Service Commission

LACLEDE GAS COMPANY

GR-99-315

REBUTTAL TESTIMONY

OF

RICHARD A. KOTTEMANN, JR.

1 REBUTTAL TESTIMONY OF RICHARD A. KOTTEMANN, JR.

2
3 Q. Please state your name, title and business address.

4 A. My name is Richard A. Kottemann, Jr. I am Superintendent
5 of Environmental and Design Engineering at Laclede Gas
6 Company, and my business address is 3950 Forest Park
7 Avenue, St. Louis, Missouri, 63108.

8 Q. Are you the same Richard A. Kottemann, Jr. who submitted
9 pre-filed direct testimony in this case?

10 A. Yes, I am.

11 Q. What is the purpose of your testimony?

12 A. I will respond to a portion of the direct testimony of
13 Staff Witness Paul W. Adam concerning Gas Holders, Account
14 362. Another Company witness, Dr. Ronald White, will
15 address other portions of Mr. Adam's testimony.
16 More specifically, I will respond to Mr. Adam's statements
17 concerning the need for the holders in Laclede's system
18 and the expected retirement dates for the holders. I will
19 discuss the recent history of Company and Staff
20 recommendations for depreciation for the holders and I
21 will point out certain errors or misstatements in Mr.
22 Adam's direct testimony.

23 Q. Are the four gas holders used and useful?

24 A. Yes. The holders and their ancillary equipment are
25 productively in service. Mr. Adam's statement on page 12,

1 lines 1-4 in his testimony suggests otherwise, but the
2 holders remain in use at times for needle peaking and at
3 times for absorbing excess gas supply.

4 Q. On page 10, lines 20-24, Mr. Adam states that in 1996
5 Company engineers "stated that within 10 years the four
6 Gas Holders would be removed". Can you provide any
7 evidence to support or dispute this?

8 A. Attached is an excerpt from the direct testimony of
9 Laclede witness Harry R. Haury III in Case No. GR-96-193,
10 concerning the average remaining life of the holders.
11 (Schedule 1) It is plain from this testimony that Mr.
12 Haury proposed 10 years as a reasonable average remaining
13 life of this property, not a deadline for the retirement
14 of the last item of property. (See especially page 5,
15 lines 7-14 of Schedule 1.)

16 My testimony in our last rate case and the instant
17 case similarly proposed an estimate for the average
18 remaining life. I do not believe statements by Company
19 engineers would have contradicted this clear record of
20 testimony as Mr. Adam states. I believe rather that Mr.
21 Adam misinterpreted the testimony.

22 Q. I refer you to page 5, lines 1 and 2 of the Haury
23 testimony. Has there been a "major component failure"
24 since Mr. Haury testified?

25 A. No.

1 Q. On page 11, lines 3-9, Mr. Adam outlines Company proposals
2 in this case and the last case, pointing out that the
3 proposals are approximately equivalent in terms of
4 depreciation amount and remaining life. Is this unusual?
5 A. I do not consider it unusual that the Company would submit
6 a proposal in a rate case that is similar in effect to a
7 proposal that was made in the previous case. I regard this
8 as consistent and predictable, since the prior request was
9 not implemented.

10 Q. On page 11, lines 15-23, Mr. Adam discusses coal fired
11 power plants. Do you consider gas holders comparable to
12 power plants?

13 A. No. In terms of scale and function, I would rather compare
14 holders to major electric substations. Even considered
15 together they are nowhere near the scale of a power plant.

16 Q. Are you surprised at Mr. Adam's testimony characterizing
17 the gas holder removal cost as "final retirement" costs,
18 distinct from "interim retirement" costs and declaring
19 that depreciation on the holders should be stopped?

20 A. Yes. The Company expected Staff to support a depreciation
21 rate on the gas holders which included net removal costs
22 based upon completion of the most recent of the studies
23 requested by Staff.

24 Q. Please explain.

1 A. In Case No. GR-94-220, Mr. Adam testified that the
2 Company's estimates of significant removal costs should
3 not be incorporated into its depreciation rates because of
4 "the absence of verifiable data" concerning the cost of
5 removal. At the conclusion of that case Mr. Adam wrote a
6 letter to Mr. George M. Russell, a Company executive,
7 stating that the Staff position on holder depreciation was
8 to allow the Company to recoup retirement and remediation
9 cost "from current customers rather than passing these
10 cost on to future customers". His letter recognizes the
11 need to estimate a retirement date. He discusses the need
12 he sees for using an environmental remediation company to
13 study costs for use in determining depreciation rates in
14 the future. Mr. Adam attached a copy of the letter to his
15 testimony in Case No. GR-96-193, and I attach one hereto
16 as Schedule 2.

17 In March 1996, the Staff Manager of Depreciation,
18 David Birenbaum, addressed a letter to Mr. Haury which
19 stated that the Staff would continue to work with Laclede
20 in regard to the cost of removing the holders. I discussed
21 in my direct testimony in the instant case a new study to
22 substantiate the cost estimate of holder removal, which
23 study was undertaken upon the express recommendation of
24 Mr. Adam.

25 In Case No. GR-96-193 the Company sought and was

1 granted a 10-year remaining life solely for the purpose of
2 the rate calculation. The Stipulation makes reference to
3 gas holders as follows:

4 **The parties expressly acknowledge that the**
5 **depreciation rate recommended herein for Account**
6 **362 does not resolve the issue of what level of**
7 **costs should be reflected in such rates to reflect**
8 **the estimated future cost of removal associated**
9 **with sludge materials contained in Laclede's four**
10 **remaining holders. Laclede agrees to cooperate**
11 **with the Staff in advance of its next general rate**
12 **case filing to develop a mutually acceptable**
13 **estimate of such costs for consideration in the**
14 **establishment of a future depreciation rate or**
15 **other appropriate recovery mechanism for this**
16 **account.**

17 This gives every appearance to me that a recommendation to
18 increase the depreciation rate on Account 362 would be
19 forthcoming from Staff upon satisfactory estimation of the
20 removal cost for the sludge materials at the bottom of the
21 gas holders.

22 Q. Did Laclede comply with these provisions of the
23 Stipulation?

24 A. Yes. In Case GR-98-374, Laclede once again sought
25 recognition for the estimated cost to process and dispose
26 of the holder sludge. As my testimony in both that, and
27 this case describes, Laclede was put in contact with
28 Creamer Environmental, Inc., an environmental contractor
29 recommended by Mr. Adam. In the interim between Case No.
30 GR-96-193 and Case No. GR-98-374, Laclede engaged the firm
31 Mr. Adam recommended to help Laclede substantiate the

1 sludge volume. A Creamer representative came to St. Louis
2 from New Jersey and examined the holders. Creamer
3 quantified a pattern of sludge accumulation within the
4 Laclede holders that was typical of many other holders
5 that their firm had actually dismantled. The results of
6 the Creamer study and cost estimate are shown in my
7 Schedule 3, and it is this estimate which is incorporated
8 in my recommended rate for Account 362 in this case.

9 Q. Did Staff finally react favorably to this estimate which
10 Laclede secured with Mr. Adam's assistance?

11 A. Mr. Adam's testimony in GR-98-374 was silent on the gas
12 holders issue. The Creamer report was discussed at the
13 Prehearing Conference, but the depreciation issue was
14 again settled with no change in the rate on Account 362.

15 Q. After presenting the results of the study that was made in
16 response to Mr. Adam's most recent request and performed
17 by the very firm recommended by Mr. Adam, how do you view
18 Mr. Adam's position that depreciation should now be
19 stopped?

20 A. Having fulfilled all of Mr. Adam's previous demands in
21 connection with this issue, it is disconcerting to say the
22 least to now read in Mr. Adam's direct testimony that,
23 verifiable cost estimate or not, a depreciation allowance
24 for this removal cost cannot be made.

1 Q. Please discuss the amount of depreciation reserve the
2 Company projects to be needed for retirement of the four
3 holders.

4 A. The total reserve requirement is estimated at \$6.6
5 million. Of this amount, \$1.8 million is attributable to
6 the original cost of plant in service, and \$4.8 million is
7 the estimated net cost of removal. In his testimony on
8 page 12, lines 1-4, Mr. Adam has apparently overlooked the
9 need for reserving the original cost of depreciable
10 property in addition to considering net cost of removal.

11 Q. I refer you to page 12, lines 10-13 of Mr. Adam's
12 testimony. Please discuss the removal cost of the last
13 holder retired by Laclede Gas Company.

14 A. The last gas holder Laclede retired was removed in 1975.
15 Records show the removal cost of the holder structure was
16 approximately equal to the scrap value of the steel. In
17 addition to this small net amount of structure
18 demolition/salvage, Company labor and material were used
19 to remove piping and appurtenances from the distribution
20 system and to complete other related work related to the
21 holder removal. All totaled, there is certainly a net cost
22 of removal (negative net salvage) for this historical
23 retirement.

1 Q. Have additions of distribution system assets such as
2 feeder mains and main pressure upgrades reduced the
3 necessity of using gas holders gradually over the years?
4 A. Yes. As I noted in my direct testimony, this trend has
5 been gradual, and it is not yet complete.
6 Q. How do you respond to Mr. Adam's suggestion at pages 12-14
7 of his direct testimony that Laclede management is to
8 blame for some of the cost of removal of the holders?
9 A. These claims are without basis in fact. Mr. Adam suggests
10 that this property was kept in service arbitrarily while
11 removal procedures became more complicated and costly. In
12 reality, we have recognized more costs in our estimates
13 because, in the time we have devoted to this topic with
14 the Staff (without seeing results in the form of
15 depreciation dollars), we have become more fully aware of
16 the various environmental costs we face.
17 Q. Could you please summarize your testimony?
18 A. In summary, the direct testimony of Mr. Adam in this case
19 is inaccurate, and is totally inconsistent with previous
20 Staff testimony and correspondence in this matter.
21 Q. Does this complete your rebuttal testimony?
22 A. Yes, it does.

DIRECT TESTIMONY OF HARRY R. HAURY, III

1 Q. Please state your name and business address.

2 A. My name is Harry R. Haury, III, and my business address is 3950 Forest Park
3 Avenue, St. Louis, MO 63108.

4 Q. What is your present position?

5 A. I am Laclede's Assistant Vice President and Chief Engineer.

6 Q. How long have you held this position, and would you briefly describe your
7 duties?

8 A. I was appointed to this position on September 1, 1992. In this capacity I
9 manage the entire range of Company engineering, environmental matters, and
10 distribution system records. Among other responsibilities, these areas provide
11 most of the design, cost analysis, planning, and budgeting functions within the
12 Operating Departments. All cost projections and estimates for operations other
13 than gas supply costs are made or reviewed by my responsibility area.

14 Q. What is your educational background?

15 A. I received a Bachelor of Science Degree in Chemical Engineering in 1978 and a
16 Masters Degree in Business Administration in 1979, both from Washington
17 University in St. Louis. I am a registered professional engineer in the State of
18 Missouri.

19 Q. Please describe your experience with Laclede.

1 A. I have been continuously employed by Laclede since June of 1978. Prior to my
2 current position, I have held a variety of positions in the Distribution Design,
3 Project Engineering, Planning and Development, and Construction and
4 Maintenance Departments.

5 Q. Have you previously testified before this Commission?

6 A. Yes, I submitted testimony in two of Laclede's general rate cases, Case No.
7 GR-84-161 and GR-90-120 regarding, among other things, cost allocation, rate
8 design and the economic impact of various operating rule changes. I also
9 submitted testimony in GA-90-280 regarding the Company's Franklin County
10 expansion.

11 Q. What is the purpose of your testimony in this case?

12 A. In Case GR-94-220, the Company filed extensive testimony concerning
13 appropriate depreciation rates for major plant items. As part of that testimony,
14 the Company sought to establish depreciation and retirement costs for the gas
15 holders.

16 Q. Why is this a major issue for the Company?

17 A. Current depreciation rates do not include recovery of realistic projected
18 retirement costs.

19 Q. Please explain.

20 A. When the holders were constructed, and during the majority of their service life
21 since then, demolition and removal would have been straight forward and the
22 costs would have been largely offset by the salvage value of the steel in the

1 holders. Current depreciation rates estimated the net demolition cost at
2 \$220,801.

3 Q. What has changed?

4 A. The Federal and State Governments have promulgated a variety of
5 environmental and worker safety rules and regulations that will require a
6 considerable increase in the cost of disposal.

7 Q. Can you explain further?

8 A. The holders were built at a time when the negative impacts of lead based paint
9 and tars on health and the environment were not understood. During the era of
10 manufactured gas plants, gas streams contained a variety of BTEX and tar
11 compounds. These materials tended to deposit on the inside of the holders. Tar
12 compounds were also used as coating materials on the outside of the holders to
13 prevent corrosion. Due to the interlocking design of the holder sections, this
14 material has also accumulated in the holders over the years. Further, portions of
15 the structure have been painted with lead based paints and asbestos is contained
16 in the coatings on various plant piping and in other miscellaneous construction
17 materials.

18 Q. Is this a hazard to current workers or the public?

19 A. No. All materials are properly contained and exposure is controlled. However,
20 during demolition and removal, considerable costs will be incurred to insure
21 worker and public safety.

22 Q. How much will it cost to demolish all of the holders?

1 A. Total cost to remove them is estimated to be \$8,723,900.

2 Q. What is the basis for this estimate?

3 A. Laclede engaged the services of Black & Veatch, under my supervision and
4 direction, to conduct a study and prepare a report as to the estimated cost of
5 demolishing and performing required remediation of the gas holders.

6 Q. Describe the nature of the study and the conclusions reached by the report.

7 A. The study shows that there will be a number of major contributing factors to the
8 cost of retirement, including the demolition, removal and disposal of asbestos
9 and lead wastes, and disposal of the holder water and the tars found in the
10 holders. The study took known and estimated engineering factors and projected
11 total project costs.

12 Q. Is this amount adequate for all removal and site restoration?

13 A. This estimate will fully cover all costs associated with removal of the holders
14 given that the assumptions regarding hazardous waste volumes are accurate.
15 Historic evidence at other holder stations would suggest that the estimated
16 volumes on tar are probably low but we have no technical means of verifying
17 larger volumes at this time. Therefore, the Company has chosen to use a
18 conservative base volume estimate.

19 Q. Are there other factors involved in the estimated annual depreciation expense?

20 A. Yes. The cost to remove the holders is not the only variable. The length of
21 remaining life also has to be estimated.

22 Q. How is this done?

1 A. The holders are perfectly serviceable and will continue to be barring any major
2 component failures. However, the nature of our distribution operations has
3 changed significantly over the past several years with the advent of FERC
4 Order 636 and the addition of an alternate gas supplier to the system.
5 Moreover, this trend will continue. As system pressure requirements change,
6 gas supply issues evolve, and public pressure regarding holder appearance
7 increase, there has been a declining value to continuing holder operations. It is
8 our opinion that the holders have a remaining life of 7 - 10 years based on these
9 factors. As such the Company is seeking to use an assumed life of 10 years.

10 Q. Could it be longer than 10 years?

11 A. All current operations point to an assumed life of 10 years or less. It is possible
12 that one or more of the holders would still be in service after 10 years. But in
13 my judgment, it is more likely that the first holder retirements will start prior to
14 the end of the 10 year period.

15 Q. Please explain?

16 A. At my direction the Company continually reviews the design of its distribution
17 system. Former design methodologies dictated that the distribution system was
18 operated in such a way as to maintain minimum distribution system pressures.
19 As older mains are replaced with newer materials, the company has shifted its
20 focus toward installing smaller mains and operating the system at higher
21 pressures. This change in design philosophy has been implemented to reduce
22 system replacement and reinforcement costs. The increased distribution system

1 pressures, however, decrease the effectiveness of the holders since the existing
2 outlet compressors were designed for lower distribution system pressures. This
3 trend will eventually eliminate the ability to effectively use the holders at times
4 of peak demand. Current trends and developments in the distribution system
5 point to an expected life of 7-10 years.

6 Q. Are there any other factors involved in judging remaining life?

7 A. Yes, three of the four holders are located near residential areas and public
8 sentiment may grow to eliminate them for appearance reasons. Further, any
9 major component failure in a holder would result in the loss of its use. In most
10 situations it would not be economically feasible to repair it and it would be
11 retired at that point. Although it is impossible to determine when such failures
12 might occur, this possibility needs to be considered in determining probable
13 remaining life.

14 Q. Does this conclude your testimony?

15 A. Yes it does.

Mr. George M. Russell
Laclede Gas Company
3950 Forest Park Blvd.
St. Louis, MO 63108

Dear George:

With the settlement of Laclede's filing in GR-94-220 the discussions that we had left Gas Holders with no plan to recoup retirement and remediation cost.

Our position is that it is better to recoup retirement and remediation cost from current customers rather than passing these costs on to future customers. The annual depreciation expense for Gas Holders has the potential for a significant change from that currently approved. Accrual at a revised rate should begin as soon as practicable.

The staff recognizes that these units have a definite life span and although the date to take the gas holders out of service is unknown, such a date can be estimated from historical data from Laclede and other gas service companies.

The cost of dismantling and remediation must be a reliable figure based on what we know when a study is conducted. We can do no better than to use current guidelines for environmental cleanup and the associated current cost. If the cost changes after some period of time, then a rate adjustment would be made at that time.

With the absence of an experienced environmental remediation organization within Laclede and the Missouri Public Service Commission the reasonable way to have a verifiable cost of removal and remediation based on known materials and measured quantities is to have an environmental remediation company complete a thorough study and bid on each of the four gas holders. From these bids a depreciation rate can be determined for Laclede's next rate case.

Schedule 2
Page 1 of 2
Kottemann Rebuttal

Mr. George Russell
August 5, 1994
Page 2

This supporting work, determination of life span and environmental study and bid, will allow the staff of the Missouri Public Service Commission to support a life span depreciation evaluation of the Gas Holders account.

Another account that may need a remedial study and a life span analysis is the Liquified Petroleum Gas Storage Cavern (LPG Cavern).

The LPG Cavern has a definite life. A best estimate of this life can be made and adjusted when more data is available to allow Laclede to fully recoup abandonment and remediation cost.

Laclede's current proposal is to load the LPG Cavern with a 2% KCL solution when it is abandoned. This sounds reasonable for an oil field operation but may have shortcomings from an environmental point of view.

We are fully aware that a major New Madrid earthquake can expect to occur in the next fifty years. If the LPG Cavern is in operation at that time there is potential that a fracture would allow the liquid/gas to get into fresh water zones, but as the fresh water is used the gas would vent and appear to be a minor inconvenience. If the LPG Cavern is abandoned and loaded with 33,400,000 gallons of KCL water the question becomes, is this an acceptable environmental medium if it migrates into fresh water zones after the earthquake?

The staff is not proposing an abandonment procedure but is suggesting that a thorough analysis of the abandonment be undertaken considering events that have high likelihood of occurring in the future. Also, the staff's position will be that these costs should be recovered from current customers over the estimated remaining life of the property rather than amortizing the cost to customers after the facility is taken out of use.

George, we look forward to working with you when Laclede files again. We would like to start communication early so the process can go smoothly and develop depreciation methods that allow Laclede to fully recover costs in a reasonable manner.

Sincerely,

Paul Adam, P.E.
Engineer-Depreciation

Holder Sludge Removal and Disposal

Laclede Gas Company
Holder Sludge Removal and Disposal

Revision : May 28, 1998

Section A. Holder Characteristics - Physical Properties

	Station N	Shrews 24	Shrews 23	Station G	Totals
Year Constructed Circa	1930	1940	1925	1901	
Holder Capacity (MMCF)	10	5	3	4.05	
Number of Lifts	5	5	4	4	
Diameter of Holder (ft)	275	204	178	211	
Area under cups (sq.ft.)	6300	4628	3240	3862	18030
Remaining Area (sq.ft)	53066	28041	21631	31087	133825
Total Area of base (sq.ft.)	59366	32669	24872	34949	151855
Water height of Well (ft)	38	36	36	33	
Volume of Well (gal)	16874085	8735900	6604495	8626807	40841287

Section B. Sludge Characteristics

Volume of sludge/water (gal) **	358865	209060	156346	212798	937069
Volume of sludge (4.5 red.) (gal)	79748	46458	34744	47288	208238
Volume of centrate water (gal)	279117	162602	121603	165510	728831
Volume of Rain Water (1.5") (gal)	55507	30545	23255	32677	141985
Volume of Rain & Centrate (gal)	334624	193147	144858	198187	870816

Section C. Field Operations Costs

Centrifuge Duration (days)	29	16	12	17	
Centrifuge Cost (\$)	\$121,104	\$66,816	\$50,112	\$70,992	\$309,024
Sludge Removal (\$)	\$248,482	\$162,388	\$121,687	\$162,388	\$694,945
Total Removal/Disposal Prep (\$)	\$369,586	\$229,204	\$171,799	\$233,380	\$1,003,969

Section D. Disposal and Other Related Costs

Sludge Landfill (\$)	\$75,050	\$43,700	\$32,680	\$44,460	\$195,890
Centrate Transport & Disposal (\$)	\$398,176	\$229,862	\$172,396	\$235,877	\$1,036,311
Total Costs (Sections C & D) (\$)	\$842,812	\$502,766	\$376,875	\$513,717	\$2,236,170

** The sludge/water content is based upon historic observations of similiar holders. A reasonable estimate of the volume of sludge/water found in a holder can be made by assuming the cup area contains a two (2) ft depth of sludge while the remaining area (center to first lift) contains an eight (8) inch depth of sludge.

BEFORE THE PUBLIC SERVICE COMMISSION

OF THE STATE OF MISSOURI

In the matter of Laclede Gas Company's)
Tariff to Revise Natural Gas Rate) Case No. GR-99-315
Schedules)

A F F I D A V I T

STATE OF MISSOURI)
) SS.
CITY OF ST. LOUIS)

Richard A. Kottemann, Jr., of lawful age, being first duly sworn, deposes and states:

1. My name is Richard A. Kottemann, Jr. My business address is 3950 Forest Park Avenue, St. Louis, Missouri 63108; and I am Superintendent of Environmental and Design Engineering of Laclede Gas Company.

2. Attached hereto and made a part hereof for all purposes is my rebuttal testimony, consisting of pages 1 to 8 and three schedules, inclusive.

3. I hereby swear and affirm that my answers contained in the attached testimony to the questions therein propounded and the information contained in the attached schedules are true and correct to the best of my knowledge and belief.

Richard A. Kottemann, Jr.

Subscribed and sworn to before me this 5th day of August, 1999.
