MISSOURI GAS ENERGY

CASE NO. GR-2001-292

Missouri Public  
Service Commission

PREPARED DIRECT TESTIMONY OF

CHARLES D. LADEROUTE

April 26, 2001

BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI

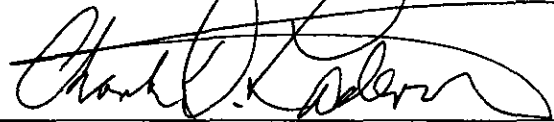

In the Matter of Missouri Gas )  
Energy's tariff sheets designed to )  
increase rates for gas service in )  
the Company's Missouri service )  
area. )

GR-2001-292

AFFIDAVIT OF CHARLES D. LADEROUTE

STATE OF MISSOURI )  
 ) ss  
COUNTY OF JACKSON )

Charles D. Laderoute, of lawful age, on his oath states: That he has reviewed the attached written testimony in question and answer form, all to be presented in the above case, that the answers in the attached written testimony were given by him; that he has knowledge of the matters set forth in such answers; that such matters are true to the best of his knowledge, information and belief.

Charles D. Laderoute

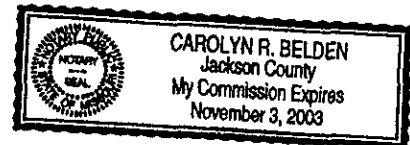

Subscribed and sworn to before me this 25th day of April, 2001.

Notary Public

[SEAL]

My Commission expires: Nov. 3, 2003

**PREPARED DIRECT TESTIMONY OF  
CHARLES D. LADEROUTE**

1 Q. Please state your name, occupation and address.

2 A. My name is Charles D. Laderoute. I am an energy consultant  
3 and President of Charles D. Laderoute, Ltd., 5114 Amazonia  
4 Road, St. Joseph, Missouri 64505.

5  
6 Q. By whom have you been retained?

7 A. My testimony is on behalf of the Midwest Gas Users' Associa-  
8 tion ("MGUA")

9  
10 Q. What are your qualifications?

11 A. I have nearly twenty-nine years of rate, regulatory and  
12 economic experience; twenty-two years as a consultant. My  
13 full qualifications are included as Appendix A to this  
14 testimony.

15  
16 Q. What is the purpose of your testimony in this proceeding?

17 A. I am testifying on the establishment of class revenue re-  
18 quirements via a cost of service allocation study ("COSS"),  
19 cost support levels for establishing monthly service, cus-  
20 tomer or minimum charges and portions of rate design. I  
21 will also address certain conceptual matters in support of

these specific items. Finally, I will make several policy suggestions.

**Q. Please identify the Schedules which you are sponsoring.**

**A.** I am sponsoring the following Schedules, all of which are part of this exhibit:

Schedule	Description
CDL-1	Comparison of Calendar 2000 Data versus 12 Months end September 1997
CDL-2	Comparison of Calendar 2000 Data versus 12 Months end September 1997
CDL-3	Residential Rate Class AMR related & Meter Reading Costs
CDL-4	Comparison of Cost Allocation Results - Case Nos. GR-98-140 vs GR-96-285
CDL-5 p. 1	Spread of Revenue Deficiency in this Case Assuming Cost Relationships from Case GR-98-240 Using MGE COSS
CDL-5 p. 2	Spread of Revenue Deficiency in this Case Assuming Cost Relationships from Case GR-98-240 Using Noack COSS Adjusted for Demand Allocator
CDL-6 p. 1	Cost Allocation Study Results - Top Down
CDL-6 p. 2	Cost Allocation Study Results - Revenue Neutral Result
CDL-6 p. 3	Cost Allocation Study Results - Including Requested Rate of Return
CDL-7	Complete Cost Allocation Study
CDL-8 p. 1	Monthly and Annual Ccf, Annual Ccf and Peak Month Allocators and Load Factor
CDL-8 p. 2	Monthly Billing Equivalents and Average Annual Customers
CDL-8 p. 3	Determination of Excess Gas Usage Factors
CDL-9	Analysis of Mains PIS
CDL-10	Spread of Revenue Requirements Based on COSS

1 In addition to my Schedules, I have included a Technical  
2 Discussion as Appendix B to my Testimony. All of this  
3 material was prepared by me or under my direct supervision.  
4

5 Q. Have you previously testified before the Missouri Public  
6 Service Commission ("MPSC" or "the Commission") or other  
7 Commissions or Boards?

8 A. I have not previously testified before the MPSC. I have  
9 testified on several occasions before the following: Michi-  
10 gan Public Service Commission, the Rhode Island Public  
11 Utilities Commission, Alberta Public Utilities Board, Massa-  
12 chusetts Department of Public Utilities, and Wisconsin  
13 Public Service Commission. I have also testified before:  
14 Washington Utilities and Transportation Commission, U.S.  
15 Department of Energy Economic Regulatory Administration and  
16 the South Carolina Public Service Authority. I have submit-  
17 ted testimony in cases that were settled before: Federal  
18 Energy Regulatory Commission and the Vermont Public Service  
19 Board.  
20

21 **Regulatory Framework, Revenue Requirements and Costs**

22 Q. Mr. Laderoute, within the regulatory framework, what are the  
23 general steps in establishing rates?

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 A. There are typically four steps: establishing the revenue  
2 requirements (also known as the total cost of service),  
3 assigning and allocating costs to rate classes, setting the  
4 rate class revenue requirements and designing rates. My  
5 testimony is focusing on the latter three items.

6  
7 Q. Why are cost and the setting of rate levels (class revenue  
8 requirements) such paramount issues?

9 A. Regardless of how much unbundling may take place, a person  
10 or business who wishes to use gas in the Missouri Gas Energy  
11 ("MGE") service territory is generally limited to having the  
12 delivery of the gas provided essentially by only one firm -  
13 the local distribution company ("LDC"); in this case MGE.  
14 As such, all gas users, whether a sales customer who relies  
15 on MGE to provide commodity gas or a transportation customer  
16 who procures their own commodity gas, rely on MGE to provide  
17 delivery service. With the exception of a user who is close  
18 to an interstate pipeline and may have the opportunity to  
19 "bypass" the LDC, a gas user is generally dependant upon MGE  
20 and this Commission for the prices (in this case the base  
21 rates or distribution charges) that they face for delivery.

22  
23 Q. The Commission and MGE?

1 A. Certainly. MGE by its actions, business strategy and manner  
2 of operations controls the costs that it brings to the  
3 Commission. The Commission itself has oversight of the  
4 overall level of costs that are allowed (the total revenue  
5 requirement) and decides the rate level (class revenue  
6 requirements). In this particular case, MGE itself did not  
7 file a COSS, so the Commission has less input to use in  
8 reaching its decision.

9  
10 Q. But MGE did propose a method to allocate the revenue defi-  
11 ciency.

12 A. That is true and I understand why they proposed their case  
13 as filed. Unfortunately, the method that they proposed is  
14 problematical for several reasons: it does not comport with  
15 standard ratemaking practice, it is not necessarily sound,  
16 and it could be a contributing factor to MGE returning in  
17 another couple of years with yet another request for an  
18 increase to base rates. In this case, they spread the total  
19 revenue deficiency to rate classes based upon each rate  
20 class's portion of existing revenues. While this method is  
21 occasionally used for specific limited purposes, such as  
22 spreading an interim increase subject to refund, it is not  
23 an acknowledged generally accepted approach to determining  
24 class revenue requirements.

1 Q. On what basis do you reach that conclusion?

2 A. My training in economics, nearly 29 years experience in gas  
3 and electric rate regulation, reading and reviewing hundreds  
4 of state, provincial and FERC Orders and Decisions, review-  
5 ing hundreds of cost allocation studies filed in state  
6 regulatory cases and before the FERC and reading scores of  
7 authoritative works.

8  
9 Q. Why is spreading a revenue deficiency to rate classes not  
10 necessarily a sound approach to establishing rate class  
11 revenue requirements?

12 A. For several reasons. Two related aspects of utility prices  
13 are paramount issues: undue price discrimination and cross  
14 subsidization. If one class of customers is not bearing its  
15 cost to serve, in order to keep the utility whole, then by  
16 definition another class or classes must cover those costs  
17 in their respective rates. When this happens, the latter is  
18 subsidizing the former.

19  
20 Moreover, if rate class revenue requirements are not set  
21 fairly close to costs, it is only fortuitous if existing  
22 revenues bear a close relationship to costs. If an objec-  
23 tive party is asked to determine if price discrimination or

1 cross subsidization is taking place, they can only make  
2 their determination based on comparing revenues to costs.  
3

4 Q. If the revenue deficiency is spread to rate classes based on  
5 existing revenue relationships, how could that be a contrib-  
6 uting factor to MGE returning in another couple of years  
7 with yet another request for an increase to base rates?

8 A. Existing revenue relationships do not necessarily have  
9 anything to do with cost relationships. Embedded within  
10 rates are various components of costs - return on invest-  
11 ment, depreciation, O & M expenses, et cetera. In general,  
12 as a utility grows in customers and consumption (sales plus  
13 transport), its revenues grow proportionally to cover the  
14 costs embedded in the existing rate levels. If the rate  
15 level is not sufficient to cover the actual costs to serve  
16 the class, then as that class grows, by definition, the  
17 utility will face a revenue deficiency. Assume three rate  
18 classes with Class A and C covering some portion of the  
19 revenue requirements (caused by cost) of Class B. Assume  
20 over time that Class A and C stay essentially the same in  
21 terms of customers and consumption, but that there is growth  
22 in Class B. The problem is that Class B, by not covering  
23 its costs, is responsible for the revenue deficiency that  
24 the utility faces. Assume that when rates were set, Class B

1 is charged \$1.00 per Mcf, yet the costs attributable to it  
2 are actually \$1.10, with the difference being primarily  
3 driven by costs associated with Mains. Now, at some later  
4 time due to inflation, additional investments, and other  
5 factors the cost is actually \$1.20. What happens if Class A  
6 and C are not growing? By definition, the utility will be  
7 losing not \$0.10, but \$0.20 per Mcf. And the existing  
8 revenue relationships are **meaningless** in determining re-  
9 quired revenue levels by class. The utility will simply  
10 never catch up. The best that it can do is to file yet  
11 another rate case.

12  
13 Q. Can you give another example of how cross subsidies could  
14 occur and why existing revenue by class can be problematical  
15 as a method to determine class revenue responsibility?

16 A. Continue with the same assumptions in the last response.  
17 Add some new assumptions. First, assume substantial amounts  
18 of Mains are being added to reach customers who are virtual-  
19 ly all in Class B. Also assume that the utility's facilities  
20 policy is set in such a manner that approximately 90% of the  
21 costs of Mains extensions for new customers are recovered in  
22 rates set for all customers. Finally assume that the amount  
23 of Mains in rate base are as follows for Class B: historical  
24 amount of Mains per historical customer for Class B is \$400

1 per customer, the incremental cost per new customer is  
2 \$2,000 and the new average is \$500 per customer. The next  
3 time that rates are set there will now be several cross  
4 subsidies. First, existing Class B customers will be subsi-  
5 dizing new Class B customers. Class A and C customers will  
6 be subsidizing existing Class B customers once and new Class  
7 B customers twice. Again, existing revenues don't necessar-  
8 ily have any relationship to costs.

9  
10 *Overview and General*

11 Q. Mr. Laderoute are you generally familiar with the background  
12 of regulation for this company?

13 A. Generally, yes. As part of my research, I reviewed the  
14 Commission's Orders in Case No. GR-98-140 and Case No. GR-  
15 96-285 including the Remand Order. I also read all the  
16 Direct, Supplemental Direct, Rebuttal and Surrebuttal per-  
17 taining to COSS and rate design in Case No. GR-98-140.  
18 Finally, I reviewed the Direct testimony and portions of  
19 Rebuttal and Surrebuttal regarding COSS and rate design in  
20 Case No. GR-96-285.

21  
22 Q. Do you have any reservations, caveats or qualifications with  
23 respect to your testimony?

1 A. At the time that this was prepared, there were many Data  
2 Requests outstanding that I assisted in preparing. Numerous  
3 other responses, though provided in a reasonable time after  
4 the request from MGE, have not been reviewed adequately to  
5 serve as input to my COSS. In several cases regarding  
6 important pieces of data, there are outstanding follow-up  
7 questions. The Responses to these could change certain of  
8 the results, and at least regarding two items the impact  
9 could be non-trivial. I would therefore like to reserve the  
10 right to update my findings to the extent that data becomes  
11 available for input into my model.

12  
13 Q. Prior to turning to specifics of your cost allocation stud-  
14 ies, are there general matters that you would like to ad-  
15 dress?

16 A. Yes. In reviewing some of the data, there are a number of  
17 items that raised concern or indicated to me that some  
18 general elaboration was necessary. First, comparing data  
19 from Case No. GR-98-140 (Test Year 12 Months ending Septem-  
20 ber 1997 Normalized and adjusted) to data from the instant  
21 case there are some interesting results. See Schedule CDL-  
22 1. While the Company has indicated that it has used a  
23 different weather normalization method, it is not clear what  
24 portion of the reduction of Mcf consumption is due to that.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 My concern is not that they changed the method. I just want  
2 to point out that this can complicate comparisons between  
3 these two cases. While overall number of customers has  
4 increased by 4.6%, annual consumption has decreased by 5.0%.  
5 Moreover, Peak Month use (January in both cases) has de-  
6 creased by 10.3%.

7  
8 Second, in reviewing this data, note that the number of  
9 customers are averages over the year. While the LVS class  
10 shows 441 customers, there were 431 at the beginning of 2000  
11 and 451 at the end of 2000. Based on data available to me  
12 at this time, all customer additions to the LVS class over  
13 the course of the year were customers switching from SGS or  
14 LGS. Certainly over the past several years there may have  
15 been some customer additions to LVS who were new to MGE and  
16 customer deletions. But the bottom line is that this class  
17 has essentially been static since the last case. Virtually  
18 all of the customer growth has been in the SGS and Residen-  
19 tial rate classes.

20  
21 Third, and most troubling is the data shown on Schedule CDL-  
22 2. Since the last rate case, MGE has added over \$49,000,000  
23 of Mains Plant in Service ("PIS") (A/C 376). This repre-  
24 sents a 21.6% change while the number of customers changed

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 by 4.6%. At the time of the last rate case, the amount of  
2 Mains per customer was \$489 and this is now \$567. Looking  
3 at this data from the incremental view, the Change in Mains  
4 per Change in Customers is \$2,262. Certainly the Company  
5 has some general Mains that are replaced (for general pur-  
6 poses or as part of the safety program). However, clearly  
7 the incremental cost of newer customers far exceeds that of  
8 existing customers. In fact, as the Commission indicated in  
9 its Order in Case No. GR-98-140 at page 49, "96 percent of  
10 the total cost of facilities extensions to serve new custom-  
11 ers will be recovered through the rates to be set in this  
12 proceeding". In that Case, MGE had proposed changes to its  
13 Facilities Extension Policy so that new customers would bear  
14 a higher portion of the costs associated with facilities to  
15 serve them. That proposal was rejected by the Commission.  
16 Since the Extension Policy has not changed, that percentage  
17 value is likely still about the same. Further, note that  
18 Mains Depreciation Expense has increased by 35.6%. I am not  
19 trying to make Extension Policy a part of this case. Howev-  
20 er, in reviewing my COSS results, the Return and Federal  
21 Income Taxes associated with only the increase in Mains PIS  
22 since the last case amounts to \$7,245,260 of additional  
23 revenue requirements. See Schedule CDL-2. That in combina-  
24 tion with \$1,536,606 of incremental Depreciation Expense

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 adds up to nearly \$9 million (7,245,250+1,536,606) of addi-  
2 tional revenue requirements since the last case. This is  
3 also a substantial portion of the revenue requirements in  
4 this case. These costs are allocated to all rate classes.  
5 As a result of this policy, existing customers, be they  
6 Residential or LVS, are **subsidizing new customers**.

7  
8 Fourth, again looking at the data on Schedule CDL-2, Meter  
9 Installations have increased dramatically. My presumption,  
10 while I await data request responses from MGE, is that a  
11 large portion of the significant increase since the rate  
12 case is attributable to the installation of the AMR equip-  
13 ment. I have not specifically taken this into consideration  
14 in performing my COSS, but should. Cost attributable to  
15 installing AMR equipment should only be borne by the classes  
16 Residential, SGS and LGS. The LVS class is already metered  
17 using EGM equipment. They have paid for the Metering por-  
18 tion of that equipment. This has been so since the Stipula-  
19 tion in Case No. GR-93-240.

20  
21 Finally, a comment about AMR metering communications equip-  
22 ment. In the process, I will introduce certain results from  
23 my COSS. Please refer to Schedule CDL-3. At this time, I  
24 do not know how much AMR equipment was included in revenue

1 requirements in the last rate case. And it is impossible  
2 for me to determine how it may have been included in the  
3 various COSS studies. However, this schedule shows that  
4 costs allocated to the Residential rate class for Meter  
5 Reading have been reduced by \$1,269,476 comparing my values  
6 to those derived from Mr. Cumming's COSS in Case No. GR-98-  
7 140. In my COSS, AMR costs are allocated to Sales customers  
8 only since the LVS class already has the EGM equipment in  
9 place. Within my study, \$5,176,487 of AMR related costs are  
10 included for return, FIT and Depreciation Expense for only  
11 the Residential class. My reason for pointing this out is  
12 that this is a very large amount of dollars. Second, within  
13 my COSS discussion, I do not detail every single nuance of  
14 every dollar allocated. This, though, illustrates that  
15 there are significant dollars involved - likely much larger  
16 than included in the last case. This represents a substan-  
17 tial portion of the revenue requirements in this case.  
18 Moreover, none of these costs should be allocated to the LVS  
19 class because, as noted above, they already have EGM equip-  
20 ment. In the prior case, most parties allocated these costs  
21 to all rate classes which was incorrect.

22  
23 *Cost of Service Comparisons*

24 Q. Please describe Schedules CDL-4 and CDL-5.

1 A. Schedule CDL-4 compares the results of cost of service  
2 studies over time by the same party. It shows that when  
3 using relatively similar methods, the cost allocation re-  
4 sults, in terms of the portions of allocated costs, will  
5 stay approximately the same. This is important because in  
6 terms of the fractions showing cost responsibility by rate  
7 class, this schedule shows that the cost responsibility does  
8 not change substantially. One of the reasons I prepared  
9 this schedule was to impute the class revenue requirements  
10 from the current case using the results of MGE's last COSS.  
11 That is, I wanted to see what the results would be for the  
12 current case had MGE performed a COSS using the methodology  
13 from the last case.

14  
15 The results of such an analysis are shown on Schedule CDL-5  
16 page 1. Using the COSS results from MGE's unadjusted COSS  
17 based on 12 months ending September 30, 1997, Line 1 shows  
18 the rate class allocated costs. Line 3 shows the fractions  
19 of totals, which I applied against the Revenue Requirements  
20 of the current case at Line 5. Line 7 shows the values MGE  
21 determined for current adjusted revenue in the current case.  
22 At Line 9, I am showing the allocated revenue requirements  
23 less current adjusted revenue; i.e. Line 5 - Line 7. I show

1 at Line 11 the MGE proposed revenues and at Line 13 MGE's  
2 proposed numbers less Line 9.

3  
4 There are though, two factors that I wanted to address.  
5 First, there was substantial concern with the approach used  
6 by MGE in determining its Demand allocator to allocate  
7 Demand related Mains in Case No. GR-98-140. They used peak  
8 month consumption, but "discounted" the values for the LVS  
9 rate class by 50%. Some parties disagreed with that, as do  
10 I. So, I wanted to see the results were the LVS class  
11 volumes not reduced. Second, I did not have access to the  
12 MGE model, but I did have the model used by Mr. Noack. At  
13 this point Mr. Noack is employed by MGE. Had MGE filed a  
14 COSS in this case, I have to presume that it would have  
15 embraced some of the thinking that he used in the last case.  
16 Whether or not that is actually the case, the model was  
17 available so I used it as the starting point.

18  
19 After modifying the Demand allocation factors for demand  
20 related Mains, the results are shown on Schedule CDL-5 page  
21 2. The structure and description of this schedule is the  
22 same as that discussed above for CDL-5 page 1. In terms of  
23 the revenue requirements for the instant case, this modifi-  
24 cation adds \$1,737,578 of costs to the LVS class (based on

1 Schedule CDL-5 p. 2 Line 5, col. e: 9,735,762 - 7,998,184  
2 from p.1 Line 5, col.e of this schedule). The important  
3 conclusions are shown at Lines 9 - 13. Had a cost based  
4 determination been used rather than spreading the revenue  
5 requirement increase on current revenues, the Residential  
6 class would receive \$7,064,874 more revenue requirements and  
7 the LVS class \$4,350,352 less compared to the MGE proposal.  
8 In terms of a cost based approach, the revenue increase  
9 (decrease) for Residential and LVS would be, respectively,  
10 \$34,838,701 and (\$1,079,750).

11  
12 Q. Could this schedule be used to establish the rate class  
13 revenue requirements in this case?

14 A. Yes. At the time that I prepared that analysis, I was  
15 unsure that I could finish an independent COSS in time for  
16 filing. I have been able to finish a study, subject to the  
17 caveats that I indicated earlier. I would make modifica-  
18 tions to my COSS based on responses to data requests to MGE.  
19 The information on Schedule CDL-5 is of use to serve as a  
20 surrogate for an MGE COSS since they didn't file a study.

21  
22 *Cost of Service Allocation Study*

23 Q. Could you give an example of how your COSS might change  
24 dependant on Responses to Data Requests of MGE?

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 A. Certainly. Apparently MGE tariffs allow LVS customers to  
2 transport or take Sales gas. Aside from this being a com-  
3 plicating matter, it affects how I allocate costs. In  
4 general, because LVS customers are transporters, they should  
5 bear **none** of the costs associated with Gas Inventory that  
6 are included in Working Capital. I have requested data that  
7 identifies the amounts of Sales gas that LVS customers are  
8 taking in the adjusted Test Year. When this data becomes  
9 available, I will modify my COSS and likely make a recommen-  
10 dation for a tariff change. In the meantime, my COSS allo-  
11 cates no Gas Inventory in Working Capital to the LVS class  
12 since they are Transporters, not Sales customers.

13  
14 Q. Do you have a position or opinion with respect to the cost  
15 component numbers that you have used?

16 A. I do not necessarily agree that they are right are wrong. I  
17 used them because they are the values that MGE filed.

18  
19 Q. Please illustrate the summary of your COSS.

20 A. Page 1 of Schedule CDL-6 shows the summary of the Top Down  
21 analysis. At Line 29 the Rate of Return by rate class is  
22 shown. This indicates that while the overall ROR is 5.88%,  
23 the class RORs range from a low of 4.18% for Residential to  
24 a high of 13.59% for LGS. In considering these results,

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 bear in mind that they are based on all of the rate base and  
2 income statement numbers that MGE filed in this case.

3  
4 Q. Have you prepared a schedule to identify the costs associat-  
5 ed with a "revenue or ROR neutral" COSS?

6 A. Yes, page 2 of Schedule CDL-6. A revenue neutral COSS  
7 simply takes the Top Down COSS results, identifies the  
8 resulting Rate of Return ("ROR") for the system and builds a  
9 Bottom Up COSS assuming that each rate class is set to earn  
10 the overall realized ROR. All adjusted values as filed by  
11 MGE are included. However, no changes are included that are  
12 a function of revenue deficiency driven by ROR and associat-  
13 ed Federal Income Taxes. This would simply keep the Company  
14 whole at the current ROR, but reallocate the class revenue  
15 requirements so that each class' revenue would bring about  
16 the same ROR as the system. The net result is shown at  
17 Lines 18-19. Residential rate levels would have to be in-  
18 creased by \$10,384,565. All other classes would have rate  
19 level decreases with the largest decrease accruing to the  
20 SGS class. The largest percentage decrease based on distri-  
21 bution margin only is shown at Line 29 for the LGS class.  
22 Since a customer faces a total bill including PGA costs,  
23 Line 39 shows the percentage changes including PGA. This is  
24 a more reasonable illustration of the impact. In sum, this

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 schedule is based on all the costs that MGE filed in its  
2 case, but does not change the level of Return plus Income  
3 Taxes to the Requested level of ROR of 10.562%.

4  
5 Q. You have excluded the Unmetered Gas Light rate class from  
6 the COSS?

7 A. Yes. For such a small class their inclusion in a COSS is  
8 meaningless. I therefore treated them as a Revenue Offset  
9 and included their revenues in Other Revenues.

10  
11 Q. Mr. Laderoute, are the values used in your COSS consistent  
12 with those filed by MGE?

13 A. Yes. My values for Rate Base, Total Operating Expenses and  
14 all other values agree with the Company filed values.

15  
16 Q. Please continue with Schedule CDL-6 page 3.

17 A. The difference between this schedule and the prior schedule  
18 is a change to the Requested ROR at Line 2 to the Company  
19 requested value of 10.562%. There is a substantial differ-  
20 ence. The net result is shown at Lines 18-19. Residential  
21 rate levels would have to be increased by \$38,962,707. SGS  
22 would also be increased and LGS and LVS would both still be  
23 decreased. The largest percentage decrease shown at Line 29  
24 would be for the LGS class. Since a customer faces a total

1 bill including PGA costs, Line 39 is a better representation  
2 and shows the percentage changes including PGA. At either  
3 extreme, the Residential class requires a 12.83% increase  
4 while the LVS class requires a 10.52% decrease.  
5

6 Q. Mr. Laderoute, looking at the COSS summary pages shown on  
7 Schedule CDL-6, are you surprised at the results?

8 A. No. In the three rate cases prior to Case No. GR-96-285,  
9 rate levels were not set on a cost of service basis, but  
10 were arrived at via a settlement. While there may have been  
11 some movement in the direction of setting rate levels closer  
12 to costs, they were not set at costs. (See Testimony of  
13 Dennis Kies in Case No. GR-96-285 at page 5.) In the  
14 original Order in Case No. GR-96-285 (January 22, 1997), the  
15 Commission rejected a Stipulation and Agreement that appar-  
16 ently would have set class revenue requirements closer to  
17 costs. The Commission then spread the revenue deficiency to  
18 classes based on existing class revenues. They did not  
19 address class cost of service. In its Order in Case No. GR-  
20 98-140 (August 21, 1998) at page 44, the Commission seems to  
21 be confusing class cost of service and revenues when it  
22 states:

23 The Commission finds that the current division of  
24 cost by class remains just and reasonable. The  
25 Commission finds that there is not sufficient

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 evidence presented in the record to support the  
2 findings proposed by the parties to change the  
3 current class cost of service percentage. There  
4 has not been any evidence of a significant change  
5 or development that would have supported any of  
6 the changes proposed. Therefore, there should be  
7 no change in the class cost of service as allocat-  
8 ed among the rate classes and found to be just and  
9 reasonable under the prior case, Case No. GR-96-  
10 285, issued on October 31, 1996 [sic].

11 The Commission then went on to spread the revenue deficiency  
12 on the proportions of existing revenues. In its Remand  
13 Order in Case No. GR-96-285 (February 1, 2001) the Commis-  
14 sion accepted the MPSC Staff COSS but then went on and did  
15 not use that study to determine rate class revenue responsi-  
16 bility. Instead, the Commission spread the revenue defi-  
17 ciency on existing revenues (while mistakenly referring to  
18 it as an equal percentage increase).

19  
20 In sum, costs have had little if any relationship to class  
21 revenues set for MGE. Moreover, costs have not been used to  
22 set revenues. Comparing Lines 28 and 26 on Schedule CDL-6  
23 page 3, the relationship of costs and existing revenues is  
24 quite different. For Residential their existing revenues are  
25 69.64% of total revenues while their costs are 76.16% of  
26 total costs. Note also rate SGS. While their portion of  
27 cost responsibility is 16.80%, even though their portion of

1 existing revenues is 19.94%, they require an increase of  
2 approximately \$2.5 million.  
3

4 **Q. Please describe the fully allocated cost of service study**  
5 **filed in this case.**

6 **A.** The complete cost allocation study has been included as  
7 Schedule CDL-7. The first five schedules of the cost allo-  
8 cation, Pages 1-5 of this schedule, depict the summary  
9 ("topsheets") of this study. These pages contain numerous  
10 summaries of the detailed information determined in the cost  
11 allocation study. My cost of service allocation study  
12 embraces all of the principles covered in the COSS Technical  
13 Discussion, Appendix B to this testimony, which covers the  
14 allocation factor conceptually, customer cost methods and  
15 other fundamental aspects of cost allocation.  
16

17 Each of the COSS schedules may be thought of as a vertical  
18 page. For cost allocation purposes, we have considered four  
19 classes: Residential, Small General Service, Large General  
20 Service and Large Volume Service. Due to the number of  
21 classes utilized, only one page is required for each of the  
22 twenty-five COSS schedules. The COSS shows clearly what is  
23 being allocated, what allocation method is being used, the  
24 amount to be allocated, the values for allocators and their

1 source, and depicts a summary of classified costs by demand,  
2 commodity and customer classification. The most important  
3 aspects of the cost allocation are addressed in this testi-  
4 mony. General principles are described in the COSS Techni-  
5 cal Discussion.  
6

7 **Q. What general steps did you perform in your fully allocated**  
8 **cost of service study?**

9 **A.** The Company's 2000 test year adjusted revenue requirements  
10 and other data supported by MGE Witness Noack is utilized.  
11 All costs were functionalized which in this case was limited  
12 to Distribution, as the Company has no Production, Transmis-  
13 sion or Storage. Next, all cost items were classified. I  
14 first considered whether the cost items were of a fixed or  
15 variable nature. Then, I classified the costs between  
16 Demand, Commodity and Customer related. Demand, Commodity  
17 and Customer Allocation factors were developed at Schedule  
18 CDL-8 based upon the 2000 test year billing determinants and  
19 other data for the rate classes. In terms of the mechanics,  
20 rate base items are allocated first since many expenses are  
21 a function of a rate base item. Expenses are next allocated  
22 followed by other taxes. Income taxes are the final item.  
23

1 Q. Can an individual easily identify the cost classifications  
2 within your cost allocation study?

3 A. Yes. Within my study, Schedule CDL-7, I show a column  
4 labeled "CR" which stands for Cost Responsibility. While  
5 many costs are strictly Demand ("D"), Commodity ("C") or  
6 Customer ("CU") related, some are functions of more than one  
7 of these. For example, if a cost item is a function of all  
8 three classifications, it is labeled as DCC. If it is a  
9 function of Demand and Customer, it is shown as DCU, etc.  
10 Composite allocators are shown at the bottom of each of my  
11 schedules so that one can clearly see how an allocation was  
12 performed. Turning to Page 7 of this schedule, one can see  
13 at Lines 5-7 that Mains have D in the CR column - they are  
14 demand related. At Line 10 Services is shown. They are a  
15 customer related cost, so a CU is shown in the cost respon-  
16 sibility, CR, column.

17  
18 Q. In general, what allocation factors were used?

19 A. Approximately 50 major direct allocators are used. Many of  
20 these were developed externally and some were developed  
21 internally to the study. In addition, numerous minor inter-  
22 nal allocators are used where costs are based on more than  
23 one classification or where previously allocated items are

1        used as an allocator. The major allocators are shown on  
2        Pages 20-25.

3  
4    Q.    Please describe how one can identify what allocation methods  
5        are used in your study?

6    A.    Please turn to Page 12 of Schedule CDL-7 which shows the  
7        allocation of Distribution Operation Expenses. Account 871,  
8        Distribution Load Dispatching, Line 4, is allocated on the  
9        basis of Peak Month. This is indicated in the area identi-  
10       fied as Allocation Basis. The values being used as the  
11       allocator are shown at Line 26. This is Allocation Factor 1  
12       on this schedule (schedule here referring to my COSS sched-  
13       ules) and it is the Sys 1 factor. The "Sys" means that this  
14       is an external factor or one that can be found on the  
15       AFACTOR schedules starting at Page 20. There are five  
16       AFACTOR schedules and they include other externally devel-  
17       oped factors or major allocation factors and certain inter-  
18       nally generated allocation factors. The peak Month alloca-  
19       tion factors come from Line 2 of Page 20.

20  
21       Looking back at Page 12 of Schedule CDL-7, at Line 6 you see  
22       that Account 874, Mains & Services Expense, is allocated on  
23       the basis of Tot(al) Mains & Services (PIS) which is Sys  
24       Factor 20 and Allocation Factor 2 of this schedule. Account

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 870, Operation Supervision & Engineering, is allocated on  
2 the subtotal of the above allocated costs on this schedule  
3 at Line 15. The allocation factor is a minor composite  
4 allocation factor and is not included in the AFACTOR sched-  
5 ules. It is simply shown at Line 34 and is determined from  
6 the data shown at Line 15. It is Allocation Factor 9 for  
7 this Schedule and it is identified as DEXP1-9. This identi-  
8 fier is developed in the following manner. The DEXP1 comes  
9 from the Name (Schedule Name) shown in the upper left of the  
10 page. The 9 means that it is the ninth allocation factor on  
11 the DEXP1 schedule. This labeling method can be used to  
12 quickly identify where an allocator was developed.

13  
14 Note line 35 where Allocation Factor 10 for this schedule is  
15 shown. The allocation factor here is Demand Related Mains &  
16 Services PIS. Mains & Services Expense, Account 874, is  
17 allocated on the basis of Tot(al) Mains & Services at Line  
18 6. Since Mains and Services PIS have both demand and cus-  
19 tomer related costs, Mains & Services Expense must also be  
20 split into a demand component and a customer related compo-  
21 nent. Allocation Factor 10 is labeled as DPT-13. Turning  
22 to Page 7 of this exhibit, Line 43 depicts the development  
23 of this allocator. Returning to Page 12, Allocation Factor  
24 10 on this schedule is used to determine the demand related

1       portion of Account 874 to be included in the Demand related  
2       costs for this schedule. Demand related costs for this  
3       schedule are summarized at Line 21. All internal allocation  
4       factors can be traced by using the above method.

5  
6   **Q.   What allocation method did you use to allocate demand relat-**  
7       **ed costs?**

8   **A.   The primary Demand allocator used is the Peak Month consump-**  
9       **tion. The primary cost item this is used for is Demand**  
10      **related Mains PIS. In this study, I have broken Mains PIS**  
11      **into two components: an amount assignable to Residential and**  
12      **SGS and allocated to them on the basis of their respective**  
13      **Peak Month's values excluding all other classes and a Demand**  
14      **related portion. In conjunction with this disaggregation of**  
15      **Mains PIS, I believe that Peak Month is a reasonable method.**  
16      **The development of the Peak Month allocators is shown on**  
17      **Schedule CDL-8 page 1. Each of the steps in its determina-**  
18      **tion is shown clearly on that schedule. The Peak Month**  
19      **allocator is a reasonable method of allocating certain**  
20      **demand related costs. The system is designed and sized to**  
21      **meet peak loads.**

1 Q. Mr. Laderoute, why did you assign certain of the demand  
2 related Mains PIS costs to only the Residential and SGS rate  
3 classes?

4 A. I do so based on a review of material filed by parties in  
5 previous MGE rate case. In Mr. Hall's studies in GR-96-285  
6 and GR-98-140 he indicated that "it can be said that mains  
7 which are less than 4" provide little, if any, benefit to  
8 the larger customer classes". (Respectively, Hall Direct at  
9 page 23 and page 30, GR-96-285 and GR-98-140) Within his  
10 approach in both cases, he assigned Mains less than 4" to  
11 the Residential and SGS rate classes. In his Supplemental  
12 Direct testimony in GR-96-285, Mr. Beck determines at Sched-  
13 ule 3 Revised various service sizes. He shows LVS services  
14 at 4" and LGS services at 3" and 4". The associated Mains  
15 would not be smaller. Further, at Revised Schedule 5 he  
16 indicates the stand alone Mains pipe diameters of 3.345 "  
17 for LGS and 5.1119" for LVS. While he did not file detailed  
18 schedules with his Direct Testimony in GR-98-140, he does  
19 indicate at pages 3 and 4 that the studies he performed were  
20 "essentially an update of Staff's C-O-S study in MGE's prior  
21 rate filing, Case No. GR-96-285". In order to be on the  
22 conservative side, I only assigned Mains of less than 3 " to  
23 the Residential and SGS classes. The determination is shown  
24 on Schedule CDL-9.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 Q. Did you include a Customer related portion of Mains PIS?

2 A. No, although I did consider doing so for several reasons.  
3 Historically, MGE in its COSS has supported a minimum system  
4 approach. See for example, Case Nos. GR-98-140, Cummings  
5 Surrebuttal Testimony at pages 5 - 8 and Gillmore Direct  
6 Testimony at Schedule DSG 1A Page 2 in Case No. GR-96-285.  
7 Second, in the COSS that he sponsored in Case No. GR-98-140,  
8 Mr. Noack supported a minimum system. See his Schedule MRN-  
9 1 page 2 which was an update to the MGE study filed in the  
10 case. See also his Rebuttal Testimony in that case at pages  
11 12, 15 - 16, and 19. Third, in its COSS for both Case No.  
12 GR-96-285 and GR-98-140, the Staff, via witness Beck, in-  
13 cluded a portion of Mains that he refers to as 'Stand  
14 Alone'. See pages 2 - 7 of his Direct Testimony in Case No.  
15 GR-96-285 and Schedule 6 which was updated via Revised  
16 Schedule 1 attached to his Supplemental Direct Testimony in  
17 that case. In his Direct Testimony in Case No. GR-98-140,  
18 Mr. Beck indicates at page 3 that the COSS in that case was  
19 an update to the study he performed in the prior case. In  
20 his Rebuttal in that case he indicates at page 5 that:

21 Staff's "Underlying Cost" mains allocator deter-  
22 mined the percentage of the cost of mains that  
23 could be considered to be stand-alone costs (which  
24 are similar to customer related costs) versus  
25 integrated system costs (which are similar to  
26 capacity related costs) to be 28% and 72% respec-  
27 tively.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 In his Schedule 1 attached to his Supplemental Testimony in  
2 Case No. GR-96-285, Mr. Beck shows 28.16% of Mains cost as  
3 Stand Alone. Now these non-demand related costs are very  
4 similar to the customer related costs that would be generat-  
5 ed via a minimum system study. In fact their impact is  
6 exactly the same.

7  
8 Finally, as I indicated earlier in this testimony, I have  
9 concerns about the additions to Mains in conjunction with  
10 the Facilities Extension policy. There appears to be a  
11 significant amount of investment that was not caused by  
12 customers in the LVS class and to a lesser extent in the LGS  
13 class. Since these customers would otherwise be allocated a  
14 significant portion of these costs based on the demand  
15 allocator, some approach might be needed to prevent allocat-  
16 ing costs to classes who likely did not cause them. A  
17 reasonable method is that of classifying a portion of the  
18 costs as customer related and allocating them on a non-  
19 demand basis.

20  
21 Q. Had you included a Customer component of Mains, what portion  
22 would that be?

23 A. As can be seen near the bottom lower portion of Schedule  
24 CDL-9, approximately 24% of Mains would have been classified

1 as Customer related. This is a bit less than the 28% of  
2 stand alone costs in Mr. Beck's last two COSS for MGE.

3  
4 Q. Turning back specifically to your COSS, please discuss in  
5 detail the more important items included on the summary  
6 pages of your COSS, Schedule CDL-7, Pages 1-5.

7 A. Page 1 of Schedule CDL-7 depicts the results of the "Top-  
8 Down" study. Here, the test year pro forma adjusted values  
9 are summarized to determine the realized rate of return  
10 ("ROR") at Line 29. The realized rate of return for the  
11 Company in toto, System Total column, and each of the rate  
12 classes is determined.

13  
14 Based upon the 2000 information, the Company would earn a  
15 5.88% overall rate of return on an annual basis (Page 1,  
16 Line 29, System Total column). Line 30 of Page 1 of this  
17 schedule shows an Index of Return for each rate and the  
18 System Total with the System Total annual as the base at  
19 100. For example, note the Residential rate of return of  
20 4.18%. Compared to the overall Company annual rate of  
21 return of 5.88%, this class earns only 71% of (.71 times)  
22 the overall company annual rate of return. This is deter-  
23 mined by dividing 4.18 by 5.88 and expressing the result as  
24 a percentage.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 Q. Which rate classes show the highest and lowest Index of  
2 Return?

3 A. Large General Service is highest at 231 and Residential is  
4 lowest at 71.

5  
6 Q. What conclusions can be drawn from the information on Rates  
7 of Return and Index of Return.

8 A. Any class with an Index over 100 is subsidizing other class-  
9 es, that is contributing more to cost recovery than custom-  
10 ers with an Index less than 100. In comparison only with  
11 the realized rate of return of 5.88% in toto, the Company is  
12 not earning an adequate return on its investment for custom-  
13 ers in the Residential class. Stated a different way, all  
14 classes earning less than the overall Company ROR are being  
15 subsidized by customers earning more than the overall Compa-  
16 ny ROR.

17  
18 Q. Please discuss the second summary page of your COSS, Page 2  
19 of Schedule CDL-7.

20 A. COSS Schedule 1-B shows the analysis to determine required  
21 revenues by rate class based on 2000 costs and the Company's  
22 requested rate of return. I took the Net Income results of  
23 the Top-Down study and added to it the changed Net Income  
24 and changed Income Related Taxes to determine the Revenues

1 associated with the Company's requested rate of return. At  
2 the COSS stage, it is my belief that the class revenue  
3 requirements should utilize equalized rates of return for  
4 all rate classes, in this case 10.562%.

5  
6 Page 2 has been set up to match the required revenues for  
7 2000 as determined by data attached to the Testimony of  
8 Company Witness Noack. This schedule is typically called a  
9 "Bottom-Up" analysis; that is, we start at the bottom,  
10 Return Required at Target ROR Line 5, and work up towards  
11 the revenue requirement. In the process, the only cost  
12 elements which change from the Top Down analysis are Return  
13 and Income Taxes. All other cost items stay the same and  
14 have been reflected in the Top-Down analysis shown on COSS  
15 Schedule 1-A, Page 1 of this exhibit.

16  
17 The Total Revenue Change is depicted on Line 16. At Lines  
18 18 and 19 I have applied the Company's Gross Up and Gross  
19 Down factors for Uncollectibles and Late Fees, respectively.  
20 At Line 22, I show the total Required Gas Operating Revenue  
21 excluding PGA revenue; PGA revenues are not an issue in this  
22 case. This includes Other Operating Revenue items. Other  
23 Operating Revenue, an offset to total revenue requirements,  
24 are as requested by MGE in this case. At Line 27, I have

1 shown Required Sales of Gas Revenue plus Transportation  
2 revenue, again excluding PGA revenue. All of these values  
3 would generate an equalized rate of return of 10.562% for  
4 each rate class.

5  
6 As can be seen at Line 16 - 19, in order for each class to  
7 generate the same rate of return, the rate levels need to be  
8 increase for Residential and SGS. In view of the realized  
9 rates of return and the Company requested ROR, the rate  
10 levels for LGS and LVS should be decreased.

11  
12 Utilizing only Base rates (i.e. excluding PGA revenues), the  
13 percentage increase by class are shown at Line 29. While on  
14 their face, certain of the values may be considered to be  
15 rather large percentage wise, I believe that the impact on  
16 customers should be viewed including the associated PGA  
17 revenues. These values are shown at Line 39.

18  
19 **Q. Please describe Page 3 of Schedule CDL-7?**

20 **A.** Page 3 of Schedule CDL-7, shows the determination of the  
21 Company's required Sales of Gas and Transportation revenue  
22 with major items shown by cost class component: Demand,  
23 Commodity and Customer. The important aggregates are shown  
24 here. Within my COSS, I have classified all costs as being

1 Demand, Commodity or Customer related. This schedule summa-  
2 rizes all the key cost components. Near the bottom, Lines  
3 29-31, I summarize Demand, Commodity and Customer Related  
4 costs. These costs added together comprise the Total Re-  
5 quired Sales of Gas and Transportation Revenue. At Lines  
6 37-39 the classified costs are shown unitized in terms of  
7 \$/Mcf.

8  
9 **Q. What is portrayed on Exhibit CDL-7 Page 4?**

10 **A.** The primary purpose of this schedule is to determine the  
11 Company's Required Sales of Gas and Transportation Revenue  
12 excluding PGA on a unitized basis. At the top of this page,  
13 I show the costs in the form of Demand, Commodity and Cus-  
14 tomer related costs. This is the same data as shown on the  
15 prior page. I also show some statistical information to  
16 facilitate the analysis. At Lines 15-17, I show the cur-  
17 rent, required and increased values per Mcf by class. At  
18 the lower portion, I indicate the unitized values. Customer  
19 related costs are shown in terms of per Mcf and per custom-  
20 er. The total cost per Mcf is shown at Line 31. In review-  
21 ing this data, the costs are simply unitized COSS costs and  
22 are not necessarily those that would correspond with rate  
23 design.

1 Q. Mr. Laderoute, what method did you use to classify costs as  
2 customer related in the COSS?

3 A. As covered more fully in the COSS Technical Discussion  
4 (Appendix B to this Testimony), I used the Basic Customer  
5 Approach. I have also shown on Schedule CDL-7 page 5 the  
6 values for the Simple Customer method. As I indicate in the  
7 COSS Technical Discussion, the Simple Customer method that I  
8 determine can be considered above an absolute floor in  
9 considering what costs are a function of having a customer  
10 attached to the system. In this study these costs are quite  
11 inclusive and should provide guidance in establishing cus-  
12 tomer or service charges, with some caveats as discussed  
13 later.

14  
15 Q. Please describe the general flow of your cost allocation  
16 study.

17 A. First, rate base items are allocated since they will be used  
18 later to allocate certain expense items. Then, operation  
19 and maintenance expenses are allocated, followed by depreci-  
20 ation and other taxes. Next, operating revenues are as-  
21 signed and allocated. At this point, income taxes may be  
22 determined. Finally, the summary pages are generated.

1 Q. Let's move to the details of the cost allocation study.

2 Starting with revenue, please discuss schedule by schedule  
3 the rationale for the most important items in your cost  
4 allocation study as shown on Schedule CDL-7.

5 A. On COSS Schedule 2, Page 6 of this exhibit, Sales rate  
6 Distribution Charge revenues are displayed as well as the  
7 same values for Transportation customers - labeled as Base  
8 Rate Margin Revenue. The values are taken from MGE Schedule  
9 FJC-1, they are specifically assigned to rate classes, and  
10 reflect the 2000 adjusted revenues as determined by MGE.

11  
12 Q. How did you determine the appropriate method to allocate the  
13 various items of Other Operating Revenue shown on this page?

14 A. I used a composite allocator giving a weight of 50 % to  
15 customers and 50% Mcf.

16  
17 Q. How was Distribution Plant in Service costs allocated at  
18 Page 7 of this exhibit?

19 A. Peak Month was used to allocate Distribution Plant in Ser-  
20 vice Accounts 374 - 379. These facilities are sized for  
21 capacity purposes and are Demand related.

22  
23 I disaggregated the costs associated with Mains A/C 376 on  
24 Schedule CDL-9. The values at the top and the footage in

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 the center bottom of this schedule was taken from the Re-  
2 sponse by MGE to MGUA DR 212. Since the values included did  
3 not add up to the amount \$278,969,931 included at Schedule C  
4 page 1 attached to Mr. Noack's testimony, I spread that  
5 total back to the various sizes at the bottom left of Sched-  
6 ule CDL-9. From this, I took the value of \$79,003,720 for  
7 Mains less than 3" which I assigned to Residential and SGS.  
8 Those values were in turn allocated to the two rate classes  
9 based on their Peak Month values excluding the values for  
10 the other two rate classes.

11  
12 Next, I performed the calculations necessary to determine a  
13 Customer component. As noted earlier, I have not included a  
14 Customer component of mains in the COSS. I took the footage  
15 in the lower center portion and removed the footage assigned  
16 to Residential and SGS. The balance of 18,479,847 feet was  
17 priced out at the average price of \$3.64 per foot for 2"  
18 Mains that I calculated at the lower right. This gave me  
19 the value of \$67,189,638 that could be used for Customer  
20 related Mains PIS which represents 24% of Total Mains PIS  
21  $(67,189,638/278,969,931)$ .

22  
23 Q. If you were to include a Customer component, how would you  
24 allocate that value?

1 A. I would not use a simple customer count allocator that some  
2 analysts might use. I would weight customers using the same  
3 weighted factor used to weight Services. This is described  
4 further below, but the factor weights each LVS customer, for  
5 example, at 23.26 times the weight given to a Residential.  
6 Further, the weighted customer factors that I use for Ser-  
7 vices are not based on customer numbers for LVS, but in-  
8 cludes an additional 30 to account for the customers who  
9 have multiple meter/service combos.

10  
11 Q. Please continue describing how you allocated Distribution  
12 Plant items on page 7 of Schedule CDL-7.

13 A. The balance of \$199,966,211 of Mains was allocated to all  
14 rate classes based on Peak Month.

15  
16 I have requested data from MGE in order to attempt to per-  
17 form Special studies to determine the costs by class for the  
18 accounts: 380-384. These studies should be based on the  
19 **actual embedded costs** for each item for each class. For  
20 classes with small number of customers, a 100% sample should  
21 be used. For Residential and SGS samples can be used.  
22 Barring the availability of this data, I used the data shown  
23 in OPC Witness Hu's Case No. GR-98-140 Rebuttal Testimony at  
24 page 6 as follows:

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

<u>Item</u>	<u>Account</u>	<u>Res</u>	<u>SGS</u>	<u>LGS</u>	<u>LVS</u>
Services	380	624.42	624.42	5,341.81	14,524.80
Meters	381	55	243	2,275	5,617.25
Meter Instal.	382	162.84	162.84	2,104.89	6,472.08
H.Reg/Inst.	383-4	23.40	290	817.37	2,009.53

I do not consider that data optimal, but it is available at this point. One reason that it is problematical is that it is based on a replacement cost analysis that determines the costs for a typical new customer. This does not give recognition to the actual historical costs. Further, for example it may not be representative of the actual historical costs that serve as the basis for rate setting. Many LVS customers were former SGS or LGS customers. A Meter for them doesn't cost \$5,617.25 but is some far lesser value. In the instant case, all of the additions to the LVS class but one were former LGS customers with one being an SGS customer. Even based on this replacement cost data, the LGS customer Meters cost is \$2,275 - not \$5,617.25.

As noted above, in determining the weighted customer costs for each of Accounts 380 - 384, I used the number of customers for each rate class and for LVS added 30 (based on MGE data) to account for those customers who have multiple services and meters. Electronic Gas Measurement A/C 385

1 serves only LVS customers, so that cost was assigned to that  
2 class.

3  
4 Q. Based on the COSS results, can you give an illustration of  
5 the impact of using these replacement values for Meters and  
6 Services?

7 A. Yes. And in the process I will also illustrate the impact  
8 based on two customers who have multiple Services and Meters  
9 since this has been an area of concern in the past. At Page  
10 25 of Schedule CDL-7, I have summarized at Lines 12 - 14  
11 data taken from Page 7. At Lines 19 - 22 I have unitized  
12 these costs per customer. For the LVS class, I have added  
13 the 30 extra units for Transportation customers with multi-  
14 ple Meters and Services. The allocated values are for  
15 Services and Meters, respectively: \$11,397 and \$3,765 per  
16 customer.

17  
18 In MGUA Data Request 221 we asked for a disk including the  
19 data that we requested in DR 149. Included in DR 149, inter  
20 alia, was historical costs for Meters and Services for LVS  
21 customers. Based on that data, the following are the aver-  
22 age gross PIS values for UMKC and CMSU compared to the COSS  
23 values:

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

	<u>Services</u>	<u>Meters</u>
--	-----------------	---------------

CMSU	\$896	\$1,894
------	-------	---------

UMKC	\$557	\$2,300
------	-------	---------

COSS	\$11,397	\$3,765
------	----------	---------

At this point we have outstanding clarification requests to MGE regarding this data. When we get that clarification, I intend to specifically assign actual costs for at least Meters and Services for all LVS customers. In the meantime, the above shows clearly that the COSS costs borne by CMSU and UMKC related to Services and Mains is considerably more than their actual costs. With 14 and 5 Meter/Service combos, respectively, CMSU and UMKC have the highest number per "actual" customer of the LVS customers with multiple combinations.

**Q. Please continue with the allocation of General Plant in Service.**

**A.** General Plant, Schedule CDL-7 Page 8 was allocated in a two step process. First, AMR PIS Account 397.1 was allocated to Sales only customers on a straight number of customers basis. This equipment was installed for Sales customers and is not used by LVS customers who use EGM equipment. As I indicated earlier in my testimony, this is a very substantial cost item. I allocated the balance of General PIS on

1 the basis of an equal 50/50 weighting of customers and Mcf.  
2 I used that same approach to allocate the non-AMR related  
3 Intangible PIS. I determined the amount of AMR Intangible  
4 plant from DR MGUA 178.

5  
6 **Q. Please discuss the allocation of Accumulated Depreciation,**  
7 **shown on Page 9 of Schedule CDL-7.**

8 A. Accumulated Depreciation was available in detail in MGE  
9 Workpaper D-1. For each of the individual accounts, I used  
10 the corresponding PIS values to allocate the respective  
11 values. The balance is all due to General PIS.

12  
13 **Q. Working Capital is shown on Schedule CDL-7 Page 10. Please**  
14 **discuss the more important of these allocations.**

15 A. Materials and Supplies and Prepayments are mostly related to  
16 the plant - in this case MGE only has Distribution plant, so  
17 I used that as the allocator. Gas Inventory is held to meet  
18 the needs of Sales customers. It serves the purpose of  
19 assisting in meeting the usage requirements of Sales custom-  
20 ers during the winter or peak months. I allocated these  
21 costs to Sales rates only based on the Excess Gas Use ap-  
22 proach. See Schedule CDL-8 Page 3. I determined the aver-  
23 age use per month by rate class for the off-peak months of  
24 April-October. These values were then multiplied by 12 to

1 determine a base use value by class. The resulting values  
2 were then subtracted from annual Mcf by class and the result  
3 is considered Excess Use. Each Sales rate class' Excess Use  
4 is divided by the total Excess Use to determine the Excess  
5 Use allocation factor.

6  
7 I analyzed the MGE Schedule E-4 attached to Mr. Noack's  
8 Testimony to determine various components of Cash Working  
9 Capital. Working Cash - O&M - Purchased Gas is a function  
10 of Sales, so this was allocated to Sales classes on the  
11 basis of Ccf for the Sales rate classes. Other O&M Working  
12 Cash is a function of the Company's operations so I allocat-  
13 ed this on the basis of Total O & M Expenses excluding Gas  
14 Cost. Working Cash - Taxes - Property is a function of  
15 Total plant in service which was used as the allocator.  
16 Total PIS was also used to allocate Offsets. Prepaid pen-  
17 sion is a function of labor and barring the availability of  
18 a detailed special study, O & M excluding gas is a good  
19 surrogate and was used to allocate this.

20  
21 **Q. Describe Page 11 of Schedule CDL-7, your Rate Base summary**  
22 **exhibit.**

23 **A.** This schedule merely summarizes the previously allocated  
24 information from other schedules. In addition, several

1 additional items are included. SLRP Deferrals and Deferred  
2 Income Taxes-SLRP are a function of Services PIS which was  
3 used as the allocator. Barring more detailed data, Customer  
4 Advances are a function of Mains. I broke Customer Deposits  
5 (based on MGE Schedule B-2) into two components and assigned  
6 the Residential value. For the C & I value, I allocated it  
7 to non-Residential classes based on Revenues. Deferred  
8 Income Taxes are mainly a function of excess of tax over  
9 book depreciation and is therefore a function of Total PIS.

10  
11 **Q. Moving to the Operation and Maintenance Expenses portion of**  
12 **your COSS, Mr. Laderoute, please discuss the allocation of**  
13 **Distribution expenses, Schedule CDL-7 Page 12.**

14 **A.** Accounts 871-2, and 875-877 are essentially related to the  
15 capacity of the system. Therefore, I allocated these costs  
16 on Peak Month. Accounts 874 and 878 are directly related to  
17 the corresponding plant in service account items, which were  
18 used to allocate them. Since Account 874 includes costs  
19 associated with both Mains and services, a composite alloca-  
20 tor of the PIS values was calculated and used. Similarly  
21 Account 878 was allocated on aggregated Meters and House  
22 Regulators PIS, Accounts 381 and 382 respectively. Custom-  
23 er Installation Expenses is a function of the number of  
24 customers and was allocated on Average Monthly Customers.

1 Account 880 is a miscellaneous catch-all account. Since it  
2 is essentially a function of all the other expenses shown on  
3 this schedule up to this point, I have used the Subtotal  
4 which would reflect a composite weighting of the various  
5 other allocation factors. A/Cs 870 and 881 have been allo-  
6 cated on the same basis.

7  
8 With respect to the Distribution Maintenance Expenses on  
9 Page 13, they are all a function of the respective PIS  
10 accounts, with a couple of exceptions. A/Cs 885 and 894 are  
11 essentially a function of the other costs and I thus used  
12 the Subtotal to allocate these costs.

13  
14 **Q. Please describe the allocation of Customer Accounts and**  
15 **Customer Service & Info Expenses on Page 14 of Schedule CDL-**  
16 **7.**

17 **A.** Based on the response to MGUA DR 171, I assigned \$30,928 to  
18 Transports for A/C 901 & 903. Account 902 was allocated on  
19 a weighted customer basis using the following weights: 10,  
20 20, 30, and 45 for Res, SGS, LGS and LVS respectively.  
21 Account 903 is essentially a function of customers - there-  
22 fore I allocated these costs on the basis of Average Custom-  
23 ers. Uncollectibles are a function and cost of doing busi-  
24 ness and are a function of revenues. I made a calculation

1 to include PGA revenues so as to split Uncollectibles be-  
2 tween PGA related and Margin related. Using data from MGE  
3 Schedule H-3, I divided the value 307,289,585 by 438,139,565  
4 from MGE Schedule H-1. This is an approximation of the PGA  
5 related revenue of total revenue and the result is .70135.  
6 I then multiplied the Uncollectible value filed by MGE,  
7 3,455,836 by .70135 to derive an estimate of PGA related  
8 Uncollectibles. This was allocated to the Sales classes on  
9 the basis of Sales Revenue including PGA Revenue (determined  
10 at Page 6 of CDL-7). The balance of Uncollectibles was  
11 allocated to all classes on the basis of Sales of Gas and  
12 Transportation revenue. I considered that all customers  
13 should share equally in the costs associated with Customer  
14 Service & Info so these costs were allocated to all classes  
15 on the basis of Average Customers.

16  
17 **Q. How did you treat Sales Expenses and Administrative and**  
18 **General Expenses?**

19 **A.** Please see Page 15 of this exhibit. Sales Expenses are  
20 neither a function simply of Mcf sales, nor of customers.  
21 It may take as much time, expense and effort to gain a sale  
22 of 75 Mcf as a sale of 7,500 Mcf. Sales Expenses are di-  
23 rected toward Sales customers. Therefore, I allocated all  
24 Sales Expenses on the basis of a composite allocator weight-

1 ed evenly on a customer and Mcf basis to Sales customers  
2 only.

3  
4 I broke Administrative and General Expenses into four compo-  
5 nents. I assigned \$35,208 based on the response to MGUA DR  
6 171. Property Insurance is a function of property, so I  
7 allocated Account 924 on the basis on Total PIS. Account  
8 926, Employee Pensions and Benefits are a function of labor.  
9 Total O & M excluding gas costs is a good proxy for a de-  
10 tailed payroll study, so I used it to allocate these costs.  
11 The balance of A & G was allocated on a composite allocator  
12 evenly weighing PIS and O&M expenses.

13  
14 **Q. Mr. Laderoute, please discuss the Summary of O & M Expenses**  
15 **on Page 16 of Schedule CDL-7.**

16 **A.** This schedule simply summarizes the Operation & Maintenance  
17 Expenses that were allocated on prior schedules. It also  
18 portrays a number of totals and subtotals and depicts the  
19 calculation of Total O & M Expenses including Gas Costs  
20 which is used as an allocator elsewhere in the COSS.

21  
22 **Q. How were Depreciation and Amortization Expenses treated?**

23 **A.** Page 17 of Schedule CDL-7 shows the allocation of Deprecia-  
24 tion and Amortization Expenses. I used the detailed infor-

1        mation from the Company's filing at MGE Schedule H-12. I  
2        used the corresponding Plant in Service values to allocate  
3        most of the Depreciation Expense, since the expense is a  
4        direct function of the underlying plant. With respect to  
5        the two AMR related items, those costs were allocated to the  
6        Sales rate classes on the basis of Sales customers. EGM  
7        Depreciation was assigned to LVS. Amortization of SLRP was  
8        on the basis of Services PIS. The Customer Service System  
9        was allocated equally to each customer on the basis of  
10       average customers.

11  
12    **Q.    Please discuss Taxes Other Than Income portrayed on Schedule**  
13    **CDL-7, Page 18.**

14    **A.    Property Taxes were allocated on the basis of Total Plant in**  
15    **Service values since property taxes are directly a function**  
16    **of PIS. As a proxy for a more direct labor allocator, I**  
17    **used O & M excluding Gas Cost, to allocate Payroll Taxes**  
18    **which is comprised of FUTA, FICA and SUTA.**

19  
20    **Q.    How were Income Taxes determined?**

21    **A.    This determination is shown on Page 19 of Schedule CDL-7.**  
22    **All calculations of Income taxes are determined on a by-**  
23    **class calculated method. Starting with revenues and working**  
24    **down an income-type statement, Taxable Income was calculated**

1 for each class by subtracting expense items from revenue and  
2 including the Additions and Deductions to arrive at Income  
3 Before Taxes.

4  
5 Q. Why was Total PIS used to allocate Interest on Long Term  
6 Debt?

7 A. Interest charges are a function of capitalization. Capital-  
8 ization is used to pay for Plant in Service.

9  
10 Q. Mr. Laderoute, please turn to Pages 20-25 of Schedule CDL-7  
11 and describe these schedules.

12 A. This area of the COSS summarizes some of the various alloca-  
13 tors used in my study. Many of these allocators were deter-  
14 mined externally while some, e.g. Total PIS, Page 22 Line 23  
15 of this exhibit, are developed internally.

16  
17 **Setting the Rate Levels - Rate Class Revenue Requirements**

18 Q. What recommendation do you have in setting the rate class  
19 revenue responsibility?

20 A. They should be based on the costs that my COSS has identi-  
21 fied. If the Commission decides that it wishes other class-  
22 es to continue to subsidize the Residential class, then I  
23 would suggest that the Commission keep the level of revenues  
24 for the LGS and LVS class at the current levels. The reduc-

1        tions that would otherwise be applicable for these classes,  
2        approximately \$1,646,726, could be used to offset the in-  
3        crease to the Residential class. However, should the Com-  
4        mission choose to do this, I would recommend that this case  
5        either be continued on an open basis or reopened one year  
6        from now. The revenues for Residential would increase by a  
7        like amount and the LGS and LVS class revenue levels would  
8        be reduced by \$509,236 and \$1,137,490 respectively.

9  
10       Whether or not the revenue requirements amount changes from  
11       that requested by MGE, I believe that the Commission in this  
12       case for MGE should set rate levels on the basis of costs.  
13       I am sympathetic with all users who are facing gas costs  
14       much higher than in the past. The LVS customers like LGS,  
15       SGS and Residential are paying the higher costs for gas  
16       commodity. That is not an issue in this case. It is time  
17       that rate levels be set at least close to costs. In the  
18       past, decisions have been made indicating that costs were  
19       used as a starting point, yet the final resolution had  
20       **nothing** to do with costs. To wit, establishing class reve-  
21       nue requirements by spreading a revenue increase on the  
22       basis of existing revenues. Definitionally, that is not  
23       using costs as a starting point.

1 Q. What is your recommendation should the revenue requirements  
2 change in this case?

3 A. Having reviewed the revenue requirements information sup-  
4 plied by the Staff, it would appear likely that the level  
5 may be lower than that filed by MGE. Of course, there is  
6 always the opportunity for a Settlement as well. In such  
7 cases, the best approach is to plug the various values into  
8 the model and see what the result is. An alternative,  
9 though less accurate approach is to spread the total revenue  
10 requirement to rate classes based on the proportionate  
11 shares of my allocated COSS (Schedule CDL-7 Page 2 Line 28 -  
12 i.e. for Res, SGS, LGS and LVS respectively: .761553159,  
13 .168044905, .014057144, and .056344791.

14  
15 Q. Have you prepared an exhibit to illustrate this?

16 A. Yes. Schedule CDL-10 shows various levels of total revenue  
17 requirements and the spread to the rate classes based on the  
18 total cost of service fractions by rate class. Comparing  
19 the values shown at Line 21 with a zero increase to the  
20 values shown on Schedule CDL-6 Page 2 illustrates that this  
21 approach is less accurate than a more detailed analysis.

22  
23 *Rate Design*

24 Q. What comments do you have regarding rate design?

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 A. My only comments are directed at rate LVS, though the Simple  
2 Cost calculations shown at Page 5 of Schedule CDL-7 can  
3 provide guidance for the other classes. Given that there is  
4 no cost support behind the MGE proposal, I do not believe  
5 that it should be accepted. Based upon my cost analysis,  
6 the LVS costs show no more than \$318.01 per customer or  
7 \$297.77 per customer including the 30 extra units for multi-  
8 ple service/meter combinations. These values are far below  
9 the \$614 proposed and \$409.30 currently in effect. However,  
10 I have stated several concerns in this Testimony and illus-  
11 trated specific costs that indicate even the \$297.77 is too  
12 high. First, none of the "new" to LVS customers are new to  
13 the Company. They all switched from SGS or LGS. As such,  
14 their existing Meters and Services costs are far overstated  
15 by the weighted replacement costs that were used.

16  
17 Second, the investigation of UMKC and CMSU costs of actual  
18 Meters and Services (who between the two account for 19  
19 units - 4%) shows far less costs than those imputed due to  
20 the allocation based on weighted customers using replacement  
21 costs. The average costs for the Services actually in place  
22 to serve CMSU is \$896 and for UMKC \$557, yet the COSS value  
23 is \$11,397. For Meters, the actual average cost for CMSU is

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1       \$1,894 and \$2,300 for UMKC compared to the COSS imputed  
2       value based on replacement costs of \$3,765.

3  
4       Within a COSS for a class with a small number of customers  
5       such as LVS, it is customary to specifically determine the  
6       actual costs based on the actual facilities in place to  
7       serve them. I have requested such data and been supplied  
8       some of it, but barring further clarification I cannot  
9       complete a study for LVS Services and Meters. Considering  
10      my recommendations above in class revenue requirements, the  
11      best I can recommend at this point is to simply keep the  
12      current compromise method used in place until such time as a  
13      thorough and complete analysis may be performed. That is,  
14      after paying up to 2 full Customer Charges each additional  
15      metering point is billed at 50% of the indicated Customer  
16      Charge.

17  
18      If the Commission chooses to leave the current class revenue  
19      requirements set at current revenue levels, then there  
20      should be no change to the structure of the LVS rate, its  
21      components or levels. Should the Commission choose to  
22      reduce the revenue requirements for LVS, I recommend that  
23      the Customer Charge level revenue be reduced by 25% of the  
24      total percentage reduction for the class. For example, if

1       it were determined that the LVS class revenues should go  
2       down by 10%, the Customer Charge level of revenue would go  
3       down by 2.5%. I arrived at this purely based on judgement.

4  
5                               *General Recommendations*

6   Q.   Mr. Laderoute, do you have any general recommendations for  
7       the Commission?

8   A.   Yes - several. First, I believe that the Commission should  
9       encourage filing utilities to perform a cost allocation  
10      study in order to facilitate and assist with the necessary  
11      determinations. Some Commissions have done this in the form  
12      of standardized filing requirements that require filing a  
13      cost of service study. Second, the Commission should en-  
14      courage filing utilities to perform special studies to  
15      determine, to the maximum extent practicable, the actual  
16      embedded average cost of Meters, Services, Regulators and  
17      Meter Installations by rate class. Third, I recommend that  
18      the Commission should encourage filing utilities to file  
19      detailed workpapers at the time of filing a case in order to  
20      reduce the amount of Data Requests. Finally, I would en-  
21      courage the Commission to consider opening a generic docket  
22      to address Facilities Line Extensions policies. Given  
23      changes in the industry, it may be appropriate to do this  
24      for both gas and electric utilities.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 Q. Does this conclude your testimony?

2 A. Yes at this time. However, as I noted earlier, I would  
3 reserve the ability to supplement this testimony and certain  
4 schedules as additional data becomes available from MGE.

**Appendix A - Qualifications**

Q. Please state your name, occupation and address.

A. My name is Charles David Laderoute. I am a consultant and President of Charles D. Laderoute, Ltd., 5114 Amazonia Road, St. Joseph, Missouri 64505.

Q. What is your educational background?

A. I graduated with a Bachelor of Science degree in Engineering Management, minoring in Mechanical Engineering, from the University of Missouri - Rolla in 1971. In 1972 I received a Bachelor of Science degree in Economics, also from the University of Missouri - Rolla. I completed a Master of Arts degree in Economics from Eastern Michigan University - Ypsilanti, Michigan in 1980. I have taken further graduate courses at Harvard University (Certificate of Advanced Studies - ABD), Boston College (PhD) and Eastern Michigan University (MBA).

Q. What other professional training have you completed?

A. I completed the P.U.R. Guide sponsored by Public Utilities Reports in 1975, the AGA Gas Rate Fundamentals Course sponsored by the American Gas Association and conducted by the University of Wisconsin Graduate School of Business in 1976, and the American Gas Association Seminar on Gas Rates at the

1 University of Maryland in 1977. While employed at Consumers  
2 Power Company, I attended many company-sponsored courses  
3 including Introduction to Public Utility Accounting spon-  
4 sored by the AGA and EEI General Accounting Committees.  
5

6 **Q. What is your business experience?**

7 **A.** During the past 29 years my work in the fields of energy  
8 economics and public utility regulation has included rate,  
9 financial, economic and regulatory matters associated with  
10 53 utilities and 12 commercial and industrial customers in  
11 29 states, 2 Canadian provinces, and 3 foreign countries.  
12

13 My firm's consulting services embrace the areas of cost of  
14 service, rate design, revenue requirements, financial analy-  
15 sis, and rate of return for both retail and wholesale opera-  
16 tions. I have served clients regarding policy analysis,  
17 technical studies and compliance assistance dealing with  
18 federal and retail regulatory requirements including FPA,  
19 NGA, PURPA, NGPA, NECPA, and FUA. I have performed gas,  
20 electric, and steam cost of service and rate design studies  
21 as well as prepared rate filings, exhibits, and testimony  
22 presented to State and Federal regulatory agencies.  
23

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 I have performed or supervised studies in the associated  
2 areas of: cogeneration, gas underground storage rates, elec-  
3 tric transmission and wheeling rates, gas transportation  
4 rate design and policy, unit power and short-term power  
5 studies, profitability and separations studies, load dis-  
6 patching, antitrust analysis including price squeeze, load  
7 research, integrated resource planning, load management,  
8 conservation, power purchases from non-utility sources, load  
9 and customer forecasting, degree day normals analysis and  
10 development of weather normalization adjustment clauses.

11  
12 Prior to forming Laderoute, Ltd., I was Principal Consultant  
13 and Project Manager for rate and regulatory assignments in  
14 the Energy Planning and Economic Services Group of Chas. T.  
15 Main, Inc., Boston, Massachusetts. Earlier, I served as  
16 Senior Rate Analyst responsible for the supervision of all  
17 wholesale electric rates and associated regulatory activi-  
18 ties for Consumers Power Company in Jackson, Michigan.

19  
20 **Q. Please identify your regulatory appearances.**

21 **A.** I testified for Southeastern Michigan Gas Enterprises (now  
22 known as SEMCO Energy) of behalf of its LDC subsidiaries  
23 Michigan Gas Co. ("Mi-Gas") and Southeastern Michigan Gas  
24 Co. ("SEMGas"). My testimony addressed: rate reclassifica-

1       tion including billing determinants and revenues on new rate  
2       classes, the cost of service allocation study ("COSS") filed  
3       in the case, proposed rate design and portions of the  
4       Company's analysis in support of Daily Balancing. In 1993  
5       and 1994, I testified in Northwestern Utilities Limited  
6       ("NUL") (Alberta, Canada) General Rate Application. I  
7       addressed the cost of service study ("COSS"), the cost  
8       causation study ("CCS" - essentially a hybrid incremen-  
9       tal/marginal cost of service study), pricing and certain  
10      rate design issues in Phase II of the proceeding in 1994.  
11      The 1993 testimony in Phase I of the case covered a number  
12      of components of NUL's forecasted revenue requirements  
13      including: personal computers, software amortization, Opera-  
14      tion & Maintenance expenses, plant acquisition adjustment,  
15      and intercompany transactions. I testified on behalf of  
16      Providence Gas Company in 1993 in two cases; a rate increase  
17      filing, Docket No. 2082, and Docket No. 2076B. My work in  
18      Docket No. 2076B included preparation of an allocated cost  
19      of service, revenue reallocation and rate design based on  
20      declining block rates. My testimony in Docket No. 2082  
21      (Direct and Rebuttal) supported the Company's proposal to  
22      move from 15 year to 10 year weather normals. I also pre-  
23      pared and sponsored the cost allocation study submitted in  
24      that case. In November 1992, I prepared testimony for

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 Providence Gas Company in Docket No. 2076A in support of its  
2 proposal to implement declining block rates for firm base  
3 rates. As part of Settlement of consolidated Dockets 2076 &  
4 2082, I assisted the company to reclassify all of its rates  
5 from end-use based to size based and developed seasonal  
6 declining block rate structures.

7  
8 I submitted testimony on behalf of Wisconsin Gas Company in  
9 1992 in Docket No. 6650-GR-110. My testimony supported the  
10 company's proposal to utilize 10 year weather normals rather  
11 than 20 year normals. The weather normalization issue was  
12 taken out of that case and the Wisconsin commission opened a  
13 generic docket to address the issue of weather normalization  
14 by all gas and electric utilities. My testimony was resub-  
15 mitted in Docket No. 05-UI-105 and I presented Rebuttal  
16 testimony in that case as well. In 1991, rebuttal testimony  
17 was prepared on behalf of Vermont Gas Systems in Docket No.  
18 5516. I supported the company's proposal to use 10 year  
19 weather normals. As part of settlement, the testimony did  
20 not become part of the record, but 10 year normals were  
21 settled on. I testified on behalf of Providence Gas Company  
22 in Docket No. 2001 in 1991. That testimony covered dual  
23 fuel and interruptible sales and transportation fully allo-  
24 cated and marginal cost of service. In Providence Gas

1 Company's 1991 Docket No. 1673, I developed a weather nor-  
2 malization\* clause to adjust the base rates for normal weath-  
3 er. The adjustment would take place on a deferred basis  
4 comparing current month degree days with 15 year normal  
5 degree days. During 1991 and 1992 I testified in Northwest-  
6 ern Utilities Limited ("NUL") (Alberta, Canada) General Rate  
7 Application, Phases I and II. My testimony in Phase I  
8 covered certain components of NUL's revenue requirements as  
9 well as the weather normalization methodology. In Phase II,  
10 I performed a fully allocated cost of service study and  
11 prepared testimony on that study and rate design. I served  
12 as a witness in Docket No. 1971, Providence Gas Company's  
13 1990 base rate case. My testimony included the Company's  
14 customer and load forecast, fully allocated cost of service  
15 study and firm sales rate design.

16  
17 I submitted testimony to the Federal Energy Regulatory  
18 Commission ("FERC") on behalf of K N Energy, Inc. in 1990  
19 Docket Nos. RP87-86-005, et al. This testimony supported  
20 the seasonal rate design filed by K N to meet the FERC's  
21 Policy Statement on rate design. That case was settled. I  
22 have testified on several occasions for Michigan Gas Compa-  
23 ny. In its 1989 base rate Case U-9323, I presented Direct  
24 and Rebuttal testimony on cost allocation, seasonal rate

1 design, load and customer forecast, weather normalization,  
2 treatment of holding company cost allocation and assignment,  
3 and treatment of plant acquisition adjustment. I presented  
4 Direct testimony in Michigan Gas Company's 1988 base rate  
5 Case No. U-9112 on cost allocation and seasonal rate design.  
6 That case was settled. In Case No. U-8897, I presented  
7 Rebuttal testimony for Michigan Gas Company in its 1988 Gas  
8 Cost Recovery Plan. This testimony pertained to the devel-  
9 opment of quarterly gas cost recovery factors. In 1987, I  
10 presented Direct and Rebuttal (two appearances) testimony  
11 before the Massachusetts Department of Public Utilities on  
12 behalf of Commonwealth Gas Company, Case No. DPU 87-122.  
13 This testimony embraced fully allocated cost of service and  
14 marginal cost of service. I testified in 1980 on the use of  
15 fully allocated cost of service studies before the Washing-  
16 ton Utilities and Transportation Commission in the Matter of  
17 The Washington Water Power Company Cause No. U-80-13 on  
18 behalf of Inland Empire Paper Company. During 1980, I  
19 testified before the Economic Regulatory Administration  
20 regarding its Proposed Voluntary Guideline on the PURPA Cost  
21 of Service Standard. I served as the expert witness in the  
22 South Carolina Public Service Authority's generic hearings  
23 regarding PURPA Sections 111 and 114 in 1980.

1 Q. Aside from general speeches, have you any experience lectur-  
2 ing in the area of public utility rates and regulation?

3 A. In 1989, my firm presented to the World Bank a one day  
4 "Seminar on Regulation of Power and Gas Utilities." During  
5 1984 and 1985 my firm presented a two day seminar on three  
6 occasions for the Electric Council of New England on "Funda-  
7 mentals of Cost of Service and Rate Design." Since 1981, I  
8 have been associated with the Center for Professional Ad-  
9 vancement as a Course Director, Organizer and Instructor.  
10 The Center is the world's largest private organization  
11 offering post-collegiate short courses for engineers, scien-  
12 tists and technical managers. I have been Course Director  
13 for Principles of Electric Utility Rate Regulation since  
14 1981. I organized Principles of Gas Utility Rate Regulation  
15 and served as Course Director. This course was first of-  
16 fered in 1982. Both of these courses have been sponsored by  
17 the Center and offered in various cities around the country.  
18 I served as Course Organizer and Director of Advanced Meth-  
19 ods in Electric Utility Rate Regulation, Course Co-Organizer  
20 and Instructor for Electric Utility Load Research and Course  
21 Organizer and Director of Electric Rate Case Participation  
22 by Power Consumers. These courses were also sponsored by  
23 the Center. In addition, I have taught over 1,000 profes-

1        sionals, engineers and managers to use personal computers in  
2        numerous short courses.

3  
4    **Q.    Have you served in any other capacity as a lecturer?**

5    **A.    As an Adjunct Instructor I taught courses in Microeconomics,**  
6        **Macroeconomics, Consumer Economics, Business Mathematics,**  
7        **Algebra and Current Economic Issues at Jackson Community**  
8        **College, Jackson, Michigan.**

9  
10   **Q.    What articles or speeches have you prepared related to**  
11        **public utility rates and regulation?**

12   **A.    I have written numerous papers and presented speeches per-**  
13        **taining to the areas of gas and electric rate making includ-**  
14        **ing the use of microcomputers:**

15        "Weather Normalization Analytics", presented to the Gas  
16        Supply Planning, Management, Control, & Deliverability Under  
17        Order 636 Conference, sponsored by the Institute of Gas  
18        Technology, Houston, TX March 7-9, 1994.

19  
20        "Determination of Weather Normals", presented before the  
21        Energy Modeling: Optimizing Information and Resources Con-  
22        ference, sponsored by the Institute of Gas Technology,  
23        Chicago, IL June 7-8, 1993.

24  
25        "Weather, Weather Normalization and Weather Normalization  
26        Adjustment Clauses", unpublished paper, 1992.

27  
28        "The Weather Problem for the Gas Industry", presented at the  
29        13th Annual North American Conference of the International  
30        Association for Energy Economics, Chicago, IL, Nov. 18-20,  
31        1991.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 "Is There a Trend? Analysis with an Application on Weather  
2 for the Gas Industry", presented before the International  
3 Association of Business Forecasting Sixth Annual Conference,  
4 Atlanta, GA Oct. 6-8, 1991.

5  
6 "Overview of Gas Forecasting: Some Pragmatic Consider-  
7 ations", presented to the New England Gas Forecasting Asso-  
8 ciation, Westborough, MA Sep. 10, 1991.

9  
10 "Gas LDC Weather Normalization: What People Are Doing About  
11 the Weather", presented at the Seventh NARUC Biennial Regu-  
12 latory Information Conference - Columbus, OH Sept. 13, 1990.

13  
14 "Weather Normalization for Gas Local Distribution Companies:  
15 An Analysis of 15 Year versus 30 Year Average Degree Days",  
16 a paper presented before the International Association of  
17 Business Forecasting Fourth Annual Conference, Philadelphia,  
18 PA Sep. 27, 1989.

19  
20 "Current Rate and Regulatory Issues Facing LDCs", speech  
21 presented to the Michigan Electric and Gas Association 1989  
22 Spring Seminar, Lansing, MI April 24, 1989.

23  
24 "Time Differentiated Natural Gas Utility Rates, Demand Cost  
25 Allocation Methods and the Relative System Utilization  
26 Method", paper presented to the State Regulatory Affairs  
27 Committee, Michigan Electric and Gas Association, Lansing,  
28 MI Jan. 19, 1989.

29  
30 "Gas Transportation Rate Design - A Treatise" unpublished  
31 paper, Dec. 1988.

32  
33 "The Relative System Utilization Method (RSUM) for Time  
34 Differentiated Natural Gas Utility Cost Allocation Studies",  
35 paper presented at Sixth NARUC Biennial Regulatory Informa-  
36 tion Conference - Columbus, OH Sept. 14, 1988.

37  
38 "Gas Local Distribution Company Rate Design," speech pre-  
39 sented to the New England Gas Association 1988 Ratemaking  
40 Concepts Seminar, Sutton, MA, April 27, 1988.

41  
42 "The Game of Gas Rate Design: Issues and Strategies,"  
43 speech presented to the New England Gas Association Planning  
44 and Rates Group Workshop, Sturbridge, MA, June 3, 1987.

45  
46 "Marginal Cost Pricing for Natural Gas Local Distribution  
47 Utilities," speech presented before the Eighth Annual North

1 American Conference of the International Association of  
2 Energy Economists, Massachusetts Institute of Technology,  
3 Cambridge, MA, November 19, 1986.

4  
5 "Utilization of Marginal Costs in the Natural Gas Industry,"  
6 speech presented before the American Gas Association Ad-  
7 vanced Regulatory Seminar, University of Maryland, College  
8 Park, MD, October 6, 1986.

9  
10 "Performing Statistics in a DBASE III Application: Bill  
11 Frequency Distribution & Load Research Customer Sample  
12 Selection." Feature article for PEGBoard, the journal of  
13 the Planning Engineers Desktop Computer Users Group, Vol. 5  
14 #3, May-June 1986.

15  
16 "Managers Use of Microcomputers in the Electric Utility,"  
17 before the Annual Meeting New York Power Authority, Harrison  
18 Conference Center, Glen Cove, Long Island, New York, March  
19 27, 1986.

20  
21 "Natural Gas Utility Cost of Service Demand Allocation  
22 Methods," speech presented to the Spring meeting of the New  
23 England Utility Rate Forum, Worcester, MA, April 11, 1985.  
24 Unpublished.

25

27 article in Nov-Dec 1984 issue of PEGBoard, the journal of  
28 the Planning Engineers Desktop Computer Users Group, p. 1.

29  
30 "Microcomputer Utilization in the Electric Utility Indus-  
31 try", article in Public Utilities Fortnightly, Sept. 27,  
32 1984 p.31.

33  
34 "Microcomputers in the Electric Utility Industry" paper  
35 presented at Fourth NARUC Biennial Regulatory Information  
36 Conference - Columbus, OH Sept. 7, 1984.

37  
38 "Gas Transmission Pipeline Cost Allocation and Rate Design -  
39 The Need for Change", paper presented at the Second Annual  
40 Energy Conference sponsored by the New England chapter of  
41 the International Association of Energy Economists, Boston,  
42 MA June 28, 1984.

43  
44 "An Introduction to Lotus 1-2-3: Typical Bill and Graphing  
45 Application for Electric Utilities" speech presented to the  
46 Spring 1984 Meeting of the New England Utility Rate Forum,  
47 Andover, MA March 9, 1984. Unpublished.

1 "Selective Marketing by Electric Utilities," speech present-  
2 ed to the 1983 Northeast Regional Public Power Annual Con-  
3 ference, Chatham, MA Sept. 1983.

4  
5 "Allocated Cost of Service Studies on Microcomputers,"  
6 speech presented to the Summer 1983 Meeting of the New  
7 England Utility Rate Forum, Sturbridge, MA July 21, 1983.

8  
9 "A Tool Kit for the Rate Analyst Pertaining to Public Utili-  
10 ty Expert Testimony," speech presented to Fall 1982 Meeting  
11 of the New England Utility Rate Forum.

12  
13 "The Public Utility Regulatory Policies Act - PURPA - Pur-  
14 poseful Policy or Federal Boondoggle", speech presented to  
15 Electric Council of New England - Financial and General  
16 Accounting Committee, April 24, 1981.

17  
18 "Electric Utility Transmission and Wheeling Service: An  
19 Analysis of Private Class A and B Electric Utilities" -  
20 Masters Thesis - Eastern Michigan University, Ypsilanti,  
21 Michigan, December 1980.

22  
23 "The Federal Energy Regulatory Commission's PURPA  
24 Cogeneration Rules: Economic, Rate Design, and Policy As-  
25 pects," presented at the Seventh Annual University of Mis-  
26 souri, Rolla-Department of Natural Resources (UMR-DNR)  
27 Conference on Energy, 1980.

28  
29 "Rate of Return Regulatory Policy - The Bane of Electric  
30 Utilities?," presented at the Seventh Annual University of  
31 Missouri, Rolla-Department of Natural Resources (UMR-DNR)  
32 Conference on Energy, 1980.

33  
34 "Time-Differentiated Accounting Costs for Electric Utility  
35 Rate Design," paper presented at Second NARUC Biennial  
36 Regulatory Information Conference, Columbus, OH, 1980.

37  
38 "Utility Rate Structures: What We Can and Should Do and  
39 What We Can't and Should Not Do," paper presented at the  
40 Fifth Annual UMR-DNR Conference on Energy, University of  
41 Missouri, Rolla, 1978.

42  
43 "Utilization of Load Studies and Load Data for Rate Determi-  
44 nation in Electric Utilities" unpublished paper, Dec. 1976.

45 Q. Please identify your professional affiliations.

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 A. I am currently or have previously held the following member-  
2 ships and offices: American Bar Association Industrial  
3 Organization Economist Associate member, firm Associate  
4 member of the American Gas Association with memberships as  
5 Analytical Associate and Financial Associate, Charter Member  
6 of the International Association for Energy Economics and  
7 Past President of the New England Chapter, Charter member  
8 and President of the Planning Engineers Desktop Computer  
9 Users Group, a microcomputer users group, American Economics  
10 Association, American Meteorological Society, American  
11 Society for Engineering Management (Charter and Lifetime  
12 Member), Association of Demand-Side Management Professionals  
13 (Charter), Association of Energy Engineers and its Demand-  
14 Side Management Society (Charter), Association for Evolu-  
15 tionary Economics, National Association of Business Econo-  
16 mists, and the National Society of Rate of Return Analysts.

17  
18 **Q. Are you a member of any honorary organizations?**

19 A. I am a member of Omicron Delta Epsilon International Honor-  
20 ary Economics Society. I am listed in: the International  
21 Biographical Centre's 1985 edition of the International  
22 Businessmen's Who's Who, the 13th and forward editions of  
23 Marquis Who's Who in the World, the 23rd and forward edi-  
24 tions of Marquis Who's Who in the East, the 27th and forward

5        of Marquis Who's Who in America and the fourth edition of  
6        Marquis Who's Who of Emerging Leaders in America.

**Appendix B - COSS Technical Discussion**

**I. FULLY ALLOCATED COST OF SERVICE STUDY PRINCIPLES.**

**A. General Principles**

Fully allocated cost of service studies, sometimes referred to as fully distributed or embedded cost of service studies, are necessary because of the nature of gas utility service. Many of the costs incurred to serve customers are of a joint or common nature. Any business, utility or other, that sells more than one product or service incurs costs, whether an out of pocket expense or costs related to capital investments, that are joint or common costs. Distribution Mains, an investment, are used to distribute gas to all rate classes served from the distribution system. The Demand portion of purchased gas, an expense, is incurred to sell gas to all system sales rate classes. There is no exact method to determine a product's or service's share of a joint or common cost. Thus, these costs are allocated using a method that is reasonable based upon judgement.

In some cases, costs are specifically identifiable as to their cost causation. These costs can be directly assigned to a rate class or classes to reflect proper cost causation. Some analysts refer to cost allocation as assigning costs. This is improper. Occasionally it is possible to assign a portion of the cost associated with a specific account and allocate the balance for individual accounts. In most cases, because a cost is common, it is necessary to identify a reasonable method to allocate that cost item to rate classes. That is, we seek to determine what caused the utility to incur the cost. This concept is referred to as proper cost causation.

Fully allocated cost studies pertain to the analysis of accounting costs. The results of such studies determine average costs. Since the utility's revenue requirements are determined based upon accounting costs, the results of a cost allocation study may be used to determine the revenue requirements by rate class.

1           **B.    Top-Down and Bottom-Up Cost Allocation Stud-**  
2           **ies**

3  
4           The process of performing a fully allocated cost of service  
5 study may be approached in two ways: top-down and bottom-up.  
6 Some analysts do not do a top-down study, but merely perform a  
7 study to determine revenue requirements by rate class (bottom-  
8 up). These are discussed in detail in Sections I. E. and F  
9 below.

10  
11  
12           **C.    Fundamental Steps in Cost Allocation**

13  
14           The cost allocation is comprised of five primary steps. All  
15 cost items, whether income or rate base related, are:

- 16           .  
17           functionalized  
18           .  
19           classified  
20           .  
21           allocated  
22           .  
23           aggregated  
24           .  
25           summarized

26  
27           Functionalization assigns costs to the function performed. For a  
28 gas utility the following broad functions are often used:

- 29           .  
30           Production  
31           .  
32           Storage  
33           .  
34           Transmission  
35           .  
36           Distribution

37  
38           After all costs have been Functionalized, they are next  
39 Classified. This analysis is actually comprised of two parts.  
40 First, each cost is analyzed and a determination is made as to  
41 whether the cost is of a fixed or variable nature. An example of  
42 a fixed cost is Distribution Mains, Uniform System Accounts  
43 ("USA") Number 376. The investment is sunk and is the same  
44 whether customers take any gas or not. Mains investment is a  
45 Plant in Service item and is included in Rate Base. The cost we  
46 are interested in is the return associated with this investment;  
47 it is a fixed cost. An example of a variable cost is the Commod-  
ity portion of purchased gas. These costs vary directly with,  
and are a function of, consumption whether measured on a volumet-  
ric basis, Mcf, or a thermal basis, i.e. MBTU or DT.

          The second step, Classification, is to classify the costs to  
three categories: Demand, Commodity and Customer. Demand (also  
referred to as Capacity) costs are those costs that are consid-

1 ered a function of the capacity of the system. Demand costs are  
2 by their very nature considered fixed types of costs. Again,  
3 Distribution Mains are a good example because they are sized, for  
4 the most part, to meet peak capacity requirements. Commodity  
5 costs are by their nature variable since they vary with, and are  
6 a function of the amount of consumption, whether volumetric or  
7 thermal. Customer costs include both fixed and variable costs.  
8 They arise simply because a customer is hooked to the system. An  
9 example of a fixed customer cost is the investment in Services,  
10 USA Number 380. This is a sunk cost and is, therefore, fixed.  
11 It is incurred whether the customer takes any gas or not. A  
12 variable customer cost is meter reading. It is not absolutely  
13 necessary to read meters. Additionally, meter reading cost is a  
14 function of the frequency of meter reads; i.e. monthly, bimonth-  
15 ly, etc. Therefore, this cost is variable. In general, the  
16 analyst usually considers costs that are of a fixed nature,  
17 excluding customer related costs, to be capacity or demand  
18 related and those that are variable, again excluding customer  
19 related costs, to be commodity related.

20  
21 The third primary step is to allocate costs or allocation.  
22 An important part of any cost allocation study pertains to the  
23 determination of appropriate allocators. Variable costs, other  
24 than customer related, are virtually always allocated on the  
25 basis of consumption. This may be thermal, DT, or volumetrically  
26 based, Mcf.

27  
28 In all cost allocation studies the allocator that is most  
29 problematical is the demand allocator. In the natural gas  
30 industry, this is especially a problem because most gas utilities  
31 do not measure demands of their customers and very few perform  
32 load research studies that can be used to determine the  
33 customers' demand characteristics. Even if larger customers do  
34 have demand meters, smaller customers such as residential and  
35 small C&I seldom do.

36  
37 Aggregation pertains to the collecting the individual  
38 allocated cost items together into the three groups: demand,  
39 commodity and customer related costs.

40  
41 Finally, since there is a significant amount of detail in a  
42 typical COSS, the results are summarized for ease of analysis and  
43 review.  
44  
45  
46

D. Aggregation Problems, Simple Cost Studies and  
Catch-All Cost Categories

It is our belief that Cost of Service Studies are more accurate if an analyst attempts to allocate most costs on an account basis. In a cost allocation study, the following steps are usually performed: functionalization, classification, allocation and finally collection or aggregation of the allocated/classified costs. Some analysts collect costs together as Customer, Commodity and Demand related and then allocate the "aggregated" costs. This approach can lead to aggregation problems which can result in less accurate results or results that are simply wrong.

One reason why analysts do this is that allocating aggregated costs can make for a much simpler study, which can be done in less time. It also does not take as much thought and consideration as a detailed account-by-account study. Based upon our review of numerous studies throughout North America, especially where we have independently performed studies against the same raw data, we have found consistently that the simpler studies often end up allocating costs improperly and in a less fair manner.

Here is a simple example from a real life case. An analyst classified demand recording meters as a Demand related cost. For the utility involved, the amounts were substantial. They then aggregated together the Demand related Distribution costs. Next, they allocated the aggregated costs on the basis of Non Coincident Demand ("NCD") by rate class. However, the analyst made no attempt to modify the NCD factors for rate classes who were not Demand metered - including Residential and all smaller general service rate classes. In this case, the NCD for the Residential class was 38.6% and they were allocated \$317,000 of Demand related costs associated with the Demand related meters. Aside from the issue of classifying the costs in question as Demand related (in our mind they should have been classified as Customer related), the fact was that demand related costs were being allocated costs to rate classes who could not possibly have caused the costs to be incurred. Since the costs were aggregated together and then allocated on a demand basis to all classes, they became a small cost item in the simple total. This problem is referred to as an aggregation problem and is particularly an issue in studies where a simple approach is used and cost are aggregated prior to allocation rather than after allocation.

1 Generally, a COSS is easier to follow and likely more  
2 accurate if costs are aggregated to cost class (demand, commodity  
3 and customer) after they are allocated, not before. The result  
4 is admittedly a more complex study with more pieces of paper. It  
5 is our view that this is not a bad thing. Additionally, we  
6 believe results are more accurate with a lesser chance of aggre-  
7 gation problems if more costs are allocated by account rather  
8 than in toto.  
9

10 A final issue of concern is that some analysts will not take  
11 the time to try to determine an appropriate allocator. As a  
12 result, there may be many cost items that they simply throw into  
13 the category of Customer or Demand related and then use a general  
14 customer or demand allocator to allocate the cost. While expedi-  
15 ent, the result may be wrong at worst or simply unfair in terms  
16 of the result.  
17

#### 18 19 E. Top-Down Analyses 20

21 In a Top-Down study, the goal is to ascertain realized rates  
22 of return in toto and by rate class for a test year. Financial  
23 and operational results for a test year are analyzed starting at  
24 revenues (the top) and progressing down through Net Income. Net  
25 Income is the bottom line from which we determine rate of return.  
26 The test year can be a full historical period, a historical  
27 period adjusted for "known and measurable" changes or a forecast-  
28 ed period. If a forecasted approach is used, a base year is  
29 often shown to provide real data.  
30

31 Regardless of whether historical data with known and measur-  
32 able changes or a fully projected test year is used, each revenue  
33 and expense item is allocated or assigned to rate classes. This  
34 is often referred to as the Income Statement side of a cost  
35 allocation study. Elsewhere in a cost allocation study, all Rate  
36 Base items (the Balance Sheet side of a study) are assigned or  
37 allocated to classes. In general, Rate Base is determined by  
38 adding all Plant in Service ("PIS"), less Accumulated Deprecia-  
39 tion, plus Working Capital. Often there will be deductions to  
40 Rate Base, sometimes referred to as "offsets". These may include  
41 such items as Customer Deposits, Accumulated Deferred Income  
42 Taxes or Contributions. Once the allocations are complete, Net  
43 Income can be divided by the Rate Base for the System Total and  
44 for each rate class to ascertain the Rate of Return for the  
45 company and each rate class used in the study.  
46

1 Allocation of costs completes the analysis in a "Top-Down"  
2 study. The analyst can determine the actual results of opera-  
3 tions and ascertain the rate of return by rate class and for the  
4 system by dividing net income by rate base for the system in toto  
5 and for each rate class.  
6

7 Before proceeding, two words of caution regarding areas of  
8 potential confusion. First, while an analyst may use some  
9 customer basis to allocate a particular cost item, he or she may  
10 classify the costs to commodity. Thus, while a customer basis,  
11 e.g. average or weighted customers, may be viewed as the fairest  
12 allocator, the analyst believes that the cost should in fact be  
13 recovered in the commodity portion of the rate. Second, Customer  
14 related costs includes costs of both a fixed and variable nature  
15 - they are not all fixed.  
16

#### 17 18 **F. Bottom-Up Analyses** 19

20 When performing a "Bottom-Up" study, the analyst must add an  
21 additional step to a cost analysis. The purpose of a Bottom-Up  
22 study is to determine the required revenue, by rate class and in  
23 total, based upon the desired rates of return. As noted above,  
24 it is certainly possible to perform a cost allocation study  
25 without doing the top-down portion. In a Bottom-Up study,  
26 allocated rate base is multiplied by the required rate of return  
27 to determine required Net Income. This is the bottom line. All  
28 other cost items, including required Income Taxes brought about  
29 by the required Net Income, are added to the required Net Income  
30 to arrive at the required revenue by rate class and for the total  
31 company. Thus, we are working from the bottom up to the top.  
32

33 In the determination of the total company revenue require-  
34 ments and in a cost allocation study, a key determinant of  
35 revenue is the rate of return. This is especially true since  
36 required income taxes ("IT") are essentially a direct function of  
37 return. In a Bottom Up study, rate of return defines Net Income.  
38 Because IT is a function of Net Income there is a multiplier  
39 effect to get to required revenue. Aside from all other cost  
40 items, if net income changes by one dollar, revenue must change  
41 by some multiple to cover the change in IT. A simple form of the  
42 multiplier is determined by taking  $1/(1-t)$  where "t" is the tax  
43 rate. Some analysts refer to this as a revenue expansion factor.  
44

45 It is our belief that a goal of utility regulation should be  
46 generally to establish revenue requirements on the basis of  
47 equalized rates of return for all rate classes; i.e. the rate of

1 return for all rate classes should be the same as that required  
2 by the company overall. This may not be appropriate in certain  
3 cases; e.g. for Interruptible customers.  
4

5 The transition from the Top-Down study to the Bottom-Up  
6 study is straightforward. In terms of costs, the only items  
7 which change are the Net Income, Income Taxes and any other items  
8 affected by the income change. Other items might include, for  
9 example, gross receipts taxes. All other costs are unaffected by  
10 a change in rate of return. As a result, the Bottom-Up study  
11 starts with the Net Income from the Top-Down study and adds (or  
12 subtracts) the additional (or decremental) costs for increased  
13 (decreased) Net Income and increased (decreased) federal level  
14 income taxes. Once these are determined, the Bottom-Up study is  
15 completed and the result is the overall required revenues by rate  
16 class.  
17

18 In summary, a Top-Down cost allocation study seeks to  
19 determine the realized rate of return by rate class starting with  
20 revenue at the top and working down to the bottom line, Net  
21 Income. The Bottom-Up study starts at the required Net Income,  
22 the bottom, and works up to determine required revenue by rate  
23 class.  
24

## 25 26 27 **II. DETERMINATION OF ALLOCATION FACTORS.**

### 28 29 30 **A. Customers**

31  
32 There are two types of Customer allocation factors:  
33 unweighted and weighted. When the customers in all rate classes  
34 should bear the same weight, the unweighted factors are used.  
35 The average number of customers by rate class or equivalently  
36 number of bills are then used in the COSS.  
37

38 Weighted Customer allocation factors are used when a differ-  
39 ent weight should be applied, but the number of customers has to  
40 be worked into the calculus. For example, based on MGE data that  
41 I used, the cost of a Residential Meter is \$55 and that for a  
42 typical LGS customer is \$2,275. To determine the weights, the  
43 cost (from a special study) for items are divided by the costs  
44 for the lowest cost class, usually Residential. In this case,  
45 the weight is 41.3636 ( $2,275/55$ ) for LGS and 1.0 for Residential  
46 ( $55/55$ ). The weights are multiplied by the number of customers  
47 in a class. This is summed across all classes and each class'

1 amount is divided by the Total. The result is the weighted  
2 allocation factor.

3  
4 In some case, the appropriate number of customers is not  
5 based on the number of "customers" or bills rendered. In this  
6 case, MGE has 30 extra meter/service combos for its 441 LVS  
7 customers. Therefore, in determining weighted factors for  
8 Accounts 380-383, 471 was used for the LVS class rather than 441  
9 "customers".

10  
11  
12 **B. Commodity**

13  
14 Monthly Mcf (or Dt or Ccf) sales data by rate class are  
15 summed and each rate class' amount is divided by the Total  
16

17  
18 **C. Demand**

19  
20 There are many types of demand allocation factors that can  
21 be used. For purposes of this study, we chose to use the Peak  
22 Month method.  
23

24  
25 **III. CUSTOMER COST METHODS**

26  
27 The determinations discussed in this section pertain to  
28 studies that include a Bottom-Up as well as Top-Down analysis.  
29 Some of the material included here is germane only to a Bottom-Up  
30 study. This material identifies some of the logic as to why we  
31 classify certain costs as Customer related. It can assist in  
32 understanding of how we come up with the Customer related costs,  
33 which backup a proposed monthly Customer Charge.  
34

35 There are four generally accepted methods categorized as  
36 approaches to determine customer related costs in a cost alloca-  
37 tion study, though two of these, zero intercept and minimum  
38 system, actually are approaches to identify a portion of Mains  
39 PIS as customer related. The methods are: minimum system, zero  
40 intercept, simple customer and a method that we refer to as the  
41 basic customer method. In a COSS, we usually determine customer  
42 related costs using the simple customer and the basic customer  
43 methods. The costs that we include in the Simple Customer  
44 Approach are fairly comprehensive as follows.  
45

46 Costs Included in the Simple Customer Approach  
47

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

Expenses:

Services portion of Mains & Services (Acct. 874)  
Meters & House Regulators (Acct. 878)  
Customer Installation (Acct. 879)  
Maintenance of Services (Acct. 892)  
Maintenance of Meters & House Regulators (Acct. 893)  
Meter Reading (Acct. 902)  
Customer Records & Collections (Acct. 903)  
Depreciation (associated with Accts. 380, 381 & 382)

Rate Base: (Return and FIT associated with)

Services (A/C 380) net of Accumulated Depreciation				
Meters (A/C 381)	"	"	"	"
Meter Install. (A/C 382)	"	"	"	"
House Reg. (A/C 383)	"	"	"	"

Resulting revenue requirement grossed up for Gross Receipts  
Taxes if necessary.

The Basic Customer Method reflects all direct and indirect costs of having a customer attached to the LDC's system. Note that the basic customer approach does not assume that all costs classified as customer related are fixed - some are in fact variable; e.g. meter reading.

The Simple Customer approach may be viewed as limited in that it often does not cover all of the direct customer related costs, let alone appropriate indirect customer related costs, that an LDC incurs to serve a customer. However, there are several renditions of the simple customer approach. Those concerns are usually directed at the most elementary and minimal approaches, which include only the following:

Return on Meters PIS  
Return on Services PIS  
Meter Reading  
Billing

More inclusive versions add some or all of the following:

Meters Operation	Meters Maintenance
Meters Depreciation	Meter related Income Taxes
Services Operation	Services Maintenance
Services Depreciation	Services related Income Taxes

1 The Basic Customer method includes the costs of return and  
2 associated income taxes associated with meters, meter installa-  
3 tions, house regulators and services plant in service on the rate  
4 base side of the revenue requirements. It also includes, on the  
5 income statement side, the costs of meter reading and customer  
6 records and collection. Since other costs within a cost alloca-  
7 tion study are in turn a function of these costs, whether direct-  
8 ly or indirectly, they are included in the Basic Customer Method.  
9 Thus, this method seeks to include a greater array of costs, but  
10 costs that are considered to be a function of having the customer  
11 attached to the system.

12  
13 In the determination of customer related costs, there may be  
14 cases where the actual method used is less important than how  
15 costs are classified and allocated. For example, it may be most  
16 appropriate to allocate a particular cost on the basis of number  
17 of customers, yet classify the cost to the commodity portion of  
18 the rate. This can be particularly true for some of the indirect  
19 costs that can get classified as customer related simply because  
20 they "tag along" with other costs in the cost allocation study.  
21 One of our concerns with many cost allocation studies is that  
22 vast groups of individual cost items are often collectively  
23 classified. This can create an aggregation problem in that once  
24 the costs have been aggregated it is simply impossible to ascer-  
25 tain what is or is not truly customer related.

26  
27 The reader should not be mislead by the above discussion.  
28 In our cost allocation studies, we determine Customer related  
29 costs on both the simple customer basis and the basic customer  
30 method. The Simple customer approach that we calculate is  
31 comprehensive and is above what would likely be a lower limit for  
32 establishing monthly customer service charges while the Basic  
33 Customer Cost identifies a ceiling. For example, a COSS might  
34 show \$20.71 per month on the Basic Customer method and \$10.07 per  
35 month on the Simple Customer method for a Residential class. At  
36 what level should the customer service charge be set? If revenue  
37 requirements are set exactly equal to allocated costs, interclass  
38 considerations are generally not an issue. This is so because  
39 any customer related costs that are not recovered in the monthly  
40 Customer Service charge will be recovered in a rate class'  
41 Commodity charge. However, there may be intraclass consider-  
42 ations. If the Customer related costs are not recovered in the  
43 service charge, they must go into the commodity charge. The  
44 result is that larger customers would subsidize smaller customers  
45 within a rate. If revenue requirements are not set at equalized  
46 rates of return, there may be inter and intraclass consider-

Direct Testimony of  
Charles D. Laderoute  
GR-2001-292

1 ations. Obviously there are many rate design goals and objec-  
2 tives, but costs are a paramount consideration.
