900 lb Steam Demand Factor

Determine the maximum coincident peaks for each month in the three year period. This produces 36 individual monthly maximum demands for the 900 psi system. From these 36 values, the three highest amounts are taken for each calendar year. This results in nine values. The percentage of steam and electric use in each of these nine values is then determined. The last step in the process is to add each of the nine percentages for electric and industrial steam allocation factors and divide by nine.

900 lb Steam Demand Allocation Factor = **21.3%**
