## **Volume 3 – Load Analysis and Load Forecasting**

## **Highlights**

- Evergy Metro expects energy consumption to grow 0.6% and peak demand to grow 0.4% annually from 2023-2043.
- Residential energy consumption is expected to provide the most growth over the next 20 years.
- Evergy Metro customers are expected to grow 0.1% annually from 2023-2043.
- Key forecast uncertainties include the impact of rising prices, technological advancement in renewable energy sector, adoption of new consumer products and energy efficiency.

## Section 1: Selecting Load Analysis Methods<sup>1</sup>

#### 1.1 Identification of End-Use Measures<sup>2</sup>

See Volume 5: Demand Side Resource Analysis.

#### 1.2 Purpose: Derivation of Data Set of Historical Values<sup>3</sup>

Evergy maintains a historical data set of load research and AMI data to support the Load forecast.

## 1.3 Analysis of Impacts of Implemented DSM And Demand-Side Rate on Load Forecasts<sup>4</sup>

See Volume 5: Demand Side Resource Analysis.

#### 1.4 Reservation of Load Analysis in Historical Database<sup>5</sup>

Evergy preserves the historical data used to derive the load forecasts and provides this data in work papers and within the forecasting models.

## **Section 2:** Historical Database for Load Analysis<sup>6</sup>

#### 2.1 Customer Class Detail<sup>7</sup>

Evergy Metro (KS Metro and MO Metro) maintains a historical database of its loads for each major class, which are Residential, Small General Service (SGS), Medium General Service (MGS), Large General Service (LGS), Large Power (LP), Lighting and Sales for Resale (SFR). In addition, SGS, MGS, LGS and LP are split into the subclasses commercial and industrial. This data begins in May 2005 for Evergy Metro and will be maintained with at least 10 years of history going forward. Beginning with the 2015 IRP filling, Evergy Metro forecasts its loads for each major class, which are Residential,

<sup>&</sup>lt;sup>1</sup> 20 CSR 4240-22.030(1)

<sup>4 20</sup> CSR 4240-22.030(1)(C)

<sup>&</sup>lt;sup>5</sup> 20 CSR 4240-22.030(1)(D) <sup>6</sup> 20 CSR 4240-22.030(2)

<sup>7 20</sup> CSR 4240-22.030(2)(A)

Commercial Small General Service (SGS), Commercial Big (The sum of MGS, LGS, and LP), Industrial (The sum of SGS, MGS, LGS, and LP), Lighting, and Sales for Resale (SFR).

## 2.2 Load Data Detail<sup>8</sup>

#### 2.2.1 Actual and Weather Normalized Energy, And Number of Customers<sup>9</sup>

MetrixND files are used to maintain this data for each subclass listed in 22.030 (2) (A). These files also contain the models used to forecast the number of customers and weather-normalize and forecast monthly energy sales.

#### 2.2.2 Actual and Weather Normalized Demands<sup>10</sup>

Actual and weather-normalized coincident demands are provided in Appendix 3B and MetrixLT projects MetroMO\_ClassEndUse.Itm, MetroMO\_ClassEndUseWN.Itm, MetroKS\_ClassEndUse.Itm and MetroKS\_ClassEndUseWN.Itm. This data is available beginning in May 2005 at which time the load research sample converted from revenue class to Class Cost of Service (CCOS). Class level hourly loads are currently weather normalized when a rate case is prepared. Jurisdiction level peaks are weather normalized annually when forecasting peak demand for the triennial IRP or IRP update.

#### 2.2.3 Actual and Weather Normalized System Peak Demands<sup>11</sup>

Actual and weather-normalized Net System Input (NSI) is contained in the MetrixLT files.

#### 2.3 Load Component Detail<sup>12</sup> 2.3.1 Units Component<sup>13</sup>

The number-of-units is the number of customers for residential and SGS commercial. For the other subclasses, MWh sales are modeled because it is more stable than kWh sales per customer and the model fit statistics are higher. In the big commercial and Industrial

<sup>&</sup>lt;sup>8</sup> 20 CSR 4240-22.030(2)(B)

<sup>&</sup>lt;sup>9</sup> 20 CSR 4240-22.030(2)(B)(1)

<sup>&</sup>lt;sup>10</sup> 20 CSR 4240-22.030(2)(B)(2)

<sup>&</sup>lt;sup>11</sup> 20 CSR 4240-22.030(2)(B)(3) <sup>12</sup> 20 CSR 4240-22.030(2)(C)

<sup>&</sup>lt;sup>13</sup> 20 CSR 4240-22.030(2)(C)(1)

customer classes, the size of customers varies more than in the smaller classes and use per customer can vary substantially as customers enter or exit the class.

#### 2.3.2 Update Procedure<sup>14</sup>

Evergy Metro has developed a MetrixND model for each subclass of kWh sales that weather normalizes sales or sales per unit. These models will update weather normalized sales at the subclass level whenever these models are updated. This procedure is automatic. Major class level demands are currently weather normalized only for a rate case and this process is not automatic as it requires many manual steps.

Heating and cooling degree days calculated with different base temperatures were tested and kept in the models if statistically significant so that nonlinear weather response functions could be represented.

# 2.3.3 Weather Measures and Estimation of Weather Effects Description and Documentation<sup>15</sup>

In this IRP filing, Evergy Metro used different methods to model the effects of weather for normalization and for forecasting. One reason for using different methods is that the sample period for WN needed to cover the entire period that historical data was available so that data could be WN. On the other hand, the forecasting models often need a more recent shorter sample period since the focus is on calibrating an end-use forecast to recent data. The method of WN used in this IRP filing is different than that used in the rate cases because it is designed to WN many years of data whereas the rate case models are based on only two years of data. Also, the method used here is much less labor intensive and can be updated more routinely.

Degree days computed at different base temperatures were tested in explaining the effects of weather on sales and system load. Degree days computed with more than one base temperature were tested in the same model to determine if the load response is nonlinear. The statistical results of model estimation in the weather normalization models

<sup>&</sup>lt;sup>14</sup> 20 CSR 4240-22.030(2)(C)(2)

<sup>&</sup>lt;sup>15</sup> 20 CSR 4240-22.030(2)(C)(3)

of monthly sales are presented in this section. Additional information is available in the MetrixND model files that are included in the electronic workpapers. This additional information includes formulas that define the explanatory variables, plots and tables of residuals, plots and tables of actual, weather-normalized, and predicted values, plots and tables of explanatory variables and model statistics and coefficients. The model coefficients were estimated using ordinary least squares regression in MetrixND. The estimation period for each class may be different, but generally includes the time period from January 2009 to June 2023.

#### 2.4 Assessments<sup>16</sup>

For the current Evergy Metro filing, historical sales and customers broken out by class cost of service for residential and industrial customers were available beginning in

<sup>&</sup>lt;sup>16</sup> 20 CSR 4240-22.030(2)(D)

January 2000. Commercial class cost of service data was available beginning May 2005. Going forward, Evergy Metro will maintain this data for at least the previous 10 years.

#### 2.4.1 Historic End-Use Drivers of Energy Usage and Peak Demand<sup>17</sup>

Historical plots of customers and kwh/customer for energy usage and peak demand can be found in *Appendix 3A*.

Residential customer growth for Evergy Metro was 1% or higher during the late 1990s and the housing boom of the early 2000s. Beginning in 2007, customer growth slowed to below 1% and slow growth continued until growth in housing development began to occur in 2013. A catch-up effect has resulted in average customer growth of 1.2% for 2012-2022.

Evergy Metro SGS Commercial customer growth was flat (average of 0.2%) in the late 2000s and early 2010s, but has risen since 2012, largely due to customer migrations from other classes. Growth from 2012 to 2022 averaged 1.4%.

Commercial Big (MGS, LGS, LP) saw rapid customer growth in the late 2000s, averaging 2.4% from 2006 to 2010. Since then, many customers have switched classes due to rate cases or consolidations, resulting in somewhat sporadic customer counts. Over the last 3 years, 2019-2022, customers have declined slightly -0.7%.

Industrial customers have gradually declined through the recent couple of decades, averaging -1.4% growth since 2010.

Residential MWh use per customer reveals a very slight downward trend (-0.8%) over the last 10 years 2012-2022. The downward trend in is due in part to increasing efficiency of air conditioning units and lighting among other things, partially offset by increase in electric space heat saturation.

<sup>&</sup>lt;sup>17</sup> 20 CSR 4240-22.030(2)(D)(1)

For Commercial SGS, both summer and non-summer use per customer declined through the year 2012. During the last decade, use per customer saw annual growth for both summer (3.2%) and non-summer (3.3%) due to the impact of customer migrations between classes.

Commercial Big (MGS, LGS, LP) use per customer declined prior to 2012 for both summer (-1.4%) and non-summer (-1.1%). Use per customer has been slightly negative (-0.8) since 2012 as efficiency gains in end uses have continued but have been offset by the impact of customer migrations between classes.

From 2005 to 2010 Industrial use per customer declined at an annual rate of -0.5% for summer and -0.5% for non-summer months. Since 2010 Industrial use per customer has increased slightly for both summer (0.4%) and non-summer (0.3%) on an annual basis, while customers and employment have steadily declined. This points to an increase in equipment use over labor use amongst area manufacturers.

#### 2.4.2 Weather Sensitivity of Energy and Peak Demand<sup>18</sup>

The following plots illustrate the weather response function of daily energy and peak demand for each major class. This data is weather normalized in the rate case process during which the weather response function is represented with an equation estimated with statistical regression analysis for the time period of July 2021 through June 2023, with the exception for Metro KS Sales for Resale which has data through June 2017. The blue symbols in the plot represent weekdays and the red symbols represent weekends.

Evergy Metro-KS has zero Sales for Resale customers as of July 2017.

#### 2.4.3 Plots Illustrating trends materially affecting electricity consumption<sup>19</sup>

Historical class plots of customers, kwh, average use, and peak are provided in *Appendix* 3A1 and were discussed above in section 2.4.1 Historic End-Use Drivers of Energy Usage and Peak Demand.

#### 2.5 Adjustments to Historical Data Description and Documentation<sup>20</sup>

Evergy Metro used binary variables in regression models to explain outliers rather than adjust the data.

#### 2.6 Length of Historical Database<sup>21</sup>

For Evergy Metro, historical sales and customers broken out by class cost of service for residential and industrial customers were available beginning in January 2000. Commercial class cost of service data was available beginning May 2005. Going forward, Evergy Metro will maintain this data for at least the previous 10 years.

## Section 3: Analysis of Number of Units<sup>22</sup>

#### 3.1 Identification of Explanatory Variables<sup>23</sup>

A forecast of the number of households in the KC metro area from Moody's Analytics was the driver for the number of residential customers of Evergy Metro. The KC metro area is the same as the Metropolitan Statistical Area (MSA) defined by the US Census Bureau and it includes some counties in both states that are not served by Evergy Metro. Also, Evergy Metro service area includes some counties that are not included in the MSA.

Despite these inconsistencies in geographic areas, the number of households in the metro area is a good driver to predict the number of our residential customers because the metro area functions economically as a single entity and the metro area includes the vast majority of our customers. Many people live on one side of the state line and work on the other side. Many people shop on both sides of the state line. And many companies each year move from one side of the state line to the other. Documentation for Moody's forecast of economic activity is provided in the workpapers in the folder \models\ Evergy Metro Base Case\Data\Economics and Documentation\Economics.

Evergy Metro tested the use of county level forecasts from Moody's several years ago but saw no improvement in forecasting accuracy. This might be because it is difficult to forecast economic activity for a small geographic area, or because economic activity crosses county lines in the metro area.

The residential customer models were tested with both households and population used as drivers and the one with the best fit was chosen. If neither was significant or had a positive coefficient, the driver was tested without a constant term in the model, and if still insignificant, a driver was not used. Typically, households had the best fit.

<sup>&</sup>lt;sup>22</sup> 20 CSR 4240-22.030(3) <sup>23</sup> 20 CSR 4240-22.030(3)

<sup>&</sup>lt;sup>23</sup> 20 CSR 4240-22.030(3)(A)

The main driver for the number of small general service customers was the number of residential customers or households. These drivers were chosen because they have worked well in the past and because most small commercial customers exist to serve households and residences and these customers will increase in areas where there are new housing developments. Examples of small commercial customers that serve households are medical offices, grocery stores, drug stores, restaurants, churches, schools, hair salons, and movie theaters.

In the models for Big (Medium GS, Large GS and Large Power) commercial customers, both non-manufacturing employment and non-manufacturing gross metro product were tested as drivers, as well as population and households. The log of population produced the best fit and was chosen as the primary driver.

#### 3.2 Statistical Model Documentation<sup>24</sup>

The following tables show the statistics for the variables in the regression models. Additional statistics and residual plots are available in the Metrix ND model files and a word document located in Evergy Metro\Metro Model Statistics.docx. A description of the SAE modelling framework is included in the SAE documentation workpapers in the folder Evergy Metro\Documentation\SAE.

**Table 16: KS Metro Industrial Customers** 

The variables ending with month and year, shown in the tables above, are defined as 1 for that month and 0 for all other months.

No economic drivers were significant in the model for industrial customers in Kansas Metro.

## Section 4: Use Per Unit Analysis<sup>25</sup>

## 4.1 Significant Energy and/or Peak Demand use for each Major Class<sup>26</sup>

## 4.1.1 End-Use Load Information<sup>27</sup>

#### **Residential Sector**<sup>28</sup>

The list of residential end-uses that Evergy Metro maintains the number of units and energy use per unit include electric furnaces, heat pumps with electric resistance backup, heat pumps with natural gas backup, ground source heat pumps, central air conditioning without a heat pump, window or wall AC units, electric water heaters, electric ovens, cook tops and ranges, full-sized refrigerators, small refrigerators and wine coolers, freezers, dishwashers, clothes washers, electric dryers, TVs, air cleaners, computers, video game systems, hot tubs, swimming pools, electric vehicles and miscellaneous uses.

#### Commercial Sector<sup>29</sup>

Evergy Metro maintains information on saturations per square foot of floor space and energy use per square foot (EUI) for end-uses including heating, cooling, ventilation, electric water heating, electric cooking, refrigeration, outdoor lighting, indoor lighting, and office equipment and miscellaneous uses. In this filing, secondary data from the U.S. DOE for the West North Central region was adopted for both Evergy Metro Kansas and Missouri. The region includes the states of North Dakota, South Dakota, Minnesota, Iowa, Nebraska, Kansas and Missouri.

The results are combined across building types using building type weights. The building types include assembly (theaters, libraries, churches etc.), education, food sales, food service, health care, lodging, small office, large office, mercantile/service, warehouse and other. This data is maintained in *ComIndices\_MO.xls* and *ComIndices\_KS.xls*. The building types are defined in NEMS to NAICS Mapping.*xls*. These spreadsheets were

<sup>&</sup>lt;sup>29</sup> 20 CSR 4240-22.030(4)(A)(1)(A) <sup>29</sup> 20 CSR 4240-22.030(4)(A)(1)(B)

provided to Evergy Metro by Itron Inc. through the Energy Forecasting Group (EFG). The spreadsheets are documented in *2023\_CommercialSAE.pdf*. These files are provided in the workpapers.

#### Industrial Sector<sup>30</sup>

Evergy Metro has a relatively small industrial sector, accounting for approximately 12% of retail sales. Evergy Metro lacks the concentration of heavy industry that some utilities have. As such, we have modeled our industrial sector with a statistically adjusted employment-based intensity model. Major end-uses are cooling and other.

#### 4.1.2 Modification of End-Use Loads<sup>31</sup>

#### Removal or Consolidation of End-Use Loads<sup>32</sup>

Evergy Metro dropped attic fans from its residential survey since these do not contribute significantly to energy use or peak demand.

#### Additions to End-Use Loads<sup>33</sup>

In 2011 Evergy Metro added electric vehicles (including PHEVs) to our database. In the 2023 base year forecast we incorporated EV adoption forecasts produced in an ongoing study of Evergy Metro service territory EV usage conducted in partnership with the Electric Power Research Institute.

Starting with the 2013 base year forecast, we began tracking solar installations and merged that tracking with the EIA forecast estimate in 2015 to start generating a solar end-use intensity forecast for use in our residential and commercial forecasts. Starting with the base year 2022 forecast, we used the EIA forecast estimate combined with Evergy territory solar adoptions to produce a standalone solar forecast for Residential and Commercial.

<sup>&</sup>lt;sup>30</sup> 20 CSR 4240-22.030(4)(A)(1)(C)

<sup>&</sup>lt;sup>31</sup> 20 CSR 4240-22.030(4)(A)(2)

<sup>&</sup>lt;sup>32</sup> 20 CSR 4240-22.030(4)(A)(2)(A)

<sup>&</sup>lt;sup>33</sup> 20 CSR 4240-22.030(4)(A)(2)(B)

#### Modification of End-Use Documentation<sup>34</sup>

The following end-uses were added to the residential survey: well pumps, video game systems, medical equipment, smart speaker, streaming devices, home theater system because these use substantial amounts of energy or we believed that these had a significant saturation in our service areas.

The DOE lighting end use estimates for both Residential and Commercial were adjusted for slope as well as total size to better align with historical Evergy Metro adoption of efficient lighting technologies and to align with the estimated remaining efficiency potential. The appliance saturation surveys were used to calibrate the DOE lighting projections. Documentation of this calibration is included in the class end use worksheets located in the folder Evergy Metro\Models\KCPL Base Case\Data\Indices.

A study and projection of electric vehicle utilization and load impact was incorporated in the current forecast. The study suggests that electric vehicle utilization is likely to significantly impact our energy load in the future. The available resources underlying the study results are included in our work papers.

#### 4.1.3 Schedule for Acquiring End-Use Load Information<sup>35</sup>

Evergy Metro completed a DSM potential study in 2022. The study collected detailed enduse saturation and efficiency data from our customers in the residential, commercial, and industrial sectors. Evergy Metro provided copies of the completed study to the stakeholders' group.

#### 4.1.4 Weather Effects on Load<sup>36</sup>

Evergy Metro used statistical regression analysis applied to the load research data to develop HELM like hourly load profiles for each month, for three different day types and for base, heating, and cooling loads. The three-day types are weekdays, weekends, and

<sup>&</sup>lt;sup>34</sup> 20 CSR 4240-22.030(4)(A)(2)(C)

<sup>&</sup>lt;sup>35</sup> 20 CSR 4240-22.030(4)(A)(3)

<sup>&</sup>lt;sup>36</sup> 20 CSR 4240-22.030(4)(A)(4)

peak days. Daily temperature was used in the regression models to identify the heating and cooling portions of the loads. The profiles were developed for each CCOS. The regressions were performed in MetrixND projects MetroMO\_ClassProfile.NDM, MetroKS\_ClassProfile.NDM using 2020-2023 load research data.

These load profiles are used in this IRP filing to allocate base, heating and cooling energy to each hour annually and monthly. These profiles are stored in MetroMO\_ClassEndUse.ltm, MetroMO\_ClassEndUseWN.ltm, MetroKS\_ClassEndUse.ltm and MetroKS\_ClassEndUseWN.ltm.

#### 4.2 End-Use Development<sup>37</sup>

#### 4.2.1 Measures of The Stock of Energy-Using Capital Goods<sup>38</sup>

Evergy Metro has conducted a residential appliance saturation survey every 3 years for many decades. The surveys have been conducted by mail historically and recently by a mix of mail and internet methods. The last survey was conducted in the third quarter of 2022 in conjunction with the 2022 potential study and included a combination of both paper and web surveys. Evergy Metro received 851 and 1,083 survey responses from residential customers in Missouri and Kansas respectively. The survey responses were matched with each customers' billing records for the previous 12 months and with heating and cooling degree days computed for the billing period and the combined data was used in a conditional demand study to estimate the energy used by each type of appliance.

Evergy Metro conducted a DSM potential study that was completed in 2020. This study collected detailed end-use saturation and efficiency data from our customers in the residential, commercial, and industrial sectors. Evergy Metro provided copies of the final report to the Stakeholders' group.

A commercial and industrial (C&I) saturation survey was conducted in 2019 in addition to the residential appliance saturation survey. The C&I survey was conducted as a single jurisdictional survey due to the sample size. There were 845 completed surveys which

<sup>&</sup>lt;sup>37</sup> 20 CSR 4240-22.030(4)(B)

<sup>&</sup>lt;sup>38</sup> 20 CSR 4240-22.030(4)(B)(1)

were allocated across strata and by SIC segment (Office, Retail, Restaurant, Grocery, College, Schools, Health, Lodging, Warehouse, Misc., Energy Intensive Mfg., Non-Intensive Mfg., Other Industrial, and Unknow). The C&I surveys were completed via Computer-Assisted Telephone Interviewing (CATI).

The C&I survey captured information about a wide range of features of customer business facilities, including the following:

- Business / building characteristics
- Heating and cooling systems (fuel type, primary /secondary, controls, and % of space)
- Water heating (type, fuel, and size)
- Lighting (number by type, controls, and operating hours)
- Electronic equipment
- Other end uses (electronics, kitchens, warehouse space, motors, etc.)
- Energy efficiency-related improvements

## 4.2.2 End-Use Energy and Demand Estimates<sup>39</sup>

Monthly energies for the end-uses that are included in our SAE models are calibrated in the SAE models to monthly billed sales for each CCOS. The coefficients for the base, heating and cooling loads calibrate those loads and the coefficient for the base load raises or lowers all the components of the base load when the base load is calibrated to monthly billed sales.

Monthly demand for the major end-uses that are included in our SAE models are calibrated to the time of the monthly system peaks. This is done in the models by taking the hourly system demands and matching them to the hourly class end-use demands. This computes the coincident peak by class and end-use. To calibrate class end-use demands to the weather normalized system peak, the system peak and weather normalized peaks are used to develop a calibration factor applied to each class and end-

<sup>&</sup>lt;sup>39</sup> 20 CSR 4240-22.030(4)(B)(2)

use. This process is done for Missouri and Kansas and completed in an Excel worksheet provided in the workpapers.

# Section 5: Selecting Load Forecasting Models<sup>40</sup>

#### 5.1 Consumption Drivers and Usage Patterns<sup>41</sup>

Evergy Metro uses the Statistically Adjusted End-use (SAE) method to forecast energy sales and demand for all classes except lighting and sales for resale. The SAE method creates a forecast of sales at the end-use level and then for each class aggregates the forecasts into base, heating and cooling energy and then calibrates these loads to monthly billed sales using statistical regressions.

Our end-use level forecasts are developed using both primary data collected by Evergy Metro and secondary data and projections produced by the U.S. Department of Energy (DOE) for the West North Central region of the U.S. DOE projections used in our models include projections of saturations for household appliances and equipment used in commercial buildings and projections of efficiencies for appliances, buildings and equipment. DOE has a large professional staff responsible for constructing and maintaining energy demand models and managing contractors. The contractors survey households, businesses and buildings on a regular schedule. Contractors are also used to conduct special studies. DOE's projections are designed to account for changes in consumer preferences, technology and building design practices. Their projections also account for the impacts of appliance and equipment standards. DOE updates its projections at least once a year and we use the most recently available projections whenever we update our models.

Evergy Metro calibrates DOE appliance saturation projections to the saturation numbers that we obtain from our residential surveys. We also calibrate DOE's projections of unit energy consumption (UEC) for appliances to the results of our conditional demand study.

<sup>40 20</sup> CSR 4240-22.030(5)

<sup>&</sup>lt;sup>41</sup> 20 CSR 4240-22.030(5)(A)

Itron hosts an annual meeting for the Energy Forecasting Group (EFG), which supports utilities that use the SAE method to forecast their sales. DOE staff attends the meeting of the EFG (which we attend) to explain changes in the assumptions, data and methods that have occurred during the previous year. Their slide decks provided during these meetings for the past several years are included in our workpapers. On their website, DOE provides detailed documentation and computer code for their models and assumptions.

#### 5.2 Long-Term Load Forecasts<sup>42</sup>

Evergy Metro believes that the SAE methodology is the best available for producing our load forecasts. DOE forecasts the impacts of all appliance and equipment standards, most of which will substantially increase efficiency.<sup>i</sup> DOE also models trends in appliance ownership and utilization.

The Annual Energy Outlook for 2023 (AEO2023) differed from the AEO2020 filed in the previous IRP forecast for both the residential and commercial outlooks. The residential outlook had changes for the following:

- Updated housing stock formation and decay
- End-use energy intensity projections
- End-use efficiency projections
- Impact of the federal efficiency investment tax incentives associated with the Inflation Reduction Act.

Total Residential intensity follows a growth trajectory very similar to the 2012 Annual Energy Outlook over the 20-year period 2023-2043, with both at -01%. A slightly sharper decline in Cooling intensity is offset by stronger growth in Base Miscellaneous consumption.

For the commercial outlook, changes were made for the following:

• End-use energy intensity projections

<sup>&</sup>lt;sup>42</sup> 20 CSR 4240-22.030(5)(B)

- End-use efficiency projections
- Revised historical saturations and efficiencies

There was a slight increase in trajectory for total Commercial intensity in the 2023 outlook compared to the 2022 outlook, increasing -0.5% to -0.7%. This change is primarily due to ventilation and lighting end-uses.

#### 5.3 Policy Analysis<sup>43</sup>

Evergy Metro believes that the SAE approach is the best available method to incorporate the impacts of appliance and equipment efficiency standards because the DOE is the best qualified institution to estimate these impacts. DOE will also incorporate any federal legal impacts into its forecasts. For example, DOE has incorporated CAFÉ regulations into its forecasts of electric vehicle unit sales, which in turn impacts kWh sales for recharging EVs.

| Product Covered                         | Initial Legislation | Last Standard Published | Compliance Date | bound By   | Proposed Standards Due | New Final Standard Dus | Potential Compliance Date | States With Standard  |

# Section 6: Load Forecasting Model Specifications<sup>44</sup>

## 6.1 Description and Documentation<sup>45</sup>

## 6.1.1 Determination of Independent Variables<sup>46</sup>

In the models of residential use per customer, the independent variables were appliance saturations, appliance UECs, the real price of electricity, real per capita income and persons per household. The appliance saturations and UEC forecasts were adopted from DOE's forecast for the west north central region. The critical assumptions influencing the forecasts of saturations and UECs are discussed in workpapers located in documentation/SAE/assumptions and describe the model assumptions, computational methodology, parameter estimation techniques. These forecasts incorporate appliance ownership trends, trends in efficiency, updated building standards and technological change.

The forecasts of real per capita income and persons per household were produced by Moody's analytics for the KC metro area. Moody's documents its methodology in *micromodel\_methodology.pdf*, *State Model Methodology.pdf* and Metro\_Model\_Methodology.*pdf*, which are supplied in the workpapers. These independent variables were used to construct an end-use forecast of residential use per customer for three major end-uses: heating, cooling and other, and these were then calibrated to monthly billed sales per customer in a linear regression. This is described in *Appendix 3: Residential SAE Modeling Framework* in the file *Res2023SAEUpdate.pdf*.

In the models of commercial sales and use per customer, the independent variables were equipment saturations and EUIs, the real price of electricity and economic variables. Economic variables were non-manufacturing employment or non-manufacturing GMP. The forecasts from DOE incorporate trends in equipment saturations, equipment efficiencies, equipment standards, building standards and technological change. These independent variables were used to construct an end-use forecast of commercial use for

<sup>&</sup>lt;sup>44</sup> 20 CSR 4240-22.030(6)

<sup>45 20</sup> CSR 4240-22.030(6)(A)

<sup>&</sup>lt;sup>46</sup> 20 CSR 4240-22.030(6)(A)(1)

three major end-uses: heating, cooling and other, and these were then calibrated to monthly billed sales or sales per customer in a linear regression. This is described in *Appendix 3: Commercial Statistically Adjusted End-Use Model* in the file 2023CommercialSAE.pdf.

In the models of industrial sales, the independent variables were EUIs on an industry and employment basis, the real price of electricity and economic variables. Economic variables were manufacturing employment or manufacturing GMP.

The forecasts from DOE incorporate trends in equipment saturations, equipment efficiencies, equipment standards, building standards and technological change. These independent variables were used to construct an intensity forecast of aggregated across industrial segments and these were then calibrated to monthly billed sales or sales per customer in a linear regression. This is described in *Appendix 3: Commercial Statistically Adjusted End-Use Model* in the file 2023CommercialSAE.pdf.

The explanatory variables used by Evergy Metro in its forecasting models incorporate the most important drivers of energy use. These drivers are energy standards, building standards, trends in saturations and equipment efficiency, economic growth at the sector level and existing company energy efficiency and DSM programs.<sup>47</sup>

Evergy Metro has used the SAE approach since 2004 to forecast its loads. The economic drivers for the residential sector have been the number of households in the KC metro area during this time period. This is the fourth triennial filling that Evergy Metro has modeled small commercial (SGS), big commercial (MGS, LGS, and LP) and industrial sales (SGS, MGS, LGS, and LP) using the statistically adjusted end-use method.

For this filing, we are using updated projections from DOE for 2023 and a June 2023 vintage economic forecast of the KC metro area from Moody's Analytics.<sup>48</sup>

#### Table 27: KS Metro Industrial Sales

The load forecasting models rely on a forecast of economic activity for the KC metro area that was produced by Moody's Analytics. The KC metro area is the same as the Metropolitan Statistical Area (MSA) defined by the US Census Bureau and it includes some counties in both states that are not served by Evergy Metro. Also, Evergy Metro's service area includes some counties that are not included in the MSA. Despite these inconsistencies in geographic areas, there are reasons why this forecast is representative of our service areas. Many people live on one side of the state line and work on the other side. Many people shop on both sides of the state line. And many companies each year move from one side of the state line to the other. Documentation for Moody's forecast of economic activity is provided in the workpapers in the folder Evergy Metro\Models\KCPL Base Case\Data\Economics.

The load forecasting models also rely on saturation and appliance and equipment utilization forecasts from the DOE. The advantages of the projections from these models are 1) DOE's Forecasting and Analyst staff includes dozens of experts and maintains a large budget for data collection and consultants, 2) DOE has a focus on measuring the impacts of appliance and equipment standards and legal mandates and 3) DOE is very transparent, making available its work and computer code on its website.<sup>iii</sup> Evergy Metro also relies on the staff that developed and maintained some of EPRI's end-use models

recommended and developed the SAE approach for Evergy Metro and many other utilities. EPRI no longer maintains its end-use forecasting models.

A potential downside of these projections for Evergy Metro is that the data and models developed by DOE are developed at a regional level rather than specifically for Evergy Metro, although this can be an advantage when one service area or region has insufficient variation to measure the impact of a variable such as electric price. Cross sectional variation in the data can be an advantage in situations where price or income elasticities are being modeled.<sup>50</sup>

#### 6.2 Documentation of Deviations in Load Forecast Models<sup>51</sup>

There are no deviations in the independent variables or functional forms of the equations from those derived from load analysis in sections (3) and (4).

# 6.3 Development and Documentation of Load Forecasting Historical Database<sup>52</sup> 6.3.1 Historical Data Collection and Maintenance for Accurate Forecasting<sup>53</sup>

The independent variables acquired from Moody's are available back to 1990. Historical economic and demographic data are updated each time Evergy Metro acquires a new forecast as revisions are common.

The independent variables acquired from DOE are available for 10 years or more; as in the case of economic data, these historical estimates are subject to revision and are updated each time Evergy Missouri West receives data with an updated forecast. New studies or data can revise historical estimates of efficiencies and saturations.

Temperature data is maintained back to 1971 for the Kansas City International Airport.

<sup>&</sup>lt;sup>53</sup> 20 CSR 4240-22.030(6)(C)(1)

#### 6.3.2 Independent Variable Adjustments<sup>54</sup>

Evergy Metro staff is not aware of any adjustments made to independent variables used in its load forecasting models.

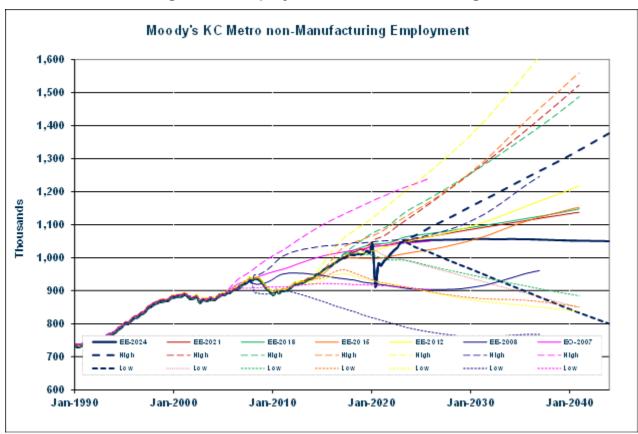

# 6.3.3 Comparison of Historical Projected and Actual Energy Usage and Peak Load Forecasts, Including the Independent Data Sets Used to Produce the Forecasts<sup>55</sup>

Evergy Metro still possesses the electronic files that it received with the independent variables used in producing energy and peak forecasts during the last ten years. Below we plot the base, high and low bands for the most important economic and demographic independent variables used in recent IRP filings.

#### Figure 23: Households

<sup>54</sup> 20 CSR 4240-22.030(6)(C)(2) <sup>55</sup> 20 CSR 4240-22.030(6)(C)(3) The current forecast for households has a slower long-term growth rate than the prior forecast after recent years has been higher than the last forecast.

#### Figure 24: Employment Non-Manufacturing

The 2024 forecast of non-manufacturing employment shows growth very similar to the 2021 forecast.

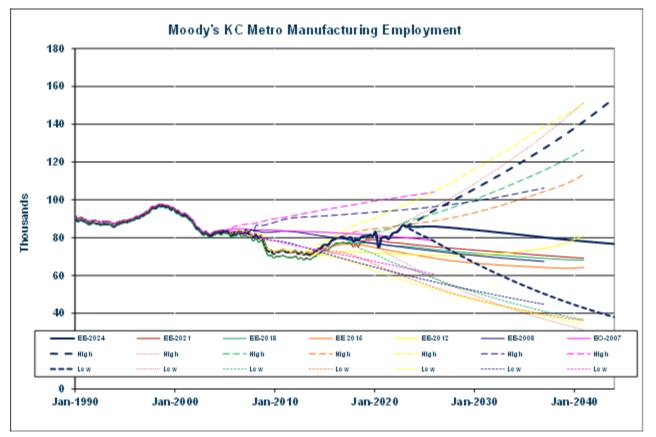

Figure 25: Employment Manufacturing

Manufacturing employment shows a large decline following the 2008 recession. It has climbed from a 2013 low and is projected to slowly decline throughout the forecast period very similar to the 2018 and 2021 forecast despite the last couple years being slightly higher than forecasted. Moody's indicates that the decline in employment for manufacturing workers is due to increased productivity from the workers, as manufacturing becomes more automated. The decline in manufacturing employment for the forecast horizon is also consistent with the observed downward trend dating back to the 1990s.

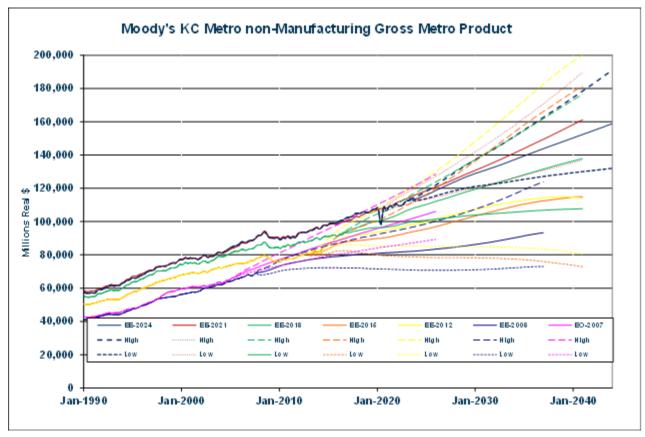

Figure 26: Gross Metro Product Non-Manufacturing

Real non-manufacturing GMP is growing much faster than employment in the forecast. The current forecasted growth trajectory is slightly lower than previously forecasted.

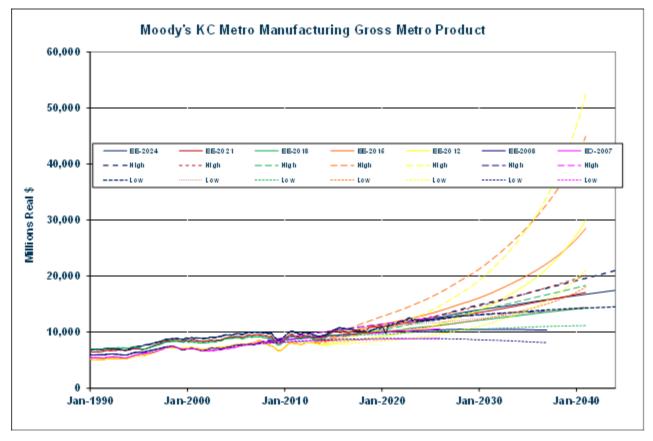

Figure 27: Gross Metro Product Manufacturing

The current forecast for Manufacturing Gross Metro Product shows slow growth throughout the forecast period, though slightly faster than the 2018 forecast. Some previous Economic forecasts showed rapid growth for two reasons: (1) growth in manufacturing employment in the long run and (2) a competitive advantage for the area in manufacturing leading to faster growth compared to the national average. In contrast, the current forecast has a continuous decline in manufacturing employment and a production growth trajectory are similar to the US as a whole. These assumptions lead to modest growth throughout the forecast period for real manufacturing GMP, as opposed to the previous rapid growth in the long-term.

# 6.3.4 Comparison of Final Forecasts to Actual Energy and Peak Demand and the Current Forecast<sup>56</sup>

Evergy Metro maintains an archive of the electronic files associated with our previous forecasts of energy use and peak demand for at least the last ten years. The graphs below compare our previous long-run forecasts for NSI and peak demand. The most recent forecast is very similar to the prior four forecasts (starting with 2014) reflecting the significant slowdown in economic growth that began in 2008, expectations for modest economic growth, the impact of currently enforced energy efficiency standards and the anticipated impact of recently enacted energy efficiency standards.

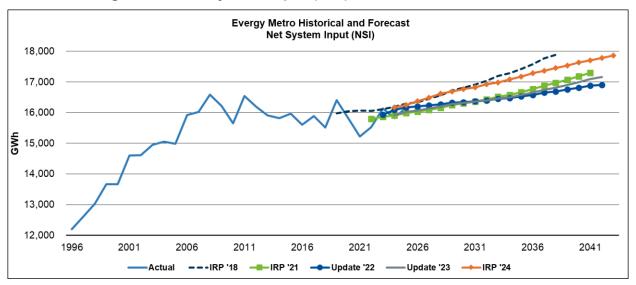

Figure 28: Net System Input (NSI) Historical and Forecasts

<sup>56 20</sup> CSR 4240-22.030(6)(C)(4)

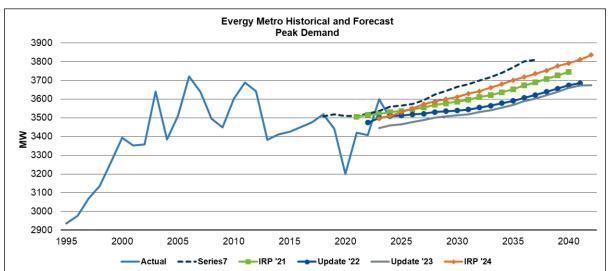

Figure 29: Peak Demand Historical and Forecasts

# Section 7: Base-Case Load Forecast<sup>57</sup>

Evergy Metro's base-case forecast was produced with a base-case economic forecast from Moody's Analytics obtained in June 2023. The forecast included the impacts of Evergy Metro's implemented energy efficiency and DSM programs on NSI and peak load. The forecast was produced using normal weather.

#### 7.1 Major Class and Total Load Detail<sup>58</sup>

#### 7.1.1 Describe and Document Relevant Economic and Demographics<sup>59</sup>

Evergy Metro accounted for the effects of real electricity prices in two ways. First, the prices of electricity and natural gas are incorporated into the Energy Information Administration forecast of electric space heat saturation, which are calibrated to Evergy Metro service territory electric space heat saturation to forecast residential and commercial electric space heat customers. These models are described in the section of this document for rule 7.B.1. Second, Evergy Metro assumes a price elasticity of between -0.05 and -0.26 (elasticities vary by customer class and end use) in each model of sales or sales per customer. These elasticities are close to the default values in the ERPI models REEPS and COMEND, which ITRON used in the original SAE models that they delivered to Evergy Metro in 2004. Since then, Evergy Metro has made some small changes to these values to improve the fit of the models.

In the residential models of kWh per customer, Evergy Metro assumes an income elasticity of 0.3 for heating and cooling and 0.3 for other uses and a person's-perhousehold elasticity of 0.3. Moody's forecast of households for the KC metro area was used in the models of residential customers as was described previously in the section for rule 3.B.

<sup>&</sup>lt;sup>57</sup> 20 CSR 4240-22.030(7)

<sup>&</sup>lt;sup>58</sup> 20 CSR 4240-22.030(7)(A)

<sup>&</sup>lt;sup>59</sup> 20 CSR 4240-22.030(7)(A)(1)

#### 7.1.2 Describe and Document Effects of Legal Mandates<sup>60</sup>

Evergy Metro uses the SAE methodology to forecast kWh sales for residential, commercial, and industrial sales. This methodology relies on DOE forecasts of UECs and EUIs, which account for appliance efficiency standards and building codes.<sup>iv</sup>

#### 7.1.3 Describe and Document Consistency<sup>61</sup>

Evergy Metro forecasts incorporate and thus are consistent with the following trends:

- Electric space heating models explain the rapid rise of electric space heating saturations in the residential and commercial sector as a function of the relative costs of using electricity and natural gas. These costs depend on electricity and natural gas prices and the efficiencies of heat pumps and natural gas furnaces.
- Forecasts of UECs and EUIs used in our models reflect the impacts of energy standards in both the past and the future.
- Forecasts of appliance and equipment saturations reflect the penetration of new devices such as CFL/LED Light Bulbs, HDTVs and the limitations of further increases for appliances that are reaching equilibrium such as dishwashers and central air conditioners.

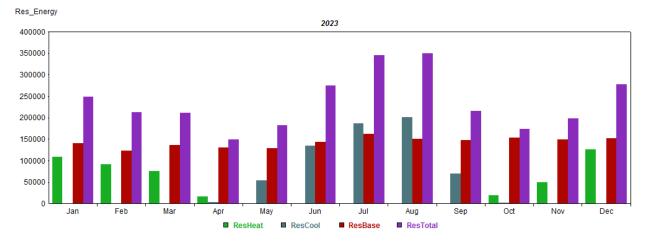

## 7.1.4 Describe and Document Weather Normalized Class Loads<sup>62</sup>

The estimates are shown below. Details for the full 20 years forecast can be found in MetroMO\_ClassEndUseWN.ltm and MetroKS\_ClassEndUseWN.ltm in the ENDUse\_Energy Frequency Transforms.

| Dec-23 | 315.62 |

Evergy Metro-KS has zero SFR customers as of July 2017.

### 7.1.5 Describe and Document Modification of Models<sup>63</sup>

No outside-the-model modifications were made to the forecasted values resulting from the energy and peak forecast models.

#### 7.1.6 Plots of Class Monthly Energy and Coincident Peak Demand<sup>64</sup>

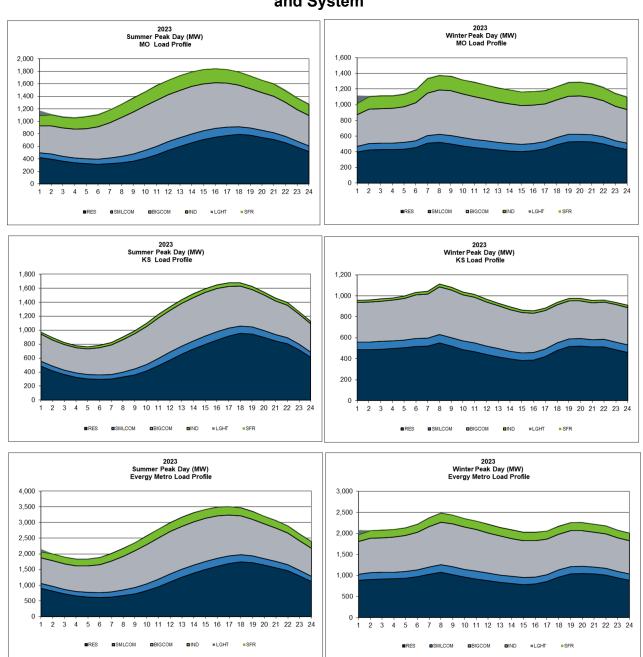

Plots for class monthly energy and coincident peak demand at the time of summer and winter system loads are provided in *Appendix 3B*. Energy plots by jurisdiction and system are provided in the file *IRP\_7.1.6\_Metro\_MWh.xlsx* and peak plots are in the file *IRP\_7.1.6\_Metro\_Peaks.xlsx*.

#### 7.1.7 Plots of Net System Load Profiles<sup>65</sup>

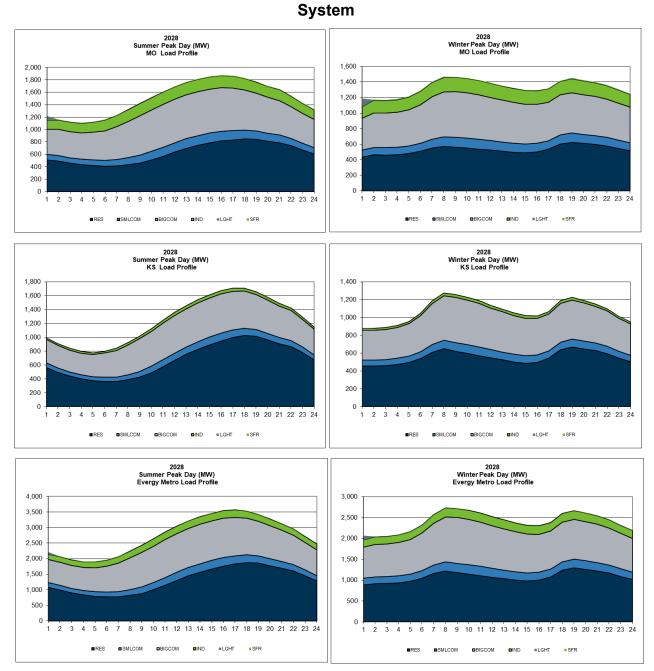

The figures below show the load profiles for the base, fifth, tenth, and twentieth years broken out by summer and winter peak days for each major class in Missouri, Kansas and for the system. The plots with data tables are provided in *Appendix 3C*. Plots for additional years can be found in the MetrixLT files (Metro*MO\_ClassEndUse*, Metro*KS\_ClassEndUse*, and *SysShape*) included in the workpapers.

#### 7.2 Describe and Document Forecasts of Independent Variables<sup>66</sup>

The forecasts of independent variables were described above in the section for rule 20 CSR 4240-22.030(6)(C)(3) and below in the section for rule for 20 CSR 4240-22.030(7)(B)(3)

#### 7.2.1 Documentation of Mathematical Models Developed by the Utility<sup>67</sup>

No mathematical models were developed by the utility to forecast the independent variables.

#### 7.2.3 Documentation of Adopted Forecasts Developed by Another Entity<sup>68</sup>

Evergy Metro used a forecast of economic and demographic variables for the KC metro area that was developed by Moody's Analytics. The reasons for using this forecast, the applicability to Evergy Metro's service area and documentation for the forecast were discussed in the sections for rules 22.030(3)(A) and 22.030(6)(A)3.

Evergy Metro used forecasts of saturations, UECs, EUIs and building efficiencies from DOE. The reasons for using these forecasts, the applicability to Evergy Metro's service area and documentation for the forecast were discussed in the sections for rules 22.030(3)(A), (4)(A)1. 22.030(B), 22.030(5)(A), 22.030(5)(B) and 22.030(6)(A)3.

# 7.2.4 Comparison of Forecast from Independent Variables to Historical Trends<sup>69</sup> Table 38: Economic Growth Rates for KC Metro Area \*\*<u>Confidential</u>\*\*

<sup>&</sup>lt;sup>66</sup> 20 CSR 4240-22.030(7)(B)
<sup>67</sup> 20 CSR 4240-22.030(7)(B)(1)

<sup>69</sup> 20 CSR 4240-22.030(7)(B)(3)

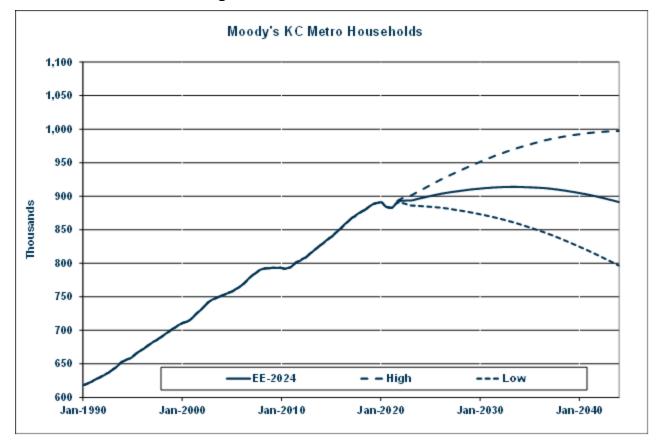

Figure 44: KC Metro Households

The household data and projection show robust growth from 1990 until the beginning of the last recession at the end of 2007, at which time growth slowed substantially. Housing stock has expanded since 2012 and the growth is expected to continue at a slowly decelerating pace until 2030 when the pace begins to decelerate more rapidly.

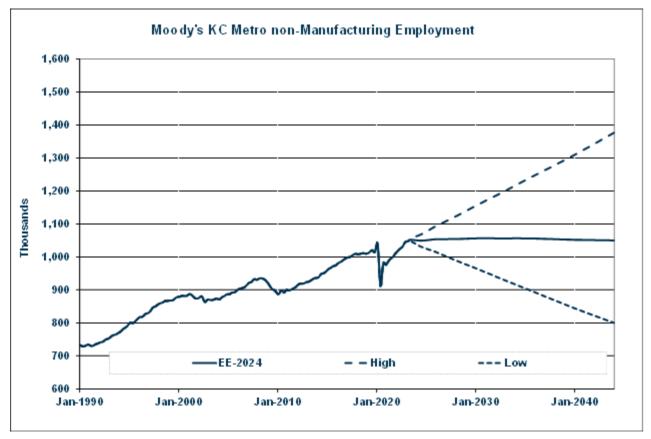

Figure 45: KC Metro Employment Non-Manufacturing

Non-manufacturing employment showed very strong growth in the 1990s, 1.9% per year, then stalled after the 2001 recession, picked up strongly in 2004 and then turned negative during the last recession. Growth returned in 2012 and grew stronger starting in 2015. Moody's expects very little growth throughout the forecast period, due in part to a slowdown and eventual decline in population.

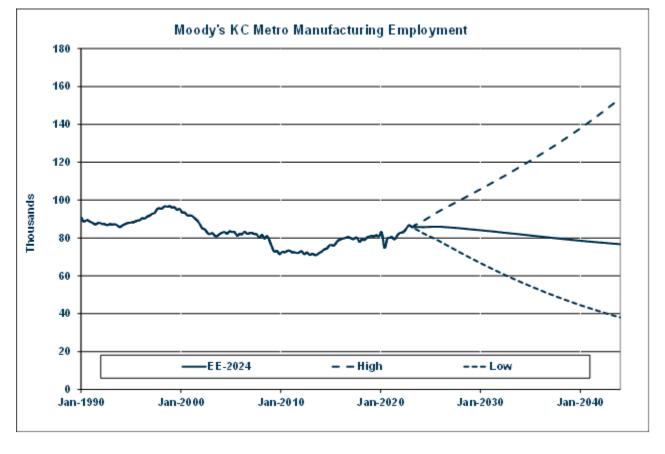

Figure 46: KC Metro Employment Manufacturing

Manufacturing employment peaked in the late 1990s and has fallen since. It fell precipitously between 1999 and 2003 and again during the last recession. After regaining some of the jobs lost in the aftermath of the last recession, Moody's expects employment to resume its historical decline.

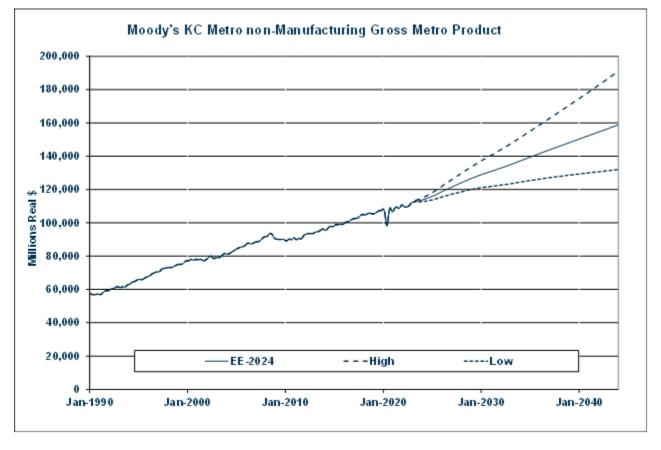

Figure 47: KC Metro Gross Metro Product Non-Manufacturing

Real non-manufacturing gross metro product grew 3% per year during the 1990s, slowed down a bit after that and then declined during the last recession. GMP is growing faster than employment because of increasing productivity, a trend seen nationally and across many service sectors. Moody's expects strong growth over the next two decades.

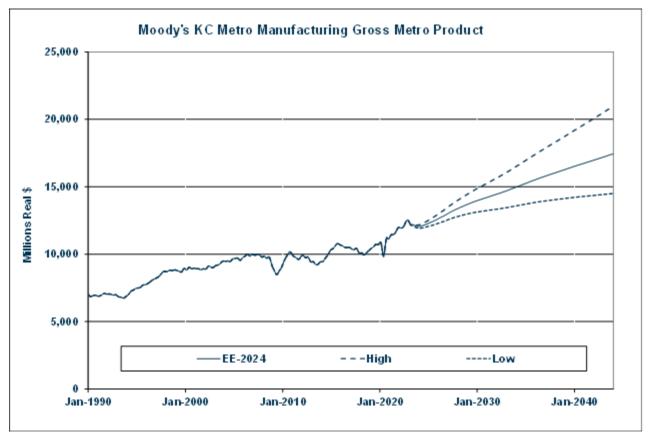

Figure 48: Gross Metro Product Manufacturing

Real gross metro product from the manufacturing sector grew strongly during the 1990s and then fell flat until it plunged during the last recession. Growth has been somewhat volatile since 2008, but positive in total. Moody's expects strong growth in the forecast period. GMP for this sector is growing while employment is flat or declining because of increasing productivity, automation of the manufacturing processes and because many of the labor-intensive portions of production have moved overseas where labor cost is lower.

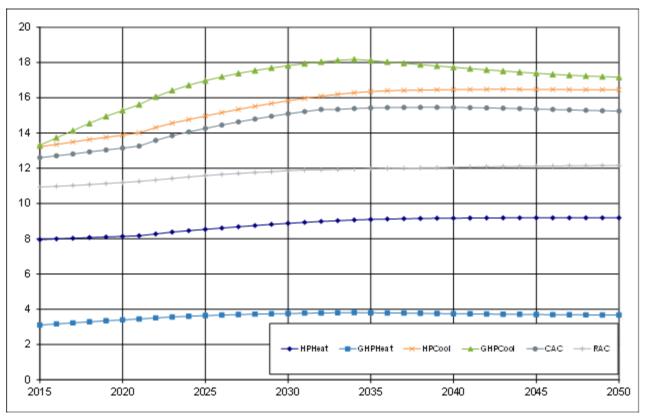

Figure 49: DOE Stock Average Appliance Efficiency Projections

DOE is expecting increases in the stock average appliance efficiencies for residential heating and cooling equipment, resulting from appliance standards. The standards impact the stock average efficiency both due to new construction and replacement units.

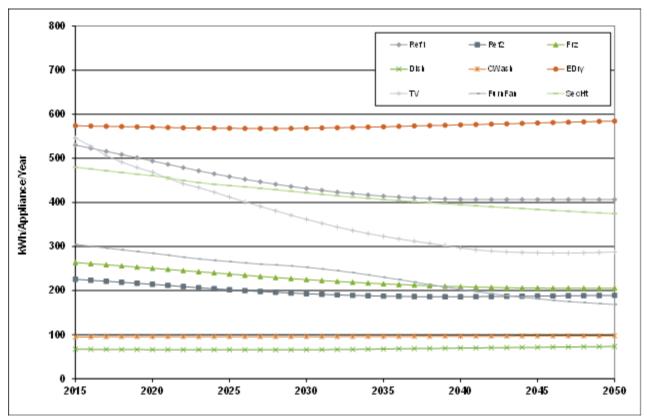

Figure 50: DOE UEC Projections (<1000 kWh/year)

The decline in UEC for refrigerators and freezers is expected to continue for another decade before beginning to level. TV UEC has fallen sharply in recent years and is expected to continue. Furnace fans are expected to continue to see a decline in UEC. Dishwashers and electric dryers are expected to see flat UEC due to slightly increasing saturation levels offsetting efficiency gains.

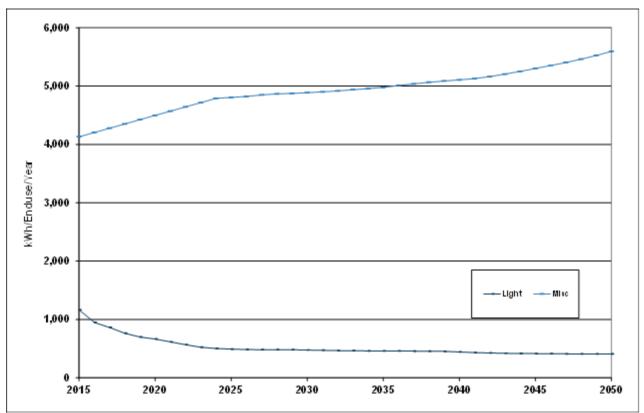

Figure 51: DOE UEC Projections (>1000 kWh/year)

Much of the decline in Lighting UEC has been realized through the adoption of LED and fluorescent lighting over incandescent. Lighting standards, many of which began in 2007 through 2015, will continue to impact consumption, though to a lesser degree, as less efficient incandescent and fluorescent lights are replaced with LED.

Miscellaneous UEC grew rapidly in the late 1990s and early 2000s before decelerating (from 5% to 3%) in 2006 and then again decelerating in 2016. The EIA expects miscellaneous UEC to grow through the forecast period.

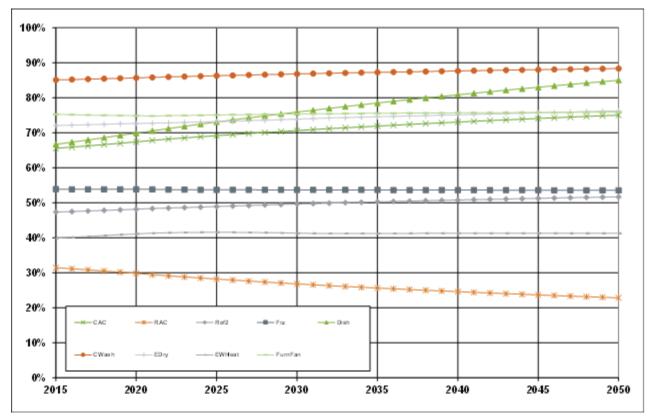

Figure 52: DOE Electric Appliance Saturation Projections (< 100%)

DOE saturation projections shown above are in line with recent historical trends.

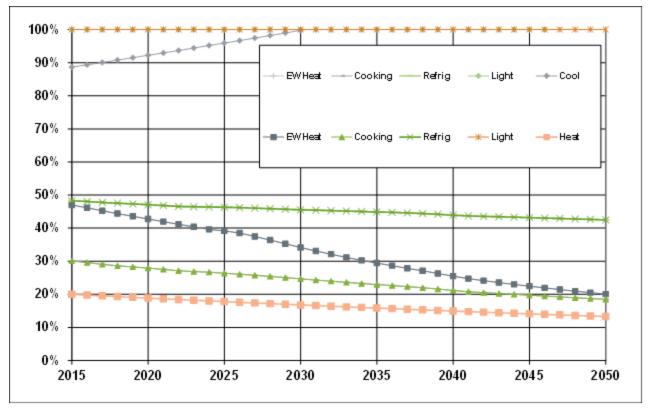

Figure 53: DOE Equipment Saturation Projections

(Average over all Commercial Building Types)

DOE commercial sector saturations are mostly in line with trends in recent historical data. Electric water heat saturation is projected to experience a slightly sharper decline starting near the late 20s.

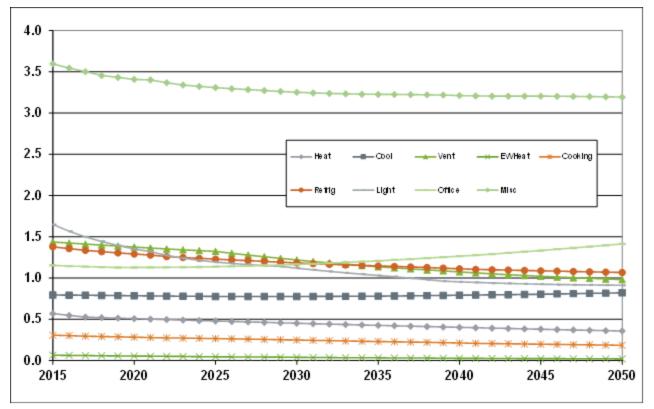

Figure 54: DOE Commercial EUI Projections

DOE estimates of the EUI for lighting have been declining since 1995 and started falling more rapidly in 2012, due to CFLs and LEDs, especially for lodging and in recessed fixtures in offices. New refrigeration standards became effective in 2017.<sup>v</sup> The heating EUI is declining and expected to further decline. A new standard for commercial heating and cooling equipment became effective in 2017.<sup>vi</sup> The EUI for miscellaneous equipment was revised lower than previous outlooks due to the incorporation of the 2012 CBECS.

#### 7.2.5 Specification and Quantification of Factors<sup>70</sup>

Evergy Metro used the forecasts of economic and demographic variables as is from Moody's Analytics.

<sup>&</sup>lt;sup>70</sup> 20 CSR 4240-22.030(7)(B)(4)

The projections of appliance saturations from DOE were calibrated to the results of our Residential appliance saturation survey and Commercial & Industrial equipment saturation survey. An additional calibration was made to lighting to account for the Evergy Metro lighting program that had been in place prior to the implementation of the 2013 federal lighting standard. The adjustment shows a stronger increase in lighting efficiency in the historical period and a slower rate of increase in efficiency in the forecast period.

#### 7.3 Net System Load Forecast<sup>71</sup>

Evergy Metro has produced an hourly forecast for each major class and the sum of these forecasts is the hourly forecast of NSI.

<sup>&</sup>lt;sup>71</sup> 20 CSR 4240-22.030(7)(C)

# Section 8: Load Forecast Sensitivity Analysis<sup>72</sup>

To perform a sensitivity analysis, we are using a method that was suggested by the Missouri Public Service Commission Staff for Evergy Metro's IRP. For each customer class, MWh sales were regressed on important driver variables and degree days and the standardized variables are used to show the relative importance of each explanatory variable. We also show the elasticity for each driver variable as measured by the statistical regression. The sensitivity analysis was run using the revenue class groups as opposed to the class cost of service groups in order to use a longer historical data set. Class cost of service historical data is available back to mid-2005. The analysis was repeated using revenue classes, residential, commercial, and industrial with monthly data available from 2001 to 2023.

The table below displays the results for MO residential customers. Among the driving variables, the cooling degree days' variable has the largest standardized coefficient, followed by billing days and heating degree days variables. Note that the base temperature for the cooling degree days' variable was 650 F and the base temperature for the heating degree days variable was 550 F. The variable hddPriceRatio variable is heating degree days with a base temperature of 550 F times the price of natural gas for the West North Central Region. This variable's purpose is to measure gas and electric prices' impact on electric space heating loads. The trends in both heating degree day response and cooling degree day response are significant as well. The variable BDays is the number of billing days averaged over each billing cycle. The regression periods used for these regressions are monthly from January 2001 to June 2023 or January 2002 to June 2023.

#### Table 39: Missouri Metro Residential

The table below provides the results for Missouri commercial customers. The variable with the largest standardized coefficient is cooling degree days. The heating degree day base temperature for the commercial model was the same as the residential model, but the cooling degree day base temperature was 600 F. Heating degree days, trend in heating degree days and the HDDpriceRatio variable all had similar impact for commercial customers. Several economic drivers were tested and were significant, including Non-Manufacturing Gross Metro Product and Households.

#### Table 44: Kansas Metro Industrial

#### 8.1 Two Additional Normal Weather Load Forecasts<sup>73</sup>

Evergy Metro used two additional economic forecasts from Moody's Analytics to produce high-growth and low-growth load forecast scenarios. These additional scenarios represent economic growth of two standard deviations above and below the base case forecast.

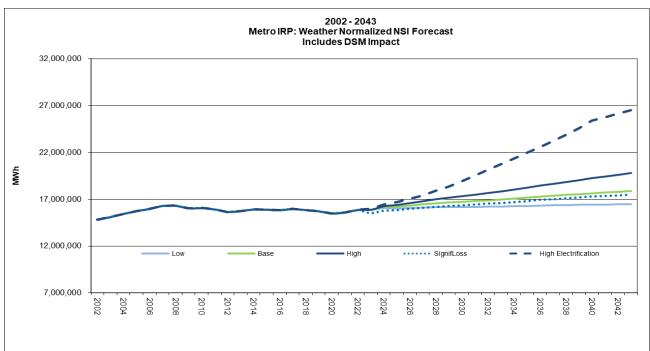

In addition to these two scenarios, Evergy Metro produced an additional scenario representing significant loss of customer.

Evergy Metro constructed this scenario by subtracting the energy and peak demand from the largest customer in both Kansas and Missouri from the results for the base case scenario. The most recent 12 billing records from each customer were used and the energy and peak from each month was used for that particular month in the forecast. Losses were added to the energy and peak demands.

The corresponding figures below show the base-case, low-case, high-case, and significant loss forecasts for energy and demand. The impact of the last recession and the economic malaise since then are evident in the plot for energy. Growth in the forecast is lower than it was prior to the last recession, and this is primarily because U.S. growth prior to the recession was fueled by circumstances that will not be repeated in the forecast horizon such as extremely lax lending standards.

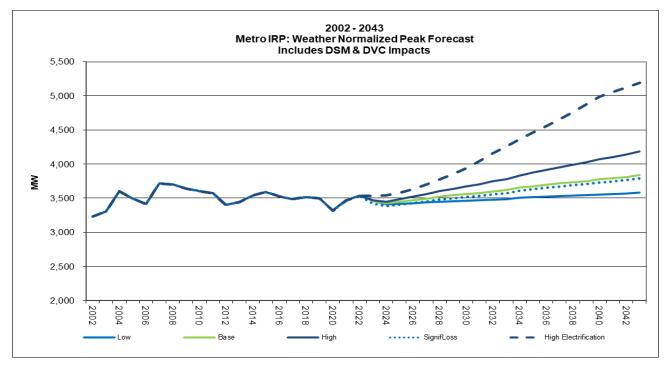

<sup>&</sup>lt;sup>73</sup> 20 CSR 4240-22.030(8)(A)

# Figure 55: MO Metro Base, Low, High, Significant Loss and Electrification Net

#### System Input Forecast

Figure 56: MO Metro Base, Low, High, Significant Loss and Electrification Peak Demand Forecast

#### 8.2 Estimate of Sensitivity of System Peak Load Forecasts to Extreme Weather<sup>74</sup>

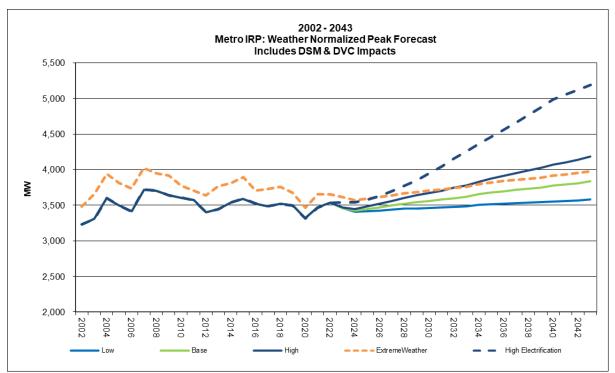

Evergy Metro created a forecast scenario using the base case economic scenario and weather from the 4 warmest years in terms of cooling degree days at KCI. These years were 1980, 1988, 2006 and 2012. The number of cooling degree days those years were 1,746, 1,724, 1,724 and 1,839. The scenario was created by running our computer programs with normal weather computed with those four years instead of with 30 years.

In 2023, the peak net of DSM rose from 3,464 MW in the base case scenario to 3,615 MW in the extreme weather scenario. In 2028, the peak net of DSM increased from 3,523 (base case) to 3,668 extreme weather scenarios. The complete set of results is in a file, *Metro NSI\_Peak Monthly\_Annual.xls.* This file contains monthly NSI and peak load for all forecast scenarios.

The corresponding figures below show the base-case, low-case, high-case, and extreme weather forecasts for energy and demand.

<sup>&</sup>lt;sup>74</sup> 20 CSR 4240-22.030(8)(B)
