DIRECT TESTIMONY

OF

MARK C. BIRK

FILE NO. EF-2024-0021

1		I. INTRODUCTION
2	Q.	Please state your name and business address.
3	А.	Mark C. Birk, 1901 Chouteau Avenue, St. Louis, Missouri 63103.
4	Q.	By whom are you employed and what is your position?
5	А.	I am the President of Union Electric Company d/b/a Ameren Missouri
6	("Ameren Mi	ssouri" or the "Company").
7	Q.	Please describe your educational background and employment
8	experience.	
9	А.	I received my Bachelor of Science degree in Electrical Engineering from
10	the Universi	ty of Missouri-Rolla in 1986 and my Master of Science in Electrical
11	Engineering	from the same institution in 1991. In 2009, I also received a Master of
12	Business Ad	ministration from Washington University in St. Louis. I am a licensed
13	professional	engineer in the State of Missouri. I began my employment with Union Electric
14	Company in	1986 as an assistant engineer in the nuclear function. In 1989, I transferred to
15	Union Electr	ic's Meramec Energy Center as an electrical engineer. In 1996, I transferred
16	to the Energy	Supply Operations Group and became a Power Supply Supervisor. I became
17	Manager of I	Energy Supply Operations in the spring of 2000. I became General Manager
18	of Energy D	elivery Technical Services in the fall of 2001 and Vice President of that
19	department	in 2002. I became Vice President of Ameren Energy, Inc., Ameren

Corporation's short-term trading affiliate, in the fall of 2003 and assumed the position with
 Ameren Missouri as Vice President of Power Operations in September of 2004. In 2012, I
 was promoted to Senior Vice President of Corporate Planning and Business Risk
 Management, and in 2015, I became Senior Vice President of Corporate Safety, Planning,
 and Operations Oversight. In 2017 I became Sr. Vice President, Customer and Power
 Operations, and I assumed my current position in December of 2021.

Q. We will be focusing on decisions made by Ameren Missouri in the 2005
to 2010 timeframe, when you were Vice President of Power Operations. Can you
describe your duties and responsibilities in that position at that time?

10 A. Yes. As Vice President of Power Operations, I was responsible for the safe, 11 efficient, and reliable operation of the Company's non-nuclear electricity generating 12 plants—including its four coal-fired plants, the Rush Island, Meramec, Sioux, and Labadie 13 Stations. These responsibilities included environmental compliance for these facilities and 14 the implementation of projects for the generating units at these facilities. My direct reports 15 included the plant managers at the Rush Island, Meramec, Sioux, and Labadie Stations.

16

EXECUTIVE SUMMARY

17

0.

Please summarize your testimony.

II.

A. The retirement of Rush Island is the culmination of a series of prudent and reasonable decisions made by the Company over many years. Every decision we have made on Rush Island incorporated the information reasonably available at the time and was guided by three principles: 1) to ensure system reliability; 2) to comply with the law; and 3) to serve the best interests of our customers.

In order to ensure system reliability, Ameren Missouri performs routine
 maintenance on all its generating assets, including its coal-fired electric generating units at

1 Meramec, Sioux, Labadie, and Rush Island. This includes replacing components as they 2 wear, to prevent forced outages or derates that would limit future availability. This has 3 happened multiple times on all of our coal fired units over multiple years across the Ameren 4 Missouri system. Such component replacements typically occur during regularly-5 scheduled turbine outages. Just like work previously performed at Labadie, Sioux and 6 Meramec, Ameren Missouri replaced some boiler components on Rush Island Unit 1 in 7 2007 and on Rush Island Unit 2 in 2010 (the aforementioned "Rush Island Projects"). The 8 Rush Island Projects were no different from those completed numerous times by every 9 other utility in the industry.

10 And also like every other utility in the industry, Ameren Missouri understood that 11 performing such work (replacing existing boiler components with similar components) on 12 existing units would not transform them into "new sources" that require a "New Source 13 Review" ("NSR" for short) preconstruction permit. NSR is a program established under 14 the federal Clean Air Act ("CAA") and administered by the states that requires permitting 15 for the creation of new emissions capacity, either through the construction of new sources 16 or the modification of existing sources. We are not aware of any utility in the country that 17 sought NSR permits for projects like those Ameren Missouri did at Rush Island and 18 elsewhere. Ameren Missouri's understanding that these projects did not require NSR 19 permitting was also shared with the Missouri Department of Natural Resources 20 ("MDNR"). New Source Review in Missouri is a state program enforceable by state 21 regulations approved by the United States Environmental Protection Agency ("EPA") for 22 implementation in Missouri as consistent with the CAA. Ameren Missouri worked closely 23 with MDNR in its administration of these and other permitting requirements, and therefore

had a common understanding of what would and what would not trigger NSR permitting
 requirements. Ameren Missouri's environmental experts examined the Rush Island
 Projects, applied that common understanding held by all utilities in Missouri and MDNR,
 and concluded that NSR permits were not required.

5 After the fact, EPA brought claims against Ameren Missouri alleging that the Rush 6 Island Projects in fact triggered the NSR requirements in the Missouri regulations. With 7 this case, the Obama Administration reactivated EPA's "NSR enforcement initiative" 8 against coal-fired electric utilities, following a pause in the Bush Administration. That 9 initiative, first started in 1999, attempted to achieve nationwide emission reductions by 10 using a new interpretation of NSR that results in universal liability by assuming that *all* 11 repairs on existing units produce an emissions increase. EPA's new enforcement 12 interpretation of NSR never went through notice and comment rulemaking, and not even 13 EPA itself uses this enforcement interpretation in making permitting decisions. In fact, 14 EPA itself abandoned these enforcement interpretations in the years leading up to the Rush 15 Island Projects and disclaimed any intent to bring such claims. The utility industry 16 recognized EPA's enforcement initiative as unlawful, illegitimate, and unfair. It therefore 17 fought EPA's NSR enforcement initiative in court, resulting in more wins than losses for 18 the utility industry.

After the Bush Administration ended, EPA did another about-face and started pursuing NSR claims using the enforcement theories that EPA had previously abandoned. Ameren Missouri contested EPA's allegations of non-compliance in court, just like many across the utility industry. Unfortunately, the results for Ameren Missouri differed from the majority of the similarly-situated utilities that had done the same sort of projects and

made the same decision to contest EPA's new enforcement interpretations. At the end of the day, the District Court disagreed with us on the law—finding the Company liable and ordering Rush Island to get a scrubber to reduce sulfur dioxide ("SO₂") emissions. But the District Court never suggested that we failed to act in good faith or that we had no legitimate basis for our understanding of the legal requirements.

By the time the District Court's order to scrub Rush Island became final, circumstances had made the continued operation of coal-fired plants extremely challenging. EPA's proposals to regulate carbon emissions from existing coal-fired power plants creates serious risks to the continued viability of these assets—risks that would make investing hundreds of millions of dollars in a scrubber in such assets imprudent. Faced with these realities, the only prudent option was to shut down Rush Island instead of adding scrubbers. The District Court approved this decision on September 30, 2023.

13 At each step along the way, we made reasonable decisions that we believed were 14 in compliance with the law and in the best interests of our customers—up to and including 15 the Rush Island retirement decision. The District Court said we were wrong on the law-16 that NSR permits were in fact required when the projects were untaken many years before. 17 We accept that decision, but it does not mean that Ameren Missouri was unreasonable in 18 reading the law as we did (and as MDNR and EPA itself did) or that we were unreasonable 19 in proceeding without permits (just like every other utility in Missouri and across the 20 country) or in challenging EPA's claims in court (as many other utilities have done 21 successfully). Given the facts and circumstances as they existed at the time, no rational 22 utility would have done anything differently with respect to Rush Island. Having made 23 prudent decisions, the securitization of the cost of retirement for Rush Island is appropriate.

1	III. COMPANY WITNESSES
2	Q. Who are the Company's other direct case witnesses?
3	A. In addition to me, the Company is supporting its financing order petition with
4	Direct Testimony from nine witnesses, as follows:
5	• Steven C. Whitworth. Mr. Whitworth was the head of the Air Quality Group in Ameren
6	Services Company's Environmental Services Department ("ESD"), and later the
7	Director of ESD, leading up to and during the planned outages when the Company
8	completed the Rush Island Projects. He retired from the Company after almost 42 years
9	of service in 2022. Mr. Whitworth's Direct Testimony addresses the decision-making
10	process respecting when permits are, or are not, required prior to proceeding with a
11	project or set of projects. His direct testimony also addresses the Company's knowledge
12	and understanding of the provisions of the federal Clean Air Act, the EPA's NSR
13	regulations issued thereunder, and the applicable Missouri State Implementation Plan
14	("SIP") at the time the decisions related to Rush Island were made.
15	• Jeffrey R. Holmstead. Mr. Holmstead is a former EPA Assistant Administrator in the
16	air program office and currently an environmental attorney, whose direct testimony
17	concerns the regulatory framework for NSR permitting in Missouri at the time of the
18	projects and the broader context in which electric utilities were making environmental
19	compliance decisions in the relevant time period. His direct testimony outlines why,
20	under that framework, Ameren Missouri acted reasonably when it concluded that no
21	permits were required for its projects at Rush Island completed during planned outages
22	at Rush Island in 2007 and 2010 (the "Rush Island Projects").

1	•	Karl R. Moor. Mr. Moor is a retiree from EPA, where he served as Deputy Assistant
2		Administrator in the air program office. Before that, he worked for years at Southern
3		Company as a Senior Vice President and attorney. Specifically, Mr. Moor was the Vice
4		President and Assistant General Counsel for Public Policy for Southern Company at the
5		time that Ameren Missouri was making its relevant environmental compliance
6		decisions. While Company witness Holmstead provides perspective from the standpoint
7		of an environmental regulator, Mr. Moor provides Direct Testimony demonstrating that
8		based on what the industry (including Ameren Missouri) knew or should have known
9		at the time concerning the NSR program, it was clearly reasonable for Ameren Missouri
10		not to have sought permits.
11	•	Matt Michels. Mr. Michels is the Company's Director of Corporate Analysis. His
12		direct testimony demonstrates that the Company's decision to retire Rush Island was
13		prudent and in the best interest of our customers.
14	•	John J. Reed. Mr. Reed is the President and Chief Executive Officer of Concentric
15		Energy Advisors and a regulatory policy and economic expert. His direct testimony
16		will discuss the appropriate regulatory standards to apply to the Company's decisions,
17		both relating to its decision not to seek NSR permits for the Rush Island Projects, and
18		its decision to retire that plant instead of installing expensive pollution control
19		equipment.
20	•	Mitchell Lansford. Mr. Lansford is the Company's Director of Regulatory Accounting,
21		whose direct testimony will develop the securitized utility tariff costs. Mr. Lansford's
22		Direct Testimony will also demonstrate the advantage of financing these costs via
23		securitization versus under the traditional method of financing and recovering such

1		costs. Mr. Lansford's Direct Testimony also addresses the proper handling of
2		accumulated deferred income taxes relating to Rush Island.
3	•	Steve Wills. Mr. Wills is the Company's Director of Regulatory Affairs. His direct
4		testimony uses the securitized utility tariff costs developed by Mr. Lansford to develop
5		an appropriate allocation of those costs to each customer class via the implementation
6		of a securitized utility tariff charge, as contemplated by the securitization statute. Mr.
7		Wills also addresses the proposed tariff that underlies that charge.
8	•	Jim Williams. Mr. Williams is the Company's Senior Director, Operations Excellence
9		Support and will discuss basic facts about the Rush Island Energy Center, its current
10		operational status and plans for retirement, and the activities and costs to be incurred in
11		completing its safe closure and decommissioning.
12	•	Katrina Niehaus. Ms. Niehaus is a Managing Director for Goldman Sachs and provides
13		an overview of the proposed securitization transaction, discusses key structural elements
14		of the proposed bonds, and addresses the primary rating agency criteria for such bonds
15		to obtain the highest possible rating, allowing them to carry the lowest possible interest
16		rate.

1	IV. AMEREN MISSOURI'S ENVIRONMENTAL COMPLIANCE DECISIONS
2	Q. I want to begin our discussion of Rush Island in the mid-2000's, when you
3	were Vice President of Power Operations. You stated earlier that as Vice President of
4	Power Operations for Ameren Missouri, from 2004 to 2011, your duties included
5	environmental compliance at the Ameren Missouri plants. What exactly did that entail?
6	A. To put it simply, as the senior officer in charge of Power Operations, it was my
7	responsibility to ensure that the Company had processes, procedures, and adequate resources in
8	place to ensure that the plants complied with state and federal environmental requirements
9	covering all media: air, water, and solid waste. With respect to air, and as required by our
10	operating permits, plant managers (after consulting with subject matter experts) certified
11	compliance on required permitting submittals regarding day-to-day operations and emissions.
12	My role was making sure Ameren Missouri was properly planning at an engineering and
13	operating level for a range of compliance matters including ever-changing federal rulemaking
14	requirements. All of these compliance efforts drew upon subject matter experts within Ameren
15	Services Company, including ESD and the Legal Department. These departments and others
16	within Ameren Services Company supported both Ameren Missouri and its affiliates in Illinois.
17	A. The Role of ESD in Environmental Compliance
18	Q. What role did ESD have in environmental compliance for the Ameren
19	Missouri plants?
20	A. ESD's job was to maintain familiarity with the applicable regulatory and
21	permitting requirements, and to utilize its collective expertise with those requirements to ensure
22	environmental compliance in the plants and to guide project planners through a host of
23	regulatory requirements. Because ESD supported both Ameren Missouri and its unregulated
24	affiliates operating in Illinois, ESD had expertise in the regulatory requirements in the separate

1 produces temperatures that reach 3,000°F and corrosive flue gases blowing abrasive entrained 2 fly ash that wear on the metal tubes that comprise most of the surface area of the boiler. Those 3 metal tubes carry water and/or steam at pressures that reach nearly 3,000 psi, equivalent to an 4 ocean depth of more than a mile. The harsh conditions inside an operating boiler constantly 5 wear on the boiler tubes, and these components will inevitably fail and must be replaced. The 6 harsh conditions inside an operating boiler also mean that repairing or replacing boiler tubes— 7 indeed, most maintenance, repair or component replacement activities on an electric generating 8 unit—can occur only when the unit is offline. Historical analysis has shown that boiler 9 component failures and planned turbine outages are leading causes of lost generation for coal 10 fired units. It is preferable to perform maintenance activities during a planned outage that can 11 be scheduled, compared to a forced outage arising from some failure or malfunction. The 12 Company therefore takes a proactive approach, using the available data to identify and address 13 issues before they become significant problems.

14 Over the years, Ameren Missouri made substantial investments in its generating 15 facilities to improve their reliability and protect their availability for the benefit of our customers. 16 As I explained to the Commission in my direct testimony provided in File No. ER-2007-0002, 17 Ameren Missouri spent over \$1.7 billion between January 1, 2002 and March 31, 2006 on 18 generating infrastructure, including investments in its existing coal-fired and hydroelectric 19 plants. On October 18, 2006, I provided the Commission's Staff with more information on 20 these expenditures, consisting of an itemized list of projects performed on Ameren Missouri's 21 coal-fired facilities between July 1, 2000 and June 30, 2006 above a threshold of \$500,000. See 22 Schedule MCB-D1. As I will discuss below, this list included numerous examples of projects just like the Rush Island Projects. NSR permits were not obtained for any of those non-Rush
 Island projects, many of which took place before the 2007 and 2010 Rush Island Projects.

Q. Were there any changes over time in how Ameren Missouri maintained its units?

5 The only significant change was one of timing. Ameren Missouri schedules a A. 6 planned turbine outage for each coal-fired unit on a regular basis, during which the unit comes 7 offline for several weeks, and Ameren Missouri performs a thorough inspection and any needed 8 maintenance activities. Over the years, the interval between the planned turbine outages for the 9 units at Labadie and Rush Island has increased: from approximately every two years to every four years, to every six years—the current outage interval.¹ The approximately six-year interval 10 11 between planned turbine outages for Labadie and Rush Island was established in the mid-2000s, 12 and to my knowledge is one of longest in the utility industry which directly benefits customers 13 due to reduced overall planned outage time, higher average availability over the 6 year period 14 supporting reliability and additional off-system sales revenue which flows back to customers.

The 2007 outage at Rush Island Unit 1 and the 2010 outage at Rush Island Unit 2 marked the first time each unit entered into a six-year cycle between planned turbine outages. The philosophy behind going to the six-year cycle was to maximize economic generation over time by reducing the time periods when the plants would be out of service (producing margins that ultimately benefitted customers in the form of lower rates), while addressing plant components in need of maintenance or replacement as needed.

Because the planned turbine outage is the ideal window in which to perform component replacement, and the intervals between such outages are now so long for the Labadie and Rush

¹ Due to differences in design, the Sioux units have remained on a three-year outage schedule.

Island units, many unrelated maintenance or replacement activities will occur during the same
 unit outage. The maintenance or replacement activities are no different than those performed
 in years past, when they occurred during separate planned outages that had been scheduled
 approximately every two years.

It is also important to understand that we are very deliberate in choosing the optimal time to schedule this work. For example, we avoid such work in the summer or the winter, when having a major coal unit down could increase costs and system reliability risks for our customers. For the same reason, we seek to avoid having more than one major coal unit off for maintenance at the same time. Similarly, we do not schedule a major coal unit outage when Callaway is being refueled. These practices are in keeping with doing everything we can to run and maintain our units in a way that is most beneficial to our customers.

Q. What types of maintenance, repair or replacement activities typically occur during a planned turbine outage for a coal-fired electric generating unit?

A. Because coal-fired electric generating units consist of thousands of components, and any one of them can cause a unit to go offline, outage work could involve almost anything connected to the unit that has or will impact reliability or availability.

For the boiler on a coal-fired unit, typical maintenance activities occurring at a planned turbine outage will include replacement of various boiler tube assemblies. Such assemblies may have different names based upon their position in the boiler and their function in the steam cycle (e.g., economizer, waterwalls, superheater, reheater), but essentially, they are all metal tubes whose purpose is to transfer heat from combustion to the water or steam flowing within each tube, producing the steam necessary to drive the turbines. Replacement of different boiler tube assemblies, as the tubes wear and begin to leak, occurs several times over the life of a unit.

1 Other common maintenance activities that occur on boilers while a unit is in outage will 2 involve the replacement of equipment that convey the elements of combustion (air and coal) 3 into the combustion zone, or convey the water into the boiler tubes that comprise the majority 4 of the boiler. Auxiliary equipment such as coal mills, air preheaters, fans, feedwater heaters, and 5 boiler feed pumps are all examples of the sorts of equipment on a boiler that one expects to 6 replace after a certain number of duty cycles or hours under load.

- Q. You noted earlier that you had provided Staff DR responses in File No.
 8 ER-2007-0002 (Schedule MCB-D1) with information on other projects from roughly 2000
 9 to 2006 replacing the same components which EPA claimed triggered a permit
 10 requirement at Rush Island. Does that response identify all such projects?
- 11 A. No. Attached to my direct testimony as Schedule MCB-D2 is a table going 12 back to roughly 20 years prior to when the Rush Island Projects were completed, showing that 13 Ameren Missouri and its Illinois affiliates routinely performed the same projects as the Rush 14 Island Projects and did so without the need for NSR permits.

Q. Can you describe the nature, scope and purpose of the Rush Island Projects?

A. Yes. As we approached the 2005 timeframe, Rush Island had been in operation for nearly 30 years. While at that time the plant continued to have good availability, some of its key components—which are constantly exposed to the harsh conditions of a steam plant's boiler—were approaching the end of their lives. This meant that the risk of more frequent outages, that would prevent the plant from serving customers, was continuing to increase simply due to the age and condition of the components. Our experience in both Illinois and Missouri indicated that tube leaks and unit derates could become more frequent due to pluggage issues

1 arising from burning Powder River Basin coal, which Rush Island had burned exclusively since 2 1995 as a means to significantly reduce fuel costs for customers and cut emissions from the 3 plant. Boiler pluggage restricts airflow through the boiler. This affects both the efficiency 4 of the heat transfer in the boiler and results in less oxygen available for combustion, thus 5 restricting maximum generating capability on (i.e., derating) the unit. In short, the plant was 6 beginning to experience performance issues, which would have worsened to customers' 7 detriment if not addressed. Ameren Missouri therefore proceeded to replace the components at 8 issue, to ensure that the units would remain in good working order.

At Rush Island Unit 1, Ameren Missouri replaced different boiler tube assemblies (economizer, reheater, and lower slope waterwall panels) and the air preheater components, and performed additional work on the unit, during an outage that lasted from February to May 2007. At Rush Island Unit 2, Ameren Missouri replaced similar boiler tube assemblies (economizer and reheater) and the air preheater components, and performed additional work on the unit, during an outage that lasted from January to April, 2010. These projects were fundamentally the same as those Ameren Missouri and its affiliates had routinely performed for decades.

Q. What exactly do you mean when you say the Rush Island Projects were part of the process of keeping the units in good working order?

A. Ameren Missouri has an obligation to maintain its generating units in good working order, so we can meet the reliability demands of our customers and sell excess energy into the MISO market to help offset costs for customers. As such, Ameren Missouri keeps track of the availability of its generating assets, and reports on the same to the Public Service Commission. Before the Rush Island Projects took place, each unit achieved top quartile annual availability. In my experience and based upon benchmarking, that is considered good for coal-

fired electric generating units. This is a testament to the good working order of both the Rush
 Island units.

3

Q. If the units were in good working order, then why was the work done?

4 For the same reasons that applied to the many similar projects done at other A. 5 units before the Company completed the Rush Island Projects. As I described above, Ameren 6 Missouri has a proactive maintenance philosophy to keep unit availability as high as practically 7 possible for the benefit of customers. Data suggested that outages and derates could be expected 8 to increase on each unit if these components were not replaced. At this point in time, each Rush 9 Island unit was on a nominal six-year outage cycle (i.e., conducting an extended planned outage 10 only once every six years). Because most maintenance, repair and replacement activities on 11 coal-fired units require the unit to be offline, and each unit has an opportunity to conduct work 12 like this only once every six years, Ameren Missouri decided to replace the identified 13 components in the scheduled planned outages to avoid the expected forced outages and derates 14 that otherwise would have occurred until the next six-year outage would be taken. In addition 15 to the specific components at issue, Ameren Missouri also conducted work during these outages 16 that increased the efficiency of the units (e.g., replacement of the low-pressure turbine 17 components, as I describe below).

18

19

Q. Did Staff or anyone else to your knowledge question the need for the projects?

A. No. As discussed earlier, I answered data requests in the Company's 2006 rate review in which I provided details on the planned outages at Rush Island that I described above. In those responses (including specific outage schedules outlined in the response to Data Request No. 264), I had indicated that Rush Island Unit 1 would undergo a planned outage in 2007, and

1 specifically listed the projects that would be performed. Similarly, I indicated that Unit 2 would 2 undergo a planned outage in 2009, also listing the projects that were in fact performed in 2010 after the outage was rescheduled from 2009 to 2010. Once the projects were completed and 3 4 went into service, they were then included in plant in service in subsequent rate reviews. No 5 party questioned the need for them or their prudence. The completion of those projects has 6 enabled Rush Island to continue its reliable, efficient operations for the benefit of our customers 7 ever since.

8

Q. You testified earlier that projects like those at Rush Island were routinely 9 done. What is your basis for that testimony?

10 A. As discussed earlier, before undertaking the work at Rush Island, we had 11 performed similar component replacements multiple times across the other Ameren Missouri 12 plants (detailed in Schedule MCB-D2). We replaced economizers, reheaters, and waterwalls 13 multiple times at Labadie, Meramec, and Sioux. We had replaced air preheater components 14 multiple times at the same plants, and at Rush Island as well. Similar equipment replacement 15 occurred frequently within the Ameren Missouri system.

16 In addition, we were very familiar with coal units owned and operated by Ameren 17 Missouri's Illinois generation affiliates, Ameren Energy Generating Company and Ameren 18 Energy Resources. And due to our familiarity with that history, we knew that the same 19 component replacement projects as those to be completed at Rush Island had also been 20 completed at several of these Illinois units, also without the need for obtaining NSR permits.

21 We were also aware that other utilities regularly performed similar component 22 replacement projects, as witnesses Whitworth, Holmstead, and Moor explain in greater detail. 23 This understanding was developed through our interactions with other utilities, some of which

1 are described by Messrs. Whitworth, Holmstead, and Moor. This understanding was also 2 reinforced by our interactions with the boiler vendors and installation contractors we engaged 3 for the Rush Island Projects. These contractors touted their extensive experience with similar 4 maintenance activities across the industry. The very existence of this boiler maintenance 5 industry-with multiple contractors whose business is focused on boiler component 6 replacement—supported our understanding that the activities at Rush Island were routine within 7 the utility industry. In addition, our engineers regularly interfaced with other utilities in Missouri 8 and came to learn of their maintenance practices.

9 We were well aware that the work proposed for Rush Island was routinely done 10 throughout the utility industry and without the need for NSR permits. If NSR permits were not 11 required for these other projects, there was no reason to believe they were required for the Rush 12 Island Projects.

Q. If Ameren Missouri concluded that the Rush Island Projects did not
trigger NSR permitting, then why did it evaluate the possible retrofit of scrubbers on Rush
Island in 2007-2010?

A. Ameren Missouri evaluated the potential retrofit of scrubbers on all of its plants during this time period, as a direct result of *other* CAA programs for which EPA was promulgating rules. The question of whether these other proposed EPA rules would require we scrub Rush Island or other Ameren Missouri units had nothing to do with whether the routine projects completed at Rush Island and our other plants, without obtaining NSR permits, somehow triggered NSR.

Q.

1Q.Did Ameren Missouri ever re-visit its pre-project determinations that the2Rush Island Projects did not trigger NSR?

A. Yes. Ameren Missouri revisited the potential application of NSR in 2007 (after the Rush Island Unit 1 projects), in the context of its ongoing environmental compliance planning process. Ameren Missouri then revisited the potential application of NSR in 2008, following the receipt of an inquiry from EPA under Section 114 of the CAA, concerning a large number of maintenance, repair and replacement projects. And Ameren Missouri revisited the potential application of NSR again in 2010, after receipt of the Notice of Violation ("NOV") issued by EPA that January.

10

What was the result of those subsequent evaluations?

A. Ameren Missouri remained firm in its conclusion that the Rush Island Projects did not trigger NSR. As a result, Ameren Missouri's Environmental Compliance Plan continued to focus on the new rules EPA was promulgating: CAIR, the Cross-State Air Pollution Rule ("CSAPR"), the Clean Air Mercury Rule ("CAMR") and the Mercury and Air Toxics Standards ("MATS") Rule.

Q. Why didn't Ameren Missouri's conclusions regarding NSR applicability change in 2010, after it received EPA's NOV?

A. As Mr. Whitworth explains, we understood that under the Missouri SIP, a project would have to increase a unit's potential emissions in order to trigger NSR permitting requirements. None of Ameren Missouri's projects ever did that, and EPA did not contend otherwise.

Although EPA made allegations in its NOV that several projects were NSR violations,
it did not explain how or why it believed that any of the projects increased emissions. EPA

1	refused to share its position on emissions increase with Ameren Missouri, and Ameren Missouri
2	was not able to learn how EPA purported to calculate emissions until years later during expert
3	discovery in the litigation. EPA did share enough for Ameren Missouri to understand that its
4	allegations of emissions increase were not based on potential emissions, but on changes in actual
5	annual emissions. But when ESD performed a calculation of actual annual emissions after
6	receipt of the NOV, it concluded that the projects would not cause an increase in actual annual
7	emissions and thus would not trigger NSR even if such requirements had applied under the
8	Missouri SIP.
9	Finally, as Mr. Whitworth and Mr. Moor explain, EPA's NSR enforcement initiative
10	resulted in more losses for EPA than wins. We therefore remained firm in our conclusion that
11	NSR did not apply to the Rush Island Projects, even after receipt of EPA's NOV.

When EPA filed suit in January 2011, it dropped most of its claims alleged in the prior NOVs. Instead, EPA filed suit on only two projects: superheater tube replacements at Rush Island Unit 1 and Rush Island Unit 2 in 2001 and 2003, respectively. In other words, it did not

Just four months later, EPA issued a Second Amended NOV, which included the 2010
 air preheater project on Rush Island Unit 2 *and* the low-pressure turbine project on Rush Island
 Unit 2 in 2010.

4 On June 28, 2011, EPA filed an amended complaint to add the 2007 component 5 replacements on Unit 1 and the 2010 component replacements on Unit 2.

6 On October 30, 2013, EPA filed yet another amended complaint, dropping the claims 7 with which it had initiated the case: the 2001 and the 2003 superheater tube replacements. This 8 left only the economizer, reheater, and lower slope tube replacements and the air preheater 9 project on Unit 1, and the economizer and reheater tube replacements and the air preheater 10 project on Unit 2 (i.e., the "Rush Island Projects") which later went to trial. Notably, EPA did 11 not pursue claims over any of the turbine projects at Rush Island that it had previously alleged 12 in its series of NOVs to have triggered NSR.

From our perspective, there is no apparent difference among the various projects EPA raised and dropped. EPA's difficulty in settling on the projects and claims it wanted to pursue undermines any contention that Ameren Missouri should have acted differently when it evaluated the Rush Island Projects for NSR applicability.

17

Q. What was the result of the NSR litigation?

A. The litigation has lasted years and is still ongoing. Over the course of that litigation, EPA dropped most of its allegations as well as all of its claims for civil penalties. After years of discovery and a 13-day trial, in January 2017 the District Court concluded that the Company should have obtained NSR permits and in September 2019 ordered the Company to install scrubbers at Rush Island to reduce its SO₂ emissions. The District Court also ordered the installation of dry-sorbent injection equipment at the Labadie Energy Center, not because of

1 any claim that there were CAA violations involving Labadie, but as a "remedy" for the claimed

2 violations at Rush Island.

The District Court then stayed most aspects of its 2019 decision, pending appeal to the Eighth Circuit. In September 2021, the Eighth Circuit affirmed the District Court's decision as to Rush Island but reversed it as to the ordered actions at Labadie. The Company sought rehearing of the Eighth Circuit's decision (as did the EPA as to that part of the decision reversing the District Court respecting the order regarding Labadie). The Eighth Circuit denied rehearing, exhausting Ameren Missouri's right to appeal.

9 Given the outcome of the litigation, Ameren Missouri assessed whether it should 10 comply with the District Court's ruling (i.e., install scrubbers at Rush Island) or take some other 11 action, such as retire the plant. As with all of its decisions, Ameren Missouri's focus was on 12 what course of action would be more beneficial for its customers. As discussed in the Direct 13 Testimony of witness Michels, the Company's analysis of the question concluded that installing 14 scrubbers was not in customers' best interest, leading to Ameren Missouri's December 2021 15 decision to retire Rush Island following completion of the necessary transmission upgrades to ensure transmission system reliability.² 16

² After making the determination that retirement of the plant rather than installing expensive pollution control equipment was in our customers' best interest, the Company requested a modification of the District Court's order to allow retirement of the plant in lieu of installing such equipment. The District Court granted this request on September 30, 2023, ordering that the plant retire by October 15, 2024.

1 **Q**. Mr. Birk, your testimony suggests that to this day, you feel strongly that 2 Ameren Missouri made reasonable, prudent decisions back in that 2005 – 2010 timeframe 3 and that, consequently, it should not have suffered an adverse judgment in EPA's NSR 4 lawsuit. Is that your point of view? 5 Absolutely, but at the end of the day the District Court ended up interpreting the A. 6 law differently than how we understood it to be, how the industry understood it to be, and how 7 the permitting authority in Missouri (MDNR) understood it to be. All this is explained by 8 Company witnesses Whitworth, Holmstead, and Moor in their Direct Testimonies. And, as 9 witnesses Whitworth and Moor recount in detail-the District Court's conclusion was also 10 different than other courts had interpreted the law *at that time*. From my perspective—and I think the Commission's prudence standard backs this perspective up—that's the only question: 11 did we act reasonably based on what we knew or reasonably should have known at that time.³ 12 13 I have no doubt that we did. Did that reasonable belief ultimately lead to an NSR violation? 14 The answer is yes, insofar as the federal courts are the ultimate arbiters of that determination. 15 While I don't like that outcome, I accept it as a fact. But being told you were mistaken a decade

16 or more after the decision was made does not mean that the decision you made was unreasonable

17 based on what you knew or should have known when you made it.

³ The focus of the relevant inquiry is discussed in detail by Company witness John Reed.

Q. In the Company's last rate review, File No. ER-2022-0337, Staff at least strongly suggested that the District Court disagreed with your perspective, with Staff quoting a statement in one of the District Court's orders where the District Court stated, "that Ameren's failure to obtain PSD permits was not reasonable." That does seem to be at odds with your viewpoint. Why isn't it?

- A. I am an engineer and not a lawyer, so I am not able to parse 10 words out of hundreds of pages of orders the District Court issued and then give an opinion on what those 10 words do or do not mean. I will note that Company witness Holmstead directly addresses this issue in his direct testimony and from my non-legal expert perspective, what he said makes sense to me. I believe it will also make sense to the Commission, which in this case is the body charged with deciding whether the retirement of the plant is prudent.
- 12

Q. So, you are not re-litigating the NSR case?

13 No, I am not re-litigating that case—nor is the Company re-litigating that case. A. 14 Having worked in the utility space for over 30 years, including involvement in many cases at 15 the Commission during that time, one thing I do understand is that the Commission does not 16 judge our decisions using hindsight. And I further understand that the Commission does not 17 judge them such that we were required to have perfect foresight about the future when we are 18 called upon to make decisions necessary to run a utility and provide service to our customers. 19 As I said before, we lost the case; I don't like that outcome, but I accept it. Once we lost the 20 case, we would have harmed our customers if we added scrubbers to a nearly 50-year-old coal 21 plant at a cost of hundreds of millions of dollars in an environment where new and more 22 stringent environmental regulations of coal plants continue to be proposed and which could 23 further impact the plant's life, so we prudently decided not to do so because that decision is in

1 our customers' best interest. As I have discussed and as Mr. Whitworth elaborates, the Company 2 did not predict that the District Court would take a completely different view of the permit 3 requirements than we had taken, that MDNR had taken, and many other utilities and other courts 4 had taken. And as our expert witnesses Holmstead and Moor explain, the Company's position 5 was reasonable. The subsequent decision by the District Court, rejecting the position of MDNR, 6 the position of the utility industry as a whole, and the majority view of other courts does not 7 mean that the Company was imprudent 15 or so years ago. Does the District Court decision mean we turned out to be mistaken? Unfortunately, it does. But that is not the question because 8 9 the prudence standard, as I understand it, prevents the Commission from punishing Ameren 10 Missouri on the basis of hindsight. The question, as I understand it, is whether Ameren Missouri 11 acted reasonably given the facts that were known and reasonably knowable at the time. I firmly 12 believe that we acted reasonably here.

13 **Q.** Why?

14 A. At every step of the way, the Company considered the information known to us 15 and was diligent in keeping abreast of information that we reasonably should have known. And 16 armed with that information, the Company made decisions designed to (1) ensure system 17 reliability; (2) comply with the law; and (3) serve the best interests of our customers along the 18 way. With respect to Rush Island specifically, those decisions incorporated the experience of 19 Ameren Missouri's experts in its Environmental Services Department, the experience of the 20 utility industry and industry experts in NSR compliance issues, the applicable Missouri law, and 21 input from both MDNR and EPA on the legal requirements. On the basis of this expertise and 22 information, it was reasonable for Ameren Missouri to perform the Rush Island Projects without 23 applying for NSR permits, because that was consistent with our understanding of what would

- 1 maintain reliability, comply with the law, and serve the best interest of our customers. Likewise,
- 2 it was also reasonable for Ameren Missouri to decide to retire Rush Island as a result of the
- 3 District Court's decision, because that was the only way to ensure system reliability, comply
- 4 with the law (as declared by the District Court), and serve customers' best interests.
 - Q. Does this conclude your direct testimony?
- 6 A. Yes, it does.

BEFORE THE PUBLIC SERVICE COMMISSION OF THE STATE OF MISSOURI

In the Matter of the Petition of Union Electric Company d/b/a Ameren Missouri for a Financing Order Authorizing the Issue of Securitized Utility Tariff Bonds for Energy Transition Costs related to Rush Island Energy Center.

EF-2024-0021

AFFIDAVIT OF MARK C. BIRK

STATE OF MISSOURI)) ss CITY OF ST. LOUIS)

d.

Mark Birk, being first duly sworn on his oath, states:

My name is Mark C. Birk, and hereby declare on oath that I am of sound mind and lawful

age; that I have prepared the foregoing Direct Testimony; and further, under the penalty of perjury,

that the same is true and correct to the best of my knowledge and belief.

Mark C. Birk

Sworn to me this 20th day of November, 2023.

AmerenUE's Response to MPSC Staff Data Request AmerenUE's Tariff Filing to Increase Rates for Electric Service Provided to Customers in the Company's Missouri Service Area

Requested From: John Cassidy

Data Request No. MPSC 0264

Please provide the planned outages for all AmerenUE generating units for each year covering 2007 through 2011. Please identify each unit and the timeframe for each unit.

Response:

See the attached information.

AmerenUE's Response to MPSC Staff Data Request MPSC Case No. ER-2007-0002 AmerenUE's Tariff Filing to Increase Rates for Electric Service Provided to Customers in the Company's Missouri Service Area

Requested From: John Cassidy

Data Request No. 0142:

Please refer to Staff Data Request No. 141 in the current rate case.

1. By generating unit, for Meramec, Rush Island, Labadie, Sioux and Callaway, please list and describe all major maintenance items completed during July 1, 2000 through June 30, 2006 that reduced AmerenUE generating unit's outages (length or frequency for all types of outages: planned, unplanned, derates, etc...) in any way on an ongoing basis. Also indicate when the maintenance was completed.

2. By generating unit, for Meramec, Rush Island, Labadie, Sioux and Callaway, please list and describe all capital improvements completed during July 1, 2000 through June 30, 2006 that reduced AmerenUE generating unit's outages (length or frequency for all types of outages: planned, unplanned, derates, etc..) in any way on an ongoing basis. Also indicate when the capital improvements were completed.

3. For each generating unit at Meramec, Rush Island, Labadie, Sioux and Callaway are there any situations that currently exist that are increasing a generating unit's outages (length and frequency for all types of outages) in any way on an ongoing basis? If yes, please list and describe the impact. Also explain when and how AmerenUE plans to address any such situations.

Response:

Attached to this response is a listing of all major maintenance items (which I have defined as those costing \$500,000 or more) and capital improvements during the requested time period, with indications of when the projects were completed. It is not possible to provide lists of each such item that "reduced AmerenUE generating unit outages" because we continuously monitor ongoing operations and maintenance and try to maintain or replace components that we feel would lead to degraded equivalent availability. The subject units are decades old (average unit age of AmerenUE's fossil units is 37 years) and they require a certain level of ongoing capital and maintenance investment just to keep them operating reliably. We would hope and expect that some capital and maintenance expenditure projects do reduce forced (unplanned)

outages or lengthen cycles between planned outages, but whether that occurs depends upon a variety of factors, including what other aging plant components may fail, the operating characteristics and dispatch requirements of the unit and the types of fuels are burned in the unit. A project (such as HP/IP turbine replacement) may have a tendency to contribute to lengthened planned outage cycles in one area but typically once this area is addressed other areas (such as ash pits) become the limiting factor. We will only know, over time, whether various projects reduce outage frequency or duration as we continue to identify and address issues that arise from lengthening the cycle. Also attached to this response is a listing of currently existing conditions that could lead to increased de-rates or unit unavailability in the near future.

Sioux	1	Air Heater Problems
Sioux Sioux	1 2	Cyclone tube leaks Furnace wall tube leaks

/ based on GADS information

How Addressed

When

Major boiler outage including boiler assessment and boiler cleaning. Also, includes replacing reheater tubes and installing weld overlaid tube shields	In budget forecast - 2008 tentative)
Replacement of cold end air heater baskets during major outage.	In budget forecast - 2010 tentative
Major boiler outage including boiler assessment and boiler cleaning. Also, includes replacing water wall tubes around corner burner compartments and around old wall blower openings. Also, includes replacement of water cooled doors.	In budget forecast - 2010 tentative
Major boiler outage including boiler assessment and boiler cleaning. Also, includes replacing water wall tubes around corner burner compartments and around old wall blower openings. Also, includes replacement of water cooled doors.	In budget forecast - 2009 tentative
Steam side condenser maintenance Isophase bus duct cooling modifications NA	In budget forecast - 2009 tentative In budget forecast - 2007 tentative NA
Extensive precipitator maintenance scheduled for next major outage.	In budget forecast - 2009 tentative
Major boiler overhaul outage Replacement of middle bank of air heater baskets.	In budget forecast - 2009 tentative In budget forecast - 2010 tentative
Major boiler outage.	In budget forecast - 2011 tentative
Upgrade boiler feed pump controls. Air Heater Replacement Ongoing adjustments and repairs Replacement of economizer during major boiler outage.	In budget forecast - 2011 tentative In budget forecast - 2007 tentative Included in ongoing budget routines. In budget forecast - 2010 tentative
Major Boiler Outage including lower slope replacement.	In budget forecast - 2010 tentative
Retube cold section air heater	In budget forecast - project spends in 2007 and 2010 tentative
Replace cyclones. Furnace wall replacements during major boiler outage	In budget forecast - 2009=>2010 tentative In budget forecast - 2011 tentative
