Ameren Missouri TRM – Volume 2: C&I Measures Revision Log

Revision	Date	Description		Formatted Table
1.0	05/30/2018	Initial version filed for Commission approval.		
1.1	06/19/2020	Updated version to include new measures and updates to		
		existing measures		
2.0	10/15/2020	Updated version to include updates to existing measures.	1	
3.0	9/15/2021	Update "Deemed Tables" with PY2020 Evaluation results plus	1	
		updates to existing measures (lighting, chiller, pool pump).		
		Added EUL lookup table for lighting measures from PY19.		
4.0	9/26/2022	Updated "Deemed Tables" with PY2021 Evaluation results and		
		added two new measures: 2.2.2 Compressed Air Leak Repair		
		(shifting Compressed Air Nozzle and VSD Air Compressor to		
		2.2.3 and 2.2.4, respectively) and 2.5.10 Chiller Tune-Up.		
5.0	10/05/2023	Updated baselines to 2015 IECC (effective 1/1/2024) for 2.5.5,		
		2.5.6, and 2.5.8. Updated baseline table to include only 2015		
		IECC for 2.5.7 PTAC/PTHP. Added "exterior" to 24/7 lighting		
		coincidence factor because 24/7 interior lighting (e.g., exit		
		signs) are included in the indoor lighting coincidence factor.		
		Retired measures 2.6.4 and 2.6.7 in response to the EISA		
		backstop provision becoming effective 8/1/2023. Expanded		
		measure 2.2.4 VSD Air Compressor description to include units		
		up to 200-hp.		
<u>6.0</u>		-Removed measures to align with approved measure list from		Formatted: No underline
	<u>1201/01\15/202</u> 45			Formatted: No underline
		Cooling Towers, Dedicated Outdoor Systems. Removed several		
		measures currently not active in the programs. Reviewed and		
		updated all measures including source documentation.

Revision 56.0

Appendix H - TRM - Vol. 2: C&I Measures

2 Compressed Air	
2.2.1 Compressed Air No Loss Condensate Drain	
2.2.2 Compressed Air Leak Repair	
2.2.3 Compressed Air Nozzle	
2.2.4 VSD Air Compressor	
3 Food Service	
2.3.1 Combination Oven	
2.3.2 Commercial Steam Cooker	
2.3.3 Fryer	
2.3.4 Convection Oven	
2.3.5 Griddle	
2.3.6 Kitchen Demand Ventilation Controls	
2.3.7 Hot Food Holding Cabinet	
2.3.8 Pre-Rinse Spray Valve	
4 Hot Water	
2.4.1 Low Flow Faucet Aerator	
2.4.2 Circulator Pump	
2.4.3 Heat Pump Water Heater	
2.4.4 Low Flow Showerheads	
5 HVAC	
2.5.1 Small Commercial Learning Thermostats	
2.5.2 Demand Controlled Ventilation	
2.5.3 Advanced Roof Top Unit (RTU) Controls	
2.5.4 Electric Chiller	
2.5.5 Heat Pump Systems	
2.5.6 Packaged Terminal Air Conditioner (PTAC) - Packaged Terminal Heat	Pump (PTHP)
2.5.7 Single-Package and Split System Unitary Air Conditioner	
2.5.8 High Volume Low Speed Fans	
2.5.9 Chiller Tune Up	
2.5.10 Efficient Cooling Towers	
2.5.11 Dedicated Outdoor Systems (DOAS)	
.6 Lighting	

Appendix H - TRM - Vol. 2: C&I Measures

2.6.1 LED Bulbs and Fixtures (Available for Income Eligible and BSS programs)	
2.6.2 LED Screw Based Omnidirectional Bulb (Available for Income Eligible and B	SS programs)179
2.6.3 LED Exit Sign (Available for Income Eligible and BSS programs)	
2.6.4 LED Specialty Lamp (Available for Income Eligible and BSS programs)	
2.6.5 Lighting Power Density (Available for Income Eligible and BSS programs)	
2.6.6 Lighting Controls	
2.7 Miscellaneous	
2.7.1 Computer Server	
2.8 Motors and Pumps	
2.8.1 Motors	
2.8.2 Pool Pump	
2.8.3 Pump Optimization	
2.8.4 Variable Frequency Drives for Pumps and Fans on Hydronic HVAC Systems .	
2.8.5 Variable Frequency Drives for HVAC Supply and Return Fans	
2.8.6 Efficient Pumps	
2.9 Refrigeration	
2.9.1 Commercial Solid and Glass Door Refrigerators & Freezers	
2.9.2 Refrigerated Beverage Vending Machine	
2.9.3 Door Heater Controls for Cooler or Freezer

Appendix H - TRM – Vol. 2: C&I Measures

Volume 2: Commercial and Industrial Measures

2.1 Appliances

2.1.1 Clothes Washer

DESCRIPTION

This measure relates to the installation of a commercial grade clothes washer meeting the ENERGY STAR[®]-minimum qualifications. Note it is assumed the domestic hot water (DHW) and dryer fuels of the installations are known.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The commercial grade clothes washer must meet the ENERGY STAR[®] minimum qualifications (provided in the table below),<u>in the following table</u>, as required by the program. The current <u>Version 8.0, is effective as of February 2018</u>. Or a top load commercial grade clothes washer <u>exceeding the California Modernized Appliance Efficiency Database (CA MAEDBS) minimum qualifications</u>. as of 2024.specification is effective as of February 5, 2018.

E	ficiency Level	Top loading	Front Loading	
Efficient	<u>ENERGY STAR[®] Or CA MAEDBS</u>	<u>≥1.49 MEF, ≤7.92 IWF</u>	<u>≥2.2 MEF, ≤4.0 IWF</u>

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a commercial-grade clothes washer meeting the minimum federal energy efficiency baseline as of January 2013<u>2018</u>.⁴

E	ficiency Level	Top loading	Front Londing
Baseline	Federal Standard	<u>1.35 MEF, 8.8 IWF</u> ≥1.6 <u>MEF, ≤8.5 WF</u>	2.00 MEF, 4.1 IWF≥2.00 MEF, ≤5.5 WF
Efficient	ENERGY STAR®	N/A	≥ 2.2 MEF, ≤4.0 IWF

Page 17

Appendix H - TRM – Vol. 2: C&I Measures

The Modified Energy Factor (MEF) includes unit operation, water heating, and drying energy use, with the higher the value the more efficient the unit; "*The quotient of the capacity of the clothes container, divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, and the energy required for removal of the remaining moisture in the wash load.*"

The <u>The Integrated</u> Water Factor (<u>IWF</u>) indicates the total water consumption of the unit, with the lower the value the less water required; "*The quotient of the total weighted per cycle water consumption for <u>all wash cycles</u> cold wash, divided by the capacity of the clothes washer:"²*

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 11 years.³

DEEMED MEASURE COST

The incremental cost is assumed to be \$200.4

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

<u>AkWh</u> = Energy Savings as calculated above

<u>2025</u>MEEIA<u>4</u>2019-21-Plan

Revision <u>56</u>.0

Formatted Table

¹¹ The percentage of total energy consumption that is used for the machine, heating the hot water, or by the dryer is different depending on the efficiency of the unit. Values are based on a data provided in the ENERGY STAR[®] Calculator for Commercial Clothes Washers.

Clothes Washers. ¹² Note that the baseline savings is based on the weighted average baseline MEF (as opposed to assuming front baseline for frontefficient unit and top baseline for top – efficient unit). The reasoning is that the support of the program of more efficient units (which are predominately front loading) will result in some participants switching from planned purchase of a top loader to a front loader.

Appendix H - TRM - Vol. 2: C&I Measures

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001379439¹³

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below.

	AkW				
Efficiency Lovel	Electric DHW	Gas DHW	Electric DHW	Gas DHW	
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer	
ENERGY STAR®	0.1115 <u>0.0937</u>	0.0316 <u>0.0127</u>	0.10010.1014	0.0202 <u>0.0205</u>	

NATURAL GAS SAVINGS

$$\begin{split} & \Delta Therms = [[(Capacity*\frac{1}{MEFbase}*\underline{x}.Ncycles)*\underline{x}((\%DHWbase*\underline{x}\%Natural\\ GasDHW*R_eff) + (\%Dryerbase*\underline{x}\%GasDryer\%Gas_Dryer))]=[(Capacity*\underline{x}\\ & \frac{1}{MEFeff}*Ncycles)*\underline{x}((\%DHWeff*\underline{x}\%GasDHW\underline{*x}\%NaturalGas_DHW*R_eff) + (\%Dryereff*\%GasDryer\%Gas_Dryer))]]*\underline{)}]]\underline{x}Therm_convert \end{split}$$

Where:

%Gas_{DH₩}	= Percentage of DHW savings assumed to be Natural natural Gas gas
R_eff	= Recovery efficiency factor
	$= 1.26^{14}$
%Gas _{Dryer}	= Percentage of dryer savings assumed to be Natural natural Gas gas
Therm_convert	= Conversion factor from kWh to Thermtherm
	=0.03412

Other factors as defined above.

DHW fuel	%Gas _{DHW}
Electric	0% -
Natural Gas	100%

Revision 56.0

Formatted: Line spacing: Multiple 1.04 li

¹³ Ameren Missouri TRM Volume 1 – Appendix G: "Table 2 – Commercial and Industrial End Use Category Monthly Shapes and Coincident Peak Factors"Business program end use category load shape: Miscellaneous, "2016 Appendix E – End Use Shapes and <u>Coincident Peak Factors pdf</u>² , <u>Ameren Missouri End UseEnergyLoadshape and CoincidentPeakFactor 2016 01 12.x1kk</u> (<u>mo.gov</u>)Based on Ameren Missouri 2016 Loadshape for Business Miscellaneous End Use. Upon inspection and comparison to the residential clothes washer coincidence factor, this is a reasonable assumption until data becomes available to inform technology specific coincidence factor. Given that business laundry schedules are likely more variable compared to residential, follows that less overlap with the system peak hour is possible.

¹⁴ To account for the different efficiency of electric and natural gas hot water heaters (gas water heater: recovery efficiencies ranging from 0.74 to 0.85 (0.78 used), and electric water heater with 0.98 recovery efficiency

⁽http://www.energystar.gov/ia/partners/bldrs_lenders_raters/downloads/Waste_Water_Heat_Recovery_Guidelines.pdf). Therefore a factor of 0.98/0.78 (1.26) is applied.

Appendix H - TRM - Vol. 2: C&I Measures

2.1.2 Clothes Dryer

DESCRIPTION

This measure is for the installation of a residential clothes dryer, utilized in a commercial setting, meeting the ENERGY STAR[®] criteria. ENERGY STAR[®] qualified clothes dryers save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions (such as air flow and/or heat input rate) improving air circulation through better drum design or booster fans, and improving efficiency of motors. Reducing the runtime of dryers through automatic termination by temperature and moisture sensors is believed to have the greatest potential for reducing energy use in clothes dryers.¹⁶ ENERGY STAR[®] provides criteria for both gas and electric clothes dryers.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Clothes dryer must meet the ENERGY STAR® version 1.1 criteria, as required by the program.

Definition of Baseline Equipment

The baseline condition is a clothes dryer meeting the minimum federal requirements for units manufactured on or after January 1, 2015. <u>As the DOE Federal Efficiency Standard perform</u> testing with the D1 method in their appendix and the ENERGY STAR[®] certifies with the D2 test the Ffederal Standard CEF value is adjusted.

Deemed Lifetime of Efficient Equipment

The expected measure life is assumed to be 14 years.⁴⁷

Deemed Measure Cost

Dryer Size	Incremental Cost 48
Standard	\$75
Compact	\$105

2.2 Compressed Air

2.2.1 Compressed Air No Loss Condensate Drain

DESCRIPTION

No-loss condensate drains remove condensate as needed without venting compressed air, resulting in less air demand and better efficiency. Replacement or upgrades of existing no-loss drains are not eligible for this measure.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a no-loss condensate drain.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a standard condensate drain (open valve, timer, or both).

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of a no-loss condensate drain is assumed to be 13 years.³¹

DEEMED MEASURE COST

The measure cost is \$700-79478 per drain.³²

Appendix H - TRM - Vol. 2: C&I Measures

2.2.2 Compressed Air Leak Repair

DESCRIPTION

This measure applies to an installed air compressor<u>system</u> that has developed <u>leaks.leaks</u>. Leaks in a compressed air system lead to an increase in energy use to maintain the necessary pressure in the system.

Savings are calculated by using information collected through survey and measurement of the compressed air system, including the cubic feet per minute (CFM) of the airflow of each leak using ultrasonic leak detection equipment.

DEFINITION OF EFFICIENT EQUIPMENT

Efficient Equipment is defined as the state of the air compressor system after leaks have been repaired. It is not necessarily the air compressor with no leaks left as some leaks may be impossible to reach or have substantial difficulty in fixing, therefore the efficient equipment is one that has all leaks repaired that have been stated to be repaired.

DEFINITION OF BASELINE EQUIPMENT

Baseline equipment is characterized by the condition of the compressed air system at the time of inspection before the leaks are repaired.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The effective useful life is 2 years.³⁶

DEEMED MEASURE COST

Measure cost should include the inspection and repair cost.

2.2.3 Compressed Air Nozzle

DESCRIPTION

This measure applies to the replacement of a standard air nozzle with high-efficiency air nozzle used in a compressed air system. High-efficiency air nozzles use the Coandă effect to pull in free air and use significantly less compressed air for blowing off parts or for drying. These nozzles have the added benefits of noise reduction and improved safety in systems with greater than 30 psig. The measure is applicable to continuous air blow off processing and manual air blow off tools.

This measure was developed to be applicable to the following program types: DI and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a <u>high efficiency</u> compressed air nozzle meeting program requirements.

The air flow, CFM, is from the manufacturer model specification sheet, for the applicable working pressure.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a standard air nozzle that is OSHA approved. for hand tools, or a standard blow off nozzle for continuous processing.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is 15 years.⁴¹

DEEMED MEASURE COST

Incremental measure costs are presented in the following table.⁴²

Nozzle Diameter	Measure Cost
1/8"	\$42
1/4"	\$ 57<u>59</u>
5/16 <u>3/8</u> "	\$ 87<u>236</u>
1/2"	\$ 121<u>335</u>

⁴⁸ Assumes 50% handheld air guns and 50% stationary air nozzles. Manual air guns tend to be used less than stationary air nozzles, and a conservative estimate of 1 second of blow-off per minute of compressor run time is assumed. Stationary air nozzles are commonly more wasteful as they are often mounted on machine tools and can be manually operated resulting in the possibility of a long term open blow situation. An assumption of 5 seconds of blow off per minute of compressor run time is used.

2.2.4 VSD Air Compressor

DESCRIPTION

This measure relates to the installation of an air compressor with a variable frequency drive, load/no load controls, or variable displacement control. A baseline modulating compressor regulates output by choking off the inlet air, which is not efficient. Efficient compressors use a variable speed drive on the motor to match output to the load. Savings are calculated using representative baseline and efficient demand numbers for compressor capacities according to the facility's load shape, and the number of hours the compressor runs at that capacity. Demand curves are as per US Department of Energy (DOE) data for a \underline{v} -ariable \underline{s} -speed compressor versus a \underline{m} -doulating compressor. This measure applies only to an individual compressor ≤ 200 hp. Only one compressor per compressed air distribution system is eligible.

This measure was developed to be applicable to the following program type: TOS. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The high efficiency equipment is a compressor 5-200 hp with variable speed control.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a modulating compressor with blow down 5-200 hp

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

10 years.51

DEEMED MEASURE COST⁵²

Incremental Cost (\$) = ((127 x hp_{compressor}) + 1446) x 1.2443^{53}

Where:

hp_{compressor} = compressor motor nominal horsepower 127 and 1,446 = compressor motor nominal hp to incremental cost conversion factor and offset

LOADSHAPE

Air Comp BUS

Algorithm

⁵¹ Based on data provided by vendors, reference file "VSD compressor lifetime and costs.xls."

⁵³ Adjustment for inflation since incremental cost study is in \$2008. The U.S. Bureau of Labor Statistic CPI Inflation Calculator was used to adjust \$2008 (JanuaryJuly) to \$220214 (JanuaryJuly). The resulting factor was 1.2443. This adjustment was evaluated against current pricing of compressors (20212024) and found to be a reasonable and appropriate.

2.3.1 Combination Oven

DESCRIPTION

This measure applies to full or half-sized electric ENERGY STAR[®] combination ovens with a pan capacity ≥ 3 and ≤ 40 and to full or half-sized natural gas fired ENERGY STAR[®] combination ovens with a pan capacity ≥ 5 and ≤ 40 capacity ≥ 5 and ≤ 20 and to full or half-sized natural gas fired ENERGY STAR[®] combination ovens with a pan capacity ≥ 6 -installed in a commercial kitchen. Combination ovens combine the function of hot air convection (convection mode), saturated and superheated steam heating (steam mode), and combination convection/steam mode for moist heating, to perform steaming, baking, roasting, re-thermalizing, and proofing of various food products. ENERGY STAR[®] certified combination ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified combination oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type, operation mode (steam or convection), and pan capacity.

ENERGY STAR[®] Requirements (Version 3.0, Effective October 12, 2023) ⁶⁶(Version 2.2, Effective October 7, 2015)

Note: $P = Pan capacity a$	as defined in Section 1.T	of the Commercial Ovens Program Reg	uirements Version 2.23.0.67

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas combination oven that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.⁶⁸

DEEMED MEASURE COST

The incremental capital cost for each type of combination oven for this measure is \$4,300<u>1,850</u>628 is listed in the following table.

$\frac{34,3001,330}{223}$ is listed in the following table.					Formatted: Font: 11 pt, Font color: Background 1

2.3.2 Commercial Steam Cooker

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] steam cookers installed in a commercial kitchen. Commercial steam cookers contain compartments where steam energy is transferred to food by direct contact. ENERGY STAR[®] certified steam cookers have shorter cook times, higher production rates, and reduced heat loss due to better insulation and more efficient steam delivery.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY $STAR^{\otimes}$ certified steam cooker meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by fuel type and pan capacity.

ENERGY STAR[®], Requirements (Version 1.2, Effective August 1, 2003)

	Electric Efficiency Requirements		Natural Gas Efficiency	
Pan Capacity	Idle Energy Rate	Cooking	Idle Energy Rate	Cooking
	Idle Energy Rate	Efficiency		Efficiency
3-pan	$\leq 400 \ \mathrm{W}$		\leq 6,250 Btu/hr	
4-pan	\leq 530 W		\leq 8,350 Btu/hr	
5-pan	$\leq 670 \ \mathrm{W}$	$\geq 50\%$	≤10, 400-<u>417</u>	≥ 38% N/A
			Btu/hr	
6-pan and larger	$\leq 800 \ \mathrm{W}$		\leq 12,500 Btu/hr	

Formatted: Font: Not Bold

Formatted: Font: Not Bold

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas steam cooker that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.74

DEEMED MEASURE COST

⁷⁴ Lifetime-ENERGY STAR[®], "Results Detail" worksheet (Equipment Life field), Commercial Kitchen Equipment Savings Calculator, (March 2024), https://www.energystar.gov/sites/default/files/2024-03/CFS%20Equipment%20Calculator.xlsx from ENERGY STAR[®] Commercial Kitchen Equipment Savings Calculator, which cites reference as "FSTC research on available models, 2009." https://www.energystar.gov/sites/default/files/2024-03/CFS%20Equipment%20Calculator.xlsx (See "Steam <u>Cookers Calcus" tab</u>) http://www.energystar.gov/sites/default/files/commercial_kitchen_equipment_calculator.xlsx

Ameren Missouri

2.3.3 Fryer

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] certified fryers installed in a commercial kitchen. ENERGY STAR[®] fryers offer shorter cook times and higher production rates through advanced burner and heat exchanger designs. Fry pot insulation reduces standby losses, resulting in lower idle energy rates. Standard-sized ENERGY STAR[®] fryers are up to 30% more efficient, and large-vat ENERGY STAR[®] fryers are up to 35% more efficient, than standard fryers.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified fryer meeting idle energy rate (W or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and fryer capacity (standard versus large vat).

ENERGY STAR® Requirements	(Version 23.0, Effective	April 22, 2011)October 1, 2016)
---------------------------	--------------------------	---------------------------------

	Electric Efficiency Requirements		Natural Gas Efficiency Requirements	
Fryer Capacity	Idle Energy Rate	Cooking Efficiency Consumption	Idle Energy Rate	Cooking Efficiency Consumption
Standard Open Deep-Fat Fryer	$\leq \frac{1,000800}{100}$ W	<u>≥ 83%</u>	≤ 9,000 Btu/hr	> 50%
Large Vat Open Deep-Fat Fryer	≤ 1,100 W	$\geq 80\%$	≤ 12,000 Btu/hr	$\geq 30\%$

2.3.4 Convection Oven

DESCRIPTION

This measure applies to either full or half-sized electric ENERGY STAR[®] convection ovens and to half-full sized natural gas fired ENERGY STAR[®] convection ovens installed in a commercial kitchen. Convection ovens are general purpose ovens that use fans to circulate hot, dry air over the food surface. ENERGY STAR[®] certified convection ovens are approximately 20% more efficient than standard ovens.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR[®] certified convection oven meeting idle energy rate (kW or Btu/hr) and cooking efficiency (%) limits, as determined by both fuel type and oven capacity (full size versus half size).

ENERGY STAR[®] Requirements (Version 2.23.0, Effective October 7, 2015 January 12, 2023) 91

	Electric Efficiency Requirements		
Oven Capacity	Idle Energy Rate	Cooking Efficiency	
<u>Electric,</u> Full Size <u>, ≥ 5 pans</u>	≤ 1 .60 .40 k₩ kW	≥ 71<u>76</u>%	
Electric, Half Size Full Size, < 5 pans	$\leq 1.00 \text{ kW}$	<u>≥76%</u>	
Half Size	$\leq 1.00 \text{ kW}$	≥71%	
Gas, full size	<u>≤9,500 Btu/hr</u>	<u>≥49%</u>

2.3.5 Griddle

DESCRIPTION

This measure applies to electric or natural gas fired ENERGY STAR[®] certified griddles installed in a commercial kitchen. ENERGY STAR[®] commercial griddles achieve approximately 10% higher efficiency than standard griddles with strategies such as highly conductive or reflective plate materials and improved thermostatic controls.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be a new ENERGY STAR[®] electric or natural gas fired griddle meeting idle energy rate limits as determined by fuel type.

ENERGY STAR[®] Requirements (Version 1.2, Effective May 8, 2009 for natural gas and January 1, 2011 for electric griddles) ⁹⁷

Electric Efficiency Requirements		Natural Gas Efficiency Requirements		1	
Idle Energy Rate	Cooking Efficiency Consumption	Idle Energy Rate	Cooking Efficiency Consumption		
$\leq 320 \text{ W/ft}^2$ $\leq 1.00 \text{ kW}$	Reported	\leq 2,650 Btu/hr/ft ² N/A	Reported	•	Formatted Table

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric or natural gas fired griddle that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.98

DEEMED MEASURE COST

The incremental capital cost for this measure is:

Electric: \$850 for a single sided and \$0 for double sided an electric griddle

andGas: \$360-1,250 for a single sided gas griddleand \$0 for double sided.99

2.3.6 Kitchen Demand Ventilation Controls

DESCRIPTION

Installation of commercial kitchen demand ventilation controls that vary the ventilation based on cooking load and/or time of day. This measure applies to the following program types: RF, NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed equipment must be a control system that varies the exhaust rate of kitchen ventilation (exhaust and/or makeup air fans) based on the energy and effluent output from the cooking appliances (i.e., the more heat and smoke/vapors generated, the more ventilation needed). This involves installing a new temperature sensor in the hood exhaust collar and/or an optic sensor on the end of the hood that sense cooking conditions which allows the system to automatically vary the rate of exhaust to what is needed by adjusting the fan speed accordingly.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is kitchen ventilation that has constant speed ventilation motor.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT¹⁰³

The expected measure life is assumed to be 15 years.

MEASURE COST10310380

The incremental capital cost for this measure is:

Measure Category	Incremental Cost (\$/HP)
DVC Control Retrofit	\$1,991
DVC Control New	\$1,991

Ameren Missouri

2.3.7 Hot Food Holding Cabinet

DESCRIPTION

This measure applies to electric ENERGY STAR[®] certified hot food holding cabinets (HFHCs) installed in a commercial kitchen. ENERGY STAR[®] HFHCs achieve approximately 70% higher efficiency than standard models by incorporating better insulation which reduces heat loss, offers better temperature uniformity within the cabinet from top to bottom, and keeps the external cabinet cooler. In addition, many certified HFHCs may include additional energy saving devices such as magnetic door gaskets, auto-door closures, or dutch doors.

This measure was developed to be applicable to the following program type: TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new ENERGY STAR[®] electric HFHC meeting idle energy rate limits as determined by product interior volume.

ENERGY STAR® Requirements (Version 2.0, Effective October 1, 2011) 110

Interior Volume (ft ³)	Idle Energy Consumption Rate (W)
0 < V < 13	\leq 21.5 V
$13 \le V \le 28$	\leq 2.0 V + 254.0
$28 \le V$	\leq 3.8 V + 203.5

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new electric HFHC that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.¹¹¹

DEEMED MEASURE COST

Actual incremental costs should be used if available. If actual costs are unknown, assume $\frac{1,7831,000}{12}$

2.3.8 Pre-Rinse Spray Valve

DESCRIPTION

Pre-rinse valves use a spray of water to remove food waste from dishes prior to cleaning in a dishwasher. More efficient spray valves use less water, thereby reducing water consumption, water heating cost, and waste water (sewer) charges. Pre-rinse spray valves include a nozzle, squeeze lever, and dish guard bumper. The primary impacts of this measure are water savings. Reduced hot water consumption saves either natural gas or electricity, depending on the type of energy the hot water heater uses.

This measure was developed to be applicable to the following program types: TOS, RF, and DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the new or replacement pre-rinse spray nozzle must use less than 1.6 gallons per minute. the maximum flow for the product class, as listed by the DOE Energy ConservationEfficiency Standards, effective January 2019.

Product Class (spray force, ozf)	Maximum Flow Rate
<u>Class 1, \leq 5.0 ozf</u>	<u><1.00 gpm</u>
Class 2, >5.0 ozf to ≤ 8.0 ozf	<u><1.20 gpm</u>
<u>Class 3, >8.0 ozf</u>	<u><1.28 gpm</u>

DEFINITION OF BASELINE EQUIPMENT

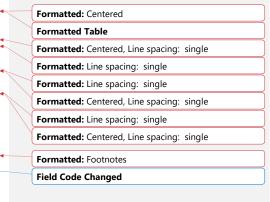

The baseline equipment will vary based on the delivery method with the maximum flow rate from the Code of Federal RegulationsDOE Energy ConservationEfficiency-Conservation Standards¹¹⁵and is defined below: . The current eodestandard, effective January 2019 is the baseline for TOS, the previous eodestandard, effective January 2006, the baseline for retrofits and direct install.

Product Class (spray force, <u>ozf)</u>	Time of Sale <u>Flow</u> <u>Rate</u>	Retrofit, Direct Install <u>, Flow Rate</u>
<u>Class 1, \leq 5.0 ozf</u>	1. <u>6.00 gpm</u> gallons per minute	<u>1.6 gpm</u>
Class 2, >5.0 ozf to ≤ 8.0 ozf	<u>1.20 gpm</u>	<u>1.6 gpm</u>
<u>Class 3, >8.0 ozf</u>	<u>1.28 gpm</u>	<u>1.6 gpm</u>

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS (NOTE WATER SAVINGS MUST FIRST BE CALCULATED)

 $\Delta kWH = \Delta Gallons + x 8.33 + x 1 + x (T_{out}Tout - T_{in}Tin) + x (1/EFF_{Elec}EFFElec) / 3,413$

Where:

∆Gallons	= amount of water saved as calculated below in Water Impact Calculation
8.33	= specific mass in pounds of one gallon of water (lbm/gal)
1	= Specific heat of water: 1 Btu/lbm/°F
Tout	= Water Heater Outlet Water Temperature
	= Custom, otherwise assume $Tin + 70^{\circ}F$ temperature rise from Tin^{119}
T_{in}	= Inlet Water Temperature
	= Custom, otherwise assume $\frac{58.47.9F59.3F^{120}}{59.3F^{120}}$
EFF_{Elec}	= Efficiency of electric water heater supplying hot water to pre-rinse spray
	valve
	=CustomActual, otherwise assume 97% ¹²¹

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh - x CF$

Where:

 $\Delta kWh = Electric energy savings, calculated above$

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor

¹¹⁹ If unknown, assume a 70 degree temperature rise from Tin per Food Service Technology Center calculator assumptions to account for variations in mixing and water heater efficiencies.

¹²⁵ Hours primarily based on PG& E savings estimates, algorithms, sources (2005), Food Service Pre-Rinse Spray Valves.
¹²⁶ The baseline equipment is assumed to be 1.6 gallons per minute. The Energy Policy Act (EPAct) of 2005 sets the maximum flow rate for pre-rinse spray valves at 1.6 gallons per minute at 60 pounds per square inch of water pressure when tested in accordance with ASTM F2224 03. This performance standard went into effect January 1, 2006.

www.Leere.energy.gov/femp/pdfs/spec_prerinsesprayvavles.pdf. ¹²⁷ Verification measurements taken at 195 installations showed average pre-flowrates of 2.23 gallons per minute. IMPACT AND PROCESS EVALUATION FINAL REPORT for CALIFORNIA URBAN WATER CONSERVATION COUNCIL 2004-5 PRERINSE SPRAY VALVE INSTALLATION PROGRAM (PHASE 2) (PG&E Program # 1198-04; SoCalGas Program 1200-04) ("CUWCC Report," Feb 2007).

¹²⁸ 1.6 gallons per minute used to be the high efficiency flow, but more efficient spray valves are available ranging down to 0.64 gallons per minute per Federal Energy Management Program which references the Food Services Technology Center web site with the added note that even more efficient models may be available since publishing the data. The average of the nozzles listed on the FSTC website is 1.06.

2.4 Hot Water

2.4.1 Low Flow Faucet Aerator

DESCRIPTION

This measure relates to the direct installation of a low flow faucet aerator or low flow faucet in a commercial building. Expected applications include small business, office, restaurant, or motel. For multifamily or senior housing, the residential low flow faucet aerator should be used.

This measure was developed to be applicable to the following program type: DI, RF, TOS-

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Efficient-Low flow faucets or aerators for bathroomssinks meetmeeting the EPA WaterSense flow rate of ≤ 1.5 gpm.¹²⁹nce

Efficient flow faucets Faucets or aerators for kitchen sinks exceeding the DOE Federal Regulations values in the Code of Federal Regulations listed for maximum allowable water flow at of ≤ 2.2 gpm.¹³⁰ the DOE F

Faucets or aerators for public lavatories exceeding the IPC Plumbing Code of <2.20.5 gpm.¹³¹ Efficient water flow bathroom equipmentlavatory faucets labeled with WaterSensemeeting EPA WaterSense requirements are eligible for private use, such as private restrooms in hospit and hotels. Efficient lavatory faucets exceeding the flow requirements of the local plumbing co installed in public areas are eligible.. Lavatory faucets To qualify for this measure the installe equipment must be an energy efficient faucet aerator or faucet, exceeding the DOE Energy Standards for a private lavatory, at 1.5 gpm or less, and a kitchen faucet at 2.2 gpm or less. For public lavatory, exceedingmust exceed the applicable code version of the IPC Internation Plumbing Code (IPC)., of 0.5 gpm. for bathrooms rated at 1.5 gallons per minute (GPM) or least or for kitchens rated at 2.2 GPM or less. Where a local building code is not stated, the 2015 IP maximum flow rate of 0.5 gpm is the baseline. Savings are calculated on an average savings faucet fixture basis.

Water Sense Faucet Requirements (Effective October 2007)¹³²

Usage	= Estimated usage of mixed water (mixture of hot water from water						
	heater line and cold-water line) per faucet (gallons per year)						
	= If data is available to provide a reasonable custom estimate it						
	should be used, if not use the defaults in the table below (or						
	substitute custom information into the calculation):						

2025 MEEIA 4 2019-21 Plan

Revision 56.0

¹⁴¹-Default assumption for unknown fuel is based on EIA Commercial Building Energy Consumption Survey (CBECS) 2012 for Midwest North Central Region (see 'HC8.9 Water Heating in Midwest Region.xls'). If utilities have specific evaluation results providing a more appropriate assumption for buildings in a particular market or geographical area, then they should be used. ¹⁰¹ Representative baseline flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use.

¹⁴² Representative baseline flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. The most comprehensive available studies did not disaggregate kitchen use from bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bathroom water use.

¹⁴³-Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

¹⁴⁴ Average retrofit flow rate for kitchen and bahroom faucet aerators from sources 1, 2, 3, and 4. This accounts for all throttling and differences from rated flow rates. Assumes all kitchen aerators at 2.2 gpm or less and all bahroom aerators at 1.5 gpm or less. The most comprehensive available studies did not disaggregate kitchen use from bahroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitchen water use from bahroom water use. It is possible that programs installing low-flow aerators lower than the 2.2 gpm for kitchens and 1.5 gpm for bahrooms will see a lower overall average retrofit flow rate.

⁴⁴⁵ Measurement should be based on actual average flow consumed over a period of time rather than a onetime spot measurement for maximum flow. Studies have shown maximum flow rates do not correspond well to average flow rate due to occupant behavior which does not always use maximum flow.

¹⁵⁶ Default assumption for unknown fuel is based on EIA Commercial Building Energy Consumption Survey (CBECS) 2012 for Midwest North Central Region (see 'HC8.9 Water Heating in Midwest Region.xls'). If utilities have specific evaluation results providing a more appropriate assumption for buildings in a particular market or geographical area, then they should be used. ¹¹⁵ Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 75%. Commercial properties are more similar to MF homes than SF homes. MF hot water is often provided by a larger commercial boiler. This suggests that the average recovery efficiency is somewhere between a typical central boiler efficiency of .59 and the .75 for single family home. An average is used for this analysis by default.

Appendix H - TRM - Vol. 2: C&I Measures

2.4.2 Circulator Pump

DESCRIPTION

Demand control recirculation pumps seek to reduce inefficiency by combining control via temperature and demand inputs, whereby the controller will not activate the recirculation pump unless both (a) the recirculation loop return water has dropped below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

This measure was developed to be applicable to the following program types: TOS, RF, and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Re-circulating pump shall cycle on based on (a) the recirculation loop return water dropping below a prescribed temperature (e.g. 100°F) and (b) a CDHW demand is sensed as water flow through the CDHW system.

DEFINITION OF BASELINE EQUIPMENT

The base case for this measure category is an existing, un-controlled recirculation pump on a gasfired Central Domestic Hot Water System.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The effective useful life is 15 years.¹⁵⁷

DEEMED MEASURE COST

The assumed measure cost is \$1,200 per pump.¹⁵⁸

Revision 56.0

2.4.3 Heat Pump Water Heater

DESCRIPTION

This measure applies to the installation of a heat pump water heater (HPWH) in place of a standard electric <u>storage</u> water heater in a commercial building. Savings are presented dependent on the heating system installed in the building due to the impact of the heat pump water heater on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a heat pump water heater meeting program efficiency requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is assumed to be a new, electric storage water heater meeting federal minimum efficiency standards.¹⁶² <u>Residential storage water heaters greater than 55 gallons may</u> not be eligible as the baseline is near that of a heat pump water heater.

Federal standards for ≤55 gallon and ≤12 kW storage water heaters are from <u>10 CFR §430.32(d)</u>. Federal standards for >120 gallo and>12 kW storage water heaters are from 10 CFR §431.110. Since the federal standard effectively requires a heat pump wate heater for residential electric storage water heaters >55 gallons and ≤120 gallons, this measure excludes those units.

Commercial storage, all	All	Medium	<u>0.98</u>	
				•

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 13-15 years.¹⁶³

DEEMED MEASURE COST

Actual costs should be used where available. Incremental capital costs are presented in the table below for heat pump water heaters with energy factors (EF) of 2.0 and 2.4 and rated<u>from 40</u> gallons to 80 gallons of storage volume.¹⁶⁴s of 40 gallons and 50 gallons, respectively.¹⁶⁵

EF Type	Rated Volume (gal)	Incremental Cost
2.0Heat Pump	40-40 to 50	\$1, 340.30<u>154</u>
2.4Heat Pump	50- 55 to 65	\$1, 187.58 269
Heat Pump	<u>66 to 80</u>	<u>\$1,646</u>

For larger HPWHs, incremental capital costs are presented below based on heating capacity.¹⁶⁶

Heating Capacity (MBtu/hr)	Incremental Cost
10-50	\$4,000 .00
>50-100	\$7,000 .00
>100-300	\$10,000 .00
>300-500	\$14,000 .00
>500	\$18,000 .00

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = ((1/\underline{U}EF_{BASE} - 1/\underline{U}EF_{EE}) \underline{*_{X}}HWU_{GAL} \underline{*_{X}}\gamma Water \underline{*_{X}}(T_{out} - T_{in}) \underline{*_{X}}1.0 \underline{*_{X}}3,412) + kWh_{COO}$ $- kWh_{HEAT}$

$kWh_{COOL} = ((1-1/\underline{U}EF_{EE}) \stackrel{*}{} HWU_{GAL} \stackrel{*}{} \gamma Water \stackrel{*}{} (T_{out} - T_{in}) \stackrel{*}{} 1.0 \stackrel{*}{} LF \stackrel{*}{} 53\% \stackrel{*}{}$	LM) /
(COPcool * 3,412) * % Cool	

kWh_{HEAT} = ((1-1/<u>U</u>EF_{EE}) *<u>x</u> HWU_{GAL} *<u>x</u> γWater *<u>x</u> (T_{out} – T_{in}) *<u>x</u> 1.0) *<u>x</u> LF *<u>x</u> 43%) / (СОР_{НЕАТ} *<u>x</u> 3,412) *<u>x</u> %ElectricHeat

Where:

kWh_cool	= Cooling savings from conversion of heat in building to water heat ¹⁶⁷
kWh_heat	= Heating cost from conversion of heat in building to water heat
	(dependent on heating fuel)
<u>U</u> EF _{BASE}	= Efficiency of baseline water heater according to federal standards,
	expressed as Uniform Energy Factor (EF) or Thermal Efficiency (Et)
	= See table below
<u>U</u> EFee	= <u>U</u> EF of heat pump water heater
	= Actual
HWUGAL	= Estimated annual hot water consumption (gallons)
	= Actual if possible to provide reasonable custom estimate. If not, two
	methodologies are provided below to develop an estimate.
γWater	= Specific weight of water
	= 8.33 pounds per gallon
Tout	= Tank temperature
	= Actual, if unknown assume 125 °F ¹⁶⁸
T _{IN}	= Incoming water temperature from well or municipal system
	= 57.898 59.38.4 °F ¹⁶⁹
1.0	= Heat capacity of water (1 Btu/lb $\underline{*x}^{\circ}F$)

¹⁶⁷ This algorithm calculates the heat removed from the air by subtracting the heat pump water heater electric consumption from the total water heating energy delivered. This is then adjusted to account for location of the heat pump unit and the coincidence of the waste heat with cooling requirements, the efficiency of the central cooling, and latent cooling demands. ¹⁶⁸ Ideally, the actual set point of the water heater should be used. If not available, 125 degrees is provided as an estimate of

¹⁶⁸ Ideally, the actual set point of the water heater should be used. If not available, 125 degrees is provided as an estimate of unmixed output temperature. While plumbing code generally limits temperatures at the end use, it typically does not limit the water heater system, which can be anywhere in the range 120 -201 degrees. For applications such as laundry and dishwashing, health and safety regulations may require water to be initially heated to higher temperatures. Since temperature set points can vary widely, market, program, or site-specific data should be used whenever possible.

¹⁶⁹ National Weather Service. Average soil temperature at 40" depth during 2015 - 2023 data of six stations in Ameren Missouri service territory. https://www.weather.gov/ncrfc/LMI_SoilTemperatureDepthMaps_National Weather Service|MO soil temp 40"|6 stations|2015 to 2023|https://www.weather.gov/ncrfc/LMI_SoilTemperatureDepthMaps_Using 40" deep soil temp as a proxy at Powell Gardens SCAN site. Average by month of available data from 3/28/02_10/11/14: 12 month average is 57.898. http://www.wec.nrcs.usda.gov/nwcc/site?sitenum=2061.

Appendix H - TRM - Vol. 2: C&I Measures

3,412	= Conversion factor from Btu to kWh
LF	= Location Factor
	= 1.0 for HPWH installation in a conditioned space
	= 0.5 for HPWH installation in an unknown location ¹⁷⁰
	= 0.0 for installation in an unconditioned space
53%	= Portion of reduced waste heat that results in cooling savings ¹⁷¹
43%	= Portion of reduced waste heat that results in increased heating load ¹⁷²
LM	= Latent multiplier to account for latent cooling demand ¹⁷³
	= 3.0 for St. Louis, MO
COPCOOL	= COP of central air conditioner
	= Actual
COPHEAT	= Actual. Note: electric resistance heating and heat pumps will have an
	efficiency greater than or equal to 100%
%Cool	= Percentage of buildings with central cooling
	= 100% for cooling in the home and 0% for no cooling in the home
%ElectricHeat	= Percentage of buildings with electric heat
	= 100% for electric heating fuel and 0% for gas heating fuel

Equipment Type	Size Category	Federal Standard Minimum Efficiency
HPWH ≤12 kW	≤55 gallon	EF: $0.96 - (0.0003 \times x rated volume in gallons)$
HPWH >12 kW	>120 gallon	Et: 98% ¹⁷⁴

Method 1 to estimate HWU_{GAL} - Consumption per water heater capacity

HWUHWUGAL = Consumption/cap - x Capacity

Formatted: Font: Not Italic

Revision 56.0

¹⁷⁰ Professional judgment.

¹⁷¹ Based on 193 days where CDD 65>0, divided by 365.25. CDD days determined from TMY data with a base temp of 65°F.

¹⁷² Based on 157 days where HDD 60>0, divided by 365.25. HDD days determined from TMY data with a base temp of 60°F. ¹⁷³ The Latent Multiplier is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

AHRI directory.

Appendix H - TRM – Vol. 2: C&I Measures

Where:

Consumption/cap

ion/cap = Estimate of consumption per gallon of tank capacity, dependent on Building Type (see table below)¹⁷⁵

Capacity

= Capacity of hot water heater in gallons = Actual

Building Type	Consumption/cap
Grocery, Convenience Store, and Restaurant	803
Lodging, Hospital, and Multifamily	630
Health Clinic, Church, Warehouse	433

¹⁷⁷ Ameren Missouri TRM Volume 1 - Appendix G: "Table 2 – Commercial and Industrial End Use Category Monthly Shapes and Coincident Peak Factors"2016 Ameren Missouri Coincident Peak Demand Factor for Commercial Water Heating. See reference "Ameren Missouri 2016 Appendix E - End Use Shapes and Coincident Factors.pdf." ¹⁷⁸ This is the additional energy consumption required to replace the heat removed from the building during the heating season by

¹⁷⁸ This is the additional energy consumption required to replace the heat removed from the building during the heating season by the heat pump water heater. The variable kWh_heating (electric resistance) is that additional heating energy for a building with electric resistance heat (COP 1.0). This formula converts the additional heating kWh for an electric resistance building to the MMBtu required in a natural gas heated building, applying the relative efficiencies.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 9 years.¹⁸⁴10 years. ¹⁸⁵

DEEMED MEASURE COST

The incremental cost for this measure is \$12.008.00186 or program actual.-.187

LOADSHAPE

Water Heating BUS, or Water Heating RES if installed in the common area of multi-family housing.

<u>Algorithm</u>

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Note these savings are per faucetshowerhead retrofitted.188

<u> AkWh = %ElectricDHW *x { (GPMbase*x Lbase - GPMlow*xLlow) / GPMbase) *x Usage-NSPD*x 365.25*x EPGelectric *x ISR</u>

Where:

<u>%ElectricDHW</u> = proportion of water heating supplied by electric resistance heating (see values in table below)

DHW fuel	%Electric_DHW
Electric	<u>100%</u>
Fossil Fuel	<u>0%</u>
Unknown	43% ¹⁸⁹

 ¹⁴⁴-Table C-6, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007. "http://neep.org/uploads/EMV%20Forum/EMV%20Studies/measure_life_GDS%5B1%5D.pdf."
 ¹⁸⁵ GDS Associates, Page C-14, Table C-6, "Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures", (GDS Associates, June 2007). (page C-14). Evaluations indicate that consumer dissatisfaction may lead to reductions in persistence, particularly in Multi-Family.

¹⁸⁶ Direct install price per faucet assumes cost of aerator and install time. (2011, Market research average of \$3 and assess and install time of \$5 (20min @ \$15/hr).

¹⁸⁷ Direct-install price per showerhead assumes cost of showerhead (Market research average of \$7 and assess and install time of \$5 (20min @ \$15/hr).

¹⁴⁸ This algorithm calculates the amount of energy saved per aerator by determining the fraction of water consumption savings for the upgraded fixture. Due to the distribution of water consumption by fixture type, as well as the different number of fixtures in a building, several variables must be incorporated.

¹³⁹ Default assumption for unknown fuel is based on EIA Commercial Building Energy Consumption Survey (CBECS) 2012 for Midwest North Central Region (see 'HC8.9 Water Heating in Midwest Region.xls'). If utilities have specific evaluation results

providing a more appropriate assumption for buildings in a particular market or geographical area, then they should be used. ⁴⁴ Representative baseline flow rate for kitchen and bathroom faucet aerators from sources 1, 2, 3, and 4. This accounts for al throttling and differences from rated flow rates. The most comprehensive available studies did not disaggregate kitchen use fror bathroom use, but instead looked at total flow and length of use for all faucets. This makes it difficult to reliably separate kitche water use from bathroom water use.

2.5.1 Small Commercial Learning Thermostats

DESCRIPTION

This measure characterizes the energy savings from the installation of a new programmable learning thermostat for reduced cooling and heating energy consumption through temperature setback during unoccupied or reduced demand times as well as automatic adjustments based on occupancy patterns and various independent variables such as weather. This measure is limited to small businesses as defined by programs,²⁰⁴ as they have smaller HVAC systems that are similar to residential HVAC systems and may be controlled by a simple manual adjustment thermostat. Mid- to large-sized businesses will typically have a building automation system or some other form of automated HVAC controls. This measure is only appropriate for single zone heating systems. Custom calculations are required for savings for learning thermostats installed in multi-zone systems.

This measure was developed to be applicable to the following program types: RF, DI, and TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature set-points according to various independent variables without manual intervention.

DEFINITION OF BASELINE EQUIPMENT

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change the temperature set-point.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a learning thermostat is assumed to be <u>10-9</u> years²⁰⁵ based upon equipment life only.³⁰⁶ a residential EUL analysis.

DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown, the capital cost for this measure is assumed to be 264224.²⁰⁷

LOADSHAPE

Cooling BUS

²⁰⁴ The square footage of the small office prototype building modeled in is 7,500 sf.

205 Table 1, HVAC Controls, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007.CADMUS, "EUL analysis of residential smart communicating thermostat – Vendor A and B", Memorandum for Southern California Edison, (February 2019), for the California ETRM, Residential Smart Thermostat Measure, https://www.caetrm.com/measure/SWHC039/08/.

rm the persistence of savings to further refine measure life assumption. As this characterization depends heavily upon a large scale but only 2-year study of the energy impacts of programmable thermostats, the longer-term impacts should be assessed. ²⁰⁷ Ameren Missouri Technical Resource Manual Effective January 1, 2018. This current value was reviewed and confirmed using PY20 program data.DSM Business Program participants, 1/2019 through 7/2024, includes equipment-eost and labor eost_Local file: "2.5.1 Measure Cost.xlsx"

2.5.2 Small Commercial Programmable Thermostats

DESCRIPTION

This measure characterizes the energy savings from the installation of a new programmable thermostat for reduced heating and cooling energy consumption through temperature set back during unoccupied or reduced demand times. This measure is limited to small businesses as defined by programs,²¹⁴ as they have smaller HVAC systems that are similar to residential HVAC systems and may be controlled by a simple manual adjustment thermostat. Mid- to large sized businesses will typically have a building automation system or some other form of automated HVAC controls. This measure is only appropriate for single zone heating systems. Custom calculations are required for savings for programmable thermostats installed in multi-zone systems.

This measure was developed to be applicable to the following program types: RF and DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual only temperature control with one that has the capability to adjust temperature set points according to a schedule without manual intervention.

DEFINITION OF BASELINE EQUIPMENT

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change the temperature set point.

Deemed Lifetime of Efficient Equipment

The expected measure life of a programmable thermostat is assumed to be 8 years²¹⁴ based upon equipment life only.²¹⁵

DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown, the capital cost for this measure is assumed to be \$181160.216

LOADSHAPE

Cooling BUS

 $[\]frac{213}{10}$ The square footage of the small office prototype building modeled in is 7.500 sf.

²¹⁴ Table 1, HVAC Controls, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007.
²¹⁵ Future evaluation is strongly encouraged to inform the persistence of savings to further refine measure life assumption. As this

characterization depends heavily encounaged to morin the perstence of savings to further refine inclusion in a samption. As the longer-term impacts should be assessed.

²¹⁶-Based upon Nicor, <u>https://www.ilsag.info/wp-content/uploads/Nicor-Gas-2022-2025-EE-Plan_filed-March-2021.pdf (see measure#239 pg 141, \$84 measure cost + \$56 labor + \$28 material)Illinois Rider 30 Business EER Program Database, Paid Rebates with Programmable Thermostat Installation Costs, Program to Date as of January 11, 2013. If Missouri average costs are available, they should be used.</u>

MEASURE CODE:

²²⁰ Heating Savings Factors for the programmable thermostat are calculated as the savings in annual building load divided by the square footage of the prototype building (5,500 sf) and converted to kBtu.

2.5.23 Demand Controlled Ventilation

DESCRIPTION

Demand control ventilation (DCV) automatically adjusts building ventilation rates based on occupancy. DCV is part of a building's ventilation system control strategy. It may include hardware, software, and controls as an integral part of a building's ventilation design. Active control of the ventilation system provides the opportunity to reduce heating and & cooling energy use.

The primary component is a control sensor to communicate either directly with the economizer or with a central computer. The component is most typically a carbon dioxide (CO_2) sensor, occupancy sensor, or turnstile counter. This measure is modeled to assume night time set backs are in operation and minimum outside air is being used when the building is unoccupied.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment condition is defined by new CO_2 sensors installed on return air systems where no other sensors were previously installed. Additionally, commissioned control logic and installed hardware must be capable of reducing ventilation rates based on sensor input. For heating savings, this measure does not apply to any system with terminal reheat (constant volume or variable air volume). For a terminal reheat system, a custom savings calculation should be used to determine the heating savings; cooling savings are still applicable to the measure.⁺

DEFINITION OF BASELINE EQUIPMENT

The base case for this measure is a space with no demand control capability, and is not required by the local building code. The current code minimum for outside-outdoor air (OA) is 17-5 CFM per occupant (ASHRAE 62.1-2022) for office buildings, which is the value assumed in this measure.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed measure life is 10 years.²²¹

DEEMED MEASURE COST

As a retrofit measure, the actual cost of installation should be used for screening. Costs should include the hardware and labor costs to install the sensors. Additional purchase and installation costs for any other component of the DCV system that was not previously existing should also be included.

LOADSHAPE

Cooling BUS

²²¹ Based on CO₂ sensor estimated life, determined through conversations with contractors to have a minimum lifetime of 10 years. It is recommended that they are part of a normal preventive maintenance program, as calibration is an important part of extending useful life. Although they are not subject to mechanical failure, they can fall out of tolerance over time.

Appendix H - TRM - Vol. 2: C&I Measures

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

For facilities heated by natural gas, cooling savings are:

 $\Delta kWh = SQFT_{cond} / 1000 + XSF_{cooling}$ For facilities heated by heat pumps, heating and cooling savings are:

 $\Delta kWh = SQFT_{cond} / 1000 - xSF_{cooling} + SQFT_{cond} / 1000 - xSF_{Heat HP}$ For facilities heated by electric resistance heating and cooling savings are:

 $\Delta kWh = SQFT_{cond} / 1000 - XSF_{cooling} + SQFT_{cond} / 1000 - XSF_{Heat ER}$

Where:

SQFT_cond= Square footage of conditioned space commissioned with DCVSF_cooling= Cooling Savings Factor, including cooling and fan energy savingsSF_Heat HP= Heating Savings factor for facilities heated by Heat Pump (HP)SF_Heat ER= Heating Savings factor for facilities heated by Electric Resistance (ER)

Savings factors are based on Building Type and weather zone - see tables below.222

²²² Energy savings factors were calculated using weather data and methodology consistent with ASHRAE standards. Savings are calculated on an annual basis for each given weather zone in Missouri. Original energy savings for DCV were developed for Illinois utilizing standards, inputs and approaches as set forth by ASHRAE 62.1 and 90.1. These savings factors were then translated into Missouri-specific values using adjustment factors based on differences in heating and cooling degree hours. See DCV savings factors v1.xlsx for derivation.

2.5.34 Advanced Roof Top Unit (RTU) Controls

DESCRIPTION

Ameren Missouri

A traditional packaged HVAC rooftop unit uses a zone thermostat to control the operation of the compressor or the gas furnace, depending on whether the zone thermostat is calling for cooling or heating. Under a conventional control scheme, the compressor or furnace is cycled on or off to maintain the zone thermostat set point with the supply fan operating continuously (when the building is occupied) to provide sufficient ventilation air and provide comfort heating and cooling for the space. The supply-fan speed is typically not capable of modulation, so it supplies constant air volume under all modes of operations.

Modulating the supply fan in conjunction with demand-controlled ventilation (DCV) can reduce both heating/cooling energy and fan energy requirements. This measure describes the energy savings realized by retrofitting traditional RTUs with advanced controllers that enable integrated air-side economization, supply-fan speed control (by installing a variable speed drive), and demand-controlled ventilation.

This measure is applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

A traditional RTU retrofitted and commissioned with advanced controls that allow for modulation of supply fan speed in conjunction with demand-controlled ventilation (DCV).

DEFINITION OF BASELINE EQUIPMENT

Packaged heating and cooling equipment with constant speed supply fans providing ventilation at the design rate at all times when the fan is operating and when the building is occupied.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15 years.²²⁴

DEEMED MEASURE COST

As a retrofit measure, actual costs should be specified when available. Default measure costs are listed below based on RTU supply fan horsepower rating:²²⁵

Supply Fan Size <u>(226-(</u> hp)	Controller	Installation Labor	Total Retrofit Cost
1	\$2,200	\$750	\$2,950
2	\$2,600	\$750	\$3,350
3	\$3,500	\$750	\$4,250
5	\$4,000	\$750	\$4,750
7.5	\$4,142	\$750	\$4,892

Algorithm

CALCULATION OF SAVINGS

Although advanced RTUs controls can enable operating strategies that result in heating and cooling savings, field testing has shown variable results (in some instances increased heating/cooling energy consumption has been observed). Field testing has suggested that upwards of 90% of total energy savings can be attributed to reduced fan energy requirements, and therefore the following savings estimates are limited to those relating to fan energy consumption.

ELECTRIC ENERGY SAVINGS

$\Delta kWh = P_{sf} \frac{P_{sf}}{+} x SF + x Hours_{fan} \frac{Hoursfan}{+}$

Where:

- = Nominal horsepower of supply fan motor P_{sf} = Fan energy savings factor_²²⁷-(kWh/hour/horsepower) SF
- $= 0.558^{228}$
- = Annual operating hours for fan motor based on Building Type. Default hours Hoursfan are provided for HVAC applications by Building Type.²²⁹ When available, actual hours should be used, especially in instances where RTU operation is seasonal.

2.5.45 Electric Chiller

DESCRIPTION

This measure involves the installation of a new electric chiller meeting the efficiency standards presented below. This measure could relate to the replacement of an existing unit at the end of its useful life or the installation of a new system in an existing building (i.e., time of sale). Only single-chiller applications should be assessed with this methodology. For multiple chiller projects, a custom analysis should be used to establish savings.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment is assumed to meet the 2015 IECC energy efficiency requirements. Chillers are rated for both the full load efficiency and the integrated part load efficiency. Chiller efficiency can be sourced by either Path A when the system is designed for full load efficiency, or Path B when designed for part load efficiency., effective January 1, 2024.

Prior to January 1, 2024, the applicable baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. When local code does not exist, use of IECC 2012 is defined as the building code baseline. In most cases, this will be some version of IECC. Depending on the version, this will correspond to the requirements defined within Table 503.2.3(7) in the case of IECC 2009, Table 403.2.3(7) in the case of either IECC 2012 or the IECC 2015, or Table C403.3.2(7) in the case of IECC 2018.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20-23 years.²³¹

DEEMED MEASURE COST

The incremental capital cost for this measure is \$106.23 per ton.²³²measure is based on the IPLV efficiency improvement over a code based minimum efficient chiller. The cost is per 0.01 IPLV improvement over code, per ton. A 150 ton screw chiller with an IPLV of 0.374, has an incremental cost of \$27,834, when the minimum code based efficiency is 0.44.

REFERENCE TABLES

Chillers Ratings - Chillers are rated with different units based on equipment type as shown below

Equipment Type	Unit
Air cooled, electrically operated	EER
Water cooled, electrically operated, positive displacement (reciprocating)	kW/ton
Water cooled, electrically operated, positive displacement (rotary screw and scroll)	kW/ton

In order to convert chiller equipment ratings to IPLV the following relationships are provided

kW/ton	= 12 / EER
kW/ton	= 12 / (COP x 3.412)
COP	= EER / 3.412
COP	= 12 / (kW/ton) / 3.412
EER	= 12 / kW/ton
EER	= COP x 3.412

Baseline Efficiency Values by Chiller Type and Capacity:

Note: Efficiency requirements depend on the path (Path A or Path B) that the building owner has chosen to meet compliance requirements. For air cooled and absorption chillers, Path A should be assumed. For water cooled chillers, the building owner should be consulted and the relevant path used for calculations. When unknown, Path A should be used.

a. The requirements for centrifugal chiller shall be adjusted for nonstandard rating conditions in accordance with Section C403.2.3.1 and are only applicable for the range of conditions listed in Section C403.2.3.1. The requirements for air-cooled, water-cooled positive displacement and absorption chillers are at standard rating conditions defined in the reference test procedure.
b. Both the full-load and IPLV requirements shall be met or exceeded to comply with this standard. Where there is a Path B, compliance can be with either Path A or Path B for any applicable for Path B and only Path A can be used for compliance.
c. NA means are not applicable for Path B and only Path A can be used for compliance.
d. FL represents the full-load performance requirements and IPLV the part-load performance requirements.

c. NA means the requirements are not applicable for Path B and only Path A can be used for compliance.
d. FL represents the full-load performance requirements and IPLV the part-load performance requirements.

MEASURE CODE:

Appendix H - TRM - Vol. 2: C&I Measures

2.5.<u>56</u> Heat Pump Systems

DESCRIPTION

This measure applies to the installation of high efficiency air-cooled, water source, ground water source, and ground source heat pump systems. This measure could apply to replacing an existing unit at the end of its useful life, or installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS<u></u>. <u>RetrofitEREP</u> and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

For this characterization to apply, the efficient equipment is assumed to be a high-efficiency aircooled, water source, ground water source, or ground source heat pump system that exceeds both the full load and part load efficiencies associated with the applicable code described in the Definition of Baseline Equipment...the heating and cooling efficiency listed in Federal Energy ConservationEfficiency Standards.

For VRF Heat pumps, heat pumps, vertical heat pumps, and other heat pumps, refer to the tables within the Federal Energy ConservationEfficiency Standards.

DEFINITION OF BASELINE EQUIPMENT

<u>Time of Sale, New Construction:</u> For this characterization to apply, the baseline equipment is assumed to be a standard-efficiency air- cooled, water source, ground water source, or ground source heat pump system that meets the 2015 IECC energy efficiency requirements, effective January 1, 2024. Federal Energy Conservation Efficiency Standards.

Appendix H - TRM – Vol. 2: C&I Measures

Retrofit, Early Replacement: For this characterization to apply, the existing equipment is working with a remaining useful life. After, remaining useful life period, the baseline is the Time of Sale baseline meeting the Federal Energy Conservation Efficiency Standards.

For unit with a capacity less than 65 kBTUh, the baseline efficiency may be converted to the newer ratings expressed by SEER2 and HSPF2.

Prior to January 1, 2024, the applicable baseline is assumed to be similar equipment meeting the energy efficiency requirements of local building code. When local code does not exist, use of IECC 2012 is defined as the building code baseline.

The rating conditions for the baseline and efficient equipment efficiencies must be equivalent. Equipment capacities less than 65 kBtu/hr may be rated with the SEER2 efficiency (single phase, residential units), while larger units rated with EER or IEER.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.²³⁸

DEEMED MEASURE COST

For analysis purposes, the incremental capital cost for this measure is assumed as \$100-104 per ton per SEER or IEER unit increase over the base case efficiency for air-cooled units.²³⁹ The incremental cost for all other equipment types should be determined on a site-specific basis.

For a 120,000 BTUh, 16.1 IEER air cooled heat pump without auxiliary heat, the incremental cost is:

10 tons x (16.1 IEER - 14.1 IEER) x \$104 = \$2,080

LOADSHAPE

Cooling BUS Heating BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

For units with cooling capacities less than 65 kBtu/hr:

²³⁸ ASHRAE, Chapter 38: Owning and Operating Costs, Table 4, "Heating, Ventilating and Air Conditioning Applications", (2023 edition) for commercial air to air heat pumps (pg 651 or 38.3), Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007 (Page C-13).

 $^{^{240}}$ SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting an existing system that is rated in SEER to SEER2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both SEER or SEER2) before applying formulas.

²⁴¹ HSPF to HSPF2 conversion factor: HSPF2 = HSPF x 87%. Conversion factor for HSPF to HSPF2 is used when converting an existing system that is rated in HSPF to HSPF2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both HSPF or HSPF2) before applying formulas.

2.5.67 Packaged Terminal Air Conditioner (PTAC) - Packaged Terminal Heat Pump (PTHP)

DESCRIPTION

A PTAC is a packaged terminal air conditioner that cools and provides heat through an electric resistance heater (heat strip). A PTHP is a packaged terminal heat pump. A PTHP uses its compressor year-round to heat or cool. In warm weather, it efficiently captures heat from inside a space and pumps it outside for cooling. In cool weather, it captures heat from outdoor air and pumps it into a space, adding heat from electric heat strips as necessary to provide heat.

This measure characterizes:

- 1) Time of Sale: the purchase and installation of a new efficient PTAC or PTHP.
- 2) Early Replacement: the early removal of an existing PTAC or PTHP from service, prior to its natural end of life, and replacement with a new efficient PTAC or PTHP unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life. The measure is only valid for non-fuel switching installations for example replacing a cooling only PTAC with a PTHP can currently not use the TRM.

This measure was developed to be applicable to the following program types: TOS, NC, and EREP.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be PTACs or PTHPs that exceed the Federal Energy Efficiency Standards.²⁴³ The non-standard size equipement type applies to installations with wall openings less than 16" high or less than 42" wide, and only for retrofit applications.

ot
2

DEFINITION OF BASELINE EQUIPMENT

TOS: the baseline conditions is the minimum efficiency that meets listed for the equipment type in the Federal Energy Efficiency Standards by size and type.

EREP: the baseline is the existing PTAC or PTHP for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life. When the existing model data is not available, the baseline efficiency is the federal standard in effect when installed.

In order for this characterization to apply, the efficient equipment is assumed to be PTACs or PTHPs that exceed baseline efficiencies.

DEFINITION OF BASELINE EQUIPMENT

TOS: the baseline conditions is in the 2015 IECC building code, which is summarized in the baseline reference table provided below.

EREP: the baseline is the existing PTAC or PTHP for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.²⁴⁴

Remaining life of existing equipment is assumed to be 5 years.²⁴⁵

DEEMED MEASURE COST

TOS: The incremental capital cost for this equipment is estimated to be \$84/ton.246

EREP: The measure cost is the full cost of removing the existing unit and installing a new one. The actual program cost should be used. If unknown assume \$1,047 per ton.²⁴⁷

²⁴⁴ ASHRAE, Chapter 38: Owning and Operating Costs, Table 4, "Heating, Ventilating and Air Conditioning Applications", (2023 edition) for commercial through-the-wall air conditioners.<u>Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007 (Page C 16)</u>

²⁴⁵ Standard assumption of one third of effective useful life.

²⁴⁶ DEER 2008. This assumes that baseline shifts between IECC versions carries the same incremental costs. Values should be verified during evaluation

²⁴⁷ Based on DCEO - IL PHA Efficient Living Program data.

The assumed deferred cost (after 5 years) of replacing existing equipment with new baseline unit is assumed to be \$1,039 per ton.²⁴⁸ This cost should be discounted to present value using the utilities' discount rate.

LOADSHAPE

Cooling BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Electric savings for PTACs and PTHPs should be calculated using the following algorithms

ENERGY SAVINGS

TOS:

$PTAC \Delta kWh^{249}$	$= \Delta k W h_{cool}$
$PTHP \Delta kWh$	$= \Delta kWh_{cool} + \Delta kWh_{heat}$
ΔkWh_{cool}	= kBtu/hr _{cool} * <u>x</u> (1/EER _{base} – 1/EER _{ee}) * <u>x</u> EFLH _{cool}
ΔkWh_{heat}	= $kBtu/hr_{heat} / 3.412 \stackrel{*}{\simeq} (1/COP_{base} - 1/COP_{ee}) \stackrel{*}{\simeq} EFLH_{heat}$

EREP:

 Δ kWh for remaining life of existing unit (1st 5years)

 $\begin{array}{lll} \Delta kWh &= \Delta kWh_{cool} + \Delta kWh_{heat} \\ \Delta kWh_{cool} &= kBtu/hr_{cool} \stackrel{*}{\searrow} (1/EER_{exist} - 1/EER_{ee}) \stackrel{*}{\searrow} EFLH_{cool} \\ \Delta kWh_{heat} &= kBtu/hr_{heat} / 3.412 \stackrel{*}{\searrow} (1/COP_{exist} - 1/COP_{ee}) \stackrel{*}{\implies} EFLH_{heat} \\ \Delta kWh for remaining measure life (next 10 years) \end{array}$

∆kWh	$= \Delta k W h_{cool} + \Delta k W h_{heat}$
ΔkWh_{cool}	= kBtu/hr _{cool}
ΔkWh_{heat}	= kBtu/hr _{heat} / 3.412 * <u>x</u> (1/COP _{base} – 1/COP _{ee}) * <u>x</u> EFLH _{heat}

Where:

kBtu/hr _{cool}	= Capacity of the cooling equipment in kBtu per hour (1 ton of cooling
	capacity equals 12 kBtu/hr).
	= Actual installed
EFLH _{cool}	= Equivalent Full Load Hours for cooling are provided in section
	2.7 <u>Table 1</u> HVAC End Use
EFLH _{heat}	= Equivalent Full Load Hours for heating are provided in Table
	1section 2.7 HVAC End Use

²⁴⁸ Based on subtracting TOS incremental cost from the DCEO data and incorporating inflation rate of 1.91%.
²⁴⁹ There are no heating efficiency improvements for PTACs since although some do provide heating, it is always through electric resistance and therefore the COPbase and COPee would be 1.0.

MEASURE CODE:

2.5.78 Single-Package and Split System Unitary Air Conditioner

DESCRIPTION

This measure promotes the installation of high-efficiency unitary air-, water-, and evaporatively cooled air conditioning equipment, both single-package and split systems. Air conditioning (AC) systems are a major consumer of electricity and systems that exceed baseline efficiencies can save considerable amounts of energy. This measure could apply to the replacement of an existing unit at the end of its useful life or the installation of a new unit in a new or existing building.

This measure was developed to be applicable to the following program types: TOS and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be a highefficiency air-, water-, or evaporatively cooled air conditioner that exceeds both the full load and part load efficiencies associated with the applicable code described in the Definition of Baseline Equipment.Federal Energy Conservation Efficiency Standards.

Federal Energy Conservation Efficiencyci Standards (effective January 2013/2023)²⁵³

DEFINITION OF BASELINE EQUIPMENT

I

TOS, New Construction: In order for this characterization to apply, the baseline equipment is assumed to be a standard-efficiency air-, water, or evaporatively cooled air conditioner that meets

²⁵³ DOE|Title10,Part 431|https://www.ecfr.gov/current/title-10/chapter-II/subchapter-D/part-431

Appendix H - TRM - Vol. 2: C&I Measures

the 2015 IECC energy efficiency requirements, effective January 1, 2024. Federal Energy ConservationEfficiency Standards.

Retrofit, Early Replacement: For this characterization to apply, the existing equipment is working with a -remaining useful life. The efficiency is the actual if known, else the standard efficiency when manufactured. After, remaining useful life period, the baseline is the Time of Sale baseline meeting the Federal Energy ConservationEfficiency Standards.Prior to January 1, 2024, the applicable baseline is assumed be similar equipment meeting the energy efficiency requirements of local building code. When local code does not exist, use of IECC 2012 is defined as the building code baseline

The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.254

DEEMED MEASURE COST

For analysis purposes, the incremental capital cost for this measure is assumed The incremental capital cost for this measure is assumed to be \$100-104 per ton_per SEER or IEER unit increase over the base case efficiency for air-cooled units.²⁵⁵

The incremental cost for all other equipment types should be determined on a site-specific basis.

For a 144,000 BTUh, 16.2 IEER air source packaged air conditoner without heat, the incremental

<u>cost is:</u>

<u>12 tons x (16.2 IEER – 14.2 IEER) x 104 = 2,496</u>

Cooling BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

For units with cooling capacities less than 65 kBtu/hr:

 ²⁵⁴ ASHRAE, Chapter 38: Owning and Operating Costs, Table 4, "Heating, Ventilating and Air Conditioning Applications", (2023 edition) for commercial roof top air conditioners, single zone or multi zone, Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007.
 ²⁵⁵ AESC Inc, ASK Energy Inc, SDGE, "Industry Standard Practice Study of Commercial Unitary Air Conditioning and Heat Pumps Systems", page 36 (September 2021) https://www.caetrm.com/media/referencedocuments/Unitary_HVAC_ISP_Report_Final.pdfBased on a review of TRM incremental cost assumptions from

Vermont, Wisconsin, and California. This assumes that baseline shift from between IECC versions carries the same incremental costs. Values should be verified during evaluation.

 Formatted: Subscript

 $^{^{256}}$ SEER to SEER2 conversion factor: SEER2 = SEER x 96%. Conversion factor for SEER to SEER2 is used when converting an existing system that is rated in SEER to SEER2. This is to meet the DOE M1 CFR Standard beginning January 1, 2023. The efficiency levels of the existing, baseline, and efficient case must be expressed in the same metrics (e.g., both SEER or SEER2) before applying formulas.

MEASURE CODE:

2025 MEEIA 4 Plan MEEIA 2019-21 Plan Revision 5.0

2.5.89 High Volume Low Speed Fans

DESCRIPTION

The measure applies to $\frac{2016}{2}$ -24 foot diameter horizontally mounted ceiling high volume low speed (HVLS) fans that are replacing multiple non HVLS fans that have reached the end of useful life.

This measure was developed to be applicable to the following program types: TOS and RF_{\perp} if applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be classified as HVLS and have a VFD. 258

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline condition is assumed to be multiple non HVLS existing fans that have reached the end of useful life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years. 259174

DEEMED MEASURE COSTT

The incremental capital cost for the fans are as follows:-¹⁷⁴

Fan Diameter Size (feet)	Incremental Cost ²⁶⁰
<u>16</u>	<u>\$4,072</u>
<u>18</u>	<u>\$4,110</u>
20	\$4150
22	\$4180
24	\$4225

2.5.<u>910</u> Chiller Tune Up

DESCRIPTION

This measure is the tune-up of an existing air-cooled or water-cooled electric chiller. The tune-up consists of tube cleaning, chilled and condenser water temperature adjustments, and reciprocating compressor unloading switch adjustments.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is an existing chiller post tune-up.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is an existing chiller prior to receiving the tune-up.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected lifetime of the measure is 5 years.

DEEMED MEASURE COST

The incremental cost for this measure varies. Use actual cost.

DEEMED O&M COST ADJUSTMENTS

There are no expected O&M cost adjustments for this measure.

BASELINE EFFICIENCY VALUES BY CHILLER TYPE AND CAPACITY

Refer to 2012 IECC Minimum Efficiency Requirements in Reference Tables section of this measure.

Page 139

Appendix H - TRM – Vol. 2: C&I Measures

ESF = Energy savings factor (= 0.0805)

For example, energy savings for the tune-up of a 350-ton chiller with an IPLV of .540_kW/Ton serving a Medium Office in St Louis is calculated as:

 $\Delta kWh = TONS * IPLV BASE * EFLH * ESF = 350 * .540 * 1386 * 0.08-05 = 2013,956098$ kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS²⁶⁵

 $\Delta kW = \Delta kWh - x CF$

Where:

 $\Delta kWh = Electric energy savings, as calculated above$

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = for Cooling (0.0009106840²⁶⁶)

For example, demand reduction for the tune-up of the above chiller resulting in 20,956 kWh of energy savings is calculated as:

 $\Delta kW = 20,956 \text{ kWh} \underline{*x} 0.0009106840 = 19.08 \text{ kW}$

NATURAL GAS ENERGY SAVINGS

= 12 / EER
= 12 / (COP x 3.412)
= EER / 3.412
= 12 / (kW/ton) / 3.412
= 12 / kW/ton
= COP x 3.412

2012 IECC Baseline Efficiency Values by Chiller Type and Capacity²⁶⁷

²⁶⁷ Note: Efficiency requirements depend on the path (Path A or Path B) that the building owner has chosen to meet compliance requirements. For air cooled and absorption chillers, Path A should be assumed. For water cooled chillers, the building owner should be consulted, and the relevant path used for calculations. When unknown, Path A should be used.

2.5.11 Efficient Heat RejectionCooling Towers

Description

This measure characterizes the replacement of cooling towers used for heat rejection with an efficient cooling tower. The measure is applicable to open circuit, closed circuit cooling towers and fluid coolers.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is an existing chiller post tune up.a replacement cooling tower exceeding the 2021 IECC efficiency for heat rejection equipment, listed in the following table.

EquipmentCooling Tower	Rating Condition	Minimum	•	Formatted: Font: 11 pt, Font color: Background 1

Ameren Missouri

EER= 12 / kW/tonEER= COP x 3.4122.5.1011 Efficient Cooling Towers

DESCRIPTION

This measure characterizes the replacement of cooling towers used for heat rejection with an efficient cooling tower. The measure is applicable to open circuit, closed circuit cooling towers and fluid coolers.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is a replacement cooling tower exceeding the 2021 IECC efficiency for heat rejection equipment, listed in the following table.

Cooling Tower Type	Rating Condition	<u>Minimum</u> Efficiency
Propeller, or axial fan open	95°F entering water	<u>.>40.2 gpm/hp</u>
<u>circuit</u>	85°F leaving water	
	85°F entering WB	
Centrifugal fan open circuit	95°F entering water	<u>.>20.0 gpm/hp</u>
	85°F leaving water	
	85°F entering WB	
Propeller, or axial fan closed	102°F entering water	.>16.1 gpm/hp
<u>circuit</u>	90°F leaving water	
	75°F entering WB	
Centrifugal fan closed circuit	102°F entering water	.>7.0 gpm/hp
	90°F leaving water	
	75°F entering WB	
Propeller, or axial fan dry	115°F entering water	<u>.>4.5 gpm/hp</u>
<u>cooler (fluid cooler)</u>	105°F leaving water	
	95°F entering WB	

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a cooling tower meeting the 2021 IECC efficiency for heat rejection equipment.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT The expected lifetime of the measure is 20 years²⁷⁰

²⁷⁰ ASHRAE, Chapter 38: Owning and Operating Costs, Table 4, "Heating, Ventilating and Air Conditioning Applications", (2023 edition) for galvanized metal cooling towers.

Appendix H - TRM – Vol. 2: C&I Measures

DEEMED MEASURE CO

The incremental cost for this measure varies. Use actual cost.

DEEMED O&M COST ADJUSTMENTS

There are no expected O&M cost adjustments for this measure.

LOADSHAPE

Cooling BUS

<u>Algorithm</u>

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS²⁷¹

$$\Delta kWh = Tons \ x \ 3 \ x \ \left(\frac{1}{(GPM/HP)_{base}} - \frac{1}{(GPM/HP)_{eff}}\right) \ x \ 0.7457x \ EFLH$$

Where:

TONS	= Chiller tons required on design day for HVAC space cooling
	= Average chillers tons required for process heat rejection
3	= Assumed condenser water gpm/ton, use actual if known
GPM/HP _{base}	= 2021 IECC heat rejection efficiency
GPM/HP _{eff}	= Installed cooling tower heat rejection efficiency, use weighted values for
	multiple cooling towers
0.7457	=kW/hp; convert horsepower to kilowatt
EFLH	= Equivalent full load hours (= dependent on location and building type, see table
	2.5 in Appendix H)

For example, energy savings for a three chiller plant, 200 Tons, with two required on design day for a medium office building in St Louis, when efficient axial fan open circuit cooling towers (80 gpm/hp) replace the existing towers is calculated as:

$$\Delta kWh = (200x2)Tons \ x \ 3 \ x \ \left(\frac{1}{40.2} - \frac{1}{80}\right) \ x \ 0.7457 \ x 1386 \ hours$$

 $\Delta kWh = 15,348 \, kWh$

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh \ x \ CF$$

Where:

²⁷¹ Standard condenser water flow sizing of 3 gpm/ton with flow efficiency of two pumps

1

Appendix H - TRM - Vol. 2: C&I Measures

- $\Delta kWh = Electric energy savings, as calculated above$
- <u>CF</u> = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0009106840^{272}

For example, demand reduction for the above cooling tower replacement with 15,348 kWh of energy savings is calculated as: $\Delta kW = 15,348 \text{ kWh x } 0.0009106840 = 13.98 \text{ kW}$

2.5.112 Dedicated Outdoor Systems (DOAS)

DESCRIPTION

This measure promotes the installation of high-efficiency dedicated outdoor systems (DOAS) utilizing direct expansion (DX) cooling (DOAS) to precondition the outside air brought into a building for ventilation.

This measure was developed to be applicable to the following program types: TOS, EREP, RF and NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be a highefficiency dedicated outdoor air system that exceeds Federal Energy Efficiency Standards. The efficiency ratings are assumed to be based on the AHRI920-2020 testing method for ISMRE2 and ISCOP2.

ISMRE2 is the integrated seasonal moisture removal efficiency, pounds of moisture per kilowatthour. ISCOP2 is the integrated seasonal coefficient of performance for heating efficiency. The measure is applicable to DOAS equipment with and without ventilation recovery systems (VERS) with a capacity less than 324 lb of moisture/hour.

Federal Energy Efficiency Standards (effective May 2024) for direct expansion dedicated outdoor air systems.²⁷³

<u>Category</u>	<u>Ventilation</u> <u>Recovery System</u>	Efficiency
Air Conditioning	No	3.8 ISMRE2
Air Conditioning	VERS	5.0 ISMRE2
Air source heat pump	No	<u>3.8 ISMRE2</u> 2.05 ISCOP2
Air source heat pump	VERS	5.0 ISMRE2 3.2 ISCOP2
Water cooled	<u>No</u>	<u>4.7 ISMRE2</u>
Water cooled	VERS	5.1 ISMRE2
Water source heat pump	No	<u>3.8 ISMRE2</u> 2.13 ISCOP2
Water source heat pump	VERS	4.6 ISMRE2 4.04 ISCOP2

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment for all program types is assumed to be a standard-efficiency DOAS, without a ventilation.

²⁷³ DOE CFR::429,431, Effective May 2024, https://www.federalregister.gov/documents/2022/11/01/2022-23185/energy conservation-program-energy-conservation-standards-for-direct-expansion-dedicated-outdoor-air Formatted: Font color: Text 1

Page 151

Formatted: Font: (Default) Times New Roman

Appendix H - TRM - Vol. 2: C&I Measures

The rating conditions for the baseline and efficient equipment efficiencies must be equivalent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years²⁷⁴

DEEMED MEASURE COST

For analysis purposes, the incremental equipment \cos^{275} for this measure is assumed to \$2.00 per CFM for DOAS without VERS, and \$4.6 per CFM for DOAS with VERS.

LOADSHAPE

Cooling BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \Delta kWh_{dehumidification, cooling} + \Delta kWh_{heating}$

For dehumidification energy savings or dehumidification with cooling:

 $\Delta kWh = MRC x (1/ISMRE2_{base} - 1/ISMRE2_{EE}) x EFLH_{DOAS}$

For units with heat pump heating:

 $\Delta kWh = KBTU/hr x (1/(ISCOP_{base} x 3.412) - 1/(ISCOP_{EE} x 3.412) x EFLH_{DOAS})$ Where:

MRC

<u>MRC</u>	= Moisture removal capacity, lb/hour	+
	=AHRI rating or manufacturer specification if installed system	
ISMRE2 _{base}	= Integrated seasonal moisture removal efficiency of the baseline equipment	
	=Federal code compliant system of same category, capacity without VERS	
ISMRE2 _{EE}	= Integrated seasonal moisture removal efficiency of the efficient equipment	
	<u>=Actual</u>	
EFLH _{DOAS}	= Effective full load hours for dehumidification or dehumidify with cooling	
	= Actual, or from table below by city, and operating schedule

Appendix H - TRM - Vol. 2: C&I Measures

2.6.1 Fluorescent Delamping

DESCRIPTION

This measure entails the permanent removal of an existing 4 foot or 8 foot T8 lamp and the associated lamp holders and ballasts from the fixture. Customers are responsible for determining whether or not to use reflectors in combination with lamp removal in order to maintain adequate lighting levels. Lighting levels are expected to meet the Illuminating Engineering Society of North America (IESNA) recommended light levels. Unused lamps, lamp holders, and ballasts must be permanently removed from the fixture and disposed of in accordance with local regulations.

This measure was developed to be applicable to RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition will vary depending on the existing fixture and number of lamps removed, however for the purposes of this measure, savings are defined on a per removed lamp basis. The retrofit wattage (efficient condition) is therefore assumed to be zero. <u>It is assumed that this measure is completed with the installation of LED lamps or LED kits.</u>

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a T8 lamp with default wattages provided below.

Deemed Lifetime of Efficient Equipment

The measure life is assumed to be 11 years.²⁸²

DEEMED MEASURE COST

Actual incremental costs should be used if available. For default values, see table below.

Measure	Cost
8-Foot Lamp Removal	\$16.00
4 Foot Lamp Removal	\$12.00
8 Foot Lamp Removal with reflector	\$30.00
4 Foot Lame Removal with reflector	\$25.00

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS²⁸³

²⁸³ <u>Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007</u> (<u>Page C-11)</u>KCP&L measure life assumption.

283- The savings numbers are for the straight lamp removal measures, as well as the lamp removal and install reflector measures.

Appendix H - TRM – Vol. 2: C&I Measures

$\Delta kWh =$	<u>Watts_{base} – Watts_{EE} * Hours * ISR * WHFe 1000</u>
Where:	
Watts _{Base}	= Wattage reduction of lamp removed. Custom input; otherwise, use values in the table below.
Watts _{EE}	=0
Hours	= Average annual lighting hours of use as provided by the customer.
	If unknown, the default value based on Building Type may be selected from the Lighting Reference Table in Section 2.6.
₩HF _e	— Waste heat factor for energy to account for cooling energy savings from light removal is selected from the Lighting Reference Table in Section 2.6 for each Building Type. If building is un-cooled, the
ISR	value is 1.0 and if unknown use C&I Average value. = In Service Rate, 100% since permanent removal is assumed.

T8 Lamp Size	Wattage ²⁸⁴
8-ft T8	38.6
4-ft T8	19.4

Heating Penalty

If electrically heated building:285

$$\Delta kWh_{neatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

Where:

IF_{kWh} = Lighting HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor

²⁴⁴ Default wattage reduction is based on averaging the savings from moving from a 2 to 1, 3 to 2 and 4 to 3 lamp fixture, as provided in the Standard Performance Contract Procedures Manual: Appendix B: Table of Standard Fixture Wattages (https://www.sdge.com/sites/default/files/SDG%_2520B%_2520B%_2520B%_2520B%_2520Fixture%2520Watts_0.pdf http://www.sdge.com/sites/default/files/SDG%_2520Fixture%2520Fixture

2.6.2 High Performance and Reduced Wattage T8 Fixtures and Lamps (Retired, effective)

DESCRIPTION

This measure applies to High Performance T8 (HPT8) lamp/ballast systems that have higher lumens per watt than standard T8 systems. This measure applies to the installation of new equipment with efficiencies that exceed that of the equipment that would have been installed following standard market practices and is applicable to time of sale as well as retrofit measures. Retrofit measures may include new fixtures or relamp/reballast measures. In addition, options have been provided to allow for the "Reduced Wattage T8 lamps" or RWT8 lamps that result in relamping opportunities that produce equal or greater light levels than standard T8 lamps while using fewer watts.

This measure was developed to be applicable to the following program types: TOS, RF, and DI. If applied to other program types, the measure savings should be verified.

The measure applies to all commercial HPT8 installations excluding new construction and major renovation or change of use measures (see lighting power density measure). Lookup tables have been provided to account for the different types of installations. Whenever possible, actual costs and hours of use should be utilized for savings calculations. Default new and baseline assumptions have been provided in the reference tables. Default component costs and lifetimes have been provided for O&M calculations. Please see the Definition Table to determine applicability for each program. HPT8 configurations not included in the TRM may be included in custom program design using the provided algorithms as long as energy savings is achieved.

The following table defines the applicability for different programs:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)	
This measure relates to the installation of new	This measure relates to the replacement of existing	Form
equipment with efficiency that exceeds that of	equipment with new equipment with efficiency that

applications use this system paired with	lumen equivalent applications where total system	
qualifying high ballast factor ballasts and high	wattage is reduced when calculated using the	
performance 32 w lamps. Custom lighting	calculation of savings algorithms.	
designs can use qualifying low, normal or high ballast-factor ballasts and qualifying lamps in lumen equivalent applications where total system wattage is reduced when calculated using the calculation of savings algorithms.	High efficiency troffers (new/or retrofit) utilizing HPT8 technology can provide even greater savings. When used in a high-bay application, high performance T8 fixtures can provide equal light to HID high-bay fixtures, while using fewer watts; these systems typically utilize high ballast factor ballasts, but qualifying low and normal ballast factor ballasts may be used when appropriate light levels are provided and overall wattage is reduced.

DEFINITION OF EFFICIENT EQUIPMENT

This characterization assumes the efficient condition for all applications are qualifying HP or RWT8 fixture and lamp/ballast combinations listed on the CEE website under qualifying HP T8 products²⁸⁸ and qualifying RWT8 products.²⁸⁰

The definition of efficient equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)	
High efficiency troffers combined with high	High efficiency troffers (new or retrofit kits)	Formatted: Font color: Background 2
efficiency lamps and ballasts allow for fewer	combined with high efficiency lamps and ballasts

High efficiency troffers must have a fixture	lumen output. High efficiency troffers must have a	
efficiency of 80% or greater to qualify.	fixture efficiency of 80% or greater to qualify.	
High bay fixtures must have fixture efficiencies	High bay fixtures will have fixture efficiencies of	
of 85% or greater.	85% or greater.	
		 Formatted: Font color: Background 2

DEFINITION OF BASELINE EQUIPMENT

The definition of baseline equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install (DI)	
The baseline is standard efficiency T8	The baseline is the existing system.	 Formatted: Font color: Background 2
systems that would have been	In July 14, 2012, federal standards were enacted that were	
installed. The baseline for high bay	expected to eliminate T12s as an option for linear fluorescent	
fixtures is pulse start metal halide	fixtures. However, due to significant loopholes in the	
fixtures.	legislation, T12 compliant product is still freely available.	

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The deemed lifetime of efficient equipment varies based on the program and is defined below:

Time of Sale (TOS)	Retrofit (RF) and Direct Install	
	(DI)	
Fixture lifetime is 15 years. ²⁹⁰	Fixture lifetime is 15 years.	Formatted: Font color: Background 2
Fixture retrofits which utilize RWT8 lamps have a lifetime	Note, since the fixture lifetime is	
equivalent to the life of the lamp, capped at 15 years. There is	deemed at 15 years, the replacement

²⁹⁴ Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy. Efficiency (CEE) Commercial Lighting Qualifying Product Lists. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline and efficient measure cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. See "HPT8 TRM Reference Tables.xlsx" for more information and specific product links. Currently, 25WT8 are not considered under this measure as their lower light trade off and limitations on temperature and dimming have caused most distributers/contractors to use 28W almost exclusively in other markate.

MEASURE CODE:

2.6.<u>1</u>³ LED Bulbs and Fixtures (<u>Available for Income Eligible and BSS programs</u>)

DESCRIPTION

The installation of Light Emitting Diode (LED) lighting systems have comparable luminosity to incandescent bulbs and equivalent fluorescent lamps at significantly less wattage, lower heat, and with significantly longer lifetimes.

This measure provides savings assumptions for a variety of <u>light emitting diode (LED)</u> -efficient lighting <u>fixtures</u>-including <u>lamps</u>, <u>bulbs</u>, <u>fixtures</u>, and <u>retrofit kits</u> <u>internal and ext</u>. The effective <u>useful life varies dependent on the lighting category</u> ernal LED fixtures, recess (troffer), canopy, and pole fixtures as well as refrigerator and display case lighting.

This measure was developed to be applicable to the following program types: TOS<u>, EREP, and</u> RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, all LED <u>bulbs</u>, <u>lamps</u>, <u>fixtures</u>, <u>retrofit kits</u> <u>fixtures</u> are <u>assumed</u> to be certified or registered with <u>a at least one</u> recognized <u>independent</u> agency. The following tables lists the requirements for <u>two-three of those</u> agencies.

Agency	Requirement	Version	Lighting Types	-
Design Lights Consortium designlightsDesignlights.org	DLC Listed	Technical requirement versions: 4.0 to current Premium or Standard classification	Lamps <u>lamps</u> , fixtures, retrofit kits, LLLC	
Design Lights Consortium designlightsDesignlights.org	DLC Hort	Technical requirement versions: 1.0 to current	Agricultural horticulturallighting	•
ENERGYSTAR EnergystarEnergystar.gov	Certified	Version 2.1 to current	Lampslamps, fixtures	4
<u>UL Solutions</u> <u>Ul.com</u>	<u>Certified</u>	<u>UL Mark</u>	<u>lamps, fixtures,</u> <u>retrofit kits,</u> <u>horticultural, LLLC</u>	•

ENERGY STAR[®] labeled or on the Design Light Consortium qualifying fixture list.²⁹⁵

LED Fixtures and Retrofit Kits with Network Controls achieve additional savings similar to the savings described in the Occupancy Controls section.

DEFINITION OF **BASELINE EQUIPMENT**

For TOS and RF and EREP installations, the baselines efficiency case is project specific and is determined using actual fixture types and counts from the existing space baseline is the lamp or fixture being replaced. The existingFor linear fluorescent fixtures, the end connectors and ballasts

²⁹⁵ Design Lights Consortium Qualified Products Lis <u>https://www.designlights.org/qpl</u> t http://www.designlights.org/qpl.

Appendix H - TRM – Vol. 2: C&I Measures

must be completely removed to qualify when retrofitting. A midlife baseline adjustment occurs at the end of the remaining useful life, approximated at 1/3 of the EUL. For

Where the installation technology is not known, the assumed baselines condition for an outdoor pole/arm, wall-mounted, garage/canopy fixture and high-bay luminaire with a high intensity discharge light source is a metal halide fixture. Deemed fixture wattages are provided in-<u>Table 2</u>, <u>LED New and Baseline AssumptionsTable 2 LED New and Baseline AssumptionsTable 2 LED New and Baseline Assumptions: reference tables at the end of this characterization.</u>

For TOS installations, the baseline is determined by the Federal Energy-Conservation Efficiency Standards, expressed in minimum lumens per watt.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

Actual incremental costs should be used if available. For default values, refer to the reference tables below.

LOADSHAPE

Lighting BUS Ext Lighting BUS Miscellaneous BUS

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} + x Hours + x WHF_e + x ISR$

Where:

Watts _{Base}	= Actual wattage of the existing or baseline system. Reference the
	"LED New and Baseline Assumptions" table for default values.
Watts _{EE}	= Actual wattage of LED fixture purchased / installed. If unknown,
	use default provided in "LED New and Baseline Assumptions."
Hours	= Average annual lighting hours of use as provided by the customer
	or selected from the Lighting Reference Table in Section 2.6 by
	Building Type. If hours or Building Type are unknown, use the C&I
	Average value.
WHFe	= Waste heat factor for energy to account for cooling energy savings
	from efficient lighting is selected from the Lighting Reference Table

2025 MEEIA 4 Plan MEEIA 2019-21 Plan Revision 5.0

Page 170

Formatted: Font color: Text 1
Formatted: Font color: Text 1

ISR

Appendix H - TRM – Vol. 2: C&I Measures

in Section 2.6 for each Building Type. If building is un-cooled, the value is 1.0.

= In Service Rate represents the percentage of reported lamps or fixtures that is installed and operating and varies with the program delivery approach. Use 100% for programs with direct installation and/or installation verification procedures (e.g., verification inspections for a sample of projects); use 98.7% for program delivery without installation verification.²⁹⁶ The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

seeNote that LED Fixtures and Retrofit Kits with Network Controls achieve additional savings similar to the savings described in the Occupancy Controls section.

Heating Penalty:

If electrically heated building:297

 $\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} + X Hours + X ISR * (-IF_{kWH})$ Where:

 $IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.$

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

CF

= Summer peak coincidence demand (kW) to annual energy (kWh) factor

 $= 0.0001899635^{298}$ for indoor lighting

= 0.0000056160 for exterior lighting

= 0.0001379439 for exterior 24/7 lighting

NATURAL GAS ENERGY SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):

Formatted: Left, Indent: Left: 0", Don't keep lines together

²⁹⁶ ISR is based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015 and consistent with other program ISR in neighboring states (Illinois and Iowa). These evaluation results are from a retail based lighting program with multiple delivery channels including point-of-sale markdown, online website, coupons, and social marketing distribution.

²⁹⁷ Negative value because this is an increase in heating consumption due to the efficient lighting.

²⁹⁸ Ameren Missouri TRM Volume 1 - Appendix G: "Table 2 - Commercial and Industrial End Use Category Monthly Shapes and Coincident Peak Factors"

Appendix H - TRM - Vol. 2: C&I Measures

 $\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts.²⁹⁹ This factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

See Reference Tables below for default assumptions.

²⁹⁹ Negative value because this is an increase in heating consumption due to the efficient lighting.

³⁰¹ IL TRM V13, Measure 4.5.4 LED Fixture Wattage, TOS Baseline and Incremental Cost Assumptions", which aggregated data from CLEAResults, DLC, VEIC and others

2025 MEEIA 4 Plan MEEIA 2019-21 Plan-Revision 56.0

³⁰⁰ Watt, lumen, lamp life, and ballast factor assumptions for efficient measures are based upon Consortium for Energy Efficiency (CEE) Commercial Lighting Qualifying Product Lists alongside past Efficiency Vermont projects and PGE refrigerated case study. Watt, lumen, lamp life, and ballast factor assumptions for baseline fixtures are based upon manufacturer specification sheets. Baseline cost data comes from lighting suppliers, past Efficiency Vermont projects, and professional judgment. Efficient cost data comes from 2012 DOE "Energy Savings Potential of Solid State Lighting in General Illumination Applications," Table A.1. See "LED Lighting Systems TRM Reference Tables.xlsx" for more information and specific product links.

Replacement	Lamp						\$62.50		\$58.00	Libblest.

³⁰² Costs are based on actual costs, and measure lives are based on analysis of actual lamp life and hours of use. Costs for baseline and LED lamps sourced from Illinois TRM V13, which aggregated data from the Design Light Consortium (DLC) Qualifying Product Lists, Efficiency Vermont projects, PGE refrigerated case study. Ists

2.6.24 LED Screw Based Omnidirectional Bulb (Retired Available for Income Eligible and BSS programs, effective 8/1/2023).³⁰³

DESCRIPTION

LEDs lighting systems convert electricity to light and emit more lumens per watt when compared to baseline EISA incandescent, halogen, or compact fluorescent lamps.

This specific characterization provides savings assumptions for LED lamps that replace standard screw-in connections (e.g., A-Type lamp) such as interior/exterior omnidirectional bulb options.

This characterization assumes that the LED is installed in a commercial location. This is, therefore, appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the residential versus nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W in 2013 and 60W and 40W in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new LED screw-based lamps must be ENERGY STAR[®] qualified based upon the ENERGY STAR[®] specification v2.0 which will become effective on 1/2/2017 (https://www.energystar.gov/sites/default/files/Luminaires%20V2%200%20Final.pdf).

Qualification could also be based or on the Design Light Consortium's qualified product list.304

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent.³⁰⁵ A midlife adjustment example is provided but not applied to measures installed prior to 2022.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

⁴⁰⁴ "Retire" indicates that the measure is not anticipated to be offered through an Ameren Missouri-administered demand-side program during the period of TRM effectiveness.
 ³⁰⁴ <u>https://www.designlights.org/QPL</u>

Formatted: Font color: Blue

Formatted: Font color: Background 2

³⁰⁵ A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$\Delta kWh =$	$Watts_{Base} - Watts_{EE}$	* Hours * WHF _e * ISR
	1000	* 110013 * W111 _e * 15K

Where:

Watts _{Base}	= Based on lumens of LED bulb installed
Watts _{EE}	= Actual wattage of LED purchased/installed. If unknown, use
	default provided below. ³⁰⁷
Hours	= Average hours of use per year as provided by the customer or
	selected from the Lighting Reference Table in Section 2.6 and based
	upon Building Type. If unknown, use the C&I Average value.
WHFe	= Waste heat factors for energy to account for cooling energy savings
	from efficient lighting are provided for each Building Type in the
	Lighting Reference Table in Section 2.6. If unknown, use the C&I
	Average value.
ISR	= In-Service Rate represents the percentage of reported lamps or
	fixtures that is installed and operating and varies with the program
	delivery approach. Use 100% for programs with direct installation
	and/or installation verification procedures (e.g., verification
	inspections for a sample of projects); use 98.7% for program delivery

Lower Lumen **Upper Lumen** Watts_{EE} LED **Delta Watts** WattsBase Range Range 250 309 25 4.0 21 310 749 29 6.7 22.3 750 1,049 43 10.1 32.9 1,050 1,489 53 12.8 40.2 1,490 2,600 72 17.4 54.6 2,601 3,000 150 43.1 106.9 3,001 3,999 200 53.8 146.2 4,000 6,000 300 76.9 223.1

without installation verification.³⁰⁸ The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

Mid-Life	Baseline	Ad	ustment	Example

During the lifetime of a standard omnidirectional LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. Since the baseline bulb changes to a CFL equivalent in 2020 due to the EISA backstop provision (except for <310 and 2600+ lumen lamps), the annual savings claim must be reduced within the life of the measure to account for this baseline shift. This reduced annual savings will need to be incorporated in to cost effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

For example, for 43W equivalent LED lamp installed in 2016, the full savings (as calculated above in the Algorithm) should be claimed for the first four years, but a reduced annual savings (calculated energy savings above multiplied by the adjustment factor in the table below) should be claimed for the remainder of the measure life.^{309&310}

2025 MEEIA 4 Plan MEEIA 2019-21 Plan Revision 56.0

Formatted: Font color: Auto

³⁰⁸ ISR is based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. This value takes into account the time-delay of when bulbs are installed over subsequent program years. The reported ISR is based on the net present value (NPV) of the savings over 4 year installation period from the PY15 bulbs, discounted back to Year 1 at 6.95% (utility discount rate). These evaluation results are from a retail-based lighting program with multiple delivery channels including point-of-sale markdown, online website, coupons, and social marketing distribution.

³⁰⁹ These adjustments should be applied to kW and gas impacts as well.

³¹⁰ Calculated with EISA requirement of 45lumens/watt.

Appendix H - TRM – Vol. 2: C&I Measures

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the falling EISA-Qualified backdrop provision, an equivalent annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. The key assumptions used in this calculation are documented below:³¹³

ļ	Incandescent / Halogen	CFL	LED ALamp
	¢1.90	\$2.20	\$5.06
	\$1.80	\$2.20	\$5.06

The present value of replacement lamps and annual levelized replacement costs using utilities' average real discount rate of 6.91% are presented below:

Location	PV of repl	acement costs	for period	Levelized ann	ual replaceme	replacement cost savings				
Location	2016 - 2017	2017 - 2018	2018 - 2019	2016 - 2017	2017 - 2018	2018 - 2019				
C&I Average	\$18.66	\$14.70	\$10.46	\$2.04	\$1.60	\$1.14				

Note: incandescent lamps in lumen range <310 and >2600 are exempt from EISA. For these bulb types, an O&M cost should be applied as follows. If unknown Building Type, assume C&I Average:

³¹³ All cost assumptions based on Cadmus "LED Incremental Cost Study: Overall Final Report," February 2016 page 19, https://ma-eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study_FINAL_01FEB2016.pdf (http://ma.eeac.org/wordpress/wp-content/uploads/MA-Task-5b-LED-Incremental-Cost-Study_FINAL_01FEB2016.pdfeeac.org/wordpress/wp_content/uploads/MA_Task_5b_LED_Incremental_Cost-Study_FINAL_01FEB2016.pdf, p.19.

Appendix H - TRM – Vol. 2: C&I Measures

2.6.5 T5 Fixtures and Lamps (Retired, effective xxx)-316

DESCRIPTION

T5 HO lamp/ballast systems have greater lumens per watt than a typical T8 system. The smaller lamp diameter of the T5HO also increases optical control efficiency and allows for more precise control and directional distribution of lighting. These characteristics make it easier to design light fixtures that can produce equal or greater light than standard T8 or T12 systems, while using fewer watts. In addition, when lighting designers specify T5 HO lamps/ballasts, they can use fewer luminaries per project, especially for large commercial projects, thus increasing energy savings further.³⁴⁷

The main markets served by T5 HO fixtures and lamps include retrofit in the commercial and nonresidential sector, specifically industrial, warehouse, and grocery facilities with higher ceiling heights that require maximum light output.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The definition of the efficient equipment is T5 HO high bay (>15ft mounting height) fixtures with 3, 4, 6, or 8 lamp configurations.

DEFINITION OF BASELINE EQUIPMENT

The definition of baseline equipment varies based on number of lamps in a fixture and is defined in the baseline reference table at the end of this characterization. The default baseline is assumed to be a PulseStart Metal Halide fixture.

Deemed Lifetime of Efficient Equipment

The deemed lifetime of the efficient equipment fixture is 15 years.³¹⁸

DEEMED MEASURE COST

Actual costs should be used if available. If not available, \$10/lamp and \$37.50/ballast can be used to account for installation labor costs.

2.6.36 LED Exit Sign (Available for Income Eligible and BSS programs)

This measure characterizes the savings associated with installing a new LED exit sign (or retrofit kit) in place of a CFL or incandescent exit sign in a commercial building. LED exit signs use less power (\leq 5 watts), have a significantly longer lifetime, and have less maintenance costs compared to incandescent or CFL exit signs.326

This measure applies to the following program types: RF and DI.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is an LED exit sign with an input power demand of 5 watts or less.³²⁷

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is the existing exit sign (either a CFL or incandescent unit).

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

Actual program delivery costs should be used if available. If not, use the full cost of \$39328 for a new LED exit sign and \$25 for a retrofit kit, plus \$6.25 in labor, 329 for a total measure cost of \$45.25 and \$31.25, respectively.

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

The annual O&M cost adjustment savings should be calculated using the following component costs and lifetimes.

Component	Baseline Measure			
Component	Cost ³³⁶	Life (yrs) 337		
CFL lamp	\$8.91	0.63 years		
Incandescent lamp	\$7.39	0.14 years		

Formatted Table

MEASURE CODE:

³³⁵ Negative value because this is an increase in heating consumption due to the efficient lighting.

³³⁶ Includes cost of labor and new replacement bulb. Labor cost of \$6.25 based on 15 minutes (including portion of travel time) and \$25 per hour, which is in line with the typical prevailing wage of a General Laborer, as per the Annual Wage Order No. 23 published by the Missouri Department of Labor. Cost of new 7W CFL bulb is \$2.66, from Itron "2010-2012 WO017 Ex Ante Measure Cost Study Final Report." Prepared for California Public Utilities Commission, May 27, 2014.
³³⁷ ENERGY STAR[®] "Save Energy, Money and Prevent Pollution with LED Exit Signs" states that CFL bulbs for exit signs typically have an average rated life of 5,000-6,000 hours. Given 24/7 run time, assume a CFL in an exit sign will require replacement

every 0.63 years (5,500 hours/8,766 hours).

2.6.<u>4</u>7 LED Specialty Lamp (Retired<u>Available for Income Eligible and BSS programs, effective 8/1/2023</u>) ³³⁸

DESCRIPTION

This characterization provides savings assumptions for LED directional, decorative, and globe lamps. This characterization assumes that the LED is installed in a commercial location. This is therefore appropriate for commercially targeted programs, or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program), utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the EISA requires all general-purpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard.

A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL. However, in 2019, the Department of Energy issued two final rules and clarified that a) the EISA backstop provision had not been triggered and therefore b) the efficiency standard would not change in 2020. As of 10/15/2020, the 45 lumen per watt EISA standard is not effective.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new lamps must be ENERGY STAR[®] labeled based upon the ENERGY STAR[®] specification v2.0 which will become effective on 1/2/2017.<u>https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2_0%20 Revised%20AUG-2016.pdf(https://www.energystar.gov/ia/partners/prod_development/revisions/downloads/eps_spec_v2.pdf). Qualification</u>

could also be based on the Design Light Consortium's qualified product list.³³⁹

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be an EISA-qualified halogen or incandescent.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group. DEEMED MEASURE COST

* "Retire" indicates that the measure is not anticipated to be offered through an Ameren Missouri-administered demand-side rogram during the period of TRM effectiveness. https://www.designlights.org/OPL

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * WHF_e * ISR$$

Where:

Watts _{Base}	= Based on bulb type and lumens of LED bulb installed. See table
	below.
Watts _{EE}	= Actual wattage of LED purchased / installed - If unknown, use default
	provided below: ³⁴¹
Hours	= Average hours of use per year as provided by the customer or selected
	from the Lighting Reference Table in Section 2.6 and based upon
	Building Type. If unknown, use the C&I Average value.
WHFe	= Waste heat factors for energy to account for cooling energy savings
	from efficient lighting are provided for each Building Type in the

³⁴⁰ Incandescent based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report," Itron, February 28, 2014. LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail co was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications," Table A.1) used to decrease the cost for a 2017 TRM assumption (see 2015 LEE Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle.

³⁴¹ WattsEE defaults are based upon the average available ENERGY STAR[®] product, accessed 06/18/2015. For any lumen rang where there is no ENERGY STAR[®] product currently available, WattsEE is based upon the ENERGY STAR[®] minimum luminou efficacy (55Lm/W for lamps with rated wattages less than 15W and 65 Lm/W for lamps with rated wattages \geq 15 watts) for th mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx." These assumptions should be reviewer regularly to ensure they represent the available **product**.

Appendix H - TRM – Vol. 2: C&I Measures

Lighting Reference Table in Section 2.6. If unknown, use the C&I Average value.

ISR = In Service Rate represents the percentage of reported lamps or fixtures that is installed and operating and varies with the program delivery approach. Use 100% for programs with direct installation and/or installation verification procedures (e.g., verification inspections for a sample of projects); use 98.7% for program delivery without installation verification.³⁴² The ISR may also be set to 100% if the installation verification is embedded in other evaluation adjustments.

Bulb Type	Lower Lumen Range	Upper Lumen Range	WattsBase	Watts _{EE}	Delta Watts
	250	349	25	5.6	19.4
	350	399	35	6.3	28.7
District	400	599	40	7.5	32.5
Directional	600	749	60	9.7	50.3
	750	999	75	12.7	62.3
	1000	1250	100	16.2	83.8
	70	89	10	1.8	8.2
	90	149	15	2.7	12.3

Heating Penalty:

If electrically heated building:³⁴³

$$\Delta kWh_{heatpenalty} = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{kWH})$$

³⁴² Based on results presented in Ameren Missouri Lighting Impact and Process Evaluation: Program Year 2015. This value taker into account the time-delay of when bulbs are installed over subsequent program years. The reported ISR is based on the net present value (NPV) of the savings over 4 year installation period from the PY15 bulbs, discounted back to Year 1 at 6.95%

(utility discount rate). These evaluation results are from a retail-based lighting program with multiple delivery char

⁴³ Results in a negative value because this is an increase in heating consumption due to the efficient lighting

Appendix H - TRM - Vol. 2: C&I Measures

Where:

 IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon Building Type. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh * CF$

Where:

 $\begin{array}{ll} \text{CF} & = \text{Summer peak coincidence demand (kW) to annual energy (kWh) factor} \\ & = 0.0001899635^{\underline{344}} \text{ for indoor lighting} \\ & = 0.0000056160 \text{ for exterior lighting} \\ & = 0.0001379439 \text{ for exterior } 24/7 \text{ lighting} \end{array}$

Other factors as defined above.

NATURAL GAS SAVINGS

Heating penalty if fossil fuel heated building (or if heating fuel is unknown):³⁴⁵

$$\Delta Therms = \frac{Watts_{Base} - Watts_{EE}}{1000} * Hours * ISR * (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Interaction Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Lighting Reference Table in Section 2.6 and based upon Building Type. If unknown, use the C&I Average value.

DEEMED O&M COST ADJUSTMENT CALCULATION

O&M cost should be applied as follows:

³⁴⁴ Ameren Missouri TRM Volume 1 - Appendix G: "Table 2 – Commercial and Industrial End Use Category Monthly Shapes and Coincident Peak Factors"

Page 196

2.6.58 Lighting Power Density (Available for Income Eligible and BSS programs)

DESCRIPTION

This measure entails the installation of efficient lighting systems in either new construction or during substantial renovation of commercial buildings that triggers compliance with code. This methodology applies to situations where code specifies maximum lighting power density allowances (W/ft²). Either the Building Area Method or Space-by-Space (not recognized by IECC 2009) method as defined in IECC 2009, 2012, 2015, 2018, 2021, or 2024 can be used for calculating the Interior Lighting Power Density (LPD).³⁴⁸ The measure consists of a design that has a lower LPD than code requires.

This measure was developed to be applicable to the following program types: NC and TOS. The measure is application for any project for which the project requires compliance with building code. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the lighting system must be more efficient than the baseline energy code maximum lighting power density in watts/square foot for either the interior space or exterior space.

DEFINITION OF BASELINE EQUIPMENT

The baseline is assumed to be the maximum lighting power density that meets the building code recognized by the local jurisdiction. In the absence of local energy building codes, and for areas with an IECC code version prior to 2018, the IECC 2018 is the baseline. For illustrative purposes in this characterization, IECC 2009, 2012, 2015, and 20182018, 2021 and 2024, are highlighted to demonstrate the methodology.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

See Lighting EUL Reference Table for EUL values by Lighting Measure Group.

DEEMED MEASURE COST

The actual incremental cost over a baseline system should be collected from the customer if possible or quantified using an alternative suitable source.

LOADSHAPE

Lighting BUS Ext Lighting BUS Miscellaneous BUS

Algorithm

²⁴⁸ Refer to the referenced code documents for specifics on calculating lighting power density using either the whole building method (IECC) or the Space by Space method (ASHRAE 90.1).

CALCULATION OF SAVINGS

ENERGY SAVINGS

$$\Delta kWh = \frac{WSF_{Base} - WSF_{EE}}{1000} * SF * Hours * WHF_{e}$$

Where:

WSF _{base} WSF _{EE}	 Baseline lighting watts per square foot or linear foot as determined by building or space type. IECC example whole building analysis values are presented in the Reference Tables below.³⁴⁹ The actual installed lighting watts per square foot or linear foot.
SF	= Provided by customer based on square footage of the building area applicable to the lighting design for new building.
Hours	= Annual site-specific hours of operation of the lighting equipment collected from the customer or selected from the Reference Table in Section 2.8 if unavailable.
WHF _e	= Waste Heat Factor for Energy to account for cooling savings from efficient lighting is as provided in the Reference Table in Section 2.8 for each Building Type. If building is not cooled, the value is 1.0.

Heating Penalty

If electrically heated building: 350

$$\Delta kWh_{heatpenalty} = \frac{WSF_{Base} - WSF_{EE}}{1000} * SF * Hours * (-IF_{kWH})$$

Where:

 IF_{kWh} = Lighting-HVAC Interaction Factor for electric heating impacts; this factor represents the increased electric space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Values are provided in the Reference Table in Section 2.8. If unknown, use the C&I Average value.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \Delta kWh * \mathbf{X} CF$$

Where:

CF = Summer peak coincidence demand (kW) to annual energy (kWh) factor = 0.0001899635^{351} for indoor lighting

³⁴⁹ See IECC 20092015, 2012 2018 and 2015 2021 - Reference Code documentation for additional information.

³⁵⁰ Negative value because this is an increase in heating consumption due to the efficient lighting.

³⁵¹ Ameren Missouri TRM Volume 1 - Appendix G: "Table 2 Commercial and Industrial End Use Category Monthly Shapes and Coincident Peak Factors." **Formatted:** Left, Indent: Left: 0", Don't keep lines together

Appendix H - TRM - Vol. 2: C&I Measures

= 0.0000056160 for exterior lighting = 0.0001379439 for exterior 24/7 lighting

Other factors as defined above.

NATURAL GAS ENERGY SAVINGS

Heating interactive loss is calculated as:

$$\Delta Therms = \frac{WSF_{Base} - WSF_{EE}}{1000} * x SF * x Hours * x (-IF_{therms})$$

Where:

IF_{Therms} = Lighting-HVAC Integration Factor for gas heating impacts; this factor represents the increased gas space heating requirements due to the reduction of waste heat rejected by the efficient lighting. Please select from the Reference Table in Section 2.8 for each Building Type.

a. In cases where both a common space type and a building area specific space type are listed, the building area specific space type are listed, the building area specific space type shall apply b. A 'Facility for the Visually Impaired' is a facility that is licensed or will be licensed by local or state authorities for senior long-term care, adult daycare, senior support or people with special visual needs.

The exterior lighting design will be based on the building location and the applicable "Lighting Zone" as defined in IECC 2015 Table C405.5.2(1) which follows. This table is identical to IECC 2012 Table C405.6.2(1) and IECC 2009 Table 505.6.2(1).

LIGHTING ZONE	DESCRIPTION
1	Developed areas of national parks, state parks, forest land, and rural areas
2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use and residential mixed-use areas
3	All other areas not classified as lighting zone 1, 2 or 4
4	High-activity commercial districts in major metropoli- tan areas as designated by the local land use planning authority

TABLE C405.5.2(1) EXTERIOR LIGHTING ZONES

The lighting power density savings will be based on reductions below the allowable design levels as specified in IECC 2009 Table 505.6.2(2), IECC 2012 Table C405.6.2(2) or IECC 2015 Table C405.5.2(2).

MEASURE CODE

Formatted: Line spacing: single

Appendix H - TRM – Vol. 2: C&I Measures

2.6.9 Metal Halide Fixtures and Lamps (Retired, effective)

DESCRIPTION

This measure involves the installation of high efficiency pulse start metal halide fixtures and lamps in place of a standard metal halide. Pulse start metal halide luminaires produce more lumens per watt and have an improved lumen maintenance compared to standard probe start technology. Similarly, the high efficiency pulse start metal halide ballast lasts longer than a standard system due to their cooler operating temperatures.³⁵⁴

This measure was developed to be applicable for the following program type: RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is an EISA compliant pulse start metal halide lamp and ballasts for luminaires. Under 2009 federal rulings metal halide ballasts in low-watt options (150W-500W fixtures) must be pulse start and have a minimum ballast efficiency of 88%.³⁵⁵ Amendments made in 2014 require more stringent energy conservations <u>efficiency</u> standards with compliance required by February 10, 2017.³⁵⁶

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is the existing bulb and fixture. If unknown assume, High Intensity Discharge (HID) Metal Halide lighting with probe start fixture and a standard \leq 400 Watt lamp.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 15 years.357

DEEMED MEASURE COST

Actual costs should be used when available. If unknown, cost is assumed to be \$267.358

LOADSHAPE

Lighting BUS

³⁵⁴Building a Brighter Future: Your Guide to EISA-Compliant Ballast and Lamp Solutions from Philips Lighting: http://1000bulbs.com/pdf/advance%20eisa%20brochure.pdf

³⁴⁵-Under EISA rulings, metal halide ballasts in low-watt options must be pulse start and have a minimum ballast efficiency of 88%. This ruling virtually eliminates the manufacture of probe start (ceramic) fixtures but some exemptions exist including significantly the 150w wet location fixtures (as rated per NEC 2002, section 410.4 (A)). These will be replaced by 150W. Department of Energy — 10 CFR Part 431 — Energy Conservation Program: Energy Conservation Standards for Metal Halide Lamp Fixtures; Final Rule 7746 Federal Register / Vol. 79, No. 27 / Monday, February 10, 2014 / Rules and Regulations https://www.federalregister.gov/articles/2014/02/10/2014-02356/energy-conservation-program-energy-conservation-standardsformetal-halide-lamp fixtures#h-9

The revised 2014 efficiency standards for metal halides require that luminares produced on or after rebrary 10, 2017, must not contain a probe-start metal halide ballast. Exceptions to this ruling include, metal halide luminaires with a regulated-lag ballast that utilize an electronic ballasts which operates at 480V and those which utilize a high-frequency (≥1000Hz) electronic ballasts. Department of Energy — 10 CFR Part 431 — Energy Conservation Program: Energy Conservation Standards for Metal Halide Lamp Fixtures; Final Rule 7746 Federal Register / Vol. 79, No. 27/ Monday, February 10, 2014 / Rules and Regulations https://www.federalregister.gov/articles/2014/02/10/2014_02356/energy_conservation_program_energy_conservation_standardsformetal-halide_lamp_fixtures/th-9

MEASURE CODE:

2.6.610 Occupancy Lighting Sensor Controls Lighting Controls

DESCRIPTION

The lighting controls measure is applicable to the installation of occupancy sensors, daylighting sensors, networked lighting controls (NLC) and luminaire level lighting controls (LLLC). Occupancy sensors are devices that reduce lighting levels by turning lights on or off in response to the presence (or absence) of people in a defined area. Associated energy savings depends on the Building building Typetype, location area covered, type of lighting-and, activity, and-occupancy pattern and control strategies.³⁶⁵

This measure relates to the installation of interior occupancy sensors on new fixtures in an existing lighting system. lighting controls with a new or existing interior lighting system, that are not required by local building energy codes. Lighting control types covered by this measure include remote-mounted and fixture mounted. It does not cover automatic photo sensors, time clocks, and energy management systems. All sensors must be hard wired and control interior lighting.

This measure was developed to be applicable to the following program types: TOS and RF-__If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

It is assumed that this The measure characterization applies to only fixture-mounted occupancy sensors, -and-remote mounted occupancy sensors, networked lighting controls (NLC) and LED fixtures equipped with light level luminaire control (LLLC). For LLLC fixtures, this measure applies to the control strategies (trimming the base wattage, dimming, occupancy, daylighting). The base watt reduction for LLLC fixtures over the existing or code based fixture is not characterized by this measure, but by measure 2.6.31 LED Bulbs and Fixtures. Also, not characterized for LLLC fixtures are HVAC temperature and humidity setback sensing.⁺

DEFINITION OF BASELINE EQUIPMENT

The baseline efficiency case assumes lighting fixtures with with no occupancy controls.only manual controls or no controls. When controls are installed with new fixtures, replacing existing fixtures, the controlled wattage is based on the new system.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for all lighting controlsoccupancy sensors and daylight sensor is assumed to be 10 years.³⁶⁶

The expected measure life for NLC and LLLC controls is assumed to align with the fixture life, at 15 years.

2.6.11 Street Lighting (Retired 8/1/2024)

DESCRIPTION

This measure characterizes the savings associated with LED street lighting conversions where a LED fixture replaces a high intensity discharge (HID) outdoor lighting system, including metal halide, high pressure sodium, and mercury vapor. LED street lights provide considerable benefits compared to HID lights, including:

- Improved nighttime visibility and safety through better color rendering, more uniform light distribution and elimination of dark areas between poles.
- Reduced direct and reflected uplight which are the primary causes of urban sky glow.
- 40-80% energy savings (dependent on incumbent lighting source).
- 50-75% street lighting maintenance savings.³⁷⁸

This measure includes LED fixture housings including cobrahead and post-top and is applicable only where utility tariffs support LED street lighting conversions.

This measure was developed to be applicable for a one-to-one RF opportunity only.379

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment must be an LED fixture that meets the United Illuminating Rate Schedule, alongside all other luminary performance requirements, based on site characteristics³⁸⁰ and all local, state and federal codes.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is the existing lighting system – a metal halide, high pressure sodium, or mercury vapor outdoor lamp, ballast, and fixture.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 12.5 years.³⁸¹

DEEMED MEASURE COST

Formatted: Font color: Background 2

³⁷⁸-See NEEP "LED Street Lighting Assessment and Strategies for the Northeast and Mid-Atlantic," January 2015, and the Municipal Solid State Street Lighting Consortium for more information

http://www1.eere.energy.gov/buildings/ssl/consortium.html

²⁷⁹⁹ Many light fixtures were placed in service 20–50 years ago and may no longer service their intended purpose. It is important to conduct a comprehensive assessment of lighting needs with a lighting professional when considering a LED street lighting project LED street lighting the measure only characterizes a one-to-one replacement value, it is recommended that this measure be updated following a Missouri assessment to see where LED street lighting has resulted in the removal of street lighting to ensure additional savings calculations are captured. Recommend using Street and Parking Facility Lighting Retrofit Financial Analysis Tool developed by DOE Municipal Solid-State Street Lighting Consortium "Model Specifications for LED Roadway Luminaires v.2.0," July 2014.

³⁸¹ The measure lifetime is calculated using 4,000 annual hours of use from Ameren Missouri "Light Emitting Diode (LED) Stree and Area Lighting Report," July 2013 (page 10) and a typical LED streetlight lifetime of 50,000 hours from Massachusetts Department of Energy Resources "LED Streetlights: What is Your Plan? (page 28_webinar)," September 11, 2013.

Appendix H - TRM - Vol. 2: C&I Measures

Actual measure installation cost should be used, including material and labor.³⁹² If the actual cost of the LED unit is unknown, use the default values for typical LED streetlight retrofits provided below.383

2.7.2 Computer Power Management Software (Retired, effective 1/1/2025)

DESCRIPTION

Computer power management software is installed on a network of computers. This is software which monitors and records computer and monitor usage, as well as allows centralized control of computer power management settings.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is defined by the requirements listed below:

- Allow centralized control and override of computer power management settings of workstations which include both a computer monitor and CPU (i.e. a desktop or laptop computer on a distributed network).
- Be able to control on/off/sleep states on both the CPU and monitor according to the network administrator defined schedules and apply power management policies to network groups.
- Have capability to allow networked workstations to be remotely wakened from powersaving mode (e.g. for system maintenance or power/setting adjustments).
- Have capability to detect and monitor power management performance and generate energy savings reports.
- Have capability to produce system reports to confirm the inventory and performance of equipment on which the software is installed.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF BASELINE EQUIPMENT

Baseline is defined as a computer network without software enforcing the power management eapabilities in existing computers and monitors.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is 4 years.³⁹⁷

DEEMED MEASURE COST

The deemed measure cost is \$29 per networked computer, including labor.³⁹⁸

2.7.3 Heat Pump Pool Heater

DESCRIPTION

This measure applies to the installation of a heat pump pool heater in place of a standard electric pool heater on an outdoor pool at a commercial location.

This measure was developed to be applicable to the following program type: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new heat pump pool heater meeting program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new, standard efficiency electric resistance pool heater.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.403

DEEMED MEASURE COST

The incremental equipment cost difference between an electric resistance pool heater and a heat pump pool heater is \$1,000 per unit.⁴⁰⁴

2.7.<u>1</u>4 Computer Server

DESCRIPTION

This measure estimates savings for an energy efficient computer server with that has been certified by-to_ENERGY STAR[®] (ES) Version 24.0.

This measure was developed to be applicable to the following program type: TOS. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient product is computer server meeting the requirements set forth by ENERGY STAR[®] Version 24.0. The measure characterization includes computer server, blade systems (one or more blade servers), resilient server, and multi-node server. Power supply efficiency must meet the PSU criteria for 10%,20%, 50% and 100% load. The power supply must also meet the power factor criteria for ENERGY STAR[®] Version 4.0. The server must also meet the active state efficiency score requirements, which include the CPU efficiency, memory efficiency and storage efficiency. The table lists the minimum active efficiency by server type and installed processors.²

DEFINITION OF BASELINE EQUIPMENT

Non ENERGY STAR[®] qualified computer server.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The life of this measure is 4 years.407

DEEMED MEASURE COST⁴⁰⁸

The incremental cost is \$9.80. The actual incremental cost of the equipment should be used, if unknown, the following estimates may be used.

<u>Number</u> Installed <u>Processors</u>	<u>Equipment</u>	Incremental cost ⁴⁰⁹
	Rack	\$331
<u>1</u>	Tower	<u>\$323</u>
	Resilient	<u>\$5000</u>
<u>2</u>	Rack	<u>\$452</u>

⁴⁰⁷ Consistent with Energy Star[®] computing equipment. It is important to note that lifetime doesn't necessarily reflect the expected functional lifetime of mechanical components, but rather the lifetime of operating system technology, which is generally assumed to become posolete after a period of four years.

2A_Consumer_Electronics/California_IOUs_Standards_Proposal_Computers_UPDATED_2013-08-06_TN-71813. The small incremental cost is in alignment with Energy Star® reporting, which lists an incremental cost of \$0 for all office

equipment.<u>Online manufacturer website product directory</u>. Base and efficient are same manufacturer, processor quantity ⁴⁰⁹ Internet online manufacturer product pricing difference for rack and tower, resilient and blade servers estimated with ^{20%} incremental cost for ENERGY STAR certified equipment. 2.8 Motors and Pumps

2.8.1 Motors

DESCRIPTION

This measure applies to the one-for-one replacement of an old, working or failed/near failure 1-350 horsepower, constant speed, uniformly loaded HVAC fan or pumping motor with a new motor of the same rated horsepower that meets or exceeds National Electrical Manufacturers Association (NEMA) Premium efficiency levels. <u>The measure includes general purpose</u> motors, induction induction, <u>and</u>-reluctance, electronically commutated, and permanent magnet motors. Fire pump motors are excluded.

This measure was developed to be applicable to the following program type: RF, NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new motor that meets or exceeds NEMA Premium efficiency levels.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment efficiency is the efficiency of the existing motor <u>for early replacements</u>, or <u>if unknown, the federal minimum required efficiency is assumed, the Federal Energy Standards for</u> <u>normal replacements</u>. ⁴¹³

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15-18 years.⁴¹⁴

DEEMED MEASURE COST

Actual incremental costs should be used if available. If actual costs are unknown, use default installed cost from table below.⁴¹⁵

Motor Size (HP)	Installed Cost
1	\$730
1.5	\$725
2	\$800

⁴¹⁸ Hours per year are estimated using the eQuest models as the total number of hours the heating or cooling system is operating for each Building Type. "Heating and Cooling Run Hours" are estimated as the total number of hours fans are operating for heating, cooling and ventilation for each Building Type. This may over claim certain applications (e.g. pumps) and so where possible actual hours should be used for these applications.

possible actual hours should be used for these applications. ⁴¹⁹ Since savings will be constant and without fluctuation over the period of operation, demand savings are simply the energy savings divided by the hours of operation. Demand savings are expected to coincide with peak demand period definitions, consistent with assumptions in VFD measures on HVAC pumps and fans.

MEASURE CODE:

2.8.2 Pool Pump

DESCRIPTION

This measure applies to the installation of a variable frequency drive (VFD) on an existing singlespeed pool pump at a commercial location. VFDs save energy by reducing the speed of the pool pump motor to match the pool's required flow rate. Additionally, VFD's soft-starting extends motor life by reducing wear.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new VFD meeting program requirements. The hydraulic horsepower must exceed 2.5 hhpHHP, which is approximately equal to a 5 hp motor, as their minimum efficiency is regulated by the dedicated pool pump (DPPP) standard.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is an existing, single-speed pool pump without a VFD or other motor control device.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.⁴²¹

DEEMED MEASURE COST

Actual costs (equipment and labor) should be used if available. If actual costs are unknown, assume equipment costs of \$200/motor horsepower and labor cost of \$46.422

2.8.3 Pool Pump Timer

DESCRIPTION

This measure applies to the installation of a pump timer on an existing single-speed pool pump at a commercial location. Many times, it is not necessary to run a pool's circulation pump 24 hours a day.

This measure was developed to be applicable to the following program type: RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new pump timer meeting program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is an existing, single speed pool pump without a VFD or other motor control device.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.

2.8.34 Pump Optimization

DESCRIPTION

Pump improvements can be done to optimize the design and control of centrifugal water pumping systems, including water solutions with freeze protection up to 15% concentration by volume. Other fluid and gas pumps cannot use this measure calculation. The measurement of energy and demand savings for commercial and industrial applications will vary with the type of pumping technology, operating hours, efficiency, and existing and proposed controls. Depending on the specific application slowing the pump, trimming or replacing the impeller may be suitable options for improving pumping efficiency. Pumps up to 40 HP are allowed to use this energy savings calculation. Larger motors should use a custom calculation (which may result in larger savings than this measure would claim).

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is proven to be an optimized centrifugal pumping system meeting the applicable program efficiency requirements:

- Pump balancing valves no more than 15% throttled; and
- Balancing valves on at least one load 100% open.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment is assumed to be the existing pumping system including existing controls and sequence of operations.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.⁴²⁷

DEEMED MEASURE COST

The incremental capital cost for this measure can vary considerably depending upon the strategy employed to achieve the required efficiency levels and should be determined on a site-specific basis.

2.8.45 Variable Frequency Drives for Pumps and Fans on Hydronic HVAC Systems

DESCRIPTION

This measure applies to VFDs installed on HVAC chilled water distribution pumps, hot water distribution pumps, condenser water pumps and cooling tower fans. Back-up pumps/fans do not qualify for this measure. There is a separate measure for HVAC supply and return fans. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure was developed to be applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The VFD is applied to a pump or fan motor that does not have a VFD. The hydronic system that the VFD is applied to must have a variable or reduced load. Installation is to include the necessary control points and parameters (example: differential pressure, differential temperature, return water temperature) as determined by a qualified engineer.

DEFINITION OF BASELINE EQUIPMENT

The time of sale baseline is a new motor installed without a VFD or other methods of control. Retrofit baseline is an existing motor operating as is.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15-15 years.431

DEEMED MEASURE COST

Customer provided costs will be used when available. Default measure costs are listed below for up to 100 hp motors.⁴³² The tables values can also be extrapolated with:

2.8.56 Variable Frequency Drives for HVAC Supply and Return Fans

DESCRIPTION

This measure applies to VFDs installed on HVAC supply fans and return fan. Back-up fans do not qualify for this measure. There is a separate measure for HVAC Pumps. The VFD will modulate the speed of the motor when it does not need to run at full load. Since the power of the motor is proportional to the cube of the speed for these types of applications, significant energy savings will result.

This measure is applicable to the following program types: TOS and RF. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The VFD is applied to an HVAC fan motor that does not have a VFD. The air distribution system must have a variable or reduced load, and installation is to include the necessary control point as determined by a qualified engineer (example: differential pressure, temperature, or volume). Savings are based on the application of VFDs to a range of baseline system conditions, including no control, inlet guide vanes, outlet guide vanes, relief dampers, and throttling valves.

DEFINITION OF BASELINE EQUIPMENT

The TOS baseline is a new motor installed without a VFD or other methods of control. The RF baseline is an existing motor operating as is. RF baselines may or may not include guide vanes, throttling valves, or other methods of control.

Installations of new equipment with VFDs which are required by regional code adoption should not claim savings.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for HVAC application is 15-15 years.441

DEEMED MEASURE COST

Customer provided costs will be used when available. Default measure costs are listed below for up to 100 hp motors.⁴⁴² The average of the values below is \$168/HP:tables values can also be extrapolated with:

2.8.67 4 Pump OptimizationEfficient Pumps

DESCRIPTION

Pump improvements can be done to optimize the design and control of centrifugal water pumping systems, including water solutions with freeze protection up to 15% concentration by volume. Oth fluid and gas pumps cannot use this measure calculation. The measurement of energy and demand savings for commercial and industrial applications will vary with the type of pumping technolog operating hours, efficiency, and existing and proposed controls. Depending on the specif application slowing the pump, trimming or replacing the impeller may be suitable options f improving pumping efficiency. Pumps up to 40 HP are allowed to use this energy saving ealculation. Larger motors should use a custom calculation (which may result in larger savings the this measure would claim). rThe Federal Energy ConservationEfficiency Standards set minimum energy ratings for clean water pumps. The types of pumps characterized in this measure include clean water commercial & industrial pumps, circulator pumps and dedicated purpose pool pumps The Federal Energy ConservationEfficiency Standards for C&I clean water pumps was effective April 24, 2023 January 27, 2020. The standards for circulator pumps are effective May 2028, bu are included in the measure eharaecharacterization. The Federal Energy ConservationEfficienc Standards for dedicated purpose pool pump with VFD motors, setting a minimum weighted energy factor (WEF) effective date was July 19, 2021. The measure requires exceeding the minimum standard by 10% or more of the rated efficiency. The measure does not include fire pumps., magn driven pumps The standards for other clean water pumps was effective April 24, 2023.s

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the C&I pump is the efficient equipment is proven to be an optimized centrifugal pumping system meeting the applicable program efficiency requirements:

- Pump balancing valves no more than 15% throttled; and Clean water pump
- <u>Balancing valves on at least one load 100% open.</u> Flow rate of ≥25 gpm (BEP, full impeller diameter); 1 to 200 hp
- Electric motor driven, (may be included in energy rating)
- Variable load pump energy index (PEI_{VL}) or constant load pump energy index (PEI_{CI}) rated.exceed the minimum standard<1.000.90 with varying C-values.

The motor and motor controls may be included in the system energy rating. The <u>PEI is equal to 1 - 1/Energy Rating (ER)</u> following formula may be used to convert the PEI to the Energy Rating, ER.-to the pump energy index, <u>PEI</u> <u>PEIEnergy Rating = (1 - PEI) x 100</u>

For circulator pumps

- Hydraulic horsepower ≤2.5 HHP.
- Flow rate of ≥25 gpm (BEP, full impeller diameter)
- Circulator Energy Index, CEI <0.90.

For dedicated dedicated purpose pool pumps

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline equipment pump is assumed to be the existing pumping system including existing controls and sequence of operations. be a minimally an efficient pump meeting Federal Energy ConservationEfficiency Standards for pumps. for a clean water pump listed in the following table.

Pump Type	Efficiency Units	Efficiency Value	Requirements Applicability
A			
C&I variable load	PEIVL	1.0	By C-value
C&I constant load	PEICL	1.0	By C-value
Self prime pool pumps	WEF, kgal/kWh	<u>-2.3 *x, hhp + 6.59</u>	<u>0.711 ≤ hhp<2.5</u>
<u>Self prime pool</u> pumpsCirculator pump	WEF, kgal/kWhCEI	<u>1.05.5</u>	<u>≥25 gpmhhp≤0.711</u>

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to 20 years.⁴⁴⁷ be 105 years.⁴⁴⁸

DEEMED MEASURE COST

The incremental capital cost for this measure can vary considerably depending upon the strategy employed to achieve the required efficiency levels and should be determined on a site-specific basis.

2.9 Refrigeration

2.9.1 Commercial Solid and Glass Door Refrigerators & Freezers

DESCRIPTION

This measure applies to ENERGY STAR[®] vertical closed and horizontal closed refrigerators or freezers installed in a commercial kitchen. ENERGY STAR[®] commercial refrigerators and freezers are more energy efficient because they are designed with components such as ECM evaporator and condenser fan motors, hot gas anti-sweat heaters, or high-efficiency compressors, which will significantly reduce energy consumption.

This measure was developed to be applicable to the following program type: TOS.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new ENERGY STAR[®] certified vertical closed or horizontal closed, solid or glass door refrigerator or freezer meeting energy consumptions requirements as determined by door type (solid or glass) and refrigerated volume (V).

ENERGY STAR[®] Requirements (Version 35.0, Effective October 1, 2014December 22, 2022) 461

Formatted: Left, Indent: Left: 0"

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new vertical closed or horizontal closed, solid or glass door refrigerator or freezer that is not ENERGY STAR[®] certified—<u>and meets the Federal Energy Efficiency</u> Standards for units built as of March 2017 for TOS. Existing, working equipment may use the value in the baseline table determined by the manufacturing date.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.462

DEEMED MEASURE COST

The incremental capital cost for this measure varies by size as shown in the table below:

Measure	Incremental Cost 463
Commercial Glass Door Freezers less than 15 ft ³	\$ 220-<u>50</u>
Commercial Glass Door Freezers 15 to 30 ft ³	\$ 950-<u>100</u>
Commercial Glass Door Freezers 30 to 50 ft ³	\$ 1,307<u>300</u>
Commercial Glass Door Freezers more than 50 ft ³	\$ 2,300 500
Commercial Glass Door Refrigerators less than 15 ft ³	\$ 250- 50

2.9.2 Refrigerated Beverage Vending Machine

DESCRIPTION

This measure applies to new ENERGY STAR[®], Class A or Class B refrigerated vending machines. ENERGY STAR[®] vending machines incorporate more efficient compressors, fan motors, and lighting systems as well as a low power mode option that allows the machine to be placed in low-energy lighting and/or low-energy refrigeration states during times of inactivity.

This measure was developed to be applicable to the following program type: TOS.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a new or rebuilt ENERGY STAR[®], Class A or Class B⁴⁶⁸ refrigerated vending machine meeting energy consumptions requirements as determined by equipment type (Class A or Class B).

ENERGY STAR[®] -Requirements (Version 3.14.0, Effective March 1, 2013 April 2020) 469

Equipment Type	Maximum Daily Energy Consumption (kWh/day)
Class A	\leq 0.0523V + 2.432
Class B	\leq 0.0657V + 2.844

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a new or rebuilt, Class A or Class B refrigerated vending machine that is not ENERGY STAR[®] certified.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.470

DEEMED MEASURE COST

The incremental cost of this measure is \$140125.471

LOADSHAPE

Refrigeration BUS

⁴⁶⁸ Class A means a refrigerated bottled or canned beverage vending machine that is fully cooled, and is not a combination vending machine. Class B means any refrigerated bottled or canned beverage vending machine not considered to be Class A, and is not a combination vending machine. See 10 CFR §431.292 "Definitions concerning refrigerated bottled or canned beverage vending machines."

2.9.3 Door Heater Controls for Cooler or Freezer

DESCRIPTION

This measure applies to door heater controls installed on commercial coolers or freezers. There are two main categories of commercially available control strategies that achieve "on-off" control of door heaters based on either (1) the relative humidity of the air in the store or (2) the "conductivity" of the door (which drops when condensation appears). In the first strategy, the system activates door heaters when the relative humidity in a store rises above a specific set point and turns them off when the relative humidity falls below that set point. In the second strategy, the sensor activates the door heaters when the door conductivity falls below a certain set point and turns them off when the conductivity rises above that set point. Savings result from a reduction in electric energy use due to heaters not running continuously and from reduced cooling loads when heaters are off. The assumptions included within this measure assume that door heater controls which are properly designed and commissioned will achieve approximately equivalent savings, regardless of control strategy.

This measure applies to the following program type: RF.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a door heater control installed on a commercial glass door cooler or freezer.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a door heater without controls, installed on a commercial glass door cooler or freezer.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.478

DEEMED MEASURE COST

Actual incremental costs should be used if available. The incremental capital cost $\frac{151-150}{150}$ per door.⁴⁷⁹

2.9.4 Electronically Commutated Motors (ECM) for Walk-in and Reach-in Coolers/Freezers

DESCRIPTION

This measure consists of replacement of an existing, uncontrolled, and continuously operating standard efficiency shaded pole evaporator fan motor in refrigerated display cases or fan coil in walk ins.

This measure achieves savings by installing a more efficient motor, thereby moving the same amount of air with less energy requirements. Additionally, less waste heat is produced, resulting in a decreased refrigeration load.

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

This measure applies to the replacement of an existing standard efficiency shaded pole evaporator fan motor in refrigerated display cases or fan coil in walk ins. The replacement unit must be an electronically commutated motor (ECM). Savings assume that efficient motors operate continuously.

DEFINITION OF BASELINE EQUIPMENT

The baseline is the existing shaded pole motor(s) with no fan control operating 8760 hours continuously in a refrigerated display case or fan coil unit of a walk in cooling unit.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.485

DEEMED MEASURE COST

The measure cost is assumed to be \$177 <u>\$358</u> per motor for a walk in cooler and <u>\$208</u> walk in freezer, <u>labor cost was assumed equal for a code compliant motor and ECM motor, including the</u> cost of the motor plus installation.⁴⁹⁶

Algorithm

CALCULATION OF SAVINGS

Savings are based on a measure created by Energy & Resource Solutions for the California Municipal Utilities Association and supported by PGE workpaper PGE3PREF126. Note that

⁴⁸⁵ Database for Energy Efficient Resources (2014). https://www.deeresources.com/("Updated 2014 EUL table, cell D52)DEER database.

⁴⁸⁶ <u>CA eTRM, "High Efficiency Fan ", Southern California Edison, "SWCROO4-02Cost analysis.xlsx" (2022), Equipment cost for ECM motor Difference in the fully installed cost (\$468) for ECM motor and controller, listed in Work Paper PGE3PREF126, "ECM for Walk-In Evaporator with Fan Controller," June 20, 2012, and the measure cost specified in the DEER database for controller (\$291).</u>

Appendix H - TRM – Vol. 2: C&I Measures

climate differences across all California climate zones resulted in negligible savings differences, which indicates that the average savings for the California study should apply equally as well to Missouri. Savings found in the aforementioned source are presented in combination with savings from controllers, however for the purposes of this measure only those associated with the ECM upgrade are considered.

ELECTRIC ENERGY SAVINGS

*<u>AkWh = Savings per motor *x motors</u>* Where:

2.9.5 Strip Curtain for Walk-in Coolers and Freezers

DESCRIPTION

This commercial measure pertains to the installation of infiltration barriers (strip curtains) on walkin coolers or freezers. Strip curtains impede heat transfer from adjacent warm and humid spaces into walk-ins when the main door is opened, thereby reducing the cooling load. As a result, compressor run time and energy consumption are reduced. The engineering assumption is that the walk in door is open for varying durations per day based on facility type, and the strip curtain covers the entire door frame. All assumptions are based on values that were determined by direct measurement and monitoring of over 100 walk-in units in the 2006-2008 evaluation for the C/A Public Utility Commission.⁴⁸⁹

This measure was developed to be applicable to the following program type: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is a strip curtain added to a walk-in cooler or freezer. The new strip curtain must cover the entire area of the doorway when the door is opened.

DEFINITION OF BASELINE EQUIPMENT

The baseline assumption is a walk in cooler or freezer that previously had either no strip curtain installed or an old, ineffective strip curtain installed.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 4 years.490

DEEMED MEASURE COST

The incremental capital cost for this measure is \$10.22/sq ft of door opening.491

2.10 Shell

2.10.1 Windows

DESCRIPTION

Energy and demand saving are realized through the installation of windows that offer performance improvements over baseline windows. Savings may be realized from reducing air infiltration, improved insulating properties, and changes to solar heat gain through the glazed surfaces of the building.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of the IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing window assemblies.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC $\frac{20122015}{2015}$. An efficient window would have specifications not exceeding these values.

<u>Characteristic</u>	Climate Zones 4 & 5	•	-(Formatted: Font: Bold, Font color: Background 1

SHGC	0.40		$\langle \rangle$	Formatted: Font color: Text 1

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.495

DEEMED MEASURE COST

For retrofit projects, full installation costs should be used, including both material and labor costs to install the windows.

In all other scenarios, the incremental cost for this measure is assumed to be 1.50 per square foot of window area.⁴⁹⁶

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building.

$\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$	
--	--

Heating and cooling savings are composed of three components: infiltration, conduction and solar gains. In instances where infiltration savings do not apply or are not eligible, it may be disregarded. If central cooling, the electric energy saved in annual cooling due to the added insulation is:

$\Delta kWh_{cooling} = Inf_{\underline{i}} ltration_{cooling} + Conduction_{cooling} + Solar_{cooling}$ Infiltration_{cooling} = (CFM_{PRE} - CFM_{POST}) * $\underline{x} \ 60 * \underline{x} \ EFLH_{cooling} * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ LM / Cooling * \underline{x} \ \Delta T_{AVG,cooling} * \underline{x} \ 0.018 * \underline{x} \ DM$

(1000 <u>*</u> χ η _{cooling})	
Where:	
CFM _{PRE}	= Infiltration at natural conditions as estimated by blower door testing
	before window upgrade
	= Actual
CFM _{POST}	= Infiltration at natural conditions as estimated by blower door testing after
	window upgrade
	= Actual
60	= Converts Cubic Feet per Minute to Cubic Feet per Hour
EFLH _{cooling}	= Equivalent Full Load Hours for Cooling [hr] are provided in Table
	<u>1Section 2.7</u> , HVAC End Use
$\Delta T_{AVG,cooling}$	= Average temperature difference [⁰ F] during cooling season between
	outdoor air temperature and assumed 75°F indoor air temperature – see
	table below
0.018	= Specific Heat Capacity of Air (Btu/ft ³ °F)
LM	= Latent Multiplier to account for latent cooling demand 497
	= 3.0 for St. Louis, MO
1,000	= Conversion from Btu to kBtu
	= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)
$\eta_{cooling}$	= Actual

⁴⁹⁷ The Latent Multiplier is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

2.10.2 Ceiling and Wall Insulation

DESCRIPTION

Energy and demand saving are realized through reductions in the building cooling and heating loads.

This measure was developed to be applicable to the following program types: RF and NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to exceed the efficiency requirements defined by the program.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, the baseline is assumed to meet the efficiency requirements set forth by local jurisdictions. In most cases, this will be some version of IECC. For retrofit applications, the baseline condition is the existing condition and requires assessment of the existing insulation. It should be based on the entire wall assembly.

Local code shall be referenced to define baseline where applicable. As an example, the following is set forth by IECC $\frac{20122015}{12}$:

	ASHRAE/IECC Climate Zone 5 (A, B, C) Nonresidential		
	Assembly Maximum Insulation Min. R-Value		
Mass	U-0.078	R-11.4 ci	
Metal Building	U-0.052	R-13 + R-13 ci	
Metal Framed	U-0.064	R-13 + R-7.5 ci	
Wood Framed and Other	U-0.064	R-13 + R-3.8 ci or R-20	

	ASHRAE/IECC Climate Zone 6 (A, B, C) Nonresidential		
	Assembly Maximum	Insulation Min. R-Value	
Mass	U-0.078	R-13.1 ci	
Metal Building	U-0.052	R-13 + R-13 ci	
Metal Framed	U-0.064	R-13 + R-7.5 ci	
Wood Framed and Other	U-0.051	R-13 + R-7.5 ci or R-20 + R-3.8 ci	

Note: ci = continuous insulation

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure expected useful life (EUL) is assumed to be 20 years per DEER 2008. This is consistent with SDG&E's 9th Year Measure Retrofit Study (1996 & 1997 Residential Weatherization Programs), CPUC's Energy Efficiency Policy Manual v.2, and GDS's Measure Life Report Residential and Commercial/Industrial Lighting and HVAC Measures (June 2007).

DEEMED MEASURE COST

For retrofit projects, full installation costs should be used.

For new construction projects, costs should be limited to incremental material and labor costs associated with the portion of insulation that exceeds code requirements.

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building:

 $\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$

If central cooling, the electric energy saved in annual cooling due to the added insulation is

 $\Delta kWh cooling = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{cooling} * \Delta T_{AVG, cooling}}{(1,000 * \eta_{cooling})}$

If the building is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

$$\Delta kWhheating = \left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CRF * EFLH_{heating} * \Delta T_{AVG,heating}$$

Where:

= Assembly heat loss coefficient with existing insulation [(hr- ⁰ F-ft ²)/Btu]
= Assembly heat loss coefficient with new insulation [(hr- ⁰ F-ft ²)/Btu]
= Area of the surface in square feet.
= Correction Factor. Adjustment to account for the effects the framing has
on the overall assembly R-value, when cavity insulation is used.
= 100% if Spray Foam or External Rigid Foam
= 50% if studs and cavity insulation ⁵⁰²
= Equivalent Full Load Hours for Cooling [hr] are provided in Table
<u>1Section 2.7</u> , HVAC End Use
= Average temperature difference [⁰ F] during cooling season between
outdoor air temperature and assumed 75°F indoor air temperature
= Conversion from Btu to kBtu
= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)
= Actual
= Equivalent Full Load Hours for Heating [hr] are provided in Table
<u>1Section 2.7</u> , HVAC end use

⁵⁰² Consistent with the information listed in ASHRAE, 2001, Table 5-1 Wall Sections with Steel Studs Parallel Path Correction Factors and experimental findings by the Oak Ridge National Laboratory, "Couple Secrets about How Framing is Effecting the Thermal Performance of Wood and Steel-Framed Walls."

 505 F_e is not one of the AHRI certified ratings provided for furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14% for residential units. This is, appropriately, ~50% greater than the Energy Star® version 3 criteria for 2% F_e. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference. Assumed to be consistent with C&I applications.
