MISSOURI PUBLIC SERVICE COMMISSION

CASE NO. WR-2003-

DIRECT TESTIMONY

OF

PAULINE M. AHERN

ON BEHALF OF

MISSOURI-AMERICAN WATER COMPANY

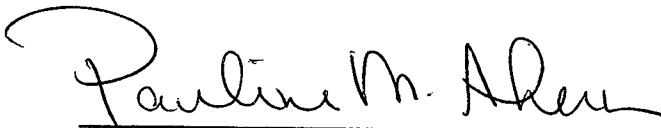

JEFFERSON CITY, MISSOURI

BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MISSOURI

IN THE MATTER OF MISSOURI-AMERICAN) WATER COMPANY FOR AUTHORITY TO) FILE TARIFFS REFLECTING INCREASED) RATES FOR WATER AND SEWER) SERVICE)	CASE NO. WR-2003-
---	-------------------

AFFIDAVIT OF PAULINE M. AHERN

Pauline M. Ahern, being first duly sworn, deposes and says that she is the witness who sponsors the accompanying testimony entitled "Direct Testimony of Pauline M. Ahern"; that said testimony and schedules were prepared by her and/or under her direction and supervision; that if inquires were made as to the facts in said testimony and schedules, she would respond as therein set forth; and that the aforesaid testimony and schedules are true and correct to the best of her knowledge.

Pauline M. Ahern

State of New Jersey
County of Burlington
SUBSCRIBED and sworn to
Before me this 12th day of May 2003.

Notary Public

My commission expires:

SHARON M. KEEFE
NOTARY PUBLIC OF NEW JERSEY

Appendix A to the Direct Testimony of Pauline M. Ahern

I. INTRODUCTION

1
2 Q. Please state your name, occupation and business address.

3
4 A. My name is Pauline M. Ahern and I am a Vice President of AUS Consultants -
5 Utility Services. My business address is 155 Gaither Drive, P.O. Box 1050,
6 Moorestown, New Jersey 08057.

7
8 Q. Please summarize your educational background and professional experience.

9
10 A. I am a graduate of Clark University, Worcester, MA, where I received a Bachelor
11 of Arts degree with honors in Economics in 1973. In 1991, I received a Master of
12 Business Administration with high honors from Rutgers University.

13 In June 1988, I joined AUS Consultants - Utility Services as a Financial
14 Analyst and am now a Vice President. I am responsible for the preparation of all
15 fair rate of return and capital structure exhibits for the principals of AUS
16 Consultants - Utility Services, including myself. I have offered expert testimony
17 on behalf of investor-owned utilities before fourteen state regulatory
18 commissions. The details of these appearances, as well as details of my
19 educational background, are shown in Appendix A supplementing this testimony.

20 I am also the Publisher of C. A. Turner Utility Reports, responsible for the
21 production, publication, distribution and marketing of these reports. C. A. Turner
22 Utility Reports provides financial data and related ratios covering approximately
23 150 public utility companies on a monthly, quarterly, and annual basis including
24 electric, combination gas and electric, gas distribution, gas transmission,
25 telephone, water and international utilities to about 1,000 subscribers, which
26 include utilities, state utility commissions, federal agencies, individuals,
27 brokerage firms, attorneys and public and collegiate libraries.

1 I also calculate and maintain the A.G.A. Index under contract with the
2 American Gas Association (A.G.A.). The A.G.A. Index is a market capitalization
3 weighted index of the common stocks of about 70 corporate members of the
4 A.G.A.

5 I have co-authored an article with Frank J. Hanley, President, AUS
6 Consultants - Utility Services entitled "Comparable Earnings: New Life for an Old
7 Precept" which was published in the American Gas Association's Financial
8 Quarterly Review, Summer 1994. I also assisted in the preparation of an article
9 authored by Frank J. Hanley and A. Gerald Harris entitled "Does Diversification
10 Increase the Cost of Equity Capital?" published in the July 15, 1991 issue of
11 Public Utilities Fortnightly.

12 I am a member of the Society of Utility and Regulatory Financial Analysts,
13 formerly the National Society of Rate of Return Analysts. In 1992, I was awarded
14 the professional designation "Certified Rate of Return Analyst" (CRRRA) by the
15 National Society of Rate of Return Analysts. This designation is based upon
16 education, experience and the successful completion of a comprehensive written
17 examination.

18 I am an associate member of the National Association of Water
19 Companies and a member of the Energy Association of Pennsylvania, formerly
20 the Pennsylvania Gas Association.

21
22 Q. What is the purpose of your testimony?

23
24 A. The purpose is to provide testimony on behalf of Missouri-American Water
25 Company (Missouri-American or the Company) as to the appropriate common
26 equity cost rate which it should be afforded the opportunity to earn on the
27 common equity financed portion of its jurisdictional rate base.

Q. What is your recommended common equity cost rate?

A. Although the Company is basing its filing upon a requested common equity cost rate, current capital market conditions indicate that a common equity cost rate range of 11.75% to 12.00% is applicable to a 43.099% common equity ratio estimated at November 30, 2003.

Q. Have you prepared schedules which support your overall recommended fair rate of return?

A. Yes, I have. They have been marked for identification as Schedules PMA-1 through PMA-11.

II. SUMMARY

Q. Please summarize your recommended common equity cost rate.

A. The overall cost of capital range of 8.62% to 8.73% summarized on Schedule PMA-1, page 1 is based upon the Company's capital structure and related ratios and fixed capital cost rates estimated at November 30, 2003. The basis of the 11.75% to 12.00% range of common equity cost rate recommendation is summarized on Schedule PMA-1, page 2.

The overall cost of capital is summarized in Table 1 below:

Common Equity	<u>43.099</u>	11.75%-12.00%	<u>5.06%-5.17%</u>
Total	<u>100.00%</u>		<u>8.62% - 8.73%</u>

16 Q. Please summarize your recommended common equity cost rate range of 11.75%
17 to 12.00%.

18
19 A. I assessed the market-based cost rates of similar risk companies, i.e., proxy
20 group, for insight into a recommended common equity cost rate applicable to the
21 Company and suitable for cost of capital purposes. Because the Company's
22 common stock is not publicly traded, market-based common equity cost rates
23 cannot be determined directly for the Company. Consequently, it is appropriate
24 to look to a proxy group or groups of similar risk companies whose common
25 stocks are actively traded for insight into an appropriate common equity cost rate
26 applicable to the Company. Using other utilities of comparable risk as proxies is
27 consistent with the principles of fair rate of return established in the Hope¹ and
28 Bluefield² cases and adds reliability to the informed expert judgment used in
29 arriving at a recommendation of common equity cost rate. Therefore, I have
30 evaluated the market data of a proxy group of water companies in arriving at my
31 recommended common equity cost rate. The bases of selection are described

¹ Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944).

² Bluefield Water Works Improvement Co. v. Public Serv. Comm'n, 262 U.S. 679 (1922).

1 below. This group, which I believe is similar to Missouri-American, consists of
2 seven C.A. Turner water companies, respectively.

3 As explained in more detail below, my analysis reflects current capital
4 market conditions and results from the application of four well-tested market-
5 based cost of common equity models, the Discounted Cash Flow (DCF)
6 approach, the Risk Premium Model (RPM), the Capital Asset Pricing Model
7 (CAPM), and the Comparable Earnings Model (CEM).

8 The results derived from each are as follows:

9
10 Table 2

	<u>Proxy Group of Seven C.A. Turner Water Cos.</u>
11	
12	
13	
14	
15	
16	
17	Discounted Cash Flow Model 10.0%
18	Risk Premium Model 12.4
19	Capital Asset Pricing Model 12.3
20	Comparable Earnings Model 13.6
21	
22	Range of Recommended
23	Common Equity Cost Rate <u>11.75% - 12.00%</u>
24	

25 After reviewing the cost rates based upon the four models, I conclude that
26 common equity cost rate range of 11.75% to 12.00% is indicated based upon the
27 application of all four models to the proxy group. Thus, 11.75% to 12.00% is my
28 recommended common equity cost rate range applicable to the common equity
29 financed portion of Missouri-American's jurisdictional rate base.

III. GENERAL PRINCIPLES

1
2 Q. What general principles have you considered in arriving at your recommended
3 common equity cost rate range of 11.75% to 12.00%.

4
5 A. In unregulated industries, marketplace competition is the principal determinant
6 establishing the price of a product or service. In the case of regulated public
7 utilities, regulation must act as a substitute for marketplace competition.
8 Consequently, marketplace data must be relied upon to assure that the utility can
9 fulfill its obligations to the public and provide adequate service at all times. This
10 requires a level of earnings sufficient to maintain the integrity of presently
11 invested capital and permit the attraction of needed new capital at a reasonable
12 cost in competition with other comparable-risk firms. These standards for a fair
13 rate of return have been established by the U.S. Supreme Court in the Hope and
14 Bluefield cases cited previously. Consequently, in my determination of a fair rate
15 of return, I have made every effort to also evaluate data gathered from the
16 marketplace for water utilities similar in risk to the Company.

17 18 IV. BUSINESS RISK

19 Q. Please define business risk and explain why it is important to the determination
20 of a fair rate of return?

21
22 A. Business risk is a collective term which incorporates all of the risks of a firm other
23 than financial risk, which will be discussed subsequently. Examples of business
24 risk include the quality of management and the regulatory environment which
25 have a direct bearing on earnings.

26 Business risk is important to the determination of a fair rate of return
27 because the greater the level of risk, the greater the rate of return investors

1 demand, consistent with the basic financial precept of risk and return.

2
3 Q. Please discuss the business risks facing the water industry in general.

4
5 A. Standard & Poor's (S&P)³ has noted that while most of the regulatory risks
6 associated with the Safe Drinking Water Act are behind the industry, the industry
7 still faces the risks related to replacing aging transmission and distribution
8 systems. As S&P states⁴:

9
10 Yet, there will always be a steady stream of rate cases to
11 incorporate spending related to upgrading plants and pipelines.
12

13 Value Line Investment Survey⁵ expects:

14
15 Long-term trends in the Water Utility Industry indicate that
16 infrastructure costs will continue to escalate. Water Utilities must
17 maintain and upgrade existing facilities in order to remain in
18 compliance with increasingly strict rules mandated by the
19 Environmental Protection Agency (EPA) and other local regulators.
20 Many of the water/wastewater systems that are presently in use
21 were originally built about 100 years ago. The EPA and other
22 industry sources indicate that hundreds of billions of dollars over
23 the next 20 years will be needed to repair the nation's entire water
24 system.
25

26 In addition, because the water industry is much more capital-intensive than the
27 electric, natural gas or telephone industries, the investment required to produce a
28 dollar of revenue is greater. Thus, the challenge to water utilities is significant.
29

³ Standard & Poor's, Global Sector Review, December 1999, pp. 319-322.

⁴ Id., p. 320.

⁵ Value Line Investment Survey, January 31, 2002.

1 As noted by S&P⁶:

2 Additional challenges, such as limited growth prospects, regulatory
3 lag, and low authorized returns and depreciation rates (about 2%
4 versus around 3% for electric utilities), will continue to hamper
5 financial performance in this highly capital-intensive business.
6
7

8 Lower depreciation rates, one of the principal sources of internal cash
9 flows for all utilities, mean that water utility depreciation as a source of internally-
10 generated cash is far less than for electric, natural gas or telephone utilities.
11 Water utilities' assets have longer lives and, hence, longer capital recovery
12 periods. As such, water utilities face greater risk due to inflation which results in
13 a higher replacement cost per dollar of net plant than for other types of utilities.

14 Moody's⁷ also notes that:

15 Over the next several years, the credit quality of the U.S. water
16 utility industry as a whole will be pressured by two factors: the
17 costs of compliance with environmental legislation and of ongoing
18 infrastructure development, and expansion beyond traditional
19 service territories.
20

21 Moody's believes that the cost of compliance with environmental
22 mandates will be more an issue for small investor-owned utilities
23 and for municipally owned water systems than for large investor-
24 owned utilities.
25

26 * * *

27
28 We expect that the credit quality of the smaller investor-owned and
29 municipal and private water utilities will likely deteriorate over the
30 next several years, reflecting continued environmental compliance
31 requirements, and higher capital investments in constructing water
32 treatment facilities, improving and replacing maturing distribution
33 and delivery infrastructure.
34
35

⁶ Standard & Poor's, CreditWeek, June 20, 1994, p. 38.

⁷ Moody's Investors Service, Global Credit Research, "The Water Utility Industry: Risks Rise for Last U.S. Regulated Monopoly", Special Comment, February 1998, pp. 1 and 6.

1 A. The basis of selection for the proxy group of seven C.A. Turner water companies
2 were those companies that meet the following criteria: 1) they are included in the
3 Water Company Group of C.A. Turner Public Utility Reports (May 2003); and 2)
4 they have Value Line or Thomson FN/First Call consensus projected growth rates
5 in earnings per share. Seven companies met all of these criteria.

6
7 Q. Please describe Schedule PMA-3.

8
9 A. Schedule PMA-3 contains comparative capitalization and financial statistics for the
10 seven C.A. Turner water companies for the years 1997 through 2001. The
11 schedule consists of two pages. Page 1 contains a summary of the comparative
12 data for the years 1997-2001, while page 2 contains notes relevant to page 1, as
13 well as the basis of selection and names of the individual companies in the proxy
14 group.

15 During the five-year period ending 2001, the achieved average earnings rate
16 on book common equity for this group ranged between 10.4% in 2000, and 11.5%
17 in 1999, and averaged 10.7%. The five-year average market/book ratio ending
18 2001 was 197.9%. The five-year ending 2001 average common equity ratio based
19 upon total investor-provided capital was 45.4%, while the five-year average
20 dividend payout ratio was 69.9%.

21 Coverage of interest charges, excluding all AFUDC from income available to
22 pay such charges, before income taxes for the years 1997-2001 ranged between
23 2.85 and 3.14 times and averaged 2.98 times during the five-year period.

1 VII. COMMON EQUITY COST RATE MODELS

2 A. The Efficient Market Hypothesis (EMH)

3 Q. Are the cost of common equity models you use market-based models, and hence
4 based upon the EMH?

5
6 A. Yes. The DCF model is market-based in that market prices are utilized in
7 developing the dividend yield component of the model. The RPM is market-based
8 in that the bond ratings and expected bond yields used in the application of the
9 RPM reflect the market's assessment of risk. In addition, the use of betas to
10 determine the equity risk premium also reflects the market's assessment of risk as
11 betas are derived from regression analyses of market prices. The CAPM is
12 market-based for many of the same reasons that the RPM is market-based, i.e., the
13 use of expected bond (Treasury bond) yields and betas. The CEM is market-
14 based in that the process of selecting the comparable risk non-utility companies is
15 based upon statistics which result from regression analyses of market prices.
16 Therefore, all the cost of common equity models I utilize are market-based models,
17 and hence based upon the EMH.

18
19 Q. Please describe the conceptual basis of the EMH.

20
21 A. The Efficient Market Hypothesis (EMH), which is the foundation of modern
22 investment theory, was pioneered by Eugene F. Fama⁸ in 1970. An efficient
23 market is one in which security prices reflect all relevant information all the time.
24 This implies that prices adjust instantaneously to new information, thus reflecting
25 the intrinsic fundamental economic value of a security.⁹

⁸ Fama, Eugene F., "Efficient Capital Markets: A Review of Theory and Empirical Work". Journal of Finance, May 1970, pp. 383-417.

⁹ Morin, Roger A., Regulatory Finance - Utilities' Cost of Capital. Public Utility Reports, Inc., Arlington, VA, 1994, p. 136.

1 The essential components of the EMH are:

- 2
3 A. Investors are rational and invest in assets providing the
4 highest expected return given a particular level of risk.
5
6 B. Current market prices reflect all publicly available
7 information.
8
9 C. Returns are independent, i.e., today's market returns are
10 unrelated to yesterday's returns.
11
12 D. Capital markets follow a random walk, i.e., the probability
13 distribution of expected returns approximates a normal
14 distribution, i.e., a bell curve.

15
16 Brealey and Myers state:¹⁰

17
18 When economists say that the security market is 'efficient', they are
19 not talking about whether the filing is up to date or whether desktops
20 are tidy. They mean that information is widely and cheaply available
21 to investors and that all relevant and ascertainable information is
22 already reflected in security prices.

23
24 The three forms of the EMH are:

- 25
26 A. The "weak" form which asserts that all past market prices and data are
27 fully reflected in securities prices, i.e., technical analysis cannot enable
28 an investor to "outperform the market".
29
30 B. The "semistrong" form which asserts that all publicly available information
31 is fully reflected in securities prices, i.e., fundamental analysis cannot
32 enable an investor to "outperform the market".
33
34 C. The "strong" form which asserts that all information, both public and
35 private, is fully reflected in securities prices, i.e., even insider information
36 cannot enable an investor to "outperform the market".
37

38 The "semistrong" form of the EMH is generally held to be true because the
39 use of insider information often enables investors to "outperform the market" and

¹⁰ Brealey, R.A. and Myers, S.C., Principles of Corporate Finance, McGraw-Hill Publications, Inc., 1996, pp. 323-324.

1 earn excessive returns. The generally-accepted "semistrong" form of the EMH
2 means that all perceived risks are taken into account by investors in the prices the
3 pay for securities. Investors are aware of all publicly-available information,
4 including bond ratings; discussions about companies by bond rating agencies and
5 investment analysts as well as the various cost of common equity methodologies
6 (models) discussed in the financial literature. In an attempt to emulate investor
7 behavior, this means that no single common equity cost rate model should be
8 relied upon in determining a cost rate of common equity and that the results of
9 multiple cost of common equity models should be taken into account.

10
11 Q. Is there support in the academic literature for the need to rely upon more than one
12 cost of common equity model in arriving at a recommended common equity cost
13 rate?

14
15 A. Yes. For example, Phillips¹¹ states:

16 Since regulation establishes a level of authorized earnings which, in
17 turn, implicitly influences dividends per share, *estimation of the growth*
18 *rate from such data is an inherently circular process. For these*
19 *reasons, the DCF model "suggests a degree of precision which is in*
20 *fact not present" and leaves "wide room for controversy and argument*
21 *about the level of k". (italics added) (p. 396)*

22
23
24 * * *

25
26 Despite the difficulty of measuring relative risk, the comparable
27 earnings standard is no harder to apply than is the market-determined
28 standard. The DCF method, to illustrate, requires a subjective
29 determination of the growth rate the market is contemplating.
30 Moreover, as Leventhal has argued: *'Unless the utility is permitted to*
31 *earn a return comparable to that available elsewhere on similar risk, it*
32 *will not be able in the long run to attract capital.'* (italics added) (p.

¹¹ Charles F. Phillips, Jr., The Regulation of Public Utilities-Theory and Practice, 1993, Public Utility Reports, Inc., Arlington, VA, p. 396, 398.

1 398)

2
3 Also, Morin¹² states:

4
5 Sole reliance on the DCF model ignores the capital market evidence
6 and financial theory formalized in the CAPM and other risk premium
7 methods. The DCF model is one of many tools to be employed in
8 conjunction with other methods to estimate the cost of equity. *It is not*
9 *a superior methodology that supplants other financial theory and*
10 *market evidence. The broad usage of the DCF methodology in*
11 *regulatory proceedings does not make it superior to other methods.*
12 (italics added) (Morin, pp. 231-232)

13
14 Each methodology requires the exercise of considerable judgment on
15 the reasonableness of the assumptions underlying the methodology
16 and on the reasonableness of the proxies used to validate a theory.
17 *The failure of the traditional infinite growth DCF model to account for*
18 *changes in relative market valuation, discussed above, is a vivid*
19 *example of the potential shortcomings of the DCF model when applied*
20 *to a given company. It follows that more than one methodology*
21 *should be employed in arriving at a judgment on the cost of equity and*
22 *that these methodologies should be applied across a series of*
23 *comparable risk companies. ...Financial literature supports the use of*
24 *multiple methods.* (italics added) (Morin, p. 239)

25
26 Professor Eugene Brigham, a widely respected scholar and finance
27 academician asserted:

28
29 *In practical work, it is often best to use all three methods -CAPM, bond*
30 *yield plus risk premium, and DCF - and then apply judgement when*
31 *the methods produce different results. People experienced in*
32 *estimating capital costs recognize that both careful analysis and very*
33 *fine judgements are required. It would be nice to pretend that these*
34 *judgements are unnecessary and to specify an easy, precise way of*
35 *determining the exact cost of equity capital. Unfortunately, this is not*
36 *possible.* (italics added) (Morin, pp. 239-240)

37
38 Another prominent finance scholar, Professor Stewart Myers, in his best-
39 selling corporate finance textbook stated:

40
41 *The constant growth formula and the capital asset pricing model are*
42 *two different ways of getting a handle on the same problem.* (italics
43 added) (Morin, p. 240)

¹² Roger A. Morin, Regulatory Finance-Utilities' Cost of Capital, 1994, Public Utilities Reports, Inc., Arlington, VA, pp. 231-232, 239-240.

1
2 In an earlier article, Professor Myers explained the point more fully:

3
4 Use more than one model when you can. Because estimating the
5 opportunity cost of capital is difficult, only a fool throws away useful
6 information. That means you should not use any one model or
7 measure mechanically and exclusively. Beta is helpful as one tool in
8 a kit, to be used in parallel with DCF models or other techniques for
9 interpreting capital market data. (Morin, p. 240)

10
11
12 In view of the foregoing, it is clear that investors are aware of all of the models
13 available for use in determining common equity cost rate. The EMH requires the
14 assumption that, collectively, investors use them all.

15
16 B. Discounted Cash Flow Model (DCF)

17 1. Theoretical Basis

18 Q. What is the theoretical basis of the DCF model?

19
20 A. The theory of the DCF model is that the present value of an expected future stream
21 of net cash flows during the investment holding period can be determined by
22 discounting the cash flows at the cost of capital, or the capitalization rate. DCF
23 theory suggests that an investor buys a stock for an expected total return rate
24 which is expected to be derived from cash flows received in the form of dividends
25 plus appreciation in market price (the expected growth rate). Thus, the dividend
26 yield on market price plus a growth rate equals the capitalization rate, i.e., the total
27 return rate expected by investors.

28
29 Q. Please comment on the applicability of the DCF model in establishing a cost of
30 common equity for the Company.

31
32 A. The extent to which the DCF is relied upon should depend upon the extent to which

1 the cost rate results differ from those resulting from the use of other cost of
2 common equity models because the DCF model has a tendency to mis-specify
3 investors' required return rate when the market value of common stock differs
4 significantly from its book value. Market values and book values of common stocks
5 are seldom at unity. The market-based DCF model will result in a total annual
6 dollar return on book common equity equal to the total annual dollar return
7 expected by investors only when market and book values are equal, a rare and
8 unlikely situation. In recent years, the market values of utilities' common stocks
9 have been well in excess of their book values as shown on page 1 of Schedule
10 PMA-3 ranging between 175.4% and 218.0% for the proxy group of seven C.A.
11 Turner water companies.

12 Mathematically, the DCF model understates/overstates investors' required
13 return rate when market value exceeds/is less than book value because, in many
14 instances, market prices reflect investors' assessments of long-range market price
15 growth potentials (consistent with the infinite investment horizon implicit in the
16 standard regulatory version of the DCF model) not fully reflected in analysts'
17 shorter range forecasts of future growth for earnings per share (EPS) and
18 dividends per share (DPS) accounting proxies. This indicates the need to better
19 match market prices with investors' longer range growth expectations embedded in
20 those prices. However, the understatement/overstatement of investors' required
21 return rate associated with the application of the market price-based DCF model to
22 the book value of common equity clearly illustrates why reliance upon a single
23 common equity cost rate model should be avoided.

1 college tuition, see stocks as the only smart alternative.
2 Perhaps Generation-Xers fear Social Security will vanish before
3 they retire, and are bulking up on stocks. Perhaps mutual-fund
4 marketing has diverted billions of dollars that once would have
5 ended up in low-interest bank accounts. Perhaps the internet
6 age has dispelled the mystique of the stock market; everyone
7 can do it.
8
9

10 Traditional rate base/rate of return regulation, where a market-based
11 common equity cost rate is applied to a book value rate base, presumes that
12 market-to-book ratios are one. This is an unproven presumption as there is
13 ample empirical evidence over sustained periods which demonstrates otherwise.
14 However, this is rarely the case as there are many factors affecting the market
15 price of common stocks, in addition to earnings. Moreover, allowed ROEs have
16 a limited effect on utilities' market/book ratios as market prices of common stocks
17 are influenced by a number of other factors beyond the direct influence of the
18 regulatory process.
19

20 For example, Phillips¹⁴ states:

21
22 Many question the assumption that market price should equal book
23 value, believing that 'the earnings of utilities should be sufficiently
24 high to achieve market-to-book ratios which are consistent with
25 those prevailing for stocks of unregulated companies.'
26

¹⁴ *Id.*, at p. 395.

1 In addition, Bonbright¹⁵ states:
2

3 In the first place, commissions cannot forecast, except within wide
4 limits, the effect their rate orders will have on the market prices of
5 the stocks of the companies they regulate. In the second place,
6 *whatever the initial market prices may be, they are sure to change*
7 *not only with the changing prospects for earnings, but with the*
8 *changing outlook of an inherently volatile stock market.* In short,
9 market prices are beyond the control, though not beyond the
10 influence of rate regulation. Moreover, even if a commission did
11 possess the power of control, any attempt to exercise it ... would
12 result in harmful, uneconomic shifts in public utility rate levels.
13 (italics added)
14

15 In view of the foregoing, a mismatch results in the application of the DCF
16 model as market prices reflect long range expectations of growth in market prices
17 (consistent with the presumed infinite investment horizon of the standard DCF
18 model), while the short range forecasts of growth in accounting proxies, i.e., EPS
19 and DPS, do not reflect the full measure of growth (market price appreciation)
20 expected in per share market value.

21
22 Q. Please explain why a DCF-derived common equity cost rate mis-specifies
23 investors' expected common equity cost rate when the market/book ratio is
24 greater or less than unity (100%).
25

26 A. Under the DCF model, the rate of return investors require is related to the price
27 paid for a stock, i.e., market price is the basis upon which they formulate the
28 required rate of return. A regulated utility is limited to earning on its net book
29 value (depreciated original cost) rate base. As discussed previously, market
30 values differ from book values for many reasons unrelated to earnings. Thus,

¹⁵ James C. Bonbright, Albert L. Danielsen and David R. Kamerschen, Principles of Public Utility Rates, 1988, Public Utilities Reports, Inc., Arlington, VA, p. 334.

1 when market values differ significantly from book values, a market-based DCF
2 cost rate applied to the book value of common equity will not accurately reflect
3 investors' expected common equity cost rate. It will either overstate or
4 understate investors' expected common equity cost rate (without regard to any
5 adjustment for flotation costs which may, at times, be appropriate on an ad hoc
6 basis) depending upon whether market value is less than or greater than book
7 value.

8 Schedule PMA-4 demonstrates how a market-based DCF cost rate
9 applied to a book value which is either below or above market value will either
10 understate or overstate investors' expectations because these expectations are
11 based on a required return on market value. As shown, there is no realistic
12 opportunity to earn the market-based rate of return on book value. As shown in
13 Column 1, investors expect a 10.00% return on a market price of \$24.00. As
14 shown in Column 2, when the 10.00% return rate on market value is applied to
15 book value which is approximately 55.5% of market value, the total annual return
16 opportunity is just \$1.333 on book value. With an annual dividend of \$0.960,
17 there is an opportunity for growth of \$0.373 which translates to just 1.55% in
18 contrast to the 6.00% growth in market price expected by investors. There is no
19 way to possibly achieve the expected growth of \$1.440 or 6.00% absent a huge
20 cut in the annual dividend, an unreasonable expectation which would result in an
21 extremely adverse reaction by investors because it would be a sign of extreme
22 financial distress.

23 Conversely, in Column 3, where the market-to-book ratio is 80%, when
24 the 10.00% return rate on market value is applied to a book value which is
25 approximately 25.0% greater than market value, the total annual return
26 opportunity is \$3.000 on book value with an annual dividend of \$0.960, there is
27 an opportunity for growth of \$2.040 which translates to 8.50% in contrast to the

1 6.00% growth in market price expected by investors.

2 In view of the foregoing, it is clear that the DCF model either understates
3 or overstates investors' required cost of common equity capital when market
4 values exceed or are less than their underlying book values and thus multiple
5 cost of common equity models should be relied upon when estimating investors'
6 expectations.

7
8 Q. Have any commissions explicitly stated that the DCF model should not be relied
9 upon exclusively?

10
11 A. Yes. As stated previously, the majority of regulatory commissions rely upon no
12 single cost of common equity model.

13 Specifically, the Iowa Utilities Board (IUB) has recognized the tendency of
14 the DCF model to understate investors' expected cost of common equity capital
15 when market values are significantly above their book values. In its June 17,
16 1994 Final Decision and Order in Docket No. RPU-93-9 Re U.S. West
17 Communications, the IUB stated:¹⁶

18
19 While the Board has relied in the past on the DCF model, in *Iowa*
20 *Electric Light and Power Company*, Docket No. RPU-89-9, "Final
21 Decision and Order" (October 15, 1990), the Board stated: "[T]he
22 DCF model may understate the return on equity in some
23 circumstances. This is particularly true when the market is
24 relatively volatile and the company in question has a market-to-
25 book ratio in excess of one." Those conditions exist in this case
26 and the Board will not rely on the DCF return. (Consumer
27 Advocate Ex. 367, See Tr. 2208, 2250, 2277, 2283-2284). *The*
28 *DCF approach underestimates the cost of equity needed to*
29 *assure capital attraction during this time of market uncertainty and*
30 *volatility. The board will, therefore, give preference to the risk*
31 *premium approach.* (italics added)

¹⁶ Public Utilities Reports - 152 PUR4th, Re: U.S. West Communications, Inc., Docket No. RPU-93-9, p. 459.

1
2 Similarly, in 1994, the Indiana Utility Regulatory Commission (IURC), for
3 example, recognized the tendency of the DCF model to understate the cost of
4 equity when market value exceeds book value¹⁷:

5
6 In determining a common equity cost rate, we must again
7 recognize the tendency of the traditional DCF model, . . . to
8 understate the cost of common equity. As the Commission stated
9 in Indiana-Mich. Power Co. (IURC 8/24/90), Cause No. 38728,
10 116 PUR 4th 1, 17-18, *"the unadjusted DCF result is almost*
11 *always well below what any informed financial analyst would*
12 *regard as defensible, and therefore, requires an upward*
13 *adjustment based largely on the expert witness's judgement."*
14 (italics added)

15 * * *

16
17
18 [u]nder the traditional DCF model . . . the appropriate earnings
19 level of the utility would not be derived by applying the DCF result
20 to the market price of the Company's stock . . . it would be applied
21 to the utility's net original cost rate base. *If the market price of the*
22 *stock exceeds its book value, . . . the investor will not achieve the*
23 *return which the model finds is necessary.* (italics added)
24

25 Also, the Hawaii Public Utilities Commission recognized this phenomenon in a
26 decision dated 6/30/92¹⁸ in a case regarding Hawaiian Electric Company, Inc.,
27 when it stated:

28
29 In this docket, as in other rate proceedings, experts disagree on
30 the relative merits of the various methods of determining the cost
31 of common equity. In this docket, HECO is particularly critical of
32 the use of the constant growth DCF methodology. It asserts that
33 method is imbued with downward bias and, thus, its use will
34 understate common equity cost. *We are cognizant of the*
35 *shortcomings of the DCF method.* There are, however,
36 shortcomings to be found with the use of CAPM and the RP
37 methods as well. We reiterate that, despite the problems with the

¹⁷ Public Utilities Reports - 150PUR4th, Re: Indiana-American Water Company, Inc., Cause No. 39595, pp. 167-168.

¹⁸ Public Utilities Reports - 134 PUR4th, Re: Hawaiian Electric Company, Inc., Docket No. 6998, p. 479.

1 use of any methodology, *all methods should be considered and*
2 *that the DCF method and the combined CAPM and RP methods*
3 *should be given equal weight.* (italics added)
4

5 More recently, the PA PUC, in its January 10, 2002 Opinion and Order in
6 Docket Nos. R-00016339 (PAWC) and C0001 through C0051 re: Pennsylvania-
7 American Water Company (PAWC) stated:

8
9 We note that, in *Lower Paxton Township v. Pennsylvania Public*
10 *Utility Commission*, 317 A.2c917 (Pa. Cmwlth. 1974) (*Lower Paxton*
11 *Township*), the Commonwealth Court recognized that this
12 Commission may consider such factors that affect the cost of capital
13 such as the utility's financial structure, credit standing, dividends,
14 risk, regulatory lag, wasting assets and any peculiar features of the
15 utility involved.

16
17 We are persuaded by PAWC's "at risk" adjustment of 60 basis
18 points, PAWC argues that a preliminary DCF calculation, which is
19 computed using the market price of PAWC's common stock, should
20 be adjusted to reconcile the divergence between market and book
21 values. The indicated cost of common equity of 10 percent,
22 therefore, reflects the barometer group's average *market*
23 capitalization, which includes a common equity ratio of 62 percent as
24 opposed to our recommended common equity ratio of 42.62 percent
25 which reflects significantly more financial risk.

26
27 PAWC further argues that, when investors value a Company's
28 common stock, they employ actual market capitalization data and not
29 book data although book capitalization is employed for ratemaking
30 purposes. Accordingly, we find that, in order to place the computed
31 DCF result on a consistent basis with the greater financial risk
32 inherent in PAWC's book value-derived capital structure ratios. A 60
33 basis point financial risk adjustment above our 10.00 percent
34 representative DCF common equity cost rate recommendation is
35 warranted.

36
37 Based on our analysis of the record, we conclude that PAWC's cost
38 of common equity of 10.60 percent is reasonable and appropriate
39 under the circumstances in this proceeding.
40
41

42 Q. Do other cost of common equity models contain unrealistic assumptions and

1 have shortcomings?

2
3 A. Yes. That is why I am not recommending that any of the models be relied upon
4 exclusively. I have focused on the shortcomings of the DCF model because
5 some regulatory commissions still place excessive or exclusive reliance upon it.
6 Although the DCF model is useful, it is not a superior methodology that supplants
7 financial theory and market evidence based upon other valid cost of common
8 equity models. For these reasons, no model, including the DCF, should be relied
9 upon exclusively.

10
11 3. Application of the DCF Model
12

13 a. Dividend Yield

14 Q. Please describe the dividend yield you used in your application of the DCF
15 model.

16
17 A. The unadjusted dividend yields are based upon an average of a recent spot date
18 (May 8, 2003) as well as an average of the three, six and twelve months ended
19 April 30, 2003, respectively, which are shown on Schedule PMA-6. The average
20 unadjusted yield of 3.3% for the seven C.A. Turner water companies is shown on
21 Schedule PMA-5, Line Nos. 1 and 6 and individually for the companies in the
22 proxy group on Schedule PMA-6.

23
24 b. Discrete Adjustment of Dividend Yield

25 Q. Please explain the dividend growth component shown on Schedule PMA-5, Line
26 Nos. 2 and 7.

27
28 A. Because dividends are paid quarterly, or periodically, as opposed to continuously

1 (daily), an adjustment to the dividend yield must be made. This is often referred
2 to as the discrete, or the Gordon Periodic, version of the DCF model.

3 Since the various companies in the proxy group increase their quarterly
4 dividend at various times during the year, a reasonable assumption is to reflect
5 one-half the annual dividend growth rate in the D_1 expression, or $D_{1/2}$. This is a
6 conservative approach which does not overstate the dividend yield which should
7 be representative of the next twelve-month period. Therefore, the actual average
8 dividend yields on Line Nos. 1 and 6 of Schedule PMA-5 have been adjusted
9 upward to reflect one-half the growth rates shown on Line Nos. 4 and 9.

10
11 c. Selection of Growth Rates for Use in the DCF Model

12 Q. Please explain the basis of the growth rates of 5.8%/7.3% for the proxy group of
13 seven C.A. Turner water companies which you use in your application of the DCF
14 model.

15
16 A. Schedule PMA-7 indicates that 80.1% of the common shares of the proxy group
17 of seven C.A. Turner water companies are held by individuals as opposed to
18 institutional investors. Individual investors are particularly likely to place great
19 significance on the opinions expressed by financial information services, such as
20 Value Line and Thomson FN/First Call, which are easily accessible and/or
21 available on the Internet.

22 Forecasts by analysts, including Value Line, are typically limited to five
23 years. In my opinion, I believe that investors in water utilities would have little
24 interest in historical growth rates beyond the most recent five years because an
25 historical five-year period balances the five-year period for projected growth
26 rates. Consequently, the use of five-year historical and five-year projected
27 growth rates in earnings per share (EPS) and dividends per share (DPS) as well

1 as the sum of internal and external growth in per share value (BR + SV) is
2 appropriate to consider in the determination of a growth rate for use in this
3 application of the DCF model. In addition, investors realize that analysts have
4 significant insight into the dynamics of the industries and they analyze individual
5 companies as well as companies' abilities to effectively manage the effects of
6 changing laws and regulations. Consequently, I have reviewed analysts'
7 projected growth in EPS, as well as historical and projected five-year compound
8 growth rates in EPS, DPS and BR + SV for each company in the proxy group.
9 The historical growth rates are from Value Line or calculated in a manner similar
10 to Value Line, while the projected growth rates in earnings are from Value Line
11 and Thomson FN/First Call forecasts. Thomson FN/First Call growth rate
12 estimates are not available for DPS and internal growth, and they do not include
13 the Value Line projections.

14 In addition to evaluating EPS and DPS growth rates, it is reasonable to
15 assume that investors also assess BR + SV. The concept is based on well
16 documented financial theory that future dividend growth is a function of the
17 portion of the overall return to investors which is reinvested in the firm plus the
18 sales of new common stock. Consequently, the growth component as proxied by
19 internal and external growth is defined as follows:

$$20 \quad g = BR + SV$$

21 Where:

22 B = the fraction of earnings retained by the firm,
23 i.e., retention ratio
24

25 R = the return on common equity

26 S = the growth in common shares outstanding
27

28 V = the premium/discount of a company's stock price
29 relative to its book value, i.e., one minus the
30 complement of the market/book ratio.
31

1 Consistent with the use of five-year historical and five-year projected
2 growth rates in EPS and DPS, I have derived five-year historical and five-year
3 projected BR+SV growth. Projected EPS growth rate averages are shown on
4 Line No. 9, while historical and projected growth in DPS, EPS, and BR + SV is
5 shown on Line No. 4, Schedule PMA-5. All of these growth rates are
6 summarized for the companies in the proxy group on page 1, Schedule PMA-8.
7 Supporting growth rate data are detailed on pages 2 through 8 of Schedule PMA-
8 8. Pages 8 through 10 of Schedule PMA-8 contain all of the most current Value
9 Line Investment Survey (Standard Edition) data for those companies in the proxy
10 group which are covered in the Standard Edition of Value Line Investment
11 Survey.

12 As shown on page 1 of Schedule PMA-8, growth rates for the proxy
13 group of seven C.A. Turner water companies range from 2.8% to 8.3%, with a
14 midpoint of 5.6% and an average of 5.9%, while projected growth rates in EPS
15 averaged 7.3%. Consequently, I conclude that growth rates of 5.8%/7.3% for the
16 proxy group of seven C.A. Turner water companies are suitable to use in the
17 application of the DCF model.

18
19 Q. Please summarize the DCF model results.

20
21 A. As shown on Schedule PMA-5, Line Nos. 5 and 10, the results of the applications
22 of the DCF model are 9.2%/10.7% for the proxy group of seven C.A. Turner
23 water companies. As shown on Line No. 8, the average DCF cost rate for the
24 proxy group is 10.0%.

1 C. The Risk Premium Model (RPM)

2 1. Theoretical Basis

3 Q. Please describe the theoretical basis of the RPM.

4
5 A. Risk Premium theory indicates that the cost of common equity capital is greater
6 than the prospective company-specific cost rate for long-term debt capital. In
7 other words, the cost of common equity equals the expected cost rate for long-
8 term debt capital plus a risk premium to compensate common shareholders for
9 the added risk of being unsecured and last-in-line in any claim on the
10 corporation's assets and earnings.

11
12 Q. Some analysts state that the RPM is another form of the CAPM. Do you agree?

13
14 A. While there are some similarities, there is a very significant distinction between
15 the two models. The RPM and CAPM both add a "risk premium" to an interest
16 rate. However, the beta approach to the determination of an equity risk premium
17 in the RPM should not be confused with the CAPM. Beta is a measure of
18 systematic, or market, risk, a relatively small percentage of total risk, i.e., the sum
19 of both non-diversifiable systematic and diversifiable unsystematic risk.
20 Unsystematic risk is fully captured in the RPM through the use of the prospective
21 long-term bond yield as can be verified by reference to pages 3 through 10 of
22 Schedule PMA-2, which confirm that the bond rating process involves an
23 assessment of all business and financial risks, i.e., total risk. In contrast, the use
24 of a risk-free rate of return in the CAPM does not, and by definition can not,
25 reflect a company's specific, i.e., unsystematic risk. Consequently, a much larger
26 portion of the total common equity cost rate is reflected in the company-specific
27 bond yield (a product of the bond rating) than is reflected in the risk-free rate in

1 the CAPM, or indeed even by the dividend yield employed in the DCF model.
2 Moreover, the financial literature recognizes the RPM and CAPM as two separate
3 and distinct cost of common equity models as discussed previously.
4

5 Q. Have you performed RPM analyses of common equity cost rate for the proxy
6 group of seven C.A. Turner water companies?
7

8 A. Yes. The result of my application of the RPM is summarized on page 1 of
9 Schedule PMA-9. On Line No. 3, page 1, Schedule PMA-9, I show the average
10 expected yield on A rated public utility bonds of 7.2%. On Line No. 4, I show the
11 adjustments, if necessary, that need to be made to the average 7.2% expected A
12 rated utility bond yield so that the expected yield of 7.2% in Line No. 5 is
13 reflective of the average Moody's bond rating of A2 for the proxy group of seven
14 C.A. Turner water companies as shown on page 2 of Schedule PMA-9. On Line
15 No. 6 of page 1, my conclusion of an equity risk premium applicable to the proxy
16 group is shown, while the total risk premium common equity cost rate is shown on
17 Line No. 7.
18

19 2. Estimation of Expected Bond Yield

20 Q. Please explain the basis of the expected bond yield of 7.2% applicable to the
21 average company in the proxy group of seven C.A. Turner water companies.
22

23 A. Because the cost of common equity is prospective, a prospective yield on
24 similarly-rated long-term debt is essential. As shown on Schedule PMA-9, page
25 2, the average Moody's bond rating for the proxy group of seven C.A. Turner
26 water companies is A2. I relied upon a consensus forecast of about 50
27 economists of the expected yield on Aaa rated corporate bonds for the six

1 calendar quarters ending with the third calendar quarter of 2004 as derived from
2 the May 1, 2003 Blue Chip Financial Forecasts (shown on page 7 of Schedule
3 PMA-9). As shown on Line No. 1 of page 1 of Schedule PMA-9, the average
4 expected yield on Moody's Aaa rated corporate bonds is 6.3%. It is necessary to
5 adjust that average yield to be equivalent to a Moody's A2 rated public utility
6 bond. Consequently, an adjustment to the average prospective yield on Aaa
7 rated corporate bonds of 0.9% was required. It is shown on Line No. 2, page 1 of
8 Schedule PMA-9 and explained in Note 2 at the bottom of the page. After
9 adjustment, the expected bond yield applicable to a Moody's A rated public utility
10 bond is 7.2% as shown on Line No. 3, page 1 of Schedule PMA-9.

11 Because the average Moody's bond rating for the proxy group of seven
12 C.A. Turner water companies is A2, no adjustment to the 7.2% prospective yield
13 on A rated public utility bonds is necessary. Therefore, the expected proxy group
14 specific bond yield is 7.2%.

15 16 3. Estimation of the Equity Risk Premium

17 Q. Please explain the method utilized to estimate the equity risk premium.

18
19 A. I evaluated the results of two different historical equity risk premium studies, as
20 well as Value Line's forecasted total annual return on the market over the
21 prospective yield on high grade corporate bonds, as detailed on pages 5, 6 and
22 8 of Schedule PMA-9. As shown on Line No. 3, page 5 of Schedule PMA-9, the
23 mean equity risk premium based on both of the studies is 5.2% applicable to the
24 proxy group of seven C.A. Turner water companies. This estimate is the result of
25 an average of beta-derived historical equity risk premium and a forecasted total
26 market equity risk premium as well as the mean historical equity risk premium
27 applicable to public utilities with bonds rated A based upon holding period

1 returns.

2 The basis of the beta-derived equity risk premiums applicable to the
3 proxy group is shown on page 6 of Schedule PMA-9. Beta-determined equity risk
4 premiums should receive substantial weight because betas are derived from the
5 market prices of common stocks over a recent five-year period. Beta is a
6 meaningful measure of prospective relative risk to the market as a whole and is a
7 logical means by which to allocate a relative share of the market's total equity
8 risk premium.

9 The total market equity risk premium utilized was 9.2% and is based upon
10 an average of both the long-term historical and forecasted market risk premiums
11 of 6.0% and 12.3%, respectively, as shown on page 6 of Schedule PMA-9. To
12 derive the historical market equity risk premium, I used the most recent Ibbotson
13 Associates' data on holding period returns for the S&P 500 Composite Index and
14 Salomon Brothers Long-term High-grade Corporate Bond Index covering the
15 period 1926-2002. The use of holding period returns over a very long period of
16 time is useful in the beta approach. As Ibbotson Associates'¹⁹ Valuation Edition
17 2003 Yearbook states:

18 The estimate of the equity risk premium depends on the length of
19 the data series studied. A proper estimate of the equity risk
20 premium requires a data series long enough to give a reliable
21 average without being unduly influenced by very good and very
22 poor short-term returns. When calculated using a long data
23 series, the historical equity risk premium is relatively stable.⁴
24 Furthermore, because an average of the realized equity risk
25 premium is quite volatile when calculated using a short history,
26 using a long series makes it less likely that the analyst can justify
27 any number he or she wants. The magnitude of how shorter
28 periods can affect the result will be explored later in this chapter.

29 Some analysts estimate the expected equity risk premium using a
30
31

¹⁹ Ibbotson Associates, Stocks, Bonds, Bills and Inflation – Valuation Edition 2002 Yearbook, pp. 76-77.

1 shorter, more recent time period on the basis that recent events
2 are more likely to be repeated in the near future; furthermore, they
3 believe that the 1920s, 1930s and 1940s contain too many
4 unusual events. This view is suspect because all periods contain
5 "unusual" events. Some of the most unusual events this century
6 took place quite recently, including the inflation of the late 1970s
7 and early 1980s, the October 1987 stock market crash, the
8 collapse of the high-yield bond market, the major contraction and
9 consolidation of the thrift industry, the collapse of the Soviet
10 Union, and the development of the European Economic
11 Community – all of these happened in the last 20 years.

12
13 It is even difficult for economists to predict the economic
14 environment of the future. For example, if one were analyzing the
15 stock market in 1987 before the crash, it would be statistically
16 improbable to predict the impending short-term volatility without
17 considering the stock market crash and market volatility of the
18 1929-1931 period.

19
20 Without an appreciation of the 1920s and 1930s, no one would
21 believe that such events could happen. The 77-year period
22 starting with 1926 is representative of what can happen: it
23 includes high and low returns, volatile and quiet markets, war and
24 peace, inflation and deflation, and prosperity and depression.
25 Restricting attention to a shorter historical period underestimates
26 the amount of change that could occur in a long future period.
27 Finally, because historical event-types (not specific events) tend
28 to repeat themselves, long-run capital market return studies can
29 reveal a great deal about the future. Investors probably expect
30 "unusual" events to occur from time to time, and their return
31 expectations reflect this. (footnote omitted)

32
33 In addition, the use of long-term data in a RPM model is consistent with
34 the long-term investment horizon presumed by the DCF model. Consequently,
35 the long-term arithmetic mean total return rates on the market as a whole of
36 12.2% and on corporate bonds of 6.2% were used, as shown at Line Nos. 1 and
37 2 of page 6 of Schedule PMA-9. As shown on Line No. 3 of page 6, the resultant
38 long-term historical equity risk premium on the market as a whole is 6.0%.

39 I used arithmetic mean return rates because they are appropriate for cost
40 of capital purposes. As Ibbotson Associates state in their Valuation Edition 2002

1 Yearbook²⁰:

2 The equity risk premium data presented in this book are arithmetic
3 average risk premia as opposed to geometric average risk premia.
4 The arithmetic average equity risk premium can be demonstrated
5 to be most appropriate when discounting future cash flows. For
6 use as the expected equity risk premium in either the CAPM or the
7 building block approach, the arithmetic mean or the simple
8 difference of the arithmetic means of stock market returns and
9 riskless rates is the relevant number. This is because both the
10 CAPM and the building block approach are additive models, in
11 which the cost of capital is the sum of its parts. The geometric
12 average is more appropriate for reporting past performance, since
13 it represents the compound average return.
14

15
16 The argument for using the arithmetic average is quite
17 straightforward. In looking at projected cash flows, the equity risk
18 premium that should be employed is the equity risk premium that
19 is expected to actually be incurred over the future time periods.
20 Graph 5-3 shows the realized equity risk premium for each year
21 based on the returns of the S&P 500 and the income return on
22 long-term government bonds. (The actual, observed difference
23 between the return on the stock market and the riskless rate is
24 known as the realized equity risk premium.) There is considerable
25 volatility in the year-by-year statistics. At times the realized equity
26 risk premium is even negative.

27 As Ibbotson Associates²¹ states in their 1999 Yearbook:

28
29 The expected equity risk premium should always be calculated
30 using the arithmetic mean. The arithmetic mean is the rate of
31 return which, when compounded over multiple periods, gives the
32 mean of the probability distribution of ending wealth
33 values....Stated another way, the arithmetic mean is correct
34 because an investment with uncertain returns will have a higher
35 expected ending wealth value than an investment which earns,
36 with certainty, its compound or geometric rate of return every
37 year....*Therefore, in the investment markets, where returns are*
38 *described by a probability distribution, the arithmetic mean is the*
39 *measure that accounts for uncertainty, and is the appropriate one*
40 *for estimating discount rates and the cost of capital. (italics added)*

²⁰ Id., p. 71.

²¹ Ibbotson Associates, Stocks, Bonds, Bills and Inflation - 1999 Yearbook, pp. 157-158.

1
2 Ex-post (historical) total returns and equity risk premium spreads differ in
3 size and direction over time. This is precisely why the arithmetic mean is
4 important as it provides insight into the variance and standard deviation of
5 returns. This prospect for variance, as captured in the arithmetic mean, provides
6 the valuable insight needed by investors to estimate future risk when making a
7 current investment. Absent such valuable insight into the potential variance of
8 returns, investors cannot meaningfully evaluate prospective risk. As discussed
9 previously, all of the cost of common equity models, including the DCF, are
10 premised upon the EMH, that all publicly available information is reflected in the
11 market prices paid. If investors relied upon the geometric mean of ex-post
12 spreads, they would have no insight into the potential variance of future returns
13 because the geometric mean relates the change over many periods to a constant
14 rate of change, thereby obviating the year-to-year fluctuations, or variance,
15 critical to risk analysis.

16 The basis of the forecasted market equity risk premium can be found on
17 Line Nos. 4 through 6 on page 6 of Schedule PMA-9. It is derived from an
18 average of the most recent 12-month, 6-month, 3-month (using the months of
19 May 2002 through April 2003) and a recent spot (May 9, 2003) median market
20 price appreciation potentials by Value Line as explained in detail in Note 1 on
21 page 3 of Schedule PMA-10. The average expected price appreciation is 84%
22 which translates to 16.47% per annum and, when added to the average (similarly
23 calculated) dividend yield of 2.15% equates to a forecasted annual total return
24 rate on the market as a whole of 18.62%, rounded to 18.6%. Thus, this
25 methodology is consistent with the use of the 12-month, 6-month, 3-month and
26 spot dividend yields in my application of the DCF model. To derive the
27 forecasted total market equity risk premium of 12.3% shown on Schedule PMA-9,

1 page 6, Line No. 6, the May 1, 2003 forecast of about 50 economists of the
2 expected yield on Moody's Aaa rated corporate bonds for the six calendar
3 quarters ending with the third calendar quarter 2004 of 6.3% from Blue Chip
4 Financial Forecasts was deducted from the Value Line total market return of
5 18.6%. The calculation resulted in an expected market risk premium of 12.3%.

6 The average of the historical and projected market equity risk premiums
7 of 6.0% and 12.3% is 9.15%, rounded to 9.2%.

8 On page 9 of Schedule PMA-9, the most current Value Line (Standard
9 Edition) betas for the companies in the proxy group are shown. Applying the
10 average beta to the average market equity risk premium of 9.2% for the seven
11 C.A. Turner water companies results on a beta adjusted equity risk premium of
12 5.8% for the proxy group as shown on Schedule PMA-9, page 6, Line No. 9.

13 A mean equity risk premium of 4.5% applicable to companies with A rated
14 public utility bonds was calculated based upon holding period returns from a
15 study using public utilities, as shown on Line No. 2, page 5 of Schedule PMA-9,
16 and detailed on page 8 of the same schedule.

17 The equity risk premium applicable to the proxy group of seven C.A.
18 Turner water companies is the average of the beta-derived premium and that
19 based upon the holding period returns of public utilities with A rated bonds, as
20 summarized on Schedule PMA-9, page 5, i.e., 5.2%.

21
22 Q. What is the RPM calculated common equity cost rate?

23
24 A. It is 12.4% for the seven C.A. Turner water companies as shown on Schedule
25 PMA-9, page 1.

26
27 Q. Some critics of the RPM model claim that its weakness is that it presumes a

1 constant equity risk premium. Is such a claim valid?

2
3 A. No. The equity risk premium varies inversely with interest rate changes,
4 although not in tandem with those changes. This presumption of a constant
5 equity risk premium is no different than the presumption of a constant "g", or
6 growth component, in the DCF model. If one calculates a DCF cost rate today,
7 the absolute result "k", as well as the growth component "g", would invariably
8 differ from a calculation made just one or several months earlier. This implies
9 that the "g" does change, although in the application of the standard DCF model,
10 the "g" is presumed to be constant. Hence, there is no difference between the
11 RPM and DCF models in that both models assume a constant component, but in
12 reality, these components, the "g" and the equity risk premium both change.

13 As Morin²² states with respect to the DCF model:

14
15 It is not necessary that *g* be constant year after year to make the
16 model valid. *The growth rate may vary randomly around some*
17 *average expected value. Random variations around trend are*
18 *perfectly acceptable, as long as the mean expected growth is*
19 *constant.* The growth rate must be 'expectationally constant' to
20 use formal statistical jargon. (italics added)
21

22 The foregoing confirms that the RPM is similar to the DCF model. Both assume
23 an "expectationally constant" risk premium and growth rate, respectively, but in
24 reality both vary (change) randomly around an arithmetic mean. Consequently,
25 the use of the arithmetic mean, and not the geometric mean is confirmed as
26 appropriate in the determination of an equity risk premium as discussed
27 previously.

²² *Id.*, p. 111.

1
2 D. The Capital Asset Pricing Model (CAPM)

3 1. Theoretical Basis

4 Q. Please explain the theoretical basis of the CAPM.

5
6 A. CAPM theory defines risk as the covariability of a security's returns with the
7 market's returns. This covariability is measured by beta ("β"), an index measure
8 of an individual security's variability relative to the market. A beta less than 1.0
9 indicates lower variability while a beta greater than 1.0 indicates greater
10 variability than the market.

11 The CAPM assumes that all other risk, i.e., all non-market or
12 unsystematic risk, can be eliminated through diversification. The risk that cannot
13 be eliminated through diversification is called market, or systematic, risk. The
14 CAPM presumes that investors require compensation for risks that cannot be
15 eliminated through diversification. Systematic risks are caused by
16 macroeconomic and other events that affect the returns on all assets.
17 Essentially, the model is applied by adding a risk-free rate of return to a market
18 risk premium. This market risk premium is adjusted proportionately to reflect the
19 systematic risk of the individual security relative to the market as measured by
20 beta. The traditional CAPM model is expressed as:

21
22
$$R_s = R_f + \beta(R_m - R_f)$$

23
24 Where: R_s = Return rate on the common stock
25
26 R_f = Risk-free rate of return
27
28 R_m = Return rate on the market as a whole
29
30 β = Adjusted beta (volatility of the security
31 relative to the market as a whole)
32

1 Numerous tests of the CAPM have confirmed its validity. These tests
2 have measured the extent to which security returns and betas are related as
3 predicted by the CAPM. However, Morin observes that while the results support
4 the notion that beta is related to security returns, it has been determined that the
5 empirical Security Market Line (SML) described by the CAPM is not as steeply
6 sloped as the predicted SML. Morin²³ states:

7
8 With few exceptions, the empirical studies agree that the implied
9 intercept term exceeds the risk-free rate and the slope term is less
10 than predicted by the CAPM. That is, low-beta securities earn
11 returns somewhat higher than the CAPM would predict, and high-
12 beta securities earn less than predicted.

13 * * *

14
15
16 Therefore, the empirical evidence suggests that the expected
17 return on a security is related to its risk by the following
18 approximation:

$$19 K = R_F + x \beta(R_M - R_F) + (1-x) \beta(R_M - R_F)$$

20
21 where x is a fraction to be determined empirically. ...the value of x
22 that best explains the observed relationship is between 0.25 and
23 0.30. If x = 0.25, the equation becomes:

$$24 K = R_F + 0.25(R_M - R_F) + 0.75 \beta(R_M - R_F)^{24}$$

25
26
27
28 In view of theory and practical research, I have applied both the
29 traditional CAPM and the empirical CAPM to the companies in the proxy group
30 and averaged the results.

31 32 2. Risk-Free Rate of Return

33 Q. Please describe your selection of a risk-free rate of return.

A. My applications of the traditional and empirical CAPM are summarized on Schedule PMA-10, page 1. As shown on Line Nos. 1 and 4, the risk-free rate adopted for both applications is 5.4%. It is based upon the average consensus forecast of the reporting economists in the May 1, 2003 of Blue Chip Financial Forecasts as shown in Note 2, page 4, of the expected yields on long-term U.S. Treasury bonds for the six quarters ending with the third calendar quarter 2004.

Q. Why is the prospective yield on long-term U.S. Treasury Bonds appropriate for use as the risk-free rate?

A. The yield on long-term T-Bonds is almost risk-free and its term is consistent with the long-term cost of capital to public utilities measured by the yields on A rated public utility bonds, and is consistent with the long-term investment horizon inherent in utilities' common stocks. Therefore, it is consistent with the long-term investment horizon presumed in the standard DCF model employed in regulatory ratemaking. Moreover, Morin²⁵ states:

Equity investors generally have an investment horizon far in excess of fifty days. More importantly, the short-term T-bill yields reflect the impact of factors different from those influencing long-term securities, such as common stock. For example, the premium for expected inflation absorbed into 90-day Treasury bills is likely to be far different than the inflationary premium absorbed into long-term securities yields. The yields on long-term Treasury bonds match more closely with common stock returns. *For investors with a long time horizon, a long-term government bond is almost risk-free. (italics added)*

As to the use of the highly volatile Treasury Bill rate, Morin cites Brigham

²⁵ *Id.*, at p. 308.

1 and Gapenski who conclude²⁶:

2
3 Treasury bill rates are subject to more random disturbances than
4 are Treasury bond rates. For example, bills are used by the
5 Federal Reserve System to control the money supply, and bills
6 are also used by foreign governments, firms, and individuals as a
7 temporary safe-house for money. Thus, if the Fed decides to
8 stimulate the economy, it drives down the bill rate and the same
9 thing happens if trouble erupts somewhere in the world and
10 money flows into the United States seeking a temporary haven.
11

12 In addition, Ibbotson Associates note in their Valuation Edition 2003
13 Yearbook²⁷

14 The horizon of the chosen Treasury security should match the
15 horizon of whatever is being valued. When valuing a business
16 that is being treated as a going concern, the appropriate Treasury
17 yield should be that of a long-term Treasury bond. Note that the
18 horizon is a function of the investment, not the investor.
19
20
21

22 In conclusion, the average expected yield on long-term Treasury Bonds is
23 the appropriate proxy for the risk-free rate in the CAPM because it is less volatile
24 than yields on Treasury Bills, is almost risk-free as noted by Morin above and is
25 consistent with the long-term investment horizon implicit in common stocks.
26

27 3. Market Equity Risk Premium

28 Q. Please explain the estimation of the expected equity risk premium for the market.

29
30 A. First, I estimate investors' expected total return rate for the market. Then I
31 estimate the expected risk-free rate which I subtract from the expected total

²⁶ Id., at p. 308.

VICE PRESIDENT**

AUS CONSULTANTS – UTILITY SERVICES

**PROFESSIONAL QUALIFICATIONS
OF
PAULINE M. AHERN, CRRA
VICE PRESIDENT
AUS CONSULTANTS – UTILITY SERVICES**

PROFESSIONAL EXPERIENCE

1996-Present

As a Vice President, I continue to prepare fair rate of return and cost of capital exhibits, as well as submitting testimony on same before state public utility commissions. I continue to provide assistance and support throughout the entire ratemaking litigation process.

As the Publisher of C.A. Turner Utility Reports, I am responsible for the production, publishing, and distribution of the reports. C.A. Turner Utility Reports provides financial data and related ratios for about 200 public utilities, i.e., electric, combination gas and electric, natural gas distribution, natural gas transmission, telephone, and water utilities, on a monthly, quarterly and annual basis. C.A. Turner Utility Reports has about 1,000 subscribers including utilities, many state regulatory commissions, federal agencies, individuals, brokerage firms, attorneys, as well as public and academic libraries. The publication has continuously provided financial statistics on the utility industry since 1930.

As the Publisher of C.A. Turner Utility Reports, I supervise the production, publishing, and distribution of the AGA Rate Service publications under license from the American Gas Association. I am also responsible for maintaining and calculating the performance of the AGA Index, a market capitalization weighted index of the common stocks of the approximately 90 corporate members of the AGA. In addition, I supervise the production of a quarterly survey of investor-owned water company rate case activity on behalf of the National Association of Water Companies.

1994-1996

As an Assistant Vice President, I prepared fair rate of return and cost of capital exhibits which are filed along with expert testimony before various state and federal public utility regulatory bodies. These supporting exhibits include the determination of an appropriate ratemaking capital structure and the development of embedded cost rates of senior capital. The exhibits also support the determination of a recommended return on common equity through the use of various market models, such as, but not limited to, Discounted Cash Flow analysis, Capital Asset Pricing Model and Risk Premium Methodology, as well as an assessment of the risk characteristics of the client utility. I also assisted in the preparation of responses to any interrogatories received regarding such testimonies filed on behalf of client utilities. Following the filing of fair rate of return testimonies, I assisted in the evaluation of opposition testimony in order to prepare interrogatory questions, areas of cross-examination, and rebuttal testimony. I also evaluated and assisted in the preparation of briefs and exceptions following the hearing process. I have submitted testimony before state public utility commissions regarding appropriate capital structure ratios and fixed capital cost rates.

1990-1994

As a Senior Financial Analyst, I prepared and supervised two analysts in the preparation of fair rate of return and cost of capital exhibits which are filed along with expert testimony before various state and federal public utility regulatory bodies. The team also assisted in the preparation of interrogatory responses.

I evaluated the final orders and decisions of various commissions to determine whether further actions are warranted and to gain insight which may assist in the preparation of future rate of return studies.

I assisted in the preparation of an article authored by Frank J. Hanley and A. Gerald Harris entitled "Does Diversification Increase the Cost of Equity Capital?" published in the July 15, 1991 issue of Public Utilities Fortnightly.

I co-authored an article with Frank J. Hanley entitled "Comparable Earnings: New Life for an Old Precept" which was published in the American Gas Association's Financial Quarterly Review, Summer 1994.

I was awarded the professional designation "Certified Rate of Return Analyst" (CRRRA) by the National Society of Rate of Return Analysts (now the Society of Utility and Regulatory Financial Analysts (SURFA)). This designation is based upon education, experience and the successful completion of a comprehensive examination.

As Administrator of Financial Analysis for C. A. Turner Utility Reports, which reports financial data for over 200 utility companies and has approximately 1,000 subscribers, I oversee the preparation of this monthly publication, as well as the annual publication, Financial Statistics - Public Utilities.

1988-1990

As a Financial Analyst, I assisted in the preparation of fair rate of return studies including capital structure determination, development of senior capital cost rates, as well as the determination of an appropriate rate of return on equity. I also assisted in the preparation of interrogatory responses, interrogatory questions of the opposition, areas of cross-examination and rebuttal testimony. I also assisted in the preparation of the annual publication C.A. Turner Utility Reports - Financial Statistics - Public Utilities.

1973-1975

As a research assistant in the Research Department of the Regional Economics Division of the Federal Reserve Bank of Boston, I was involved in the development and maintenance of econometric models to simulate regional economic conditions in New England in order to study the effects of, among other things, the energy crisis of the early 1970's and property tax revaluations on the economy of New England. I was also involved in the statistical analysis and preparation of articles for the New England Economic Review. Also, I acted as assistant editor for New England Business Indicators.

1972

As a research assistant in the Office of the Assistant Secretary for International Affairs, U.S. Treasury Department, Washington, D.C., I developed and maintained econometric models which simulated the economy of the United States in order to study the results of various alternate foreign trade policies so that national trade policy could be formulated and recommended.

I am also a member of the Society of Utility and Regulatory Financial Analysts (formerly the National Society of Rate of Return Analysts).

Clients Served

I have offered expert testimony before the following commissions:

Arkansas
California
Delaware
Hawaii
Illinois
Indiana
Maine

Michigan
Missouri
New Jersey
Pennsylvania
South Carolina
Virginia
Washington

I have sponsored testimony on the rate of return and capital structure effects of merger and acquisition issues for:

California-American Water Company

New Jersey-American Water Company

I have sponsored testimony on fair rate of return and related issues for:

Audubon Water Company
Carolina Water Service, Inc.
Consumers Illinois Water Company
Consumers Maine Water Company
Consumers New Jersey Water Company
Elizabethtown Water Company
Emporium Water Company
GTE Hawaiian Telephone Inc.
Long Neck Water Company
Middlesex Water Company

Dear Reader,

This volume updates the 1994 edition of *Corporate Finance Criteria*. There are several new chapters, covering our recently introduced Bank Loan Ratings, criteria for "notching" junior obligations, and the role of cyclicity in ratings. Naturally, the ratio medians have been brought up to date.

Standard & Poor's criteria publications represent our endeavor to convey the thought processes and methodologies employed in determining Standard & Poor's ratings. They describe both the quantitative and qualitative aspects of the analysis. We believe that our rating product has the most value if users appreciate all that has gone into producing the letter symbols.

Bear in mind, though, that a rating is, in the end, an opinion. The rating experience is as much an art as it is a science.

Solomon B. Samson
Chairman, Corporate Ratings Criteria Committee

Utilities

The utilities rating methodology encompasses two basic components: business risk analysis and financial analysis. Evaluation of industry characteristics, the utility's position within that industry, its regulation, and its management provides the context for assessing a firm's financial condition.

Historical analysis is a tool for identifying strengths and weaknesses, and provides a starting point for evaluating financial condition. Business position assessment is the qualitative measure of a utility's fundamental creditworthiness. It focuses on the forces that will shape the utilities' future.

Utilities credit analysis factors

Business risk	Financial risk
• Markets and service area economy	• Earnings protection
• Competitive position	• Capital structure
• Operations	• Cash flow adequacy
• Regulation	• Financial flexibility/capital attraction
• Management	
• Fuel, power, and water supply	
• Asset concentration	

The credit analysis of utilities is quickly evolving, as utilities are treated less as regulated monopolies and more as entities faced with a host of challengers in a competitive environment. Marketplace dynamics are supplanting the power of regulation, making it critically important to reduce costs and/or market new services in order to thwart competitors' inroads.

Markets and service area economy

Assessing service territory begins with the economic and demographic evaluation of the area in which the utility has its franchise. Strength of long-term demand for the product is examined from a macroeconomic perspective. This enables Standard & Poor's to evaluate the affordability of rates and the staying power of demand.

Standard & Poor's tries to discern any secular consumption trends and, more importantly, the reasons for them. Specific items examined include the size and growth rate of the market, strength of the franchise, historical and projected sales growth, income levels and trends in population, employment, and per capita income. A utility with a healthy economy and customer base—as illustrated by diverse employment opportunities, average or above-average wealth and income statistics, and low unemployment—

will have a greater capacity to support its operations.

For electric and gas utilities, distribution by customer class is scrutinized to assess the depth and diversity of the utility's customer mix. For example, heavy industrial concentration is viewed cautiously, since a utility may have significant exposure to cyclical volatility. Alternatively, a large residential component yields a stable and more predictable revenue stream. The largest utility customers are identified to determine their importance to the bottom line and assess the risk of their loss and potential adverse effect on the utility's financial position. Credit concerns arise when individual customers represent more than 5% of revenues. The company or industry may play a significant role in the overall economic base of the service area. Moreover, large customers may turn to cogeneration or alternative power supplies to meet their energy needs, potentially leading to reduced cash flow for the utility (even in cases where a large customer pays discounted rates and is not a profitable account for the utility). Customer concentration is less significant for water and telecommunication utilities.

Competitive position

As competitive pressures have intensified in the utilities industry, Standard & Poor's analysis has deepened to include a more thorough review of competitive position.

Electric utility competition

For electric utilities, competitive factors examined include: percentage of firm wholesale revenues that are most vulnerable to competition; industrial load concentration; exposure of key customers to alternative suppliers; commercial concentrations; rates for various customer classes; rate design and flexibility; production costs, both marginal and fixed; the regional capacity situation; and transmission constraints. A regional focus is evident, but high costs and rates relative to national averages are also of significant concern because of the potential for electricity substitutes over time.

Mounting competition in the electric utility industry derives from excess generating capacity, lower barriers to entering the electric generating business, and marginal costs that are below embedded costs. Standard & Poor's has already witnessed declining prices in wholesale markets, as *de facto* retail competition is already being seen in several parts of the country. Standard & Poor's believes that over the coming years more and more customers will want and demand lower prices. Initial concerns focus on the largest industrial loads, but other customer classes will be increasingly vulnerable. Competition will not necessar-

ily be driven by legislation. Other pressures will arise from global competition and improving technologies, whether it be the declining cost of incremental generation or advances in transmission capacity or substitute energy sources like the fuel cell. It is impossible to say precisely when wide-open retail competition will occur; this will be evolutionary. However, significantly greater competition in retail markets is inevitable.

Gas utility competition

Similarly, gas utilities are analyzed with regard to their competitive standing in the three major areas of demand: residential, commercial, and industrial. Although regulated as holders of monopoly power, natural gas utilities have for some time been actively competing for energy market share with fuel oil, electricity, coal, solar, wood, etc. The long-term staying power of market demand for natural gas cannot be taken for granted. In fact, as the electric utility industry restructures and reduces costs, electric power will become more cost competitive and threaten certain gas markets. In addition, independent gas marketers have made greater inroads behind the city gate and are competing for large gas users. Moreover, the recent trend by state regulators to unbundle utility services is creating opportunities for outsiders to market niche products. Distributors still have the upper hand, but those who do not reduce and control costs, and thus rates, could find competition even more difficult.

Natural gas pipelines are judged to carry a somewhat higher business risk than distribution companies because they face competition in every one of their markets. To the extent a pipeline serves utilities versus industrial end users, its stability is greater. Over the next five years, pipeline competition will heat up since many service contracts with customers are expiring. Most distributor or end-use customers are looking to reduce pipeline costs and are working to improve their load factor to do so. Thus, pipelines will likely find it difficult to recontract all capacity in coming years. Being the pipeline of choice is a function of attractive transportation rates, diversity and quality of services provided, and capacity available in each particular market. In all cases though, periodic discounting of rates to retain customers will occur and put pressure on profitability.

Water utility competition

As the last true utility monopoly, water utilities face very little competition and there is currently no challenge to the continuation of franchise areas. The only exceptions have been cases where investor-owned water companies have been subject to condemnation and municipalization because of poor service or political motivations. In that regard, Standard & Poor's pays close attention to costs and rates in relation to neighboring utilities and national averages. (In contrast, the privatization of public water facilities has begun, albeit at a slower pace than anticipated. This is occurring mostly in the form of operating contracts and public/private partnerships, and not in asset transfers. This trend should continue as cities look for ways to bal-

ance their tight budgets.) Also, water utilities are not fully immune to the forces of competition; in a few instances wholesale customers can access more than one supplier.

Telephone competition

The Telecommunications Act of 1996 accelerates the continuing challenge to the local exchange companies' (LECs) century-old monopoly in the local loop. Competitive access providers (CAPs), both facilities-based and resellers, are aggressively pursuing customers, generally targeting metropolitan areas, and promising lower rates and better service.

Most long-distance calls are still originated and terminated on the local telephone company network. To complete such a call, the long-distance provider (including AT&T, MCI, Sprint and a host of smaller interexchange carriers or "IXCs") must pay the local telephone company a steep "access" fee to compensate the local phone company for the use of its local network. CAPs, in contrast, build or lease facilities that directly connect customers to their long-distance carrier, bypassing the local telephone company and avoiding access fees, and thereby can offer lower long-distance rates. But the LECs are not standing still; they are combating the loss of business to CAPs by lowering access fees, thereby reducing the economic incentive for a high usage long-distance customer to use a CAP. LECs are attempting to make up for the loss of revenues from lower access fees by increasing basic local service rates (or at least not lowering them), since basic service is far less subject to competition. LECs are improving operating efficiency and marketing high margin, value-added new services. Additionally, in the wake of the Telecommunications Act, LECs will capture at least some of the inter-LATA long-distance market. As a result of these initiatives, LECs continue to rebuild themselves—from the traditional utility monopoly to leaner, more marketing oriented organizations.

While LECs, and indeed all segments of the telecommunications sector, face increasing competition, there are favorable industry factors that tend to offset heightened business risk and auger for overall ratings stability for most LECs. Importantly, telecommunications is a declining-cost business. With increased deployment of fiber optics, the cost of transport has fallen dramatically and digital switching hardware and software have yielded more capable, trouble-free and cost-efficient networks. As a result, the cost of network maintenance has dropped sharply, as illustrated by the ratio of employees per 10,000 access lines, an oft cited measurement of efficiency. Ratios as low as 25 employees per 10,000 lines are being seen, down from the typical 40 or more employees per 10,000 ratio of only a few years ago.

In addition, networks are far more capable. They are increasingly digitally switched and able to accommodate high-speed communications. The infrastructure needed to accommodate switched broadband services will be built into telephone networks over the next few years. These advanced networks will enable telephone companies to look to a greater variety of high-margin, value-added serv-

STANDARD & POOR'S CORPORATE RATINGS CRITERIA

ices. In addition to those current services such as call waiting or caller ID, the delivery of hundreds of broadcast and interactive video channels will be possible. While these services offer the potential of new revenue streams, they will simultaneously present a formidable challenge. LECs will be entering the new (to them) arena of multimedia entertainment and will have to develop expertise in marketing and entertainment programming acumen; such skills stand in sharp contrast to LECs' traditional strengths in engineering and customer service.

Operations

Standard & Poor's focuses on the nature of operations from the perspective of cost, reliability, and quality of service. Here, emphasis is placed on those areas that require management attention in terms of time or money and which, if unresolved, may lead to political, regulatory, or competitive problems.

Operations of electric utilities

For electric utilities, the status of utility plant investment is reviewed with regard to generating plant availability and utilization, and also for compliance with existing and contemplated environmental and other regulatory standards. The record of plant outages, equivalent availability, load factors, heat rates, and capacity factors are examined. Also important is efficiency, as defined by total megawatt hour per employee and customers per employee. Transmission interconnections are evaluated in terms of the number of utilities to which the utility in question has access, the cost structures and available generating capacity of these other utilities, and the price paid for wholesale power.

Because of mounting competition and the substantial escalation in decommissioning estimates, significant weight is given to the operation of nuclear facilities. Nuclear plants are becoming more vulnerable to high production costs that make their rates uneconomic. Significant asset concentration may expose the utility to poor performance, unscheduled outages or premature shutdowns, and large deferrals or regulatory assets that may need to be written off for the utility to remain competitive. Also, nuclear facilities tend to represent significant portions of their operators' generating capability and assets. The loss of a productive nuclear unit from both power supply and rate base can interrupt the revenue stream and create substantial additional costs for repairs and improvements and replacement power. The ability to keep these stations running smoothly and economically directly influences the ability to meet electric demand, the stability of revenues and costs, and, by extension, the ability to maintain adequate creditworthiness. Thus, economic operation, safe operation, and long-term operation are examined in depth. Specifically, emphasis is placed on operation and maintenance costs, busbar costs, fuel costs, refueling outages, forced outages, plant statistics, NRC evaluations, the potential need for repairs, operating licenses, decommissioning estimates and amounts held in external trusts, spent fuel storage capacity, and management's nuclear experi-

ence. In essence, favorable nuclear operations offer significant opportunities but, if a nuclear unit runs poorly or not at all, the attendant risks can be great.

Operations of gas utilities

For gas pipeline and distribution companies, the degree of plant utilization, the physical condition of the mains and lines, adequacy of storage to meet seasonal needs, "lost and unaccounted for" gas levels, and per-unit nongas operating and construction costs are important factors. Efficiency statistics such as load factor, operating costs per customer, and operating income per employee are also evaluated in comparison to other utilities and the industry as a whole.

Operations of water utilities

As a group, water utilities are continually upgrading their physical plant to satisfy regulations and to develop additional supply. Over the next decade, water systems will increasingly face the task of maintaining compliance, as drinking water regulations change and infrastructure ages. Given that the Safe Drinking Water Act was authorized in 1974, the first generation of treatment plants built to conform with these rules are almost 20 years old. Additionally, because the focus during this period was on satisfying environmental standards, deferred maintenance of distribution systems has been common, especially in older urban areas. The increasing cost of supplying treated water argues against the high level of unaccounted for water witnessed in the industry. Consequently, Standard & Poor's anticipates capital plans for rebuilding distribution lines and major renewal and replacement efforts aimed at treatment plants.

Operations of telephone companies

For telephone companies, cost-of-service analysis focuses on plant capability and measures of efficiency and quality of service. Plant capability is ascertained by looking at such parameters as percentage of digitally switched lines; fiber optic deployment, in particular in those portions of the plant key to network survival; and the degree of broadband capacity fiber and coaxial deployment and broadband switching capacity. Efficiency measures include operating margins, the ratio of employees per 10,000 access lines, and the extent of network and operations consolidation. Quality of service encompasses examination of quantitative measures, such as trouble reports and repeat service calls, as well as an assessment of qualitative factors, that may include service quality goals mandated by regulators.

Regulation

Regulatory rate-setting actions are reviewed on a case-by-case basis with regard to the potential effect on creditworthiness. Regulators' authorizing high rates of return is of little value unless the returns are earnable. Furthermore, allowing high returns based on noncash items does not benefit bondholders. Also, to be viewed positively, regulatory treatment should allow consistent performance from

STANDARD & POOR'S CORPORATE RATINGS CRITERIA

period to period, given the importance of financial stability as a rating consideration.

The utility group meets frequently with commission and staff members, both at Standard & Poor's offices and at commission headquarters, demonstrating the importance Standard & Poor's places on the regulatory arena for credit quality evaluation. Input from these meetings and from review of rate orders and their impact weigh heavily in Standard & Poor's analysis.

Standard & Poor's does not "rate" regulatory commissions. State commissions typically regulate a number of diverse industries, and regulatory approaches to different types of companies often differ within a single regulatory jurisdiction. This makes it all but impossible to develop inclusive "ratings" for regulators.

Standard & Poor's evaluation of regulation also encompasses the administrative, judicial, and legislative processes involved in state and federal regulation. These can affect rate-setting activities and other aspects of the business, such as competitive entry, environmental and safety rules, facility siting, and securities sales.

As the utility industry faces an increasingly deregulated environment, alternatives to traditional rate-making are becoming more critical to the ability of utilities to effectively compete, maintain earnings power, and sustain creditor protection. Thus, Standard & Poor's focuses on whether regulators, both state and federal, will help or hinder utilities as they are exposed to greater competition. There is much that regulators can do, from allocating costs to more captive customers to allowing pricing flexibility—and sometimes just stepping out of the way.

Under traditional rate-making, rates and earnings are tied to the amount of invested capital and the cost of capital. This can sometimes reward companies more for justifying costs than for containing them. Moreover, most current regulatory policies do not permit utilities to be flexible when responding to competitive pressures of a deregulated market. Lack of flexible tariffs for electric utilities may lure large customers to wheel cheaper power from other sources.

In general, a regulatory jurisdiction is viewed favorably if it permits earning a return based on the ability to sustain rates at competitive levels. In addition to performance-based rewards or penalties, flexible plans could include market-based rates, price caps, index-based prices, and rates premised on the value of customer service. Such rates more closely mirror the competitive environment that utilities are confronting.

Electric industry regulation

The ability to enter into long-term arrangements at negotiated rates without having to seek regulatory approval for each contract is also important in the electric industry. (While contracting at reduced rates constrains financial performance, it lessens the potential adverse impact in the event of retail wheeling. Since revenue losses associated with this strategy are not likely to be recovered from rate-payers, utilities must control costs well enough to remain

competitive if they are to sustain current levels of bondholder protection.)

Natural gas industry regulation

In the gas industry, too, several state commission policies weigh heavily in the evaluation of regulatory support. Examples include stabilization mechanisms to adjust revenues for changes in weather or the economy, rate and service unbundling decisions, revenue and cost allocation between sales and transportation customers, flexible industrial rates, and the general supportiveness of construction costs and gas purchases.

Water industry regulation

In all water utility activities, federal and state environmental regulations continue to play a critical role. The legislative timetable to effect the 1986 amendments to the Safe Drinking Water Act of 1974 was quite aggressive. But environmental standards-setting has actually slowed over the past couple of years due largely to increasing sentiment that the stringent, costly standards have not been justified on the basis of public health. A moratorium on the promulgation of significant new environmental rules is anticipated.

Telecommunications industry regulation

Despite the advances in telecommunications deregulation, analysis of regulation of telephone operators will continue to be a key rating determinant for the foreseeable future. The method of regulation may be either classic rate-based rate of return or some form of price cap mechanism. The most important factor is to assess whether the regulatory framework—no matter which type—provides sufficient financial incentive to encourage the rated company to maintain its quality of service and to upgrade its plant to accommodate new services while facing increasing competition from wireless operators and cable television companies.

Where regulators do still set tariffs based on an authorized return, Standard & Poor's strives to explore with regulators their view of the rate-of-return components that can materially impact reported versus regulatory earnings. Specifically these include the allowable base upon which the authorized return can be earned, allowable expenses, and the authorized return. Since regulatory oversight runs the gamut from strict, adversarial relationships with the regulated operating companies to highly supportive postures, Standard & Poor's probes beyond the apparent regulatory environment to ascertain the actual impact of regulation on the rated company.

Management

Evaluating the management of a utility is of paramount importance to the analytical process since management's abilities and decisions affect all areas of a company's operations. While regulation, the economy, and other outside factors can influence results, it is ultimately the quality of management that determines the success of a company.

STANDARD & POOR'S CORPORATE RATINGS CRITERIA

With emerging competition, utility management will be more closely scrutinized by Standard & Poor's and will become an increasingly critical component of the credit evaluation. Management strategies can be the key determinant in differentiating utilities and in establishing where companies lie on the business position spectrum. It is imperative that managements be adaptable, aggressive, and proactive if their utilities are to be viable in the future; this is especially important for utilities that are currently uncompetitive.

The assessment of management is accomplished through meetings, conversations, and reviews of company plans. It is based on such factors as tenure, industry experience, grasp of industry issues, knowledge of customers and their needs, knowledge of competitors, accounting and financing practices, and commitment to credit quality. Management's ability and willingness to develop workable strategies to address their systems' needs, to deal with the competitive pressures of free market, to execute reasonable and effective long-term plans, and to be proactive in leading their utilities into the future are assessed. Management quality is also indicated by thoughtful balancing of public and private priorities, a record of credibility, and effective communication with the public, regulatory bodies, and the financial community. Boards of directors will receive ever more attention with respect to their role in setting appropriate management incentives.

With competition the watchword, Standard & Poor's also focuses on management's efforts to enhance financial condition. Management can bolster bondholder protection by taking any number of discretionary actions, such as selling common equity, lowering the common dividend payout, and paying down debt. Also important for the electric industry will be creativity in entering into strategic alliances and working partnerships that improve efficiency, such as central dispatching for a number of utilities or locking up at-risk customers through long-term contracts or expanded flexible pricing agreements. Proactive management teams will also seek alternatives to traditional rate-base, rate-of-return rate-making, move to adopt higher depreciation rates for generating facilities, segment customers by individual market preferences, and attempt to create superior service organizations.

In general, management's ability to respond to mounting competition and changes in the utility industry in a swift and appropriate manner will be necessary to maintain credit health.

Fuel, power, and water supply

Assessment of present and prospective fuel and power supply is critical to every electric utility analysis, while gauging the long-term natural gas supply position for gas pipeline and distribution companies and the water resources of a water utility is equally important. There is no similar analytical category for telephone utilities.

Electric utilities

For electric utilities emphasis is placed on generating

reserve margins, fuel mix, fuel contract terms, demand-side management techniques, and purchased power arrangements. The adequacy of generating margins is examined nationally, regionally, and for each individual company. However, the reserve margin picture is muddied by the imprecise nature of peak-load growth forecasting, and also supply uncertainty relating to such things as Canadian capacity availability and potential plant shut-downs due to age, new NRC rules, acid rain remedies, fuel shortages, problems associated with nontraditional technologies, and so forth. Even apparently ample reserves may not be what they seem. Moreover, the quality of capacity is just as important as the size of reserves. Companies' reserve requirements differ, depending upon individual operating characteristics.

Fuel diversity provides flexibility in a changing environment. Supply disruptions and price hikes can raise rates and ignite political and regulatory pressures that ultimately lead to erosion in financial performance. Thus, the ability to alter generating sources and take advantage of lower cost fuels is viewed favorably.

Dependence on any single fuel means exposure to that fuel's problems: electric utilities that rely on oil or gas face the potential for shortages and rapid price increases; utilities that own nuclear generating facilities face escalating costs for decommissioning; and coal-fired capacity entails environmental problems stemming from concerns over acid rain and the "greenhouse effect."

Buying power from neighboring utilities, qualifying facility projects, or independent power producers may be the best choice for a utility that faces increasing electricity demand. There has been a growing reliance on purchased power arrangements as an alternative to new plant construction. This can be an important advantage, since the purchasing utility avoids potential construction cost overruns as well as risking substantial capital. Also, utilities can avoid the financial risks typical of a multiyear construction program that are caused by regulatory lag and prudence reviews. Furthermore, purchased power may enhance supply flexibility, fuel resource diversity, and maximize load factors. Utilities that plan to meet demand projections with a portfolio of supply-side options also may be better able to adapt to future growth uncertainties. Notwithstanding the benefits of purchasing, such a strategy has risks associated with it. By entering into a firm long-term purchased power contract that contains a fixed-cost component, utilities can incur substantial market, operating, regulatory, and financial risks. Moreover, regulatory treatment of purchased power removes any upside potential that might help offset the risks. Utilities are not compensated through incentive rate-making; rather, purchased power is recovered dollar-for-dollar as an operating expense.

To analyze the financial impact of purchased power, Standard & Poor's first calculates the net present value of future annual capacity payments (discounted at 10%). This represents a potential debt equivalent—the off-balance-sheet obligation that a utility incurs when it enters into a long-term purchased power contract. However, Standard

STANDARD & POOR'S CORPORATE RATINGS CRITERIA

& Poor's adds to the utility's balance sheet only a portion of this amount, recognizing that such a contractual arrangement is not entirely the equivalent of debt. What percentage is added is a function of Standard & Poor's qualitative analysis of the specific contract and the extent to which market, operating, and regulatory risks are borne by the utility (the risk factor). For unconditional, take-or-pay contracts, the risk factor range is from 40%-80%, with the average hovering around 60%. A lower risk factor is typically assigned for system purchases from coal-fired utilities and a higher risk factor is usually designated for unit-specific nuclear purchases. The range for take-and-pay performance obligations is between 10%-50%.

Gas utilities

For gas distribution utilities, long-term supply adequacy obviously is critical, but the supply role has become even more important in credit analysis since the Federal Energy Regulatory Commission's Order 636 eliminated the interstate pipeline merchant business. This thrust gas supply responsibilities squarely on local gas distributors. Standard & Poor's has always believed distributor management has the expertise and wherewithal to perform the job well, but the risks are significant since gas costs are such a large percentage of total utility costs. In that regard, it is important for utilities to get preapprovals of supply plans by state regulators or at least keep the staff and commissioners well informed. To minimize risks, a well-run program would diversify gas sources among different producers or marketers, different gas basins in the U.S. and Canada, and different pipeline routes. Also, purchase contracts should be firm, with minimal take-or-pay provisions, and have prices tied to an industry index. A modest percentage of fixed-price gas is not unreasonable. Contracts, whether of gas purchases or pipeline capacity, should be intermediate term. Staggering contract expirations (preferably annually) provides an opportunity to be an active market player. A modest degree of reliance on spot purchases provides flexibility, as does the use of market-based storage. Gas storage and on-property gas resources such as liquefied natural gas or propane air are effective peak-day and peak-season supply management tools.

Since pipeline companies no longer buy and sell natural gas and are just common carriers, connections with varied reserve basins and many wells within those basins are of great importance. Diversity of sources helps offset the risks arising from the natural production declines eventually experienced by all reserve basins and individual wells. Moreover, such diversity can enhance a pipeline's attractiveness as a transporter of natural gas to distributors and end users seeking to buy the most economical gas available for their needs.

Water utilities

Nearly all water systems throughout the U.S. have ample long-term water supplies. Yet to gain comfort, Standard & Poor's assesses the production capability of treatment plants and the ability to pump water from underground aquifers in relation to the usage demands from consumers.

Having adequate treated water storage facilities has become important in recent years and has helped many systems meet demands during peak summer periods. Of interest is whether the resources are owned by the utility or purchased from other utilities or local authorities. Owning properties with water rights provides more supply security. This is especially so in states like California where water allocations are being reduced, particularly since recent droughts and environmental issues have created alarm. Since the primary cost for water companies is treatment, it makes little difference whether raw water is owned or bought. In fact, compliance with federal and state water regulations is very high, and the overall cost to deliver treated water to consumers remains relatively affordable.

Asset concentration in the electric utility industry

In the electric industry, Standard & Poor's follows the operations of major generating facilities to assess if they are well managed or troubled. Significant dependence on one generating facility or a large financial investment in a single asset suggests high risk. The size or magnitude of a particular asset relative to total generation, net plant in service, and common equity is evaluated. Where substantial asset concentration exists, the financial profile of a company may experience wide swings depending on the asset's performance. Heavy asset concentration is most prevalent among utilities with costly nuclear units.

Earnings protection

In this category, pretax cash income coverage of all interest charges is the primary ratio. For this calculation, allowance for funds used during construction (AFUDC) is removed from income and interest expense. AFUDC and other such noncash items do not provide any protection for bondholders. To identify total interest expense, the analyst reclassifies certain operating expenses. The interest component of various off-balance-sheet obligations, such as leases and some purchased-power contracts, is included in interest expense. This provides the most direct indication of a utility's ability to service its debt burden.

While considerable emphasis in assessing credit protection is placed on coverage ratios, this measure does not provide the entire earnings protection picture. Also important are a company's earned returns on both equity and capital, measures that highlight a firm's earnings performance. Consideration is given to the interaction of embedded costs, financial leverage, and pretax return on capital.

Capital structure

Analyzing debt leverage goes beyond the balance sheet and covers quasi-debt items and elements of hidden financial leverage. Noncapitalized leases (including sale/lease-back obligations), debt guarantees, receivables financing, and purchased-power contracts are all considered debt equivalents and are reflected as debt in calculating capital

structure ratios. By making debt level adjustments, the analyst can compare the degree of leverage used by each utility company.

Furthermore, assets are examined to identify undervalued or overvalued items. Assets of questionable value are discounted to more accurately evaluate asset protection.

Some firms use short-term debt as a permanent piece of their capital structure. Short-term debt also is considered part of permanent capital when it is used as a bridge to permanent financing. Seasonal, self-liquidating debt is excluded from the permanent debt amount, but this situation is rare—with the exception of certain gas utilities. Given the long life of almost all utility assets, short-term debt may expose these companies to interest-rate volatility, remarketing risk, bank line backup risk, and regulatory exposure that cannot be readily offset. The lower cost of shorter-term obligations (assuming a positively sloped yield curve) is a positive factor that partially mitigates the risk of interest-rate variability. As a rule of thumb, a level of short-term debt that exceeds 10% of total capital is cause for concern.

Similarly, if floating-rate debt and preferred stock constitute over one-third of total debt plus preferred stock, this level is viewed as unusually high and may be cause for concern. It might also indicate that management is aggressive in its financial policies.

A layer of preferred stock in the capital structure is usually viewed as equity—since dividends are discretionary and the subordinated claim on assets provides a cushion for providers of debt capital. A preferred component of up to 10% is typically viewed as a permanent wedge in the capital structure of utilities. However, as rate-of-return regulation is phased out, preferred stock may be viewed by utilities—as many industrial firms would—as a temporary option for companies that are not current taxpayers that do not benefit from the tax deductibility of interest. Even now, floating-rate preferred and money market perpetual preferred are problematic; a rise in the rate due to deteriorating credit quality tends to induce a company to take out such preferred stock with debt. Structures that convey tax deductibility to preferred stock have become very popular and do generally afford such financings with equity treatment.

Cash flow adequacy

Cash flow adequacy relates to a company's ability to generate funds internally relative to its needs. It is a basic component of credit analysis because it takes cash to pay expenses, fund capital spending, pay dividends, and make interest and principal payments. Since both common and preferred dividend payments are important to maintain capital market access, Standard & Poor's looks at cash flow measures both before and after dividends are paid.

To determine cash flow adequacy, several quantitative relationships are examined. Emphasis is placed on cash flow relative to debt, debt service requirements, and capital spending. Cash flow adequacy is evaluated with respect to a firm's ability to meet all fixed charges, including capacity payments under purchased-power contracts. Despite the conditional nature of some contracts, the purchaser is obligated to pay a minimum capacity charge. The ratio used is funds from operations plus interest and capacity payments divided by interest plus capacity payments.

Financial flexibility/capital attraction

Financing flexibility incorporates a utility's financing needs, plans, and alternatives, as well as its flexibility to accomplish its financing program under stress without damaging creditworthiness. External funding capability complements internal cash flow. Especially since utilities are so capital intensive, a firm's ability to tap capital markets on an ongoing basis must be considered. Debt capacity reflects all the earlier elements: earnings protection, debt leverage, and cash flow adequacy. Market access at reasonable rates is restricted if a reasonable capital structure is not maintained and the company's financial prospects dim. The analyst also reviews indenture restrictions and the impact of additional debt on covenant tests.

Standard & Poor's assesses a company's capacity and willingness to issue common equity. This is affected by various factors, including the market-to-book ratio, dividend policy, and any regulatory restrictions regarding the composition of the capital structure.

STANDARD & POOR'S CORPORATE RATINGS CRITERIA

Formulas for key ratios

$$\text{Pretax interest coverage} = \frac{\text{Pretax income from continuing operations} + \text{interest expense}}{\text{Gross interest}}$$

$$\text{Pretax fixed charge coverage including rents} = \frac{\text{Pretax income from continuing operations} + \text{interest expense} + \text{gross rents}}{\text{Gross interest} + \text{gross rents}}$$

$$\text{Pretax funds flow interest coverage} = \frac{\text{Pretax funds flow} + \text{interest expense}}{\text{Gross interest}}$$

$$\text{Funds from operations as a \% of total debt} = \frac{\text{Funds from operations}}{\text{Total debt}} \times 100$$

$$\text{Free operating cash flow as a \% of total debt} = \frac{\text{Free operating cash flow}}{\text{Total debt}} \times 100$$

$$\text{Pretax return on permanent capital} = \frac{\text{Pretax income from continuing operations} + \text{interest expense}}{\text{Sum of (1) average of beginning of year and end of year current maturities, long-term debt, non-current deferred taxes, and equity and (2) average short-term borrowings during year as disclosed in footnotes}} \times 100$$

$$\text{Operating income as a \% of sales} = \frac{\text{Operating income}}{\text{Sales}} \times 100$$

$$\text{Long-term debt as a \% of capitalization} = \frac{\text{Long-term debt}}{\text{Long-term} + \text{equity}} \times 100$$

$$\text{Total debt as a \% of capitalization} = \frac{\text{Total debt}}{\text{Total debt} + \text{equity}} \times 100$$

$$\text{Total debt} + 8 \text{ times rents as a \% of adjusted capitalization} = \frac{\text{Total debt} + 8 \text{ times gross rentals paid}}{\text{Total debt} + 8 \text{ times gross rentals paid} + \text{equity}} \times 100$$

Glossary

Equity	Shareholders' equity (including preferred stock) plus minority interest.
Free operating cash flow	Funds from operations minus capital expenditures, minus (plus) the increase (decrease) in working capital (excluding changes in cash, marketable securities, and short-term debt).
Funds from operations	Net income from continuing operations plus depreciation, amortization, deferred income taxes and other noncash items.
Gross interest	Gross interest incurred before subtracting (1) capitalized interest, (2) interest income.
Gross rents	Gross operating rents paid before sublease income.
Interest expense	Interest incurred minus capitalized interest, plus amortization of capitalized interest.
Long-term debt	As reported on the balance sheet, including capitalized lease obligations.
Net cash flow	Funds from operations less preferred and common dividends.
Operating income	Sales minus cost of goods manufactured (before depreciation and amortization), selling, general and administrative, and research and development costs.
Pretax funds flow	Pretax income from continuing operations plus depreciation, amortization, and other noncash items.
Total debt	Long-term debt plus current maturities, commercial paper, and other short-term borrowings.

Utility Financial Targets Are Revised

Standard & Poor's has revised the four principal financial targets that it uses to analyze the credit quality of all investor-owned electric, natural gas, and water utilities in the U.S. (see table on page 3).

Standard & Poor's has created a single set of financial targets that can be applied across the different utility segments. These financial measures reflect the convergence that is occurring throughout the utility industry and the changing risk profile of the industry in general.

No rating changes will result from establishing these new financial targets since they were developed by integrating prior utility financial benchmarks and historical industrial medians. The new financial targets, like the previous benchmarks, pertain to risk-adjusted ratios that distinguish between lower-risk and higher-risk activities. The targets have been broadened to correspond with Standard & Poor's 10-point business profile assessments. The business profile scores assess the qualitative attributes of a firm, with "1" being considered lowest risk and "10" highest risk. Thus, the new targets allow for comparability on a single scale between typically lower-risk activities, such as water operations, gas distribution, and electric transmission, and higher-risk activities, such as merchant power generation, oil and gas exploration and production, and energy trading and marketing. For example, a water utility, which can expect to have a lower business risk profile than a typical integrated electric utility, will be required to meet less stringent financial targets for any given rating category.

Funds from operations to total debt, funds from operations interest coverage, pretax interest coverage, and total debt to total capital are the four credit-protection ratios that are an integral part of

Standard & Poor's quantitative review on the overall credit analysis of the utility sector. Standard & Poor's recognizes that the nature of utilities' business strategies is changing significantly and is shifting toward higher-risk endeavors. These undertakings bear risk characteristics that are more representative of an industrial company than a regulated utility. Therefore, Standard & Poor's also incorporates a greater reliance on several additional ratios in its credit analysis. These include, but are not limited to, pretax return on permanent capital, funds from operations to current obligations, earnings before interest and taxes to total assets, net cash flow to capital expenditures, and capital expenditures to average total capital. Additionally, further analysis of the cash flow coverage of all obligations (including preferred stock) is performed. Although these measures do not have published targets, broader use of these financial ratios, combined with the four principal targets, provides greater depth to the fundamental analysis used in the rating evaluation process.

Consistent with Standard & Poor's ratings methodology, the four published financial targets will be used with other quantitative measures, business risk analysis, and comparative analysis of peer groupings to determine credit ratings. The new targets are designed to assist utilities, utility affiliates, and the investment community in assessing the relative financial strength of issuers. ■

Proxy Group of Seven C. A. Turner Water Companies
Capitalization and Financial Statistics
1997-2001, Inclusive

Notes:

- (1) All capitalization and financial statistics for the group are the arithmetic average of the achieved results for each individual company in the group, and are based upon financial statements as originally reported in each year.
- (2) Computed by relating actual long-term debt interest or preferred stock dividends booked to average of beginning and ending long-term debt or preferred stock reported to be outstanding.
- (3) Coverages - excluding all AFUDC represent the number of times available earnings, excluding all AFUDC, cover fixed charges.

Selection Criteria:

The basis of selection was to include those water companies: 1) which are included in the Water Company Group of C. A. Turner Public Utility Reports (May 2003); and 2) which have Value Line (Standard Edition) five-year EPS growth rate projections or Thomson FN / First Call consensus five-year EPS growth rate projections.

The following seven water companies met the above criteria:

American States Water Co.
Artesian Resources, Inc.
California Water Service Group
Middlesex Water Co.
Philadelphia Suburban Corp.
Southwest Water Company
York Water Co.

Hypothetical Example of the Inadequacy of
A DCF Return Rate Related to Book Value
When Market Value is Greater / Less than Book Value

<u>Line No.</u>	<u>1</u>	<u>2</u>	<u>3</u>
	<u>Market Value</u>	<u>Book Value with Market to Book Ratio of 180%</u>	<u>Book Value with Market to Book Ratio of 80%</u>
1. Per Share	\$ 24.000	\$ 13.33	\$ 30.00
2. DCF Cost Rate (1)	10.00%	10.00%	10.00%
3. Return in Dollars	\$ 2.400	\$ 1.333	\$ 3.000
4. Dividends (2)	\$ 0.960	\$ 0.960	\$ 0.960
5. Growth in Dollars	\$ 1.440	\$ 0.373	\$ 2.040
6. Return on Market Value	10.00%	5.55% (3)	12.50% (4)
7. Rate of Growth on Market Value	6.00% (5)	1.55% (6)	8.50% (7)

Notes: (1) Comprised of 4.0% dividend yield and 6.0% growth.

(2) $\$24.00 \times 4.0\%$ yield = \$0.960.

(3) $\$1.333 / \24.00 market value = 5.55%.

(4) $\$3.000 / \24.00 market value = 12.50%.

(5) Expected rate of growth per market based DCF model.

(6) Actual rate of growth when DCF cost rate is applied to book value ($\$1.333$ possible earnings - $\$0.960$ dividends = $\$0.373$ for growth / $\$24.00$ market value = 1.55%).

(7) Actual rate of growth when DCF cost rate is applied to book value ($\$3.000$ possible earnings - $\$0.960$ dividends = $\$2.040$ for growth / $\$24.00$ market value = 8.50%).

Schedule PMA-5

Missouri-American Water Company
Indicated Common Equity Cost Rate
Through Use of the Discounted Cash Flow Model
Summary of Conclusion

Proxy Group of Seven
 C. A. Turner Water
 Companies

Based upon Historical and Projected Growth in DPS, EPS, and BR+SV

1. Dividend Yield (1)	3.3 %
2. Dividend Growth Component (2)	<u>0.1</u>
3. Yield	3.4
4. Growth Rate (3)	<u>5.8</u>
5. Indicated Return Rate	<u><u>9.2 %</u></u>

Based upon Projected Growth in EPS

6. Dividend Yield (1)	3.3 %
7. Dividend Growth Component (2)	<u>0.1</u>
8. Yield	3.4
9. Growth Rate (3)	<u>7.3</u>
10. Indicated Return Rate	<u><u>10.7 %</u></u>
11. Conclusion	<u><u>10.0 %</u></u>

- Notes:
- (1) From Schedule PMA-6.
 - (2) This reflects a growth rate component equal to one-half the conclusion of growth rate (from page 1 of Schedule PMA-8) x Line Nos. 1 and 6 to reflect the periodic payment of dividends (Gordon Model) as opposed to the continuous payment. Thus, $3.3\% \times (1/2 \times 5.8\%) = 0.1\%$.
 - (3) Conclusion of growth from page 1 of Schedule PMA-8.

Missouri-American Water Company
Derivation of Dividend Yield for Use in the
Discounted Cash Flow Model

	Dividend Yield				Average Dividend Yield (5)
	Spot (05/08/03) (1)	Average of Last 3 Months (2)	Average of Last 6 Months (3)	Average of Last 12 Months (4)	
Proxy Group of Seven					
<u>C. A. Turner Water Companies</u>

Average of all Growth Rates (6)
Average of Midpoint of Range and Average of all Growth Rates
Average of Projected EPS Growth Rates (7)

- Notes:
- (1) As shown on pages 8 through 10 of this Schedule. Historical growth rates are five-year compound growth rates.
 - (2) From page 2 of this Schedule.
 - (3) Average of Columns 5 and 6.
 - (4) From page 6 of this Schedule.
 - (5) Calculated using the same methodology as Value Line Investment Survey, i.e., three-year base periods.
 - (6) Average of Columns 1, 2, 3, 4, 5, 6, and 8.
 - (7) From Column 7.
 - (8) Excludes negatives. Also excludes the 29.5% five-year historical growth rate in EPS for Southwest Water Company because, in Ms. Ahern's opinion, such a growth rate is clearly an outlier.

1 return rate for the market. The result is an expected equity risk premium for the
2 market, some proportion of which must be allocated to the companies in the
3 proxy group through the use of beta. As a measure of risk relative to the market
4 as a whole, the beta is an appropriate means by which to apportion the market
5 risk premium to a specific company or group.

6 As shown on Schedule PMA-10, page 1, Line No. 2, the proportional
7 market equity risk premium, based on the traditional CAPM, is 6.4% for the proxy
8 group of seven C.A. Turner water companies. Applying the empirical CAPM
9 results in an equity risk premium of 7.3% for the seven C.A. Turner water
10 companies as shown on Line No. 5 on page 1 of Schedule PMA-10. The total
11 market equity risk premium utilized was 10.1% and is based upon an average of
12 the long-term historical and projected market risk premiums.

13 The basis of the projected median market equity risk premium is
14 explained in detail in Note 1 on page 3 of Schedule PMA-10. As previously
15 discussed, it is derived from an average of the most recent 12-month, 6-month, 3-
16 month (using the months of May 2002 through April 2003) and a recent spot (May
17 9, 2003) 3 - 5 year median total market price appreciation projections from Value
18 Line and the long-term historical average from Ibbotson Associates. The
19 appreciation projections by Value Line plus average dividend yield equate to a
20 forecasted annual total return rate on the market of 18.6%. The long-term
21 historical return rate of 12.2% on the market as a whole is from Ibbotson
22 Associates' Stocks, Bonds, Bills and Inflation - Valuation Edition 2003 Yearbook.
23 In each instance, the relevant risk-free rate was deducted from the total market
24 return rate. For example, from the Value Line projected total market return of
25 18.6%, the forecasted average risk-free rate of 5.4% was deducted indicating a
26 forecasted market risk premium of 13.2%. From the Ibbotson Associates' long-
27 term historical total return rate of 12.2%, the long-term historical income return

1 rate on long-term U.S. Government Securities of 5.2% was deducted indicating
2 an historical equity risk premium of 7.0%. Thus, the average of the projected and
3 historical total market risk premiums of 13.2% and 7.0%, respectively, is 10.1%.

4
5 Q What is the result of your applications of the traditional and empirical CAPM to
6 the proxy group?

7
8 A. As shown on Schedule PMA-10, Line No. 3 of page 1, the traditional CAPM cost
9 rate is 11.8% for the proxy group of seven C.A. Turner water companies. And,
10 as shown on Line No. 6 of page 1, the empirical CAPM cost rate is 12.7% for the
11 proxy group. The traditional and empirical CAPM cost rates are shown
12 individually by company on pages 2 and 3 of Schedule PMA-10. As shown on
13 Line No. 7, the CAPM cost rate applicable to the proxy group is 12.3% based
14 upon the traditional and empirical CAPM results.

15
16 E. Comparable Earnings Model (CEM)

17 1. Theoretical Basis

18 Q. Please describe your application of the Comparable Earnings Model and how it is
19 used to determine common equity cost rate.

20
21 A. My application of the CEM is summarized in Schedule PMA-11 which consists of
22 three pages. Pages 1 and 2 show the CEM results for the proxy group of seven
23 C.A. Turner water companies. Page 3 contains the notes related to pages 1 and
24 2.

25 The comparable earnings approach is derived from the "corresponding
26 risk" standard of the landmark cases of the U.S. Supreme Court. Therefore, it is
27 consistent with the Hope doctrine that the return to the equity investor should be

1 commensurate with returns on investments in other firms having corresponding
2 risks.

3 The CEM is based upon the fundamental economic concept of
4 opportunity cost which maintains that the true cost of an investment is equal to
5 the cost of the best available alternative use of the funds to be invested. The
6 opportunity cost principle is also consistent with one of the fundamental
7 principles upon which regulation rests: that regulation is intended to act as a
8 surrogate for competition and to provide a fair rate of return to investors.

9 The CEM is designed to measure the returns expected to be earned on
10 the book common equity, in this case net worth, of similar risk enterprises. Thus,
11 it provides a direct measure of return, since it translates into practice the
12 competitive principle upon which regulation rests. In my opinion, it is
13 inappropriate to use the achieved returns of regulated utilities of similar risk
14 because to do so would be circular and inconsistent with the principle of equality
15 of risk with non-price regulated firms.

16 The difficulty in application of the CEM is to select a proxy group of
17 companies which are similar in risk, but are not price regulated utilities.
18 Consequently, the first step in determining a cost of common equity using the
19 comparable earnings model is to choose an appropriate proxy group of non-price
20 regulated firms. The proxy group should be broad-based in order to obviate any
21 company-specific aberrations. As stated previously, utilities need to be
22 eliminated to avoid circularity since the returns on book common equity of utilities
23 are substantially influenced by regulatory awards and are therefore not
24 representative of the returns that could be earned in a truly competitive market.

25 26 2. Application of the CEM

27 Q. Please describe your application of the CEM.

1
2 A. My application of the CEM is market-based in that the selection of non-price
3 regulated firms of comparable risk is based upon statistics derived from the
4 market prices paid by investors.

5 I have chosen a proxy group of ninety-six domestic, non-price regulated
6 firms to reflect both the systematic and unsystematic risks of the proxy group of
7 seven C.A. Turner water companies. The proxy group of ninety-six non-utility
8 companies is listed on pages 1 and 2 of Schedule PMA-11. The criteria used in
9 the selection of these proxy companies were that they be domestic non-utility
10 companies and have a meaningful rate of return on net worth, common equity or
11 partners' capital reported in Value Line (Standard Edition) for each of the five
12 years ended 2002, or projected for 2005-2007/2006-2008. Value Line betas
13 were used as a measure of systematic risk. The residual standard error, or the
14 standard error of the estimate from the regression equation from which each
15 company's beta was derived, was used as a measure of each firm's specific, i.e.,
16 unsystematic risk. The residual standard error reflects the extent to which events
17 specific to a company's operations will affect its stock price and, therefore, is a
18 measure of diversifiable, unsystematic, company-specific risk. *In essence,*
19 *companies which have similar betas and residual standard errors, have similar*
20 *investment risk, i.e., the sum of systematic (market) risk as reflected by beta and*
21 *unsystematic (business and financial) risk, as reflected by the residual standard*
22 *error, respectively. Those statistics are derived from regression analyses using*
23 *market prices which, under the EMH reflect all relevant risks. The application of*
24 *these criteria results in a proxy group of non-price regulated firms similar in risk to*
25 *the average company in the proxy group.*

26 The proxy group of ninety-six non-price regulated companies were
27 chosen based upon ranges of unadjusted beta and residual standard error. The

1 ranges were based upon the average standard deviations of the unadjusted beta
2 and the average residual standard error for the proxy group of seven C.A. Turner
3 water companies.

4 The water companies in the proxy group have an average unadjusted
5 beta of 0.43 whose standard deviation is 0.1044 as of March 14, 2003, as shown
6 on page 2 of Schedule PMA-11. The average residual standard error from the
7 regression equations which derived the proxy group's average unadjusted beta is
8 4.2528 as shown on Schedule PMA-11, page 2 with a standard deviation of
9 0.1869 as derived in Note 5, page 3 of Schedule PMA-11. Ranges of unadjusted
10 betas from 0.12 to 0.74 and of residual standard errors from 3.6921 to 4.8135
11 were used to select the proxy group of ninety-six domestic non-utility companies
12 comparable to the profile of the proxy group of seven C.A. Turner water
13 companies as can be gleaned from pages 1 and 2 and explained in Note 1 on
14 page 3 of Schedule PMA-11. These ranges are based upon the proxy group's
15 average unadjusted beta of 0.43 and average residual standard error of 4.2528
16 plus or minus three standard deviations of beta ($0.1044 \times 3 = 0.3132$) and
17 residual standard errors ($0.1869 \times 3 = 0.5607$). The use of three standard
18 deviations assures capturing 99.73% of the distribution of unadjusted betas and
19 standard errors, assuring comparability.

20 I believe that this methodology for selecting non-price regulated firms of
21 similar total risk (i.e., non-diversifiable systematic and diversifiable non-
22 systematic risk) is meaningful and effectively responds to the criticisms normally
23 associated with the selection of firms presumed to be comparable in total risk.
24 This is because the selection of non-price regulated companies comparable in
25 total risk is based upon regression analyses of market prices which reflect
26 investors' assessment of all risks, diversifiable and non-diversifiable. Thus, the
27 empirical selection process results in companies comparable in both systematic

1 and unsystematic risks, i.e., total risk.

2 Once a proxy group of non-price regulated companies is selected, it is
3 then necessary to derive returns on book common equity, net worth or partners'
4 capital for the companies in the group. I have measured these returns using the
5 rate of return on net worth, common equity or partners' capital reported by Value
6 Line (Standard Edition). It is reasonable to measure these returns over both the
7 most recent historical five-year period as well as those projected over the
8 ensuing five-year period.

9
10 Q. What is your conclusion of CEM cost rate?

11
12 A. A conclusion of CEM cost rate is 14.9% for the proxy group of seven C.A. Turner
13 water companies as shown on page 2 of Schedule PMA-11. Note that I have
14 applied a test of significance (Student's t-statistic) to determine whether any of
15 the historical or projected returns are significantly different from their respective
16 means at the 95% confidence level. As a result, the historical means of five
17 companies and the projected means of five companies have been excluded.

18 I have also decided to eliminate from the total group of ninety-six
19 companies, all those rates of return which are greater than 20.0% or below the
20 prospective yield of 7.2% on Moody's A rated public utility bonds (see page 1 of
21 Schedule PMA-9)). Such elimination results in an arithmetic mean return rate of
22 13.6% on an historical five-year basis and 13.5% on a projected five-year basis.
23 I rely upon the midpoint of the arithmetic mean historical five-year and projected
24 five-year rate of return of 13.6% as my CEM conclusion.

25 26 VIII. CONCLUSION OF COMMON EQUITY COST RATE

27 Q. What is your range of recommended common equity cost rate?

1
2 A. Although the Company's filing is based upon a requested common equity cost
3 rate of 11.00%, my recommended range of common equity cost rate is 11.75% to
4 12.00% based upon common equity cost rates resulting from all four cost of
5 common equity models consistent with the EMH which logically mandates the
6 use of multiple cost of common equity models.

7 In formulating my recommended common equity cost rate range of 11.75%
8 to 12.00%, I reviewed the results of the application of four different cost of
9 common equity models, namely, the DCF, RPM, the CAPM, and CEM for the
10 proxy group. I employ all four cost of common equity models as primary tools in
11 arriving at my recommended common equity cost rate because no single model
12 is so inherently precise that it can be relied upon solely, to the exclusion of other
13 theoretically sound models. As discussed above, all four models are based upon
14 the Efficient Market Hypothesis (EMH), and therefore, have application problems
15 associated with them. The EMH, as also previously discussed, requires the
16 assumption that investors rely upon multiple cost of common equity models.
17 Moreover, as demonstrated in this testimony, the prudence of using multiple cost
18 of common equity models is supported in the financial literature. Therefore, none
19 should be relied upon exclusively to estimate investors' required rate of return on
20 common equity.

21 In a market environment where market value deviates significantly from
22 book value (lower or higher), sole reliance on the DCF model is problematic for a
23 regulated utility because its application results in an overstatement or
24 understatement, respectively, of investors' required rate of return. Investors
25 expect to achieve their required rate of return based upon dividends received
26 and appreciation in market price. This testimony has shown that market prices
27 are significantly influenced by factors other than earnings per share (EPS) and

1 dividends per share (DPS). Thus, because it is necessary to use accounting
 2 proxies for growth in the DCF model, such as EPS, DPS, or their derivative,
 3 internal growth, which do not reflect the full extent of market price growth
 4 expected by investors. Market prices reflect other factors affecting growth not
 5 accounted for in the standard regulatory version of the DCF model such as an
 6 increase in the market value per share due to expected increases in
 7 price/earnings multiples and less obvious factors included in the long-range
 8 goals of investors. For these reasons, sole reliance on the DCF model should be
 9 avoided. In fact, state commissions in Iowa, Indiana, Hawaii and Pennsylvania
 10 as discussed in detail above, which have previously relied primarily upon the
 11 DCF, have explicitly recognized this tendency of the DCF model to understate
 12 the common equity cost rate when, as now, market prices significantly exceed
 13 book values.

14 The results of the four cost of common equity models applied to the proxy
 15 group of seven C.A. Turner water companies is shown on Schedule PMA-1 and
 16 summarized below:

17 Table 4

	<u>Proxy Group of Seven C.A. Turner Water Companies</u>

24 Flow Model	10.0%
25 Risk Premium Model	12.4
26 Capital Asset Pricing	
27 Model	12.3
28 Comparable Earnings	
29 Model	13.6
30	
31 Range of Recommended	
32 Common Equity Cost Rate	<u>11.75%-12.00%</u>

1 3.41 times is before the impact of attrition. After the impact of attrition, such an
2 opportunity, in my opinion, would result in an achieved pretax interest coverage
3 range lower than 3.36 to 3.41 times.
4

5 Q. Please discuss the Company's opportunity for pretax interest coverage range of
6 3.36 to 3.41 times.
7

8 A. Missouri-American's implicit opportunity to earn pretax interest coverage of from
9 3.36 to 3.41 times falls at the upper end of the range of S&P's revised utility
10 financial target pretax interest coverage ratios of 2.8 to 3.4 times (see page 12 of
11 Schedule PMA-2) required of a utility in the A bond rating category and assigned
12 a business position of "3", the average bond rating category and S&P business
13 position of the proxy group. But, as stated previously, the opportunity for pretax
14 interest coverage ranging from 3.36 to 3.41 times is before the impact of attrition
15 which would serve to decrease the actually achieved pretax interest coverage of
16 Missouri-American below the 3.36 to 3.41 times pretax coverage range.

17 In view of the foregoing, then an opportunity to earn pretax interest
18 coverage of from 3.36 to 3.41 times is conservatively appropriate, thus affirming
19 the reasonableness of my recommended common equity cost rate range of
20 11.75% to 12.00% and the conservativeness of the Company's requested
21 common equity cost rate of 11.00%.
22

23 Q. Does that conclude your direct testimony?
24

25 A. Yes.

Business: American States Water Co. operates as a holding company. Through its principal subsidiary, Southern California Water Company, it supplies water to 75 communities in 10 counties. Service areas include the greater metropolitan areas of Los Angeles and Orange Counties. The company also provides electric utility services to approximately 22,000 customers in the city of Big Bear Lake and in areas of San Bernardino County. Acquired Chaparral City Water of Arizona (10/00); 11,400 customers. Has about 500 employees. Off. & dir. own less than 1% of common stock (4/03 Proxy). Chairman: Lloyd Ross. President & CEO: Floyd Wicks. Incorporated: CA. Add: 630 East Foothill Boulevard, San Dimas, CA 91773. Tel.: 909-394-3600. Web: www.gswater.com.

American States Water Company's share earnings in 2003 should be flat with last year's total. The company was recently informed by the Federal Energy Regulatory Commission that it would probably not allow American to reduce the price of its contract with Mirant for energy. The contract was signed during the California energy crisis in March, 2001, and will result in American's Bear Valley Electric Service subsidiary paying an above-market price for electricity through the end of 2006. Although the company has filed a few rate cases in recent months, the California Public Utilities Commission has been slow in making its decisions. Indeed, regulatory delays reduced 2002's share net by about \$0.09. Nonetheless, recent rate increases should lead to higher revenues this year. Also, meteorological data indicate that AWR should experience good weather patterns in 2003 that may bolster water usage. The company is ramping up capital expenditures. Since the recent termination of its cash-preservation program, American has returned to a normal maintenance routine. As such, it expects to spend about \$80 million on capital improvements in 2003. We believe that the company will finance these expenditures with borrowings and an equity offering late in the year. Investors should note that an equity offering would dilute share net. **American will likely post modest earnings growth over the coming 3 to 5 years.** Ongoing rate increases and steady population growth should maintain the top line's momentum. Too, we believe American would benefit from small-scale takeovers outside of California, because the move would limit the company's exposure to the state's onerous regulatory climate. These acquisitions would not only boost revenues, but would provide geographic diversity. **These shares are ranked to move in line with the year-ahead market.** Moreover, they offer limited total-return potential out to 2006-2008. Nonetheless, income-oriented investors should note that the stock offers a safe, attractive dividend payout, and we believe that the declared dividend will grow at an average rate over the long haul.

Cash Assets 3.2 1.0 1.1																		BUSINESS: California Water Service Group provides regulated and nonregulated water service to over 2 million people (461,200 customers) in 98 communities in California, Washington, and New Mexico. Main service areas: San Francisco Bay area, Sacramento Valley, Salinas Valley, San Joaquin Valley & parts of Los Angeles. Acquired Dominguez Services Corp. (5/00); Rio Grande Corp. (11/00). Revenue breakdown, '02: residential, 70%; business, 18%; public authorities, 5%; industrial, 4%; other, 3%. '02 reported deprec. rate: 2.1%. Has about 800 employees. Chairman: Robert W. Foy, President & CEO: Peter C. Nelson, Inc.: Delaware. Address: 1720 North First Street, San Jose, California 95112-4598. Telephone: 408-367-8200. Internet: www.calwater.com.																	
Other 37.6 39.4 41.9																		California Water's first-quarter results were weak. The company posted a \$0.05-a-share loss, versus a \$0.12 profit a year earlier. Much of the shortfall can be attributed to continued delays in receiving rate relief from the California Public Utilities Commission (CPUC). General rate cases filed in July, 2001 are now 12 months late. Also, unfavorable weather patterns led to a decline in water usage. That, too, hurt share earnings, to the tune of about \$0.05. Revenues, meantime, declined nominally, to \$51.3 million, while operating expenses rose 5%. Water production costs increased because the company did not receive another \$750,000 water wholesaler refund as it did in 2002. Moreover, maintenance expenses and depreciation were higher. Wages and benefits also rose due mainly to contracts with unions that called for salary increases. This will likely be a difficult year for the company. California Water's first-quarter revenue woes should continue until the CPUC provides rate relief. Once that happens, we expect revenues to finally move above 2002 levels. When the CPUC decides on California Water's 2001																	
Current Assets 40.8 40.4 43.0																		rate cases, any higher rates granted are slated to be effective as of April, 2003, providing the water utility with a bit more revenue than it would have achieved otherwise. Also, the top line ought to get a boost from new customers and rate increases that were enacted in January, 2003. Nonetheless, expense growth (maintenance, depreciation, wages) will likely outpace any top-line gains this year, producing a likely profit shortfall. California Water has good growth prospects out to 2006-2008. We believe the regulatory environment will improve over the next few years, as a new president at the CPUC has more time to affect change. Too, rate increases, small acquisitions, and population growth should sustain solid revenue advances, pushing earnings to perhaps near \$2.00 a share. These good-quality shares are ranked to move in line with the market over the coming year. Although the dividend payout will probably exceed earnings this year, we believe the disbursement is relatively secure and that the board may even approve a small payout hike in 2004. <i>Joseph Espallat</i> <i>May 2, 2003</i>

Missouri-American Water Company
Development of the Market-Required Rate of Return on Common Equity Using
the Capital Asset Pricing Model for
the Proxy Group of Seven C. A. Turner Water Companies
Adjusted to Reflect a Forecasted Risk-Free Rate and Market Return

Notes:

- (1) From the twelve previous month-end (May '02 – Apr. '03), as well as a recently available (May 9, 2003), Value Line Summary & Index, a forecasted 3-5 year total annual market return of 18.6% can be derived by averaging the 12-month, 6-month, 3-month and spot forecasted total 3-5 year total appreciation, converting it into an annual market appreciation and adding the Value Line average forecasted annual dividend yield.

The 3-5 year average total market appreciation of 84% produces a four-year average annual return of 16.47% $((1.84^{25}) - 1)$. When the average annual forecasted dividend yield of 2.15% is added, a total average market return of 18.62% (2.15% + 16.47%), rounded to 18.6%, is derived.

The 12-month, 6-month, 3-month and spot forecasted total market return of 18.6% minus the risk-free rate of 5.4% (developed in Note 2) is 13.2% (18.6% - 5.4%). The Ibbotson Associates calculated market premium of 7.0% for the period 1926-2002 results from a total market return of 12.2% less the average income return on long-term U.S. Government Securities of 5.2% (12.2% - 5.2% = 7.0%). This is then averaged with the 13.2% Value Line market premium resulting in a 10.1% market premium. The 10.1% market premium is then multiplied by the beta in column 1 of page 2 of this Schedule.

- (2) Average forecast based upon six quarterly estimates of long-term Treasury Bond yields per the consensus of nearly 50 economists reported in the Blue Chip Financial Forecasts dated May 1, 2003 (see page 7 of Schedule PMA-9). The estimates are detailed below:

	<u>Long-Term Treasury Bond Yield</u>
Second Quarter 2003	5.0%
Third Quarter 2003	5.1
Fourth Quarter 2003	5.3
First Quarter 2004	5.4
Second Quarter 2004	5.6
Third Quarter 2004	5.7
Average	<u>5.4%</u>

- (3) The traditional Capital Asset Pricing Model (CAPM) is applied using the following formula:

$$R_S = R_F + \beta (R_M - R_F)$$

Where R_S = Return rate of common stock
 R_F = Risk Free Rate
 β = Value Line Adjusted Beta
 R_M = Return on the market as a whole

- (4) The empirical CAPM is applied using the following formula:

$$R_S = R_F + .25 (R_M - R_F) + .75 \beta (R_M - R_F)$$

Where R_S = Return rate of common stock
 R_F = Risk-Free Rate
 β = Value Line Adjusted Beta
 R_M = Return on the market as a whole

NA = Not Available

Missouri-American Water Company
Comparable Earnings Analysis

E = Estimated

Notes: (1) The criteria for selection of the proxy group of ninety-six non-utility companies was that the non-utility companies be domestic and have a meaningful rate of return on net worth, common equity or partners' capital for each of the five years ended 2002 or projected 2005-2007 / 2006-2008 as reported in Value Line Investment Survey (Standard Edition). The proxy group of ninety-six non-utility companies was selected based upon the proxy group of seven C. A. Turner water companies' unadjusted beta range of 0.12 - 0.74 and residual standard error of the regression range of 3.6921 - 4.8135. These ranges are based upon plus or minus three standard deviations of the unadjusted beta and standard error of the regression as detailed in Ms. Ahern's accompanying direct testimony. Plus or minus three standard deviations captures 99.73% of the distribution of unadjusted betas and standard errors of the regression.

(2) Ending 2002.

(3) 2005-2007 / 2006-2008.

(4) The Student's T-statistic associated with these returns exceeds 1.96 at the 95% level of confidence. Therefore, they have been excluded, as outliers, to arrive at proper mean historical and projected returns as fully explained in Ms. Ahern's accompanying testimony.

(5) The standard deviation of the proxy group of seven water companies' residual standard deviation is 0.1869. The standard deviation of the residual standard deviation is calculated as follows:

$$\text{Standard Deviation of the Resid. Std.} = \frac{\text{Residual Standard Deviation}}{\sqrt{2N}}$$

where: N = number of observations. Since Value Line betas are derived from weekly price change observations over a period of five years, N = 259

$$\text{Thus, } 0.1869 = \frac{4.2528}{\sqrt{518}} = \frac{4.2528}{22.7596}$$

(6) Mid-point of the arithmetic mean of the historical five year average and five year projected rate of return on net worth.

(7) Arithmetic mean of historical five year rates of return and five year projected rates of return on net worth, common equity or partners' capital excluding those above 20% and below the prospective yield of 7.3% on A rated Moody's public utility bonds (from page 1 of Schedule PMA-10.)

(8) Mid-point of the arithmetic mean of historical five year rates of return and five year projected rates of return on net worth, common equity or partners' capital excluding those above 20% and below the prospective yield of 7.2% on A rated Moody's public utility bonds (from page 1 of Schedule PMA-9.)
