 21E.VINTAGE YEAR DEPRECIATION OF GENERAL PLANT ASSETS,22FERC ACCOUNTS 391, 393-395, AND 397-3995

23 Q. PLEASE DESCRIBE THE VINTAGE GROUP METHODOLOGY.

1 A. For general plant assets in accounts 391, 393-395, and 397-3995, Liberty is 2 requesting to implement to use a vintage year accounting method approved by the FERC in Accounting Release Number 15 ("AR-15"), Vintage Year Accounting 3 4 For General Plant Accounts, dated January 1, 1997. AR-15 allowed utilities to 5 use a simplified method of accounting for general plant assets, excluding structures and improvements (referred to as "general plant"). The AR-15 release 6 7 allowed high-volume, low-cost assets to be amortized over the associated useful life, eliminated the need to track individual assets, and allows a retirement to be 8 9 booked at the end of the depreciable life. This method is often referred to as 10 "amortization of general plant."

Adopting the method of accounting allowed in AR-15 changes the level of 11 12 detail maintained in the asset records and performs the depreciation calculation at 13 a vintage level rather than at a total account level. The plant asset balances will 14 be maintained by vintage installed with the retirement being recorded when book 15 depreciation has been completed. The empirical retirement data for actuarial or 16 semi-actuarial analysis will no longer be reliable; however, the determination of 17 useful life can be made appropriately with the use of market forces, manufacturer 18 expected life, technological obsolescence, business planning, known causes of 19 retirement, and changes in expected future utilization.

The depreciation calculation uses a useful life applied to a vintage versus the entire account. The depreciation recovery is complete when the vintage accumulated depreciation is equal to the vintage plant adjusted for estimated salvage and removal costs.

17

# Q. PLEASE DESCRIBE THE METHODOLOGY OR TECHNIQUE EMPLOYED IN ANALYZING THE LIFE OF VINTAGE GROUP PROPERTY.

A. Actuarial life analysis was performed on each account. Those results and
discussions with management for future goals of implementing an Organizationalwide deployment of certain assets, along with my own professional judgment
formed the basis of the proposed life for these accounts. The lives being
proposed reflect more recent experience and Liberty Utilities future intentions of
these assets and set an appropriate recovery period for the assets going forward.

# 10 Q. PLEASE DESCRIBE THE RESULTS OF THE VINTAGE GROUP 11 DEPRECIATION STUDY.

A. Liberty's present depreciation rates were compared to the Depreciation Study
recommendations in Appendix B of Exhibit DAW-2. The rates proposed for
Vintage Group property are an increase of \$69 thousand based on plant balances
as of September 30, 2015. In addition there is an additional \$23 thousand
requested to recover the difference between book and theoretical reserves for this
group. The computations are shown in Appendix A-1 of Exhibit DAW-2.

# 18 Q. HAVE SIMILAR DEPRECIATION RATES BEEN APPROVED FOR 19 LIBERTY IN OTHER JURISDICTIONS?

A. Yes. In 2017, the Illinois Commerce Commission and Iowa Utilities Board
 approved the depreciation rates for Liberty's Illinois and Iowa jurisdictions which
 were derived from this depreciation study.

# 1 IV. <u>CONCLUSION</u>

- 2 Q. WERE EXHIBITS DAW--1 THROUGH DAW-3 PREPARED BY YOU OR
- 3 UNDER YOUR DIRECT SUPERVISION AND CONTROL?
- 4 A. Yes.
- 5 Q. DOES THIS CONCLUDE YOUR PRE-FILED DIRECT TESTIMONY?
- 6 A. Yes.

# LIBERTY MID-STATES GAS State of Missouri Book Depreciation Accrual Rate Study At September 30, 2015

## LIBERTY MID-STATES GAS State of Missouri DEPRECIATION RATE STUDY EXECUTIVE SUMMARY

Liberty Mid-States Gas ("Liberty" or "Company"), engaged Alliance Consulting Group to conduct a depreciation study of the Company's Gas and Thermal utility plant depreciable assets as of September 30, 2015.

The study proposes depreciation parameters, including Average Service Life, lowa Curve, and Net Salvage percentages as set forth in Appendix C, which are a result of actuarial analysis, statistical analysis, and professional judgement after meeting with various company experts. The Company has currently been using accrual rates resulting from various stipulations or orders received in the past.

All annual accrual rates were determined using the straight line method, average life group ("ALG") procedure, and remaining life technique. Depreciation and amortization rates reflect any imbalance between actual and theoretical reserves. Use of the remaining life depreciation system includes a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of each depreciable group.

Given the many changes in life and net salvage in this study, this study recommends a reallocation of book reserve by plant account within each function. This reallocation does not change the total reserve within each function. Rather, reallocating the reserve within a function realigns the depreciation reserve balances within each function using the proposed life and net salvage parameters. Reallocation occurred within each functional group; such as, transmission, distribution and general property. All accounts were reallocated using the theoretical reserve model.

This study recommends an overall increase of approximately \$1.1 million in annual depreciation expense, compared to the depreciation rates currently in effect. Appendix B demonstrates the change in depreciation expense for the various Gas Plant accounts. The increase is primarily due to accounts 3810-Meters and 3820-

Meter Installations where the accrual rates increased from 2.16% to 5.01% and from 3.00% to 5.58% respectively. The overall increase in depreciation expense is also driven by changes in life and net salvage as well as treatment of any book and theoretical reserve imbalance.

#### PURPOSE

The purpose of this study is to develop depreciation rates for gas and thermal depreciable property as recorded on the books of Liberty Mid-States Gas, State of Missouri ("Liberty-Missouri" "Company") as of September 30, 2015.

The depreciation rates in this study were designed to recover the total remaining undepreciated investment, adjusted for net salvage, over the remaining life of Liberty-Missouri's property on a straight-line basis. Liberty-Missouri is a regulated gas utility principally engaged in providing production and delivery services to customers in Missouri. Liberty-Missouri provides the essential service of producing and delivering natural gas safely, reliably and economically to end-use consumers through its transmission and distribution systems. Liberty Missouri also uses general plant to support its natural gas operations.

#### STUDY RESULTS

Recommended depreciation rates for Liberty-Missouri Gas depreciable property are shown in Appendix A. Appendix A contains the following sections: A Computation of depreciation accrual rates for Liberty-Missouri Gas depreciable property, A-1 Computation of amortization rates for Liberty-Missouri Gas amortized accounts. The proposed rates translate into an annual depreciation accrual of approximately \$4.8 million based on Liberty-Missouri's depreciable gas plant investment at September 30, 2015. A comparison between depreciation rates and annual accruals at current levels versus the proposed rates and resulting annual accruals is shown in Appendix B. As shown in Appendix B, the annual depreciation expense calculated by the same method using the existing approved depreciation rates is approximately \$3.7 million for Liberty-Missouri's' gas assets, resulting in a \$1.1 million increase in annual depreciation expense. The proposed lives and net salvage parameters on which these calculations are based is shown in Appendix C. Net Salvage analysis is shown in Appendix D.

#### **GENERAL DISCUSSION**

#### **Definition**

The term "depreciation" as used in this study is considered in the accounting sense; that is, a system of accounting that distributes the cost of assets, less net salvage (if any), over the estimated useful life of the assets in a systematic and rational manner. It is a process of allocation, not valuation. This expense is systematically allocated to accounting periods over the life of the properties. The amount allocated to any one accounting period does not necessarily represent the loss or decrease in value that will occur during that particular period. The Company accrues depreciation on the basis of the original cost of all depreciable property included in each functional property group. At retirement, the full cost of depreciable property, less the net salvage value, is charged to the depreciation reserve.

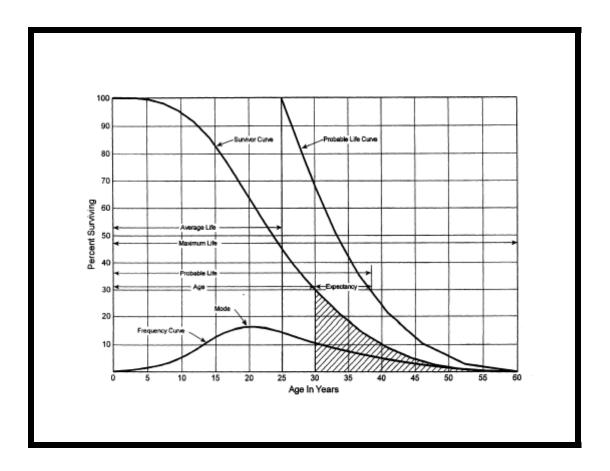

#### **Basis of Depreciation Estimates**

Annual and accrued depreciation were calculated in this study by the straightline, vintage group, remaining-life depreciation system. In this system, the annual depreciation expense for each vintage is computed by dividing the original cost of the asset vintage (less allocated depreciation reserve less estimated net salvage) by its respective average remaining life. The resulting annual accrual amounts were divided by the original cost of the depreciable property in each account to determine the depreciation rate. The calculated remaining lives and annual depreciation accrual rates were based on attained ages of plant in service and the estimated service life and salvage characteristics of each depreciable group, and were computed in a direct weighting by multiplying each vintage or account balance times its remaining life and dividing by the plant investment in service at September 30, 2015. The computations of the annual depreciation rates are shown in Appendix A through A-1, and the comparison of proposed vs current depreciation rates is shown in Appendix B.

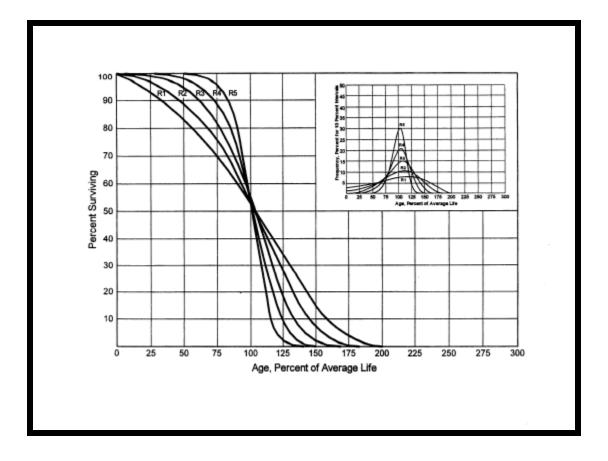

An actuarial analysis approach was incorporated into the analyses of Liberty-Missouri data. This method has been used by utility companies across the regulated industry. Vintaged information was assembled in this study to allow actuarial analysis to be performed. Judgment was used to a greater or lesser degree on each account. This approach is more fully described in a later section.

#### Survivor Curves

To fully understand depreciation projections in a regulated utility setting, there must be a basic understanding of Survivor Curves. Individual assets within a group do not normally have identical lives or investment amounts. The average life of a group can be determined by comparing actual experience against various Survivor Curves. A Survivor Curve represents the percentage of property remaining in service at various age intervals. The most widely used set of representative Survivor Curves are the lowa Survivor Curves (Iowa Curves). The Iowa Curves are the result of an extensive investigation of life characteristics of physical property made at the Iowa State College Engineering Experiment Station in the first half of the twentieth century. Through common usage, revalidation, and regulatory acceptance, these curves have become a descriptive standard for the life characteristics of industrial property. An example of an Iowa Curve is shown below.

There are four families in the Iowa Curves which are distinguished by the relation of the age at the retirement mode (largest annual retirement frequency) and the average life. The four families are designated as "R"— Right, "S" — Symmetric, "L" — Left, and "O" — Origin Modal. First, for distributions with the mode age greater than the average life, an "R" designation (i.e., Right modal) is used. The family of "R" moded curves is shown below.

Second, an "S" designation (i.e., Symmetric modal) is used for the family whose mode age is symmetric about the average life. Third, an "L" designation (i.e., Left modal) is used for the family whose mode age is less than the average life. Fourth, a special case of left modal dispersion is the "O" or origin modal curve family. Within each curve family, numerical designations are used to describe the relative magnitude of the retirement frequencies at the mode. A "6" indicates that the retirements are not greatly dispersed from the mode (i.e., high mode frequency) while a "1" indicates a large dispersion about the mode (i.e., low mode frequency). For example, a curve with an average life of 30 years and an "L3" dispersion is a moderately dispersed, left modal curve that can be designated as a 30 L3 Curve. An SQ, or square, Survivor Curve occurs where no dispersion is present (i.e., units of common age retire simultaneously).

For all depreciable accounts, a Survivor Curve pattern was selected based on analyses of historical data, as well as other factors, such as general changes relevant to the Company's operations. The blending of professional judgment concerning current conditions and future trends, along with the matching of historical data permits the depreciation analyst to make an informed selection of an account's average life and retirement dispersion pattern. Iowa Curves were used to depict the estimated Survivor Curves for each account.

#### Actuarial Analysis

Actuarial analysis (retirement rate method) was used in evaluating historical asset retirement experience where vintage data were available and sufficient retirement activity was present. In an actuarial analysis, interval exposures (total property subject to retirement at the beginning of the age interval, regardless of vintage) and age interval retirements are calculated. The complement of the ratio of interval retirements to interval exposures establishes a survivor ratio. The survivor ratio is the fraction of property surviving to the end of the selected age interval, given that it has survived to the beginning of that age interval. Survivor ratios for all of the available age intervals were chained by successive multiplications to establish a series of survivor factors, collectively known as an observed life table. The observed life table shows the experienced mortality characteristic of the account and may be compared to standard mortality curves such as the lowa Curves. Many accounts were analyzed using this method. Placement bands were used to illustrate the composite history over a specific era, and experience bands were used to focus on retirement history for all vintages during a set period. Matching data in observed life tables for each experience and placement band to an lowa Curve requires visual examination. As stated in widely-cited text, <u>Depreciation Systems</u> by Wolf and Fitch, "the analyst must decide which points or sections of the curve should be given the most weight. Points at the end of the curve are often based on fewer exposures and may be given less weight than those points based on larger samples" (page 46). Some analysts chose to use mathematical fitting as a tool to narrow the population of curves using a least squares technique. Use of the least squares approach does not imply a statistical validity; however, because the underlying data does not meet the criteria for independence between vintages and the same average price for property units through time. Thus, <u>Depreciation Systems</u> cautions, "... the results of mathematical fitting should be checked visually and the final determination of best fit made by the analyst" (page 48). This study uses the visual matching approach to match Iowa Curves, since mathematical fitting produces theoretically possible curve matches. Visual examination and experienced judgment allow the depreciation professional to make the final determination as to the best curve type.

Detailed information for each account is shown later in this study and in workpapers.

In this study all assets in three contiguous states were analyzed together: lowa, Illinois, and Missouri. There were data limitations in modeling actuarial data for Liberty Mid-States Gas assets. All properties currently operated by Liberty were owned by Atmos Energy. Detailed historical records of transactional activity were available only from 2000 forward for all three states. Data extracted from the Atmos Energy plant accounting system provided data from 2000-2012, and data from Liberty's records was provided from 2012-2015. One state, Missouri, had data prior to 2000, but the other two states did not have any records predating 2000. For these reasons, an experience band of 2000-2015 was run for each account where retirement data was available. In general three placement bands were run: overall, mid-range, and 2000-2015.

#### Judgment

Any depreciation study requires informed judgment by the analyst conducting the study. A knowledge of the property being studied, company policies and procedures, general trends in technology and industry practice, and a sound basis of understanding depreciation theory are needed to apply this informed judgment. In this depreciation study, judgment was used in areas such as Survivor Curve modeling and selection, depreciation method selection, simulated plant record method analysis, and actuarial analysis. Where there are multiple factors, activities, actions, property characteristics, statistical inconsistencies, property mix in accounts or a multitude of other considerations that affect the analysis (potentially in various directions), judgment is used to take into account all of these considerations and synthesize them into a general direction or understanding of the characteristics of the property. Individually, no one consideration in these cases may have a substantial impact on the analysis, but overall, the collective effect of these considerations may shed light on the use and characteristics of assets. Judgment may also be defined as deduction, inference, wisdom, common sense, or the ability to make sensible decisions. There is no single correct result from statistical analysis; hence, there is no answer absent the application of informed professional judgment and experience.

#### **DETAILED DISCUSSION**

#### **Depreciation Study Process**

This depreciation study encompassed four distinct phases. The first phase involved data collection and field interviews. The second phase was where the initial data analysis occurred. The third phase was where the information and analysis was evaluated. After the first three stages were complete, the fourth phase began. This phase involved the calculation of deprecation rates and documenting the corresponding recommendations.

During the Phase I data collection process, historical data was compiled from continuing property records and general ledger systems. Data was validated for accuracy by extracting and comparing to multiple financial system sources: Projects System (construction ledger), Fixed Asset System (continuing property ledger), General Ledger, and interfaces from other operating systems. Audit of this data was validated against historical data from prior periods, historical general ledger sources, and field personnel discussions. This data was reviewed extensively so that it could be put in the proper format for a depreciation study. Further discussion on data review and adjustment is found in the Salvage Consideration section of this study. Also as part of the Phase I data collection process, numerous discussions were conducted with engineers and field operations personnel to obtain information that would be helpful in formulating life and salvage recommendations in this study. One of the most important elements in performing a proper depreciation study is to understand how the Company utilizes assets and the environment of those assets. Understanding industry and geographical norms for mortality characteristics are important factors in selecting life and salvage recommendations; however, care must be used not to apply them rigorously to any particular company since no two companies would have the same exact forces of retirement acting upon their assets. Interviews with engineering and operations personnel are important ways to allow the analyst to obtain information that is helpful when evaluating the output from the life and net salvage programs in relation to the Company's actual asset utilization and environment. Information that was gleaned in these discussions is found both in the Detailed Discussion portions of the Life Analysis and Salvage Analysis sections and also in workpapers. In addition, Alliance personnel possess a significant understanding of the property and its forces of retirement due to years of day-to-day exposure to property and the operations of gas utility property.

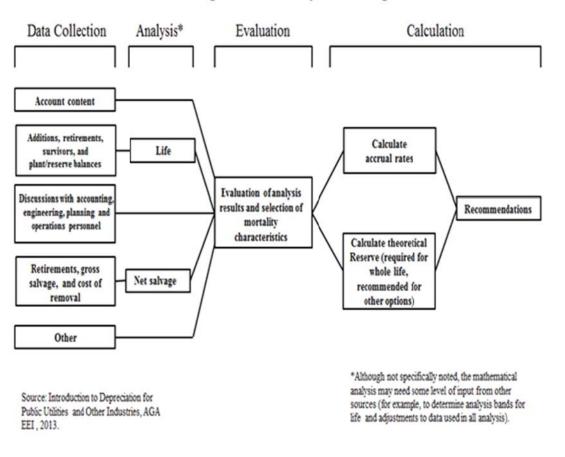

Phase 2 is where the actuarial analysis was performed. Phase 2 and Phase 3 overlap to a significant degree. The detailed property records information was used in Phase 2 to develop observed life tables, graphs and statistics for analysis. Net salvage analysis consists of compiling historical salvage and removal data by account to determine values and trends in gross salvage and removal cost. This information was then carried forward into Phase 3 for the evaluation process.

Phase 3 is the evaluation process, which synthesized analysis, interviews, and operational characteristics into a final selection of asset lives and net salvage parameters. The historical analysis from Phase 2 was further enhanced by the incorporation of recent or future changes in the characteristics or operations of assets that were revealed in Phase 1. The preliminary results were then reviewed and discussed with Company accounting and operations personnel. Phases 2 and 3 validated the asset characteristics as seen in the accounting transactions with actual Company operational experience.

Finally, Phase 4 involved the calculation of accrual rates, making recommendations and documenting the conclusions in a final report. The calculation of accrual rates is found in Appendix A. Recommendations for the various accounts are contained within the Detailed Discussion of this report. The depreciation study flow diagram shown as Figure 1<sup>1</sup> documents the steps used in conducting this study. Depreciation Systems<sup>2</sup>, a well-respected scholarly treatise on the topic of depreciation, documents the same basic processes in performing a depreciation study, including statistical analysis, evaluation of statistical analysis, discussions with management, forecast assumptions, and document recommendations.

# Book Depreciation Study Flow Diagram

## LIBERTY UTILITIES DEPRECIATION STUDY PROCESS

## **Depreciation Calculation Process**

Annual depreciation expense amounts for depreciable accounts were calculated by the vintage group, straight line, remaining life procedure.

In a whole life representation, the annual accrual rate is computed by the following equation,

$$AnnualAccrualRate = \frac{(100\% - NetSalvagePercent)}{AverageServiceLife}$$

The vintage group procedure considers each year of plant placement as a separate group, unlike the broad group model which combines all placement years into one group. The vintage group model uses a unique Survivor Curve for each vintage to combine observed and forecast survivor ratios rather than a single curve for each vintage as the broad group model does.

Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of the group. With the straight line, remaining life, average life group system using lowa Curves, composite remaining lives were calculated according to standard broad group expectancy techniques, noted in the formula below:

$$Composite \operatorname{Re} mainingLife = \frac{\sum V \operatorname{int} ageOriginalCost * \operatorname{Re} mainingLife}{\sum TotalOriginalCost}$$

For each plant account, the difference between the surviving investment, adjusted for estimated net salvage, and the allocated book depreciation reserve, was divided by the composite remaining life to yield the annual depreciation expense as noted in this equation.

$$AnnualDepreciationExpense = \frac{OriginalCost - Book \text{ Re serve} - (OriginalCost)*(1 - NetSalvage\%)}{Composite \text{ Re mainingLife}}$$

where the net salvage percent represents future net salvage.

Within a group, the sum of the group annual depreciation expense amounts, as a percentage of the depreciable original cost investment summed, gives the annual

depreciation rate as shown below:

$$AnnualDepreciationRate = \frac{\sum AnnualDepreciationExpense}{\sum OriginalCost}$$

Average salvage was assumed equal to future net salvage when computing reserve ratios. These calculations are shown in Appendix D. The calculations of the theoretical depreciation reserve values and the corresponding remaining life calculations are shown in workpapers. Book depreciation reserves are maintained on an account level and were used to compute depreciation rates for each account.

## LIFE ANALYSIS

#### Gas Transmission Accounts, FERC Accounts 366.0-370.0

#### FERC Account 366.0 Structures and Improvements (50 S3)

This account consists of buildings and other related structures and improvements related to transmission operations. There is currently \$3.9 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$3 thousand. There were no retirements in this account from 2000-2015. Based on judgment, this study recommends a 50 S3 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is provided.

#### FERC Account 366.1 T&D-Other Structures (50 S3)

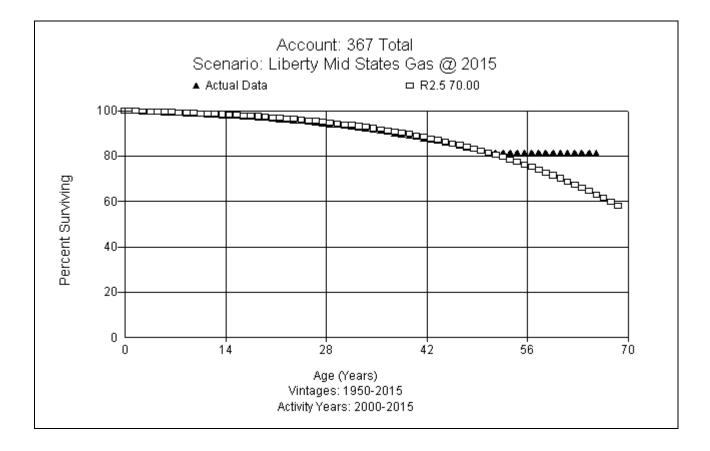

This account consists primarily of fences and pipeline rebranding related to control of the transmission systems. There is currently \$140 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$61 thousand. There were no retirements in this account from 2000-2015. Based on judgment, this study recommends a 50 S3 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is provided.

#### FERC Account 367.0 Transmission Mains Cathodic Protection (25 SQ)

This account consists of cathodic protection assets for transmission mains such as anodes, ground beds, and rectifiers. There is currently \$99 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$84 thousand. There were few retirements in this account from 2000-2015. Based on judgment, this study recommends a 25 SQ curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is provided.

#### FERC Account 367.1 Transmission Mains Steel (70 R2.5)

This account consists of t steel transmission mains of various diameters and related assets such as clamps odorant equipment, and vaults. There is currently \$12.4 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$9.5 million. Liberty operations personnel report that they see little deterioration in mains, and that most of the transmission mains are from the 1950s and 1960s. They opine that current requirements for mains are creating a better quality product than in the past. This study recommends a 70 R2.5 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

#### FERC Account 367.2 Transmission Mains Plastic (see Acct 367.1)

This account consists of plastic transmission mains of various diameters. Upon review by Liberty operations personnel, it was determined that the mains should have been booked in account 367.1, since plastic mains would not withstand the pressure transmission assets must perform at. Liberty will transfer these assets to account 3671, and no plant will be booked in this account in the future.

## FERC Account 369.0 M&R Station Equipment (40 R2.5)

This account consists of transmission metering and regulating station equipment such as odorizers, chart recorders, and regulators. There is currently \$875 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$560 thousand. Liberty operations personnel report that transmission equipment generally operates at higher pressure. Some equipment such as control valves and regulators would generally be the same as distribution, in-line heaters are generally found only on transmission. The Company has budgeted to start replacing "take points" (transmission stations) going in to the future. They are currently working on 3, two of which will finish in 2015 and another that will be completed in 2016. There have been limited retirements in this account, which make the life for this account appear much longer than is reasonable for these assets. Based on judgment, this study recommends a 40 R2.5 curve for this account. No graph is provided.

#### FERC Account 370.0 Communication Equipment (25 S2.5)

This account consists of microwave and radio communication equipment and related assets. There is currently \$5 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. Operations personnel report that now employees communicate by cell (new technology) as opposed to using RTUs in the past. Liberty is starting to replace RTUs because the older assets are failing and replacement parts are not available. Based on judgment, this study recommends a 25 S2.5 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph

is shown.

## Gas Distribution Accounts, FERC Accounts 374.2-387.0

#### FERC Account 374.2 Distribution Land Rights (70 R2.5)

This account consists of land rights associated with distribution operations. There is currently \$306 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$257 thousand. There were no retirements in this account from 2000-2015. Based on the life of distribution mains, this study recommends a 70 R2.5 curve for this account. No graph is provided.

#### FERC Account 375.0 Structures and Improvements (45 R2)

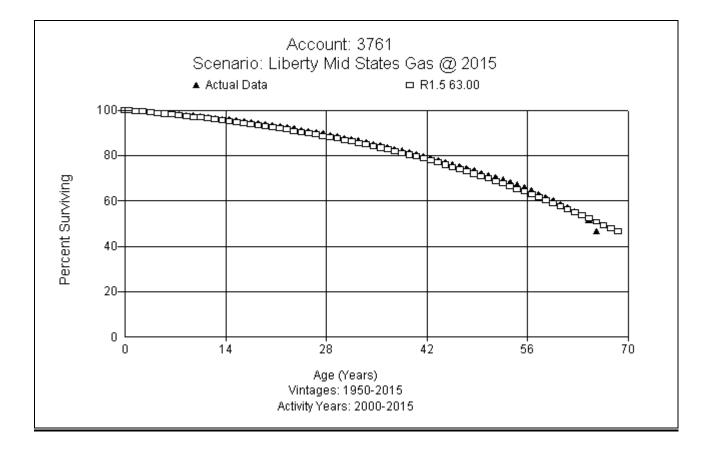

This account consists of structures and improvements, fences and buildings related to distribution operations. There is currently \$87 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$80 thousand. There were no retirements in this account from 2000-2015. Based on judgment, this study recommends a 45 R2 curve for this account. No graph is provided.

## FERC Account 376.0 Distribution Mains Cathodic Protection (25 SQ)

This account consists of cathodic protection equipment, such as anodes, valves, clamps, rectifiers, and groundbeds associated with distribution mains. There is currently \$3.2 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$2.3 million. Operations personnel report that anode beds are designed to last twenty years. They report that rectifiers will last longer although there have been some replacements. Based on operations input and characteristics of the assets, this study recommends a 25 SQ curve for this account. No graph is provided.

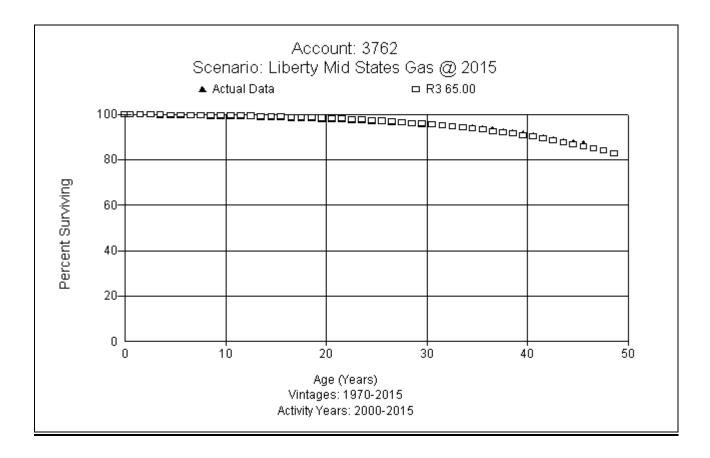

#### FERC Account 376.1 Distribution Mains Steel (63 R1.5)

This account consists of distribution mains and associated equipment. There is currently \$28.5 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$18.9 million. The material types in this account are cast iron, bare steel, bare unprotected steel, and PVC, and protected steel. Operations personnel expect the life if this account to be shorter than transmission mains in 3671, because there is more bare steel and the material is not as robust, For protected steel, operations expect a 65 to 70 year life. Since the process of replacing bare steel is underway, this mediates the longer life seen by transmission mains. Based on judgement, history, and input from Company personnel, this study recommends a 63 R1.5 curve for this account. A graph of the actual experience and the selected Missouri Survivor Curve is shown below.

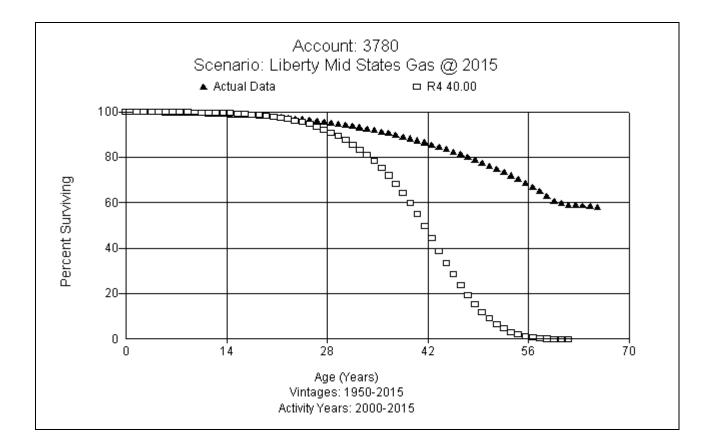

#### FERC Account 376.2 Distribution Mains Plastic (65 R3)

This account consists of plastic distribution mains and associated equipment. There is currently \$42.6 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$28.9 million. The Company began installed plastic pipe in the 1970s. Some first generation plastic pipe and pre-1983 pipe needs to be removed. Operations personnel hope plastic will last as long as steel, but there is no certainty on the life cycle. Historical data is limited since the experience band is only 2000-2015. Based on judgment, this study recommends a 65 R3 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

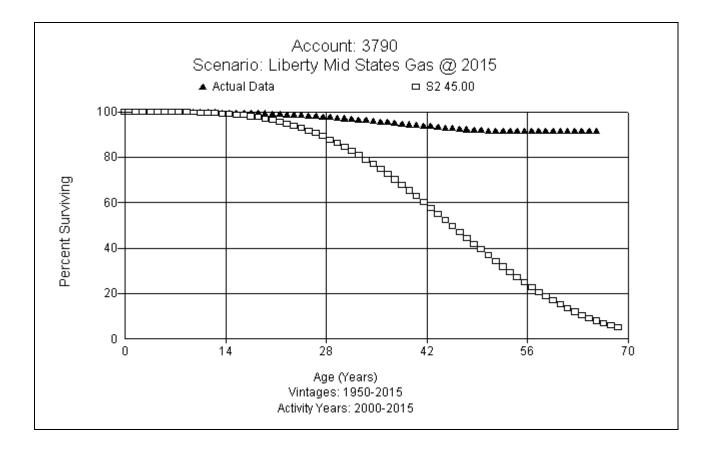

#### FERC Account 378.0 M&R Station Equipment – General (40 R4)

This account consists of M&R station piping, regulators, controls, odorizers and other equipment used in distribution measuring and regulating stations. There is currently \$2.9 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$1.6 million. Operations personnel expect the life of account 378 to be shorter than account 379-city gates. Company personnel report that they have replaced hardware in field (SCADA) equipment and a number of relief valves in recent years. This study recommends a 40 R4 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

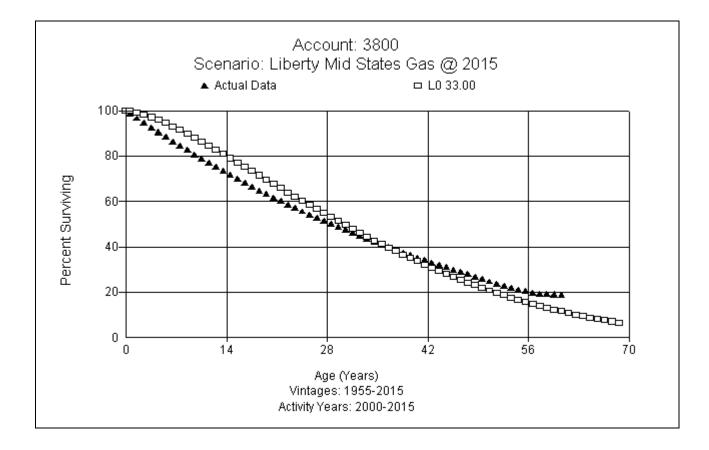

#### FERC Account 379.0 M&R Station Equipment – City Gate (45 S2)

This account consists of M&R station piping, regulators, controls, odorizers, and other equipment used in city gate distribution measuring and regulating stations. There is currently \$2.7 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$1.7 million. Operations personnel expect the life of account 379 to be longer than account 378-measruing and regulating stations. Company personnel report that they have replaced a number of relief valves in recent years. This study recommends a 45 S2 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

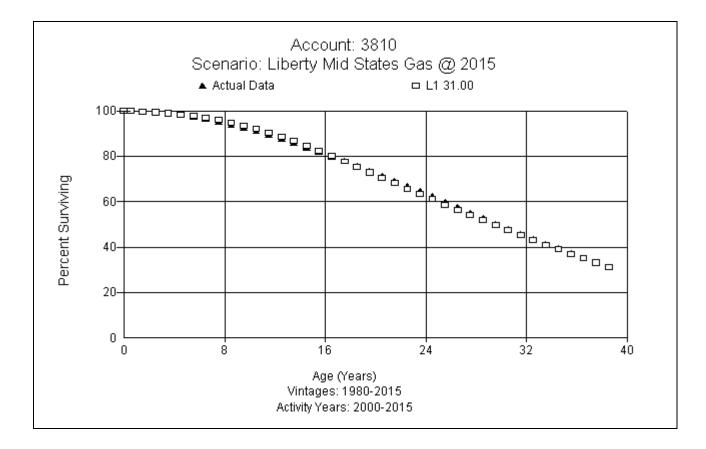

#### FERC Account 380.0 Services (33 L0)

This account consists of assets related to distribution services. There is currently \$45.9 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$28 million. This account includes various material types: copper, plastic and steel. Missouri gas a copper service replacement program in place. Company personnel report that services are being damaged by third parties and relocations. For the past 35 years, plastic has been the predominant material in this account. Company personnel expect the life of services to be shorter than the life of mains. In 2016, the company will focus retiring inactive service (approximately 20K services). Based on history and judgement, this study recommends a 33 L0 curve for this account. A graph of the actual experience and the selected lowa Survivor Curve is shown below.

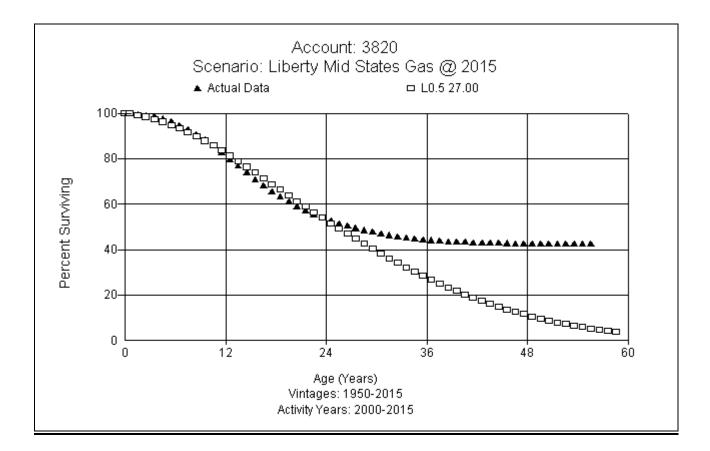

#### FERC Account 381.0 Meters (31 L1)

This account consists of meters and meter reading equipment. There is currently \$13.4 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$8.3 million. The Company's meter assets vary by state: Missouri is 100% AM, Missouri has farm taps and 2% are AMI, and Missouri has about 1.5% AMR. Missouri samples ten percent of meters and retires that proportion every year. Company personnel expect ERT battery life to be 15 to 25 years depending on frequency and overall for meters to last around 30 years. The company that refurbishes meters for Liberty will work on assets to 30 years old. Based on Company personnel's input, history, and judgment, this study recommends a 31 L1 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

#### FERC Account 382.0 Meter Installations (27 L0.5)

This account consists of meter installation equipment. There is currently \$20.4 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$10.9 million. Based on Company history and judgment, this study recommends a 27 L0.5 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 383.0 House Regulators (27 L0.5)

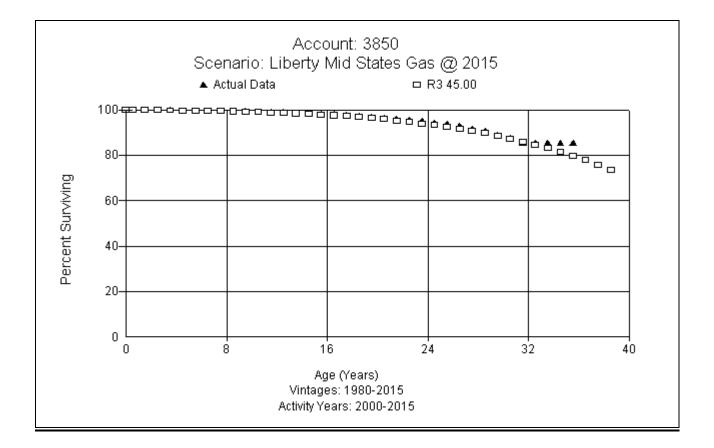

This account consists of house regulators and equipment. There is currently \$3.2 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$2.3 million. There is limited history to analyze. Based on judgment, this study recommends a 27 L0.5 curve for this account, the same as account 382.0. No graph is provided.

## FERC Account 384.0 House Regulatory Installations (27 L0.5)

This account consists of house regulatory installation equipment. There is currently \$732 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. There is limited history to analyze. Based on judgment, this study recommends a 27 L0.5 curve for this account, the same as account 382.0. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is provided.

#### FERC Account 385.0 Industrial M&R Station Equipment (45 R3)

This account consists of industrial measuring and regulating station equipment. There is currently \$783 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$521 thousand. The Company is upgrading a number of meter sets. Company personnel believe there should not be much difference between the life of this account and 378 and 379. Based on results with other accounts and judgment, this study recommends a 45 R3 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

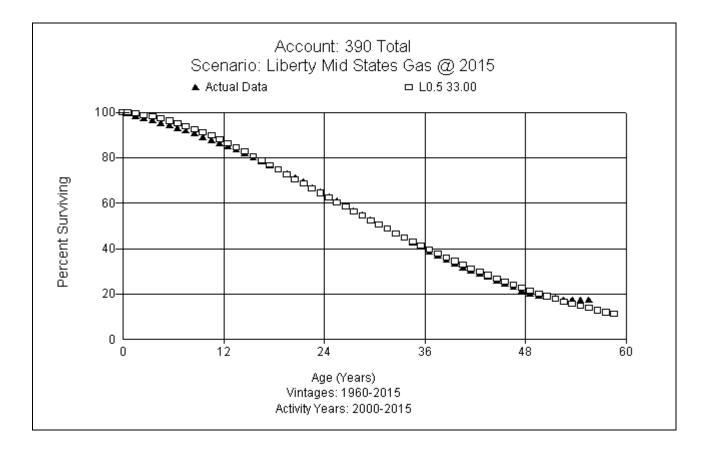

## FERC Account 387.0 Other Equipment (10 R2)

This account consists of other equipment. There is currently \$97 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$6 thousand. The assets in this account include tools, calibration equipment, software, and locators. There is no retirement history for this account. Based on judgment, this study recommends a 10 R2 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

# Gas General Accounts, FERC Accounts 390.0-399.5 GENERAL PLANT DEPRECIATED ACCOUNTS

## FERC Account 390 General Structures & Improvements (33 L0.5)

This account consists of general office structures, and other components such as roofs, cabinets, HVAC equipment, yard improvements, and security systems. There is currently \$3.1 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$1.9 million. All 390 subaccounts were combined for life analysis in this account. Based on life analysis, this study recommends a 33 L0.5 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 390.1 General Structure Frame (33 L0.5)

This account consists of frame structures in general plant. There is currently \$68 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$22 thousand. This study recommends a 33 L0.5 curve for this account based on the combined life analysis results for account 390. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 390.2 General Improvements (33 L0.5)

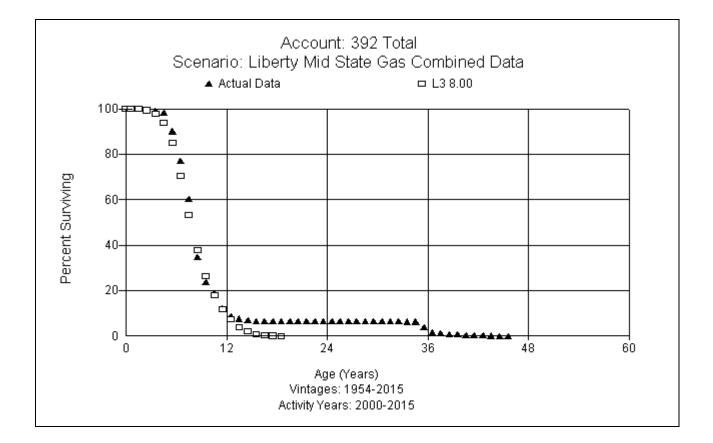

This account consists of leasehold improvements. There is currently no plant in Missouri and \$86 thousand in total plant for Mid-States Gas. This study recommends a 33 L0.5 curve for this account based on the combined life analysis results for account 390. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 390.3 General Improvements – Leased Premise (33 L0.5)

This account consists of improvements such as cooling equipment related to leased buildings. There is currently \$52 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. This study recommends a 33 L0.5 curve for this account based on the combined life analysis results for account 390. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 392.0 Transportation Equipment (8 L3)

This account consists of gas transportation equipment. There is currently \$513 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$267 thousand. All 392 accounts were combined for this study. Based on historical analysis and judgment, this study recommends an 8 L3 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 392.1 Transportation Equipment <12,000 LB (8 L3)

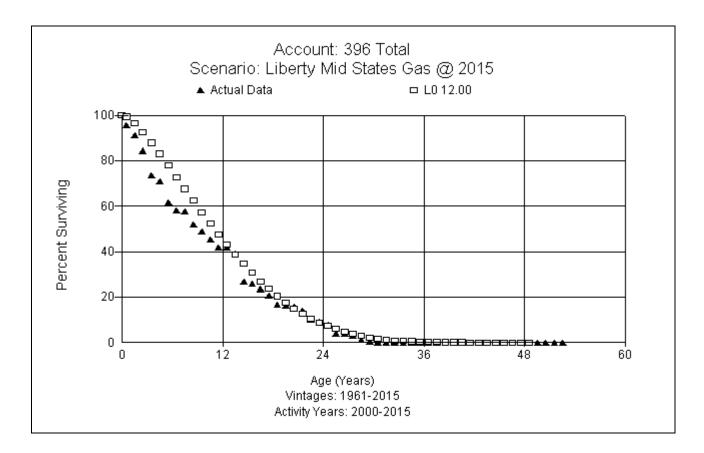

This account consists of transportation equipment weighing less than 12,000 pounds. There is currently \$4.2 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$2.3 million. This study recommends an 8 L3 curve for this account based on results for the combined 392 assets. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 396.0 Power Operated Equipment (12 L0)

This account consists of power operated equipment. There is currently \$1.1 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$656 thousand. All assets for the 396 accounts were combined for life analysis. Based on life analysis and judgment, this study recommends a 12 L0 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 396.1 Gen - Ditchers (12 L0)

This account consists of ditchers. There is currently \$239 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$194 thousand. All assets for the 396 accounts were combined for life analysis. Based on life analysis and judgment, this study recommends a 12 L0 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 396.2 Gen - Backhoes (12 L0)

This account consists of backhoes. There is currently \$380 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$257 thousand. This study recommends a 12 L0 curve for this account based on the combined 396 analysis. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 396.3 Gen - Welders (12 L0)

This account consists of welders. There is currently no plant in Missouri and \$12 thousand in total plant for Mid-States Gas. This study recommends a 12 L0 curve for this account based on the combined 396 analysis. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## **GENERAL PLANT AMORTIZED ACCOUNTS**

## Adoption of Vintage Group Amortization

This study recommends the adoption of vintage group amortization for certain General plant accounts. FERC adopted Accounting Release 15 in 1997 using the following criteria:

1. the individual classes of assets for which vintage year accounting is followed are high volume, low value items;

2. there is no change in existing retirement unit designations, for purposes of determining when expenditures are capital or expense;

3. the cost of the vintage groups is amortized to depreciation expense over their useful lives and there is no change in depreciation rates resulting from the adoption of the vintage year accounting;

4. interim retirements are not recognized;

5. salvage and removal cost relative to items in the vintage categories are included in the accumulated depreciation account and assigned to the oldest vintage first; and

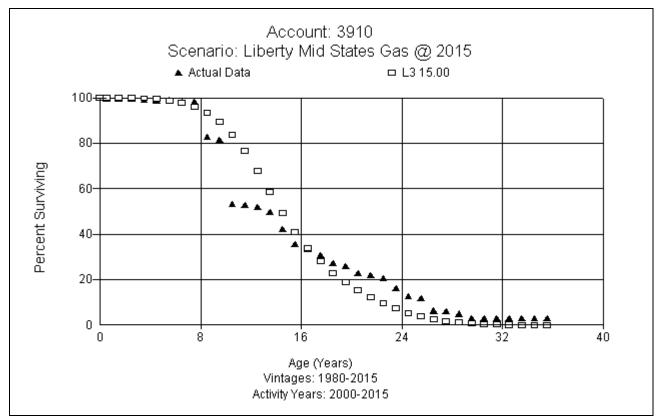

6. properties are retired from the affected accounts that, at the date of the adoption of vintage year accounting, meet or exceed the average service life of properties in that account.

A vintage year method of accounting for the general plant accounts that meets all of the foregoing requirements may be implemented without obtaining specific authorization from the Commission to do so.

To implement this amortization mechanism, it is necessary to first retire the assets whose age is longer than the recommended service life for each group. It will no longer be necessary to track of the location and retirement of those assets. Those amounts are shown for each account in Appendix A-1. After those assets are retired, the remaining plant in service for each account will be amortized using the amortization rates shown in Appendix A-1 and B. Annually, assets which reach the average service life of each account will be retired when the assets reach their average service life. In addition, an additional accrual is necessary for each plant account to make up the difference between the book depreciation reserve and the theoretical depreciation reserve. Those amounts will be accrued until the total reserve difference for each account shown in Appendix A-1. For example in Missouri, Account 391 will require an annual accrual of \$3,011.83 annually for 11.89 years until the reserve difference of \$35,802.05 has been accumulated. At that point the additional annual accrual will cease.

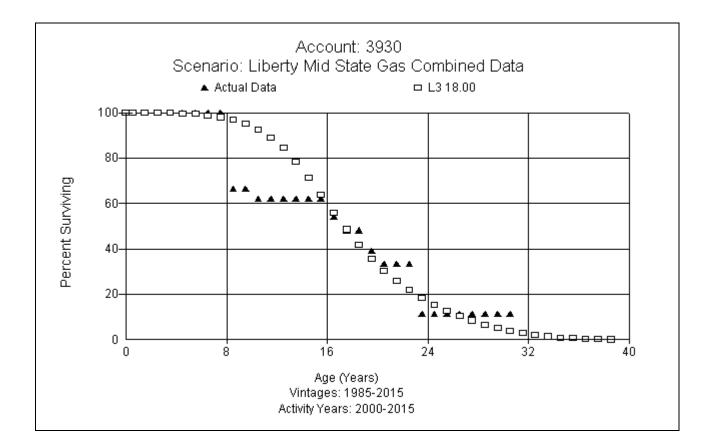

## FERC Account 391.0 Office Furniture & Equipment (15 L3)

This account consists of general office furniture and equipment. There is currently \$1.3 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$740 thousand. This study recommends a 15 L3 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

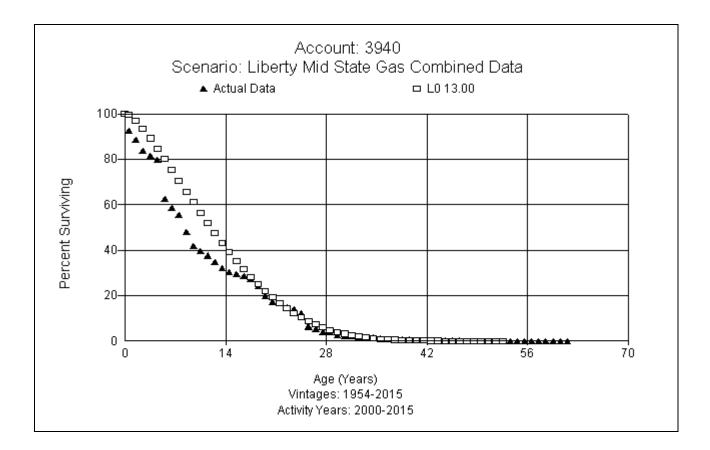

## FERC Account 393.0 Stores Equipment (18 L3)

This account consists of gas transportation equipment. There is currently \$25 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$9 thousand. This study recommends an 18 L3 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

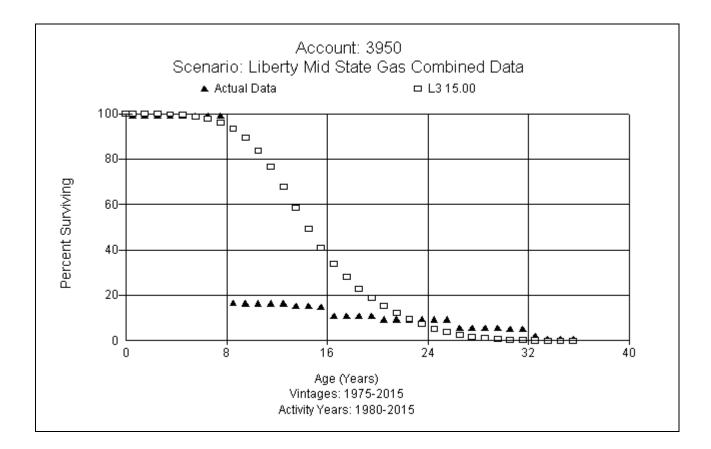

## FERC Account 394.0 Tools, Shop, & Garage Equipment (13 L0)

This account consists of various tools and shop equipment. There is currently \$2 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$1.4 million. This study recommends a 13 L3 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

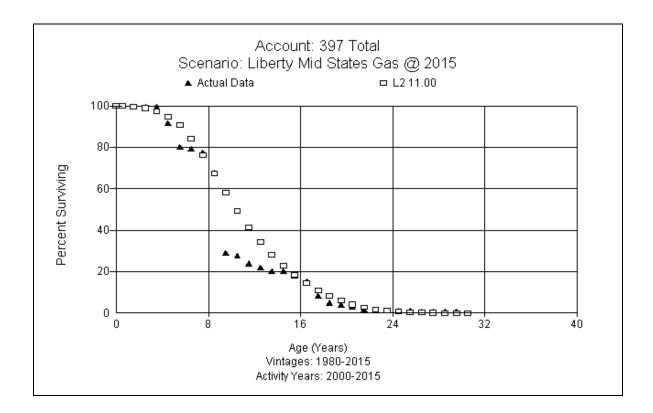

## FERC Account 395.0 Laboratory Equipment (15 L3)

This account consists of laboratory equipment. There is currently \$2 thousand in total plant for Mid States Gas. And of that amount, the entire plant balance is in Missouri. This study recommends a 15 L3 curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 397.0 Communications Equipment (11 L2)

This account consists of general plant communications equipment. There is currently \$96 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$38 thousand. All 397 accounts were combined to analyze this account. This study recommends an 11 L2 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 397.1 General Comm Eq Mob Radios (11 L2)

This account consists of general plant communications equipment – mobile radios. There is currently no plant located in Missouri and \$170 in total plant for Mid-States Gas. This study recommends an 11 L2 curve for this account based on the combined 397 results. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 397.2 General Comm Eq Fixed Radios (11 L2)

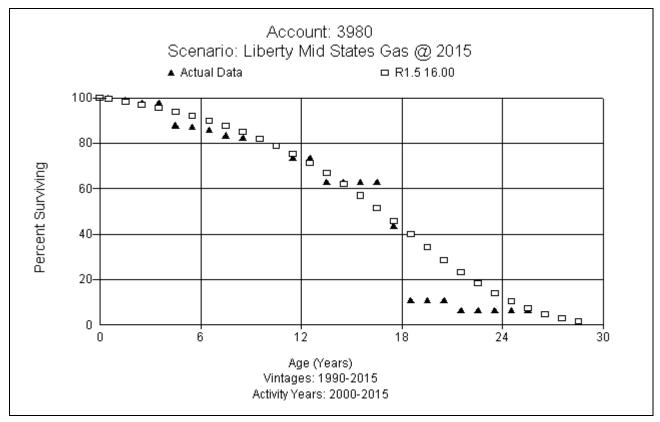

This account consists of general plant communications equipment – fixed radios. There is currently \$14 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. This study recommends an 11 L2 curve for this account based on the combined 397 results. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 397.3 General Comm Eq Telemetering (11 L2)

This account consists of general plant communications equipment – telemetering. There is currently \$4 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. This study recommends an 11 L2 curve for this account based on combined 397 results. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets.

## FERC Account 398 Miscellaneous Equipment (16 R1.5)

This account consists of miscellaneous general plant equipment. There is currently \$1.5 million in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$926 thousand. This study recommends a 16 R1.5 curve for this account. A graph of the actual experience and the selected Iowa Survivor Curve is shown below.

## FERC Account 399.3 Other Tang Prop – Network – H/W (7 SQ)

This account consists of other tangible property such as networking hardware. There is currently \$4 thousand in total plant for Mid States Gas. Of that amount, the entire plant balance is in Missouri. Based on judgment, this study recommends a 7 SQ curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is shown.

## FERC Account 399.4 Other Tang Prop – PC Hardware (7 SQ)

This account consists of other tangible property such as PC hardware. There is currently \$86 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$69 thousand. Based on judgment and the recommendation for account 399.3, this study recommends a 7 SQ curve for this account. No graph is shown.

## FERC Account 399.5 Other Tang Prop – PC Software (5 SQ)

This account consists of other tangible property such as networking hardware. There is currently \$31 thousand in total plant for Mid-States Gas. Of that amount, the plant balance in Missouri is \$21 thousand. Based on judgement, this study recommends a 5 SQ curve for this account. If any assets are added to this account in Missouri, we recommend the adoption of the proposed parameter for those assets. No graph is shown.

#### **NET SALVAGE ANALYSIS**

When a capital asset is retired, physically removed from service, and finally disposed of, terminal retirement is said to have occurred. The residual value of a terminal retirement is called gross salvage. Net salvage is the difference between the gross salvage (what the asset was sold for) and the removal cost (cost to remove and dispose of the asset).

Gross salvage and cost of removal related to retirements are recorded to the general ledger in the accumulated provision for depreciation at the time retirements occur within the system.

Removal cost percentages are calculated by dividing the <u>current</u> cost of removal by the <u>original</u> installed cost of the asset. Some plant assets can experience significant negative removal cost percentages due to the timing of the addition versus the retirement. For example, a distribution asset in FERC Account 365 with a current installed cost of \$500 (2015) would have had an installed cost of \$50<sup>3</sup> in 1962 (which is the average life of the account). A removal cost of \$50 for the asset calculated (incorrectly) on current installed cost would only have a negative 10 percent removal cost (\$50/\$500). However, a correct removal cost calculation would show a negative 100 percent removal cost for that asset (\$50/\$50). Inflation from the time of installation of the asset until the time of its removal must be taken into account in the calculation of the removal cost percentage, will be applied to the <u>original</u> installed cost of assets.

Since Liberty acquired these assets from Atmos, they have maintained net salvage data in their records from 2013-2015. No data was available for years 2011 and 2012 during Atmos' ownership. Alliance Consulting and Liberty diligently attempted to obtain such information but it was not provided to either group. For 2005-2010, historic net salvage was available from two states- Illinois and Missouri. Again, we attempted to obtain net salvage for lowa for 2005-2010 but we did not receive any information. To compile net salvage history, Illinois and Missouri were

combined in 2005-2010, and all three states were combined in 2013-2015. Those results are shown in Appendix D. Thus, removal cost in 2005-2010 may be understated since to information from Iowa is excluded.

## Gas Transmission Accounts, FERC Accounts 366.0-370.0

## FERC Account 366.0 Structures and Improvements (-5% net salvage)

This account consists of any gross salvage and removal cost associated with buildings and other related structures and improvements related to transmission operations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. Generally there is a small amount of removal cost in removing structures and improvements. To model net salvage in the future, this study recommends negative five percent net salvage for this account.

## FERC Account 366.1 Other Structures (-5% net salvage)

This account consists of any gross salvage and removal cost associated with primarily structures and assets related to control of the transmission system. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. Generally there is a small amount of removal cost in removing structures and improvements. To model net salvage in the future, this study recommends negative five percent net salvage for this account.

## FERC Account 367.0 Transmission Mains Cathodic Protection (0% net salvage)

This account consists of any gross salvage and removal cost associated with transmission mains such as anodes, ground beds, and rectifiers. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 367.1 Transmission Mains Steel (-20% net salvage)

This account consists of any gross salvage and removal cost associated with steel transmission mains and related assets. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been limited retirement or net salvage activity over the study period. Generally there is some removal cost in removing mains. To model net salvage in the future, this study recommends negative 20 percent net salvage for this account.

## FERC Account 367.2 Transmission Mains Plastic (see Acct 367.1)

This account consists of any gross salvage and removal cost associated with plastic transmission mains and related assets. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. Generally there is some removal cost in removing mains. All existing plant in this account will be transferred to account 367.1 and no future plant assets will be booked in this account.

## FERC Account 369.0 M & R Station Equipment (-10% net salvage)

This account consists of any gross salvage and removal cost associated with transmission metering and regulating station equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been limited retirement or net salvage activity over the study period. Generally there is some removal cost in station equipment. To model net salvage in the future, this study recommends negative 20 percent net salvage for this account.

## FERC Account 370.0 Communication Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with microwave and radio communication equipment and related assets. The approved

net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## Gas Distribution Accounts, FERC Accounts 374.2-387.0

## FERC Account 374.2 Distribution Land Rights (0% net salvage)

This account consists of any gross salvage and removal cost associated with land rights associated with distribution operations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. Generally there is no removal cost associate with land rights. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 375.0 Structures and Improvements (0% net salvage)

This account consists of any gross salvage and removal cost associated with structures and controls related to distribution operations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage activity over the study period. Generally there is no removal cost associate with structures and improvements. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 376.0 Distribution Mains Cathodic Protection (0% net salvage)

This account consists of any gross salvage and removal cost associated with cathodic protection equipment for distribution mains and associated equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. Removal cost has been charged to this account over many years. Generally there is little removal cost associated with cathodic protection equipment. To model net salvage in the future, this study recommends zero percent net salvage for this account

## FERC Account 376.1 Distribution Mains Steel (-20% net salvage)

This account consists of any gross salvage and removal cost associated with steel distribution mains and associated equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is between negative 18 and 21 percent net salvage for the six through eight year moving averages in 2015, as shown in Appendix D. To model net salvage in the future, this study recommends negative 20 percent net salvage for this account

## FERC Account 376.2 Distribution Mains Plastic (-5% net salvage)

This account consists of any gross salvage and removal cost associated with plastic distribution mains and associated equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is between negative 4 and 5 percent net salvage for the seven through nine year moving averages in 2015, as shown in Appendix D. To model net salvage in the future, this study recommends negative five percent net salvage for this account

### FERC Account 378.0 M & R Station Equipment – General (-10% net salvage)

This account consists of any gross salvage and removal cost associated with M&R station piping, regulators, controls, odorizers and other equipment used in distribution measuring and regulating stations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is negative 13 percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends negative 10 percent net salvage for this account

## FERC Account 379.0 M & R Station Equipment – City Gate (-10% net salvage)

This account consists of any gross salvage and removal cost associated with M&R station piping, regulators, controls, odorizers and other equipment used in city

gate distribution measuring and regulating stations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is negative 30 percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends negative 10 percent net salvage for this account, which is the same recommendation for account 378.0.

### FERC Account 380.0 Services (-50% net salvage)

This account consists of any gross salvage and removal cost associated with assets related to distribution services. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is between negative 56 and 28 percent net salvage for 2015, as shown in Appendix D. To model net salvage in the future, this study recommends negative 50 percent net salvage for this account.

#### FERC Account 381.0 Meters (-35% net salvage)

This account consists of any gross salvage and removal cost associated with electromechanical distribution meters. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is varies between negative 33 and negative 54 percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends negative 35 percent net salvage for this account.

#### FERC Account 382.0 Meter Installations (-35% net salvage)

This account consists of any gross salvage and removal cost associated with equipment and installation costs related to meter installations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account varies between negative 54 percent net salvage to negative 349 percent as shown in Appendix D. To model net salvage in the future, this study recommends negative 35

percent net salvage for this account.

#### FERC Account 383.0 House Regulators (0% net salvage)

This account consists of any gross salvage and removal cost associated with house regulators. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. Generally there is little or no removal coast associated with house regulators. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 384.0 House Regulators Installations (0% net salvage)

This account consists of any gross salvage and removal cost associated with house regulator installations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 385.0 Industrial M&R Station Equip (-10% net salvage)

This account consists of any gross salvage and removal cost associated with industrial measuring and regulating stations. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. Generally there is a small amount of removal cost associate with these assets. To model net salvage in the future, this study recommends negative 10 percent net salvage for this account.

### FERC Account 387.0 Other Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with other distribution equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## Gas General Accounts, FERC Accounts 390.0-399.5

## FERC Account 390.0 General Structures & Improvements (0% net salvage)

This account consists of any gross salvage and removal cost associated with general office structures. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 390.1 General Structure Frame (0% net salvage)

This account consists of any gross salvage and removal cost associated with structure frames. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 390.2 General Improvements (0% net salvage)

This account consists of any gross salvage and removal cost associated with general improvements. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 390.3 General Improvements Leased Premise (0% net salvage)

This account consists of any gross salvage and removal cost associated with general improvements on leased property. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends zero percent net

salvage for this account.

#### FERC Account 391.0 Office Furniture & Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with general office furniture and equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

#### FERC Account 392.0 Transportation Equipment (6% net salvage)

This account consists of any gross salvage and removal cost associated with transportation equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is six percent net salvage for the eight and nine year bands, as shown in Appendix D. To model net salvage in the future, this study recommends six percent net salvage for this account.

#### FERC Account 392.1 Transportation Equipment <12,000 LB (6% net salvage)

This account consists of any gross salvage and removal cost associated with transportation equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. There has been no retirement or net salvage experienced over the study period. To model net salvage in the future, this study recommends six percent net salvage for this account. This is the same recommendation for account 392.0.

#### FERC Account 393.0 Stores Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with stores equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

#### FERC Account 394.0 Tools, Shop, & Garage Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with various tools and shop equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 395.0 Laboratory Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with laboratory equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 396.0 Power Operated Equipment (10% net salvage)

This account consists of any gross salvage and removal cost associated with power operated equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is varies from 8 percent positive net salvage to positive 64 percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends 10 percent net salvage for this account.

#### FERC Account 396.1 General - Ditchers (10% net salvage)

This account consists of any gross salvage and removal cost associated with

general equipment like ditchers. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. This account was combined with all other 396 accounts as shown in Appendix D. To model net salvage in the future, this study recommends 10 percent net salvage for this account.

### FERC Account 396.2 General - Backhoes (10% net salvage)

This account consists of any gross salvage and removal cost associated with general equipment like backhoes. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. This account was combined with all other 396 accounts as shown in Appendix D. To model net salvage in the future, this study recommends 10 percent net salvage for this account.

## FERC Account 396.3 General - Welders (10% net salvage)

This account consists of any gross salvage and removal cost associated with general equipment like welders. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. This account was combined with all other 396 accounts as shown in Appendix D. To model net salvage in the future, this study recommends 10 percent net salvage for this account.

## FERC Account 397.0 Communication Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with general plant communications equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 397.1 General Communication Eq Mob Radios (0% net salvage)

This account consists of any gross salvage and removal cost associated with general plant communications equipment such as mobile radios. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 397.2 General Communication Eq Fixed Radios (0% net salvage)

This account consists of any gross salvage and removal cost associated with general plant communications equipment such as fixed radios. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 397.3 General Communication Eq Telemetering (0% net salvage)

This account consists of any gross salvage and removal cost associated with general plant communications equipment such as telemetering. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

## FERC Account 398.0 Miscellaneous Equipment (0% net salvage)

This account consists of any gross salvage and removal cost associated with miscellaneous general plant equipment. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent

net salvage for this account.

### FERC Account 399.3 Oth Tang Prop – Network – H/W (0% net salvage)

This account consists of any gross salvage and removal cost associated with other tangible property such as network hardware. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 399.4 Oth Tang Prop – PC Hardware (0% net salvage)

This account consists of any gross salvage and removal cost associated with other tangible property such as PC hardware. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.

### FERC Account 399.5 Oth Tang Prop – PC Software (0% net salvage)

This account consists of any gross salvage and removal cost associated with other tangible property such as PC software. The approved net salvage for this account is unknown, since the current accrual rates did not specify any net salvage parameters. The overall moving average for this account is zero percent net salvage as shown in Appendix D. To model net salvage in the future, this study recommends zero percent net salvage for this account.
