Staff vs. Company Computation of Depreciation Rate

Q. Did Staff and AmerenUE use similar methods to determine the average service life, curves and salvage amounts?

A. Yes. The method of study used to determine the average service life, curves and salvage amounts were essentially the same with the exception of some data interpretation for curve selection, variance in average service life selection and salvage rate selection. This interpretation is at the depreciation engineer's discretion based upon experience and engineering judgment.

Q. Mr. Weidmayer makes the statement beginning on page 4, line 14, "Ms. Mathis has determined average service lives by relying almost entirely on analysis of historical data and ignoring other relevant information..." Is his statement true?

A. No. In Case No. EC-2002-1, I conducted field inspections and discussed plant operations and plans for property retirement at Ameren UE's four coal fired plants and two hydroelectric plants. In the process I became very familiar with the property. For this case, Case No. ER-2007-0002, in addition to reviewing information Staff obtained from AmerenUE through data requests, its filings in this case and press releases, I relied on the knowledge I gathered from field inspections and discussions with members of the Commission's Engineering Staff regarding recent plant operations. I also reviewed depreciation work including Staff's proposed and the Commission's ordered rates for other Missouri electric utilities. My depreciation study included engineering judgment, which took into consideration the type of plant, how it operates, and how long it will last to confirm or modify the results of my statistical analysis of AmerenUE's mortality data. AmerenUE has a

1 substantial amount of actuarial data that even if relied on solely, would produce good
2 estimates of the life and net salvage for that plant.

3 Q. Has the Commission recently given any strong guidance as to the accounting
4 treatment of depreciation?

5 A. Yes. In its March 10, 2005, Report and Order in Case No. ER-2004-0570, the
6 Commission on page 54, stated, "It is the policy of this Commission to return to traditional
7 accounting methods for Net Salvage." On page 52 of that same Report and Order the
8 Commission stated:

9 Under the traditional accrual method favored by Empire, the
10 depreciation rate for a particular asset or group of assets is calculated as
11 follows:

12
13
$$\text{Depreciation Rate} = \frac{100\% - \% \text{ Net Salvage}}{\text{Average Service Life (years)}}$$

14
15

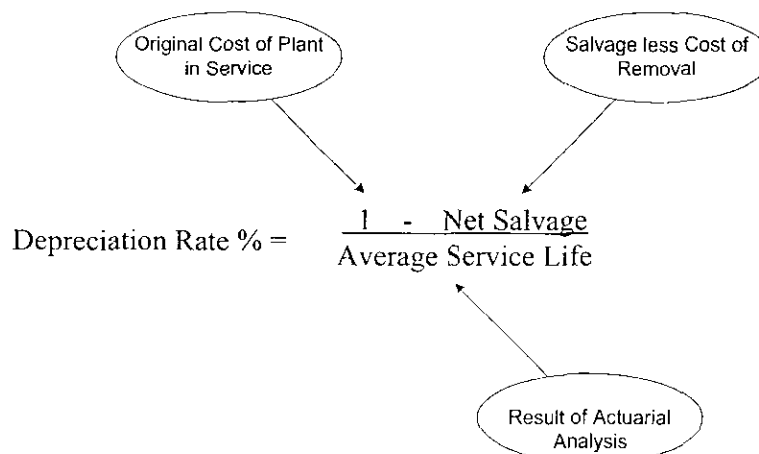

16 In the above formula historically for this Commission 100% represents the Original Cost of
17 the plant in service. The % "Net Salvage equals the gross salvage value of the asset minus the
18 cost of removing the asset from service. The net salvage percentage is determined by
19 dividing the net salvage experienced for a period of time by the original cost of the property
20 retired during that same period of time." The Average Service Life is determined by a
21 common method of actuarial analysis of historical plant additions and retirements involving
22 the Iowa curve sets.

23 Q. Why are there differences then in the results of the determined depreciation
24 rates?

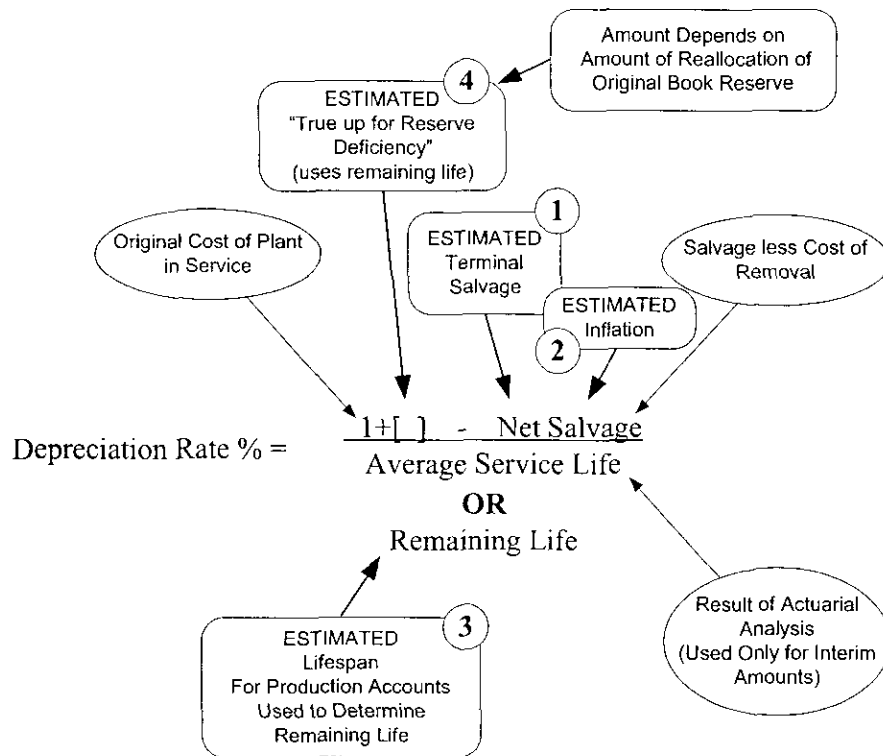

25 A. These differences are mainly attributable to AmerenUE adding additional
26 assumptions and variables to their determination of the depreciable rates that have not
27 previously been used by the Commission for the determination of AmerenUE's depreciation

1 rates. The diagram below compares the differences between the Staff's and AmerenUE's
2 calculation of depreciation rates. (1) AmerenUE adds an additional estimated amount for
3 terminal net salvage for steam production plant in the net salvage calculation. (2) Ameren UE
4 adds an additional amount for future inflation for steam production plant in the terminal net
5 salvage calculation. (3) AmerenUE assumes final retirement dates or Lifespan for production
6 plant accounts. The Lifespan drives the estimates for a remaining life that is used to adjust the
7 period over which the future depreciation amount and accruals will need to be made based
8 upon the time available before everything in the account is retired. (4) AmerenUE adds a
9 "True-up for Reserve Deficiency" to the original cost of plant in service that is based upon
10 their reallocated reserve amounts and remaining life.

11 **Staff and Commission Policy for Computation of Depreciation Rate:**

Company Interpretation of Computation of Depreciation Rate:

Q. In Mr. Bill Stout's Rebuttal Testimony, page 10 lines 19-23, he states, "Terminal net salvage should be incorporated in the determination of annual depreciation rates for power plants. The dates of retirement are not speculative. Avoiding any recovery of such costs due to the lack of a date certain creates even worse inequities than applying Ms. Mathis' indefinite life assumption when determining the average life of each installation year." Do you agree with him?

A. No. It is speculative, and not known or measurable, as to both the time dismantling will occur and the dollar amount that will be incurred. Given this significant uncertainty it is inappropriate for customers to pay the expense of removal at this time. Mr. Stout's suggestion is to use an estimate premised on the most expensive retirement option. Mr. Stout has ignored the fact that the Company should choose its most economical

1 retirement option. Also, Staff is not implying an indefinite life by not including terminal net
2 salvage estimates in its depreciation study. Rather, an average service life with interim net
3 salvage costs associated with interim retirements would fully recover the investment over its
4 average service life.

5 Q. Has the Commission recently addressed terminal net salvage?

6 A. Yes. On page 53 of its March 10, 2005 Report and Order in Case
7 No. ER-2004-0570, the Commission stated:

8 Second, with respect to Terminal Net Salvage of Production Plant
9 Accounts, this Commission generally has not allowed the accrual of
10 this item. The reason is that generating plants are rarely retired and any
11 allowance for this item would necessarily be purely speculative. It is
12 true that all depreciation is founded upon estimates, but all estimates
13 are not unduly speculative. Just as utility companies plan rate cases
14 around the projected in-service dates of new plants, so Empire can plan
15 around the retirement of its generating plants so that the Net Salvage
16 expense is incurred in a Test Year. Another alternative is the device of
17 the Accounting Authority Order. As already discussed in connection
18 with the Production Account Service Life issue, there is no evidence
19 that the retirement of any of Empire's plant is imminent and the
20 estimated retirement dates considered in this proceeding are not
21 persuasive. For these reasons, the Commission will not allow the
22 accrual of any amount for Terminal Net Salvage of Production Plants.

23 Q. Did AmerenUE recently ask the Commission to give definitive guidance as to
24 the appropriate treatment of net salvage?

25 A. Yes. On page 7 of AmerenUE's initial brief filed in ER-2004-0570, on
26 January 21, 2004, Ameren UE stated:

27 All of the stakeholders-including utilities, customers and the financial
28 community-will benefit if the Commission establishes a consistent
29 treatment of net salvage. Moreover, the parties and the Commission
30 can conserve resources if a consistent Commission policy prevents this
31 issue from being litigated over and over in each rate case.

1 Q. Has Ameren UE followed in this case the guidance the Commission provided
2 for depreciation accounting in its March 10, 2005 Report and Order in Case
3 No. ER-2004-0570?

4 A. No. As AmerenUE witness William Stout states in his direct testimony filed in
5 this case, AmerenUE is asking the Commission to incorporate estimated amounts and
6 variables both denied and beyond those the Commission addressed in Case
7 No. ER-2004-0570. AmerenUE has used a reserve adjusted hybrid of the remaining life
8 depreciation technique instead of the whole life formula, and is requesting terminal net
9 salvage of inflation adjusted unknown, uncertain, projected plant retirements that have not
10 been made a part of its Integrated Resource Planning.

11 Q. A component of Mr. Stout's terminal net salvage is future inflation. Did you
12 make an adjustment for future inflation in any of you depreciation calculations?

13 A. No, based on Commission guidance in prior cases I did not. In a Capital City
14 Water Company general rate case, Case No. WR-94-297, the Commission stated:

15 The Commission determines that no adjustments for inflation are
16 appropriate because the proposed inflation adjustments are not known,
17 nor are they measurable. In addition the Commission is of the opinion
18 that the proposed adjustments for inflation are speculative in nature.

19 Also, in a Kansas City Power & Light Company general rate case, Case
20 No. ER-80-48, in its Report and Order, the Commission said:

21 The Commission can only base its decision on facts and knowledge
22 presently available and has accepted the latest known figures. The
23 Commission notes that one of the purposes of the true-up hearing was
24 to allow the parties to present to the Commission the most current
25 prices for fuel the area most likely to be subject to inflation. The
26 Commission will not pass on to the Company's ratepayers a speculative
27 inflation adjustment. To do so would be to pass on inflation before the
28 fact and to put all of the risk of inflation on the ratepayer. For the
29 forgoing reasons, the Commission finds that the Company's proposed
30 attrition adjustment as discussed above is disallowed.

1 Q. Mr. Bill Stout states in his Rebuttal Testimony pg. 3 lines 3-11, the following:

2 The use of a life span for each power plant, based on the experience
3 and expectations of the company and the industry, is far preferable to
4 the assumption that these plants will live forever and have an infinite
5 life. We know that the plants do not have infinite lives, but we do not
6 know for certain when they will be retired. So, should we do what we
7 know is wrong or use our best judgment to estimate when the final
8 retirement of the plant will occur? My answer to this question is that
9 we should use informed judgment, incorporating appropriate analyses
10 and the outlook of management and the industry, in the same manner
11 that we do for mass property whose retirement dates are not certain
12 either.

13 What is your response to his assertion Staff is assuming power plants “will live forever and
14 have an infinite life”?

15 A. Staff is not assuming the power plants will “have an infinite life.” Staff is
16 unwilling to assume at this time these plants will be retired in the foreseeable future, and in
17 the absence of better information, is using average service lives for the property at these
18 power plants. Determination of the exact timing of the retirement of a particular facility can
19 only be made relatively close to the time of its anticipated retirement date. Until that time,
20 many variables such as power supply replacement, technology improvements, market
21 conditions, and regulatory requirements change over time. For these reasons, the final
22 retirement date is uncertain.

23 Q. Why are AmerenUE’s retirement dates for steam production plant a significant
24 issue?

25 A. These retirement dates for production plant are an issue because AmerenUE is
26 projecting the date certain that generation plant will be retired and then using these dates as
27 the basis for shortening average lives (ASLs) and increasing the depreciation rates for its
28 generation plant. Shortening the ASL is a way to increase depreciation expense to achieve
29 increased revenue requirements. Steam Production Plant makes up a significant portion of

1 plant in service. The difference in annual accrual between Staff and Company in Steam
2 Production Plant is approximately 48 million dollars.

3 Q. Has the Commission addressed the life span issue lately?

4 A. Yes, in the first paragraph of the Report and Order from The Empire District
5 Electric Company Case No. ER-2004-0570, page 51, the Commission stated:

6 The record shows that generation plants tend to remain in service
7 indefinitely under present conditions and that this is likely to continue
8 to be the case in the future. For these reasons, the Commission will
9 reject the reduced service lives sponsored by Empire in favor of the
10 longer lives produced through the use of Iowa Curves as advocated by
11 Staff and Public Counsel. The Commission concludes that the
12 estimated retirement dates relied upon by Roff are simply not
13 persuasive.

14 Q. Is there anything about how AmerenUE arrived at the retirement dates
15 Mr. Weidmayer uses in AmerenUE's 2005 Study that makes them more persuasive than the
16 retirement dates Empire District Electric Company used in the study it relied on in Case
17 No. ER-2004-0570 for its generation plant?

18 A. No. In the AmerenUE's 2006 Capacity Balance Spreadsheet attached to this
19 testimony as Schedule 1, AmerenUE has not presented any plans to eliminate generation
20 capacity, a condition that shows retirement of plant is forthcoming.

21 The Commission's Electric Resource Planning Chapter (Chapter 22) requires Missouri
22 investor-owned electric utilities to use a 20 year planning horizon (4 CSR 240-22.020(43)).
23 In its most recent Chapter 22 compliance filing, Ameren UE did not discuss any plans to retire
24 any of its generating units in the 20 year planning horizon ending in 2024. If indeed
25 AmerenUE expects to retire its Meramec units in 2021, its planning process should have taken
26 this retirement date into account. The planning process should have also taken into account
27 any construction plans for new plant that would replace the generating capacity for Sioux,

1 which is estimated by Ameren UE to be retired in 2027. Please refer again to Schedule 1.
2 Further, the Commission just approved AmerenUE's Electric Resource Plan on February 8,
3 2007, in Case No. EO-2006-0240.

4 Q. Have the retirement dates AmerenUE proposes for its steam production plant
5 changed over time?

6 A. Yes. For the depreciation study it filed with the direct testimony of its
7 witnesses in this case, AmerenUE used 2026 as the date for the retirement of all its steam
8 production plant based on the assumption that, on average, the steam production plants would
9 be retired that year. In the rebuttal testimony of AmerenUE witness Mark Birk, AmerenUE
10 provides separate retirement dates for each of steam production plant. In the last case where
11 AmerenUE's electric rates were examined, Case No. EC-2002-1, AmerenUE used a different
12 set of retirement dates for each of those plants.

13 The table following shows the steam production plant retirement dates AmerenUE has
14 proposed in this case and in Case No. EC-2002-1.

RETIREMENT DATES			
	2000 Study EC-2002-1	2005 Study ER-2007-0002 Weidmayer Direct	(Revised) 2005 Study ER-2007-0002 Birk Rebuttal
Meramec	2016	2026	2021
Sioux	2018	2026	2027
Labadie	2023	2026	2033
Rush Island	2027	2026	2037
Osage	2031	2036	2046
Taum Sauk	2010	2036	2036

15
16 I have attached as Schedule 2 the proposed AmerenUE Retirement Dates from
17 the 2000 Study.

1 Q. John Wiedmayer states in his Rebuttal Testimony, pg. 7 lines 6-7, "I calculated
2 the theoretical reserve by account and compared it with the book reserve and determined the
3 reserve variance that I recommended be amortized over the remaining life of the account."
4 Do you agree with this treatment of the imbalance of the reserve?

5 A. No. Mr. Wiedmayer is taking his estimated reserve variance for each account
6 and using his remaining life estimation to determine the annual amortization true up to the
7 original cost of plant in service. The Staff does not find AmerenUE's theoretical reserve to be
8 valid due to the inclusion of additional depreciation parameters as discussed above. The Staff
9 would use the straight-line whole life technique to calculate the theoretical reserve. If the
10 whole-life technique is used, the theoretical reserve calculation supported by the Staff shows
11 the depreciation reserve is over accrued by \$722 million. However, the Staff is not proposing
12 a negative amortization associated with this for Staff's cost-of-service calculation.

13 **Licensed Plant**

14 Q. On page 4, lines 15-17, Mr. Weidmayer states, "In addition, she[, referring to
15 you,] elected not to estimate life spans for steam and hydro power plants even though she did
16 use the life span approach and estimated a retirement date for the Callaway Nuclear Plant."
17 Would you explain why Staff did not use the same basis for the lives of property at
18 AmerenUE's hydro-electric plants that it used for AmerenUE's Callaway nuclear plant?

19 A. Taum Sauk and Osage are regulated by the FERC (Federal Energy Regulatory
20 Commission), which may issue an original license for up to 50 years for constructing,
21 operating, and maintaining jurisdictional projects. When a license expires, the Commission
22 can issue a new license (relicense) to either the existing licensee or a new licensee for a period
23 of 30 to 50 years. Osage has been in operation since 1931. For most Hydraulic Power plants,

1 the design life far exceeds the licensed life. Nearly all hydro components have very long lives
2 compared to most other industrial assets. During most of the plant life, components require
3 minimal maintenance. Although Osage was granted a 40 year operating license expiring in
4 2046, the plant has the capability to last even longer.

5 The design life of Osage far exceeds any licensing period, has been used to generate
6 electricity since 1931, and unlike a nuclear plant, does not have the issue of nuclear radiation.
7 Further, due to the value of The Lake of the Ozarks for recreation, it is improbable the
8 operating life of Osage will be determined by its license. Like Osage, Taum Sauk has been
9 operated by AmerenUE for a considerable amount of time, since 1963, it is so valuable to
10 Ameren UE for generation it has used Taum Sauk heavily and plans to repair or rebuild it, and
11 Taum Sauk does not have the issue of nuclear radiation.

12 Callaway is regulated by the NRC (Nuclear Regulatory Commission), which initially
13 granted 40 year operating licenses for all US. Nuclear power plants, and is now granting 20-
14 year extensions. In the absence of a history of how long these types of nuclear plants operate
15 and the uncertainty the license would be renewed, in the past Staff has used Callaway's
16 licensed life for depreciation purposes. In summary, nuclear generation does not have the
17 operating history that hydro-electric plants have.

18 For all the foregoing reasons, Staff does not believe AmerenUE's FERC operating
19 license for Osage or Taum Sauk define the operating lives of these plants.

20 Q. Does this conclude your testimony?

21 A. Yes it does.

MATHIS

**Table A. Estimated Survivor Curve, Net Salvage, Original Cost, Calculated Annual and Accrued Depreciation
Related to Electric Plant at December 31, 2000**

Depreciable Group	Probable Retirement Year	Estimated Survivor Curve	Net Salvage Percent	Original Cost at 12/31/00	Annual Accrual Amount	Annual Accrual Rate	Calculated Accrued Depreciation
(1)	(2)	(3)	(4)	(5)	(6)	(7)=(6)/(5)	(8)
