VI. Tariff Changes..... 9

1 **I. Executive Summary**

2 **A. Staff Class Cost-of-Service and Rate Design Objectives**

3 Staff's class cost-of-service and rate design objectives are:

- 4 1. *To develop rates reflecting the class cost-of-service (CCOS) in all districts*  
5 *except the Brunswick and Warren County Districts. Customers pay their*  
6 *actual cost of receiving service and the Company has an opportunity to recover*  
7 *its actual cost of providing service (including an opportunity to receive a return*  
8 *on its investment) by assigning the results of the CCOS to each customer*  
9 *classification;*
- 10 2. *To move the rates closer to the CCOS in the Brunswick and Warren County*  
11 *Districts. Staff believes each customer in each district should pay their true*  
12 *cost of service, however, Staff also recognizes that this would place a burden*  
13 *of extremely high rates for the customers of the Brunswick and Warren County*  
14 *Districts;*
- 15 3. *To eliminate the declining block rates by developing single block rates in each*  
16 *customer classification for each district. Single block rates are easy for the*  
17 *customer to understand and will eliminate the increased burden placed on the*  
18 *small volume user in the first block of a declining block rate structure;*
- 19 4. *To collect the Commission-ordered overall increase or decrease in revenues.*

20 **B. Staff's Plan to Accomplish These Objectives**

21 To accomplish these objectives, Staff recommends the following actions by the  
22 Commission:

- 23 1. Adoption of Staff's proposed rates, which reflect the results of Staff's CCOS  
24 study and which allocates costs to each customer classification in each district.
- 25 2. Reduction in the amount of the subsidy to the Brunswick and Warren County  
26 Districts provided by the St. Louis Metro (SLM) District;
- 27 3. Adoption of the single block rates within each customer classification for each  
28 district as recommended by Staff.
- 29 4. Order an overall revenue increase/decrease be implemented according to each  
30 rate component of each rate schedule as recommended by Staff.

1 **II. Class-Cost-of-Service Water Operations**

2 **A. Overview**

3 The purpose of Staff's CCOS study is to determine and provide the Commission with  
4 a measure of relative class cost responsibility for Missouri-American Water Company's  
5 (Company or MAWC) overall revenue requirement on a district specific basis. For purposes  
6 of Staff's CCOS study, Staff used the customer classifications provided by the Company. For  
7 individual costs, class cost responsibility can be either assigned or allocated to customer  
8 classes using reasonable methods for determining the class responsibility for that cost. The  
9 results are then summarized so that they can be compared to revenues being collected based  
10 on current rates.

11 The CCOS study does not include any allowance for a true-up estimate as provided in  
12 the Staff's Accounting work papers. At this time it is impossible to accurately spread a true-  
13 up estimate among the various cost allocation factors without knowing which specific  
14 accounts are affected by the true-up.

15 **B. Base-extra Capacity Method**

16 Staff allocated each district's total cost using the "base-extra capacity" method, which  
17 is a method generally accepted by the industry. This method involves allocating the various  
18 cost components based on data pertaining to operating costs, operating revenues, system  
19 capacity, customer usage and customer numbers. The results of these allocations show the  
20 relative cost-of-service for each customer class and the appropriate revenue levels that should  
21 be recovered from each customer class. Rates are then designed to recover the costs that are  
22 allocated to each class.

23 In the base-extra capacity method, costs are generally separated into four (4) primary  
24 cost components: (1) base costs, (2) extra capacity costs, (3) customer costs, and (4) direct fire  
25 protection costs.

26 Base costs are the costs that vary with water consumption and are allocated to  
27 customer classifications according to the amount of water consumed.

28 Extra capacity costs are the costs associated with meeting the requirements that are in  
29 excess of the average load conditions. The extra capacity costs include operation and

1 maintenance expenses and capital costs for system capacity above what is required for the  
2 average rate of use.

3 Customer costs are those costs associated with the number of customers, regardless of  
4 consumption. These costs include customer accounting and collection expenses, meter-  
5 reading expenses, billing expenses and return on and of plant related to meters and services.

6 Fire protection costs are those costs directly assigned to fire protection functions.

7 Allocation of each of these costs is accomplished by applying class allocation factors.  
8 These class allocation factors are applied to the annualized and normalized expenses, plant,  
9 rate base and return on investment to determine the total costs to be recovered in each district.

10 The customer class allocation factors developed are based on Staff's district specific  
11 cost-of-service allocations as of Staff's direct filing and, as noted above, do not include the  
12 recovery of any true-up allowance.

### 13 **C. Schedules included in Staff's CCOS Study**

14 Schedule 1 includes Staff's CCOS study for each district, which summarizes the  
15 current cost of service, revenues at present rates, revenues at proposed rates and the amount of  
16 increase/decrease for each customer class within each operating district.

17 Schedule 2 shows the allocation of the Auditing Department's cost-of-service by  
18 customer class and then to the functions of base use, maximum day use, maximum hour use,  
19 meter cost and service cost, billing and collection cost and fire service cost for each operating  
20 district.

21 Schedule 3 shows the development of the allocation factors used in the allocation  
22 between customer classifications shown in Schedule 2.

23 Schedule 4 includes the number of meters and services for each operating district with  
24 an appropriate weighting factor for each customer class.

25 Schedule 5 shows the allocation to public and private fire service costs in proportion  
26 to the relative potential demands placed on each system by public fire hydrants and private  
27 fire services.

### 28 **D. Allocation Factors**

29 Factor 1 is the allocation of costs that vary with the amount of water consumed. This  
30 factor is used in the allocation of such costs as purchased water, purchased power, and  
31 chemicals. The costs are allocated to the customer rate classifications in proportion to the

1 average daily consumption for each customer rate classification. These types of costs vary  
2 with the amount of water consumed and are considered base costs.

3 Factors 2 and 3 are the allocations of costs associated with facilities serving base and  
4 maximum day extra capacity functions, and the allocation of costs associated with facilities  
5 serving base, maximum day extra capacity and fire protection functions. These factors are  
6 calculated by the allocation of such costs as source of supply expenses (excluding purchased  
7 water) and water treatment expenses (excluding chemicals). These types of costs are  
8 associated with meeting usage requirements in excess of the average, and generally, they are  
9 the costs associated with meeting maximum day requirements.

10 Factors 4 and 5 are the allocation of costs associated with facilities serving base and  
11 maximum hour extra capacity functions, and the allocation of costs associated with storage  
12 facilities. These factors are calculated by the allocation of costs related to smaller mains and  
13 storage facilities such as tanks and standpipes. These costs are allocated partly on average  
14 consumption and maximum hour extra demand. These types of costs are related to facilities  
15 that are designed to meet maximum hour and fire protection requirements.

16 Factor 6 is the allocation of costs associated with power and pumping facilities. These  
17 costs are allocated on the combined bases of maximum day and maximum hour extra  
18 capacity. This factor is calculated by the weighting of factors 2, 3 and 4 for each customer  
19 classification.

20 Factor 7 is the allocation of costs associated with transmission and distribution mains.  
21 This factor is calculated from the weighting of factors 3 and 4.

22 Factor 8 is the allocation of costs associated with fire hydrants. This factor is  
23 calculated by the allocation of costs directly associated with fire hydrants themselves and the  
24 maintenance thereof.

25 Factor 9 is the allocation of costs associated with meters. This factor is calculated by  
26 the allocation of costs associated with the meters themselves and the maintenance thereof.  
27 These costs are allocated to the customer classifications based on the size and quantities of  
28 meters serving each customer classification.

29 Factor 10 is the allocation of costs associated with services. This factor is calculated  
30 by the allocation of costs associated with the cost of service by customer classification.

1 Factor 11 is the allocation of transmission and distribution operation supervision and  
2 engineering and miscellaneous expenses. This factor is calculated by the allocation of  
3 operation costs for each customer classification.

4 Factor 12 is the allocation of transmission and distribution maintenance supervision  
5 and engineering, structures and improvements and other expenses. This factor is calculated  
6 by the allocation of maintenance costs for each customer classification.

7 Factor 13 is the allocation of billing and collection costs. This factor is calculated by  
8 the total number of customers for each customer classification.

9 Factor 14 is the allocation of meter reading costs. This factor is calculated by the  
10 number of metered customers for each customer classification.

11 Factor 15 is the allocation of administrative and general expenses and cash working  
12 capital. This allocation includes all other operation and maintenance expenses except  
13 purchased water, power, chemicals and waste disposal for each customer classification.

14 Factor 16 is the allocation of labor related taxes and benefits. All direct labor  
15 expenses are included in this factor for each customer classification.

16 Factor 17 is the allocation of organization, franchises and consents, miscellaneous  
17 intangible plant and other rate base elements. This factor is based on original cost less  
18 depreciation for each customer classification.

19 Factor 18 is the allocation of income taxes and income available for return for each  
20 customer classification.

21 Factor 19 is the allocation of regulatory commission expenses, assessments and other  
22 water revenues for each customer classification.

### 23 **E. Transmission Mains and Distribution Mains**

24 One change in Staff's present CCOS study as compared to previous CCOS studies is  
25 that Staff is proposing a main adjustment for certain large industrial customers in the Joplin,  
26 St. Joseph and SLM Districts. Staff has reviewed maps of the Company's distribution  
27 systems for the above-mentioned districts and believes it is appropriate to make a main  
28 adjustment for certain large industrial customers. Staff has performed an adjustment similar  
29 to the Company's for the Joplin and St. Joseph Districts.

30 Staff believes the distribution system of the SLM District is significantly more  
31 complicated because of the number of transmission and distribution mains and the size of the

1 system. Staff believes it is appropriate to make a main adjustment for the large industrial  
2 customers connected to mains 12-inches and larger. Staff used the Company's consumption  
3 adjustment of 54.2% for the large industrial customers in the SLM District. Staff does not  
4 believe it is appropriate at this time to make an adjustment on the remaining industrial  
5 customers being served on smaller mains because all transmission and distribution mains are  
6 being used to transmit and distribute water to these remaining customers.

7 The Company does not classify its mains by function in most of its districts. Rather,  
8 the Company makes the assumption that mains that are larger than 10" are transmission mains  
9 and mains that are 10" or smaller are distribution mains. Staff assigned the total footage of  
10 mains to the maximum hour consumption in factor 7.

#### 11 **F. Results of Water Class Cost-of-Service Study**

12 Staff believes the CCOS study correctly allocates the cost of providing service to each  
13 customer classification in each district. Since the CCOS in the Brunswick and Warren  
14 County Districts continues to be extremely high, and would cause an undue burden to those  
15 ratepayers, Staff is proposing that the rates for these districts continue to be subsidized, albeit  
16 at a lesser level than the previous rate case. The subsidization of rates at Staff's proposed  
17 level not only avoids this undue burden and allows more "reasonable" rates to the customers  
18 in the Brunswick and Warren County Districts, but also more precisely allocates the cost of  
19 providing service to each customer classification served by the Company.

### 20 **III. Rate Design Water Operations**

#### 21 **A. Overview**

22 Staff's rate design for the Company's water operations is based on the actual revenue  
23 requirement for each district and that district's CCOS to determine each customer class' cost-  
24 of-service. The rates generally consist of a fixed monthly customer charge and a usage  
25 (commodity) charge, which are generally based upon the number of customers in the class  
26 and the usage characteristics of those customers.

#### 27 **B. Design of Block Rates**

28 Presently, a single-block rate is used for residential customers in the Brunswick,  
29 Joplin, Jefferson City, Mexico, St. Joseph, and Warrensburg Districts. The SLM District  
30 utilizes a single-block rate for all customer classes. In the Parkville District and the non-

1 residential customer classes in the above districts, excluding SLM, a declining block rate  
2 structure is utilized. A declining block rate structure is one in which the commodity rate is  
3 based upon pre-established blocks of usage. As the customer consumes more and moves to a  
4 different block, the commodity rate declines; or, stated another way, the more a customer  
5 uses, the additional gallons are cheaper than the initial gallons. Staff is proposing the  
6 elimination of the declining block structure in the remaining customer rate classifications for  
7 these districts and the elimination of the declining block structure in all of the customer rate  
8 classifications for the Parkville District and establishing a single-block rate. The existing  
9 declining block rates result in the small users in a customer class paying much more of the  
10 costs to provide their water than large customers pay, due to the fact that as more water is  
11 used, the rate being charged is lower. Also, moving away from a declining block structure is  
12 a move towards conservation.

### 13 **C. Results of Water Rate Design**

14 Due to the move from a declining block rate structure to a single-block rate structure,  
15 Staff's proposal will cause the commodity rates within the larger usage blocks to increase at a  
16 greater rate than changes in the initial block. Depending on the overall change in revenue  
17 requirement to a specific district, the initial block may actually increase or decrease. Staff is  
18 continuing to support district specific customer charges.

19 Staff's proposed rates continue to be significantly higher in the Brunswick and Warren  
20 County Districts when compared to the Company's other districts. The proposed commodity  
21 charge for the Brunswick District is almost three times the Warren County proposed  
22 commodity charge. The proposed customer charge and proposed commodity charge for the  
23 Warren County District are approximately twice as high as the average of the other operating  
24 districts of the Company. Staff recommends costs continue to be spread to the St. Louis  
25 District to continue assisting these two districts with their high cost-of-service.

## 26 **IV. Class-Cost-of Service Sewer Operations**

### 27 **A. Overview**

28 Because the Company's sewer operations are relatively small and generally consist of  
29 residential customers Staff did not perform a CCOS study for the Company's sewer  
30 operations. Staff's audit and development of cost-of-service (COS) for MAWC's sewer

1 operations is based on the Water & Sewer Departments small company rate design  
2 methodology.

3 Warren County (Incline Village) has two commercial sewer customers consisting of  
4 the Homeowner's clubhouse. The usage characteristics for these two sewer customers mirror  
5 the usage of a residential customer. The Cedar Hill District has commercial customers;  
6 however, none of these systems have the complexities of allocating costs between varied  
7 customer classes.

## 8 **B. Results**

9 The COS indicates that the customer base for the Warren County District is  
10 insufficient to distribute the high cost of providing service and plant investment at a  
11 reasonable level among the existing customers.

12 The COS for the sewer districts do not include any allowance for a true-up estimate  
13 for the same reasons stated earlier in the overview of the CCOS for the water operations.

## 14 **V. Rate Design Sewer Operations**

### 15 **A. Overview**

16 Staff's rate design for the Company's sewer operations is based on the Water & Sewer  
17 Departments small company rate design methodology. The customers of the Parkville and  
18 Warren County sewer districts are based on a flat rate while the customers of the Cedar Hill  
19 District have a customer charge and a commodity charge for any usage above 6,000 gallons.

### 20 **B. Design of Rates**

21 Schedule 6, 7, and 8 are the rate design worksheets for the Company's sewer  
22 operations and contain the following pages: Rate-Making Income Statement, Revenues-  
23 Current Rates, Rate Design, Revenues-Proposed Rates and Residential Customer Billing  
24 Comparison.

25 The Rate-Making Income Statement worksheet is a summary of the Company's  
26 operating revenues at current rates and the Company's cost-of-service determined by the  
27 Commission's auditing department. The last line on the worksheet is the overall revenue  
28 increase that Staff is recommending for each sewer district.

29 The Revenues-Current Rates worksheet summarizes Staff's annualized number of the  
30 Company's customers for each sewer district. The Cedar Hill sewer district is further

1 summarized by customer type and whether the customers are metered or non-metered. In  
2 addition, the center of the worksheet summarizes Staff's annualized commodity volumes over  
3 6,000 gallons for the customers of the Cedar Hill District. The Company's other revenues are  
4 summarized for each district and the bottom of the page summarizes the total operating  
5 revenues for each district.

6 The Rate Design worksheet computes the amount of the increase from the Company's  
7 current approved rates to Staff's proposed rates. As shown on the Rate Design worksheet,  
8 Staff is proposing an equal percentage increase for the customer and commodity charge in the  
9 Cedar Hill Sewer District.

10 The Revenues-Proposed Rates worksheet is similar in layout to the Revenues-Current  
11 Rates worksheet. The primary differences between these two sheets are the Proposed Rates  
12 worksheet computes Staff's proposed rates based on the proposed rates listed on the preceding  
13 Rate Design worksheet and the last two lines of the worksheet compares Staff's increase in  
14 revenues at proposed rates verses Staff's recommended increase in operating revenues.

15 The Residential Customer Billing Comparison worksheet compares the current  
16 residential customer rates to Staff's proposed residential customer rates. The worksheet also  
17 summarizes the proposed increase by dollar and percentage amounts.

### 18 **C. Results of Rate Design**

19 Since the COS in the Warren County District continues to be extremely high, and in  
20 Staff's opinion would cause rate shock to the ratepayers, Staff is proposing that the rates be  
21 subsidized. Staff recommends ratepayers in the St. Louis District continue to assist with this  
22 district's high cost-of-service.

## 23 **VI. Tariff Changes**

24 The Company filed consolidated water tariffs, proposed consolidated miscellaneous  
25 water fees within the tariff, and proposed a low income customer charge. Presently, Staff is  
26 not opposed to the concept of MAWC consolidating the water tariffs and has not taken a  
27 position on the consolidated miscellaneous water tariff fees. Staff may discuss these proposed  
28 changes further in Rebuttal Testimony.

1           Generally, Staff is in favor of the concept of a low-income program such as the one  
2 that is being proposed by the Company. However, Staff believes that at this time, any  
3 changes to the Company's proposal is properly addressed in rebuttal testimony.

4     *Staff Expert: James M. Russo*
