Missouri Public  
Service Commission

Exhibit No. 2

Issue: Rate of Return

Witness: John C. Dunn

Exhibit Type: Rebuttal Testimony

Sponsoring Party: Missouri Gas Energy

Case No.: GR-2004-0209

Date Filed: May 24, 2004

BEFORE THE PUBLIC SERVICE COMMISSION  
STATE OF MISSOURI

MISSOURI GAS ENERGY  
CASE NO. GR-2004-0209

REBUTTAL TESTIMONY

OF

JOHN C. DUNN

ON BEHALF OF MISSOURI GAS ENERGY

May 2004

REBUTTAL TESTIMONY OF JOHN C. DUNN  
ON BEHALF OF  
MISSOURI GAS ENERGY

INDEX TO TESTIMONY

	<u>Page Number</u>
ORGANIZATION OF REBUTTAL .....	1
PRELIMINARY MATTERS .....	2
PROPER CAPITAL STRUCTURE .....	7
• Capital Structure proposed by the Staff and Public Counsel Is Unusual and Arbitrary .....	9
• The Consolidated Capital Structure is Wrong in any Event .	17
ACTUAL COST OF LONG TERM DEBT .....	23
SHORT TERM DEBT IN THE CAPITAL STRUCTURE .....	26
REQUIRED RETURN ON EQUITY .....	27
• Contrived and Mechanical DCF Calculations .....	27
• Dividend Per Share Growth Should not be used in the DCF Calculations.....	28
• Age of Data .....	32
• Disregard of CAPM/Risk-Premium .....	34
• Wrong Form of DCF Model .....	35
• Problems with Comparable Group .....	36
• Equity Ratio Adjustment .....	37
• Economic Environment .....	39
• Failure to Adjust DCF Appropriately .....	39
• Mr. Murray's Selection of Companies .....	42
• Comparison of Public Counsel and Staff End Results .....	43

• Unexplained Adjustments .....	52
• Use of an Inappropriate Source .....	52

1                   REBUTTAL TESTIMONY OF JOHN C. DUNN  
2                   ON BEHALF OF  
3                   MISSOURI GAS ENERGY  
4

5   Q.   Please state your name and business address.

6   A.   My name is John C. Dunn. My business address is 7400 West  
7        110<sup>th</sup> Street, Suite 750, Overland Park, Kansas 66210.

8   Q.   Are you the same John C. Dunn who filed direct testimony in  
9        this case before the Missouri Public Service Commission  
10       ('`Commission'') on behalf of Missouri Gas Energy ('`MGE''),  
11       a division of Southern Union Company ('`Southern Union'')?

12  A.   Yes sir, I am.

13  Q.   What is the purpose of your rebuttal testimony?

14  A.   To respond to the direct testimony of Mr. David Murray, a  
15        witness for the Commission Staff ('`Staff''), and the direct  
16        testimony of Mr. Travis Allen, a witness for the Office of  
17        the Public Counsel ('`Public Counsel''). Both filed  
18        testimony in this case recommending a return on equity, a  
19        regulatory capital structure and an overall cost of capital  
20        for MGE in this proceeding.

21                   ORGANIZATION OF REBUTTAL

22  Q.   How is your rebuttal testimony organized?

23  A.   The testimony is organized into three major areas, each of  
24        which has sub-topics. The three major areas are:

- 25        1. The selection of the proper capital structure for the  
26           MGE cost of capital calculation, including the proper  
27           equity ratio.

1       2.    The actual cost of debt for the MGE cost of capital  
2            calculation.

3       3.    The required return on equity for MGE, including the  
4            proper discounted cash flow ("DCF") calculations.

5       Both the Staff and Public Counsel witnesses have performed  
6            arbitrary and contrived calculations in the above three  
7            areas, producing an artificially low recommended cost of  
8            capital. These unreasonably low recommendations are not the  
9            product of genuine analytical effort because both witnesses  
10           lack the required expertise. Rather they are improper,  
11           strategic efforts designed to produce a specific desired  
12           result. Consequently, neither recommendation is helpful to  
13           the Commission in reaching a decision.

14                           PRELIMINARY MATTERS

15   Q.   Are there any preliminary matters to be addressed at this  
16        point?

17   A.   Yes. Staff witness Murray's direct testimony contains a  
18        substantial amount of meaningless boilerplate. Mr. Murray  
19        admitted during depositions in both Case No. GR-2001-292 and  
20        Case No. GR-2004-0209 that his testimony is essentially a  
21        "canned" document modeled in excruciating detail after  
22        other testimonies previously filed by the Staff.

23           In both depositions, Mr. Murray confirmed that much of  
24        his testimony in this case contains the same language and  
25        supposed "analysis" as his testimony in 2001 regarding MGE  
26        in Case No. GR-2001-292 and as used by Staff witness Ronald

1 L. Bible submitted in 1998 in Case No. GR-98-140. Indeed,  
2 some parts of Mr. Bible's testimony were simply copied into  
3 Mr. Murray's testimony in this proceeding, even though there  
4 is no apparent relevance of the copied material to this  
5 case. (See Murray direct testimony, p. 5, lns. 28-34 and p.  
6 6, lns. 1-11.)

7 The same is true of the direct testimony of Public  
8 Counsel witness Allen. Like Mr. Murray's use of "utility  
9 division testimony," Mr. Allen has substantially adopted  
10 the prior testimony of Mr. Mark Burdette, formerly with the  
11 Public Counsel.

12 Both Mr. Murray's calculations and Mr. Allen's  
13 calculations are mechanistic and have simply been carried  
14 forward from previous rate proceedings with no meaningful  
15 analysis. In the case of Mr. Allen, the adoption of the  
16 testimony took place only weeks after his employment by the  
17 Public Counsel.

18 Q. If the policy portion of the testimony of these witnesses is  
19 on point and relevant in this proceeding, is it appropriate  
20 for the Commission to consider that testimony in this case?

21 A. If the testimony and the analysis is thoughtful, prepared by  
22 a qualified expert and based on a careful analysis and  
23 relevant, it is certainly appropriate to consider it in this  
24 proceeding.

25 Q. Do these testimonies meet this standard?

26 A. No. Neither Mr. Murray's testimony nor Mr. Allen's  
27 testimony meets this standard. Instead, their "canned"

1 testimony from prior cases has been simply "dumped into the  
2 record" in this proceeding. As a result, there is no  
3 meaningful determination of the return on equity for MGE  
4 presented by the Staff or Public Counsel.

5 Further, the superficial analysis sponsored by both Mr.  
6 Allen and Mr. Murray demonstrates clearly that neither  
7 analysis is appropriate for determining a cost of capital  
8 recommendation for MGE in this case. Both are arbitrary,  
9 and both are designed to produce a recommendation which is  
10 low by any standards and extremely low by current standards  
11 of reasonableness.

12 Q. Are there objective criteria which can be used to determine  
13 whether the Staff and the Public Counsel return on equity  
14 and cost of capital recommendations in this case are outside  
15 the bounds of reasonableness such that they should not be  
16 accorded any weight by the Commission?

17 A. Yes. The recommendations of both witnesses can be compared  
18 to the findings of other regulatory bodies in similar rate  
19 proceedings around the country. These decisions bring  
20 together not only the recommendation of numerous parties,  
21 but also the wisdom of various commissions in reaching their  
22 decisions. It certainly is appropriate to compare such  
23 decisions of other commissions to recommendations being made  
24 in Missouri. This Commission cannot reasonably make  
25 decisions in a vacuum without any sense of context as to  
26 what other organizations are doing.

27 Q. Do you have any information concerning such decisions?

1 A. Yes. The table below the data for which came from  
2 Regulatory Research Associates, contains decisions made by  
3 regulatory authorities for natural gas utilities for the  
4 period from January 1, 2003 through the first quarter 2004:

<u>Period</u>	<u>Return Equity</u>	<u>Equity Ratio</u>	<u>Cost of Capital</u>
2002	11.03%	48.28%	8.80%
2003	10.99%	49.03%	8.75%
2004 Q 1	11.10%	45.51%	8.52%

11 Q. What does this information reveal?

12 A. Clearly, decisions made recently by other commissions are  
13 substantially higher in terms of return on equity and cost  
14 of capital than the recommendations made to this Commission  
15 by both its own Staff and the Public Counsel in this case.  
16 Here the Staff is recommending only a 9.02% return on equity  
17 on a 25.38% equity ratio resulting in a cost of capital of  
18 6.68% to 6.94% and the Public Counsel is recommending a  
19 9.34% return on equity on a 25.98% equity ratio resulting in  
20 a cost of capital of 7.38%. Furthermore, the decisions of  
21 the other commissions also have much higher equity ratios.

22 Q. What does this tell you?

23 A. This brings into sharp focus the fact that the  
24 recommendations of both the Public Counsel and the Staff in  
25 this proceeding are significantly out of step with decisions  
26 of other regulatory authorities, and should be rejected by  
27 the Commission on this basis alone.

28 Q. Public Counsel witness Allen argues at page 16, lines 12-17  
29 of his direct testimony that his recommendation to use the  
30 upper limit of his range is adequate compensation to the

1 shareholders for the significant difference in the equity  
2 ratio between the comparative companies and the equity ratio  
3 which he recommends for MGE. How do you respond?

4 A. His assertion is unreasonable.

5 Q. Please explain.

6 A. The equity ratio proposed by witness Allen is 40% for his  
7 comparative companies and only 26% for MGE. As I will show  
8 later, the 40% equity ratio for the Allen comparative group  
9 may even be too low. The equity ratio he attributes to MGE  
10 is only two-thirds of the equity ratio of his comparative  
11 group before correction. His total adjustment to the return  
12 on equity to compensate for that differential is to move  
13 from the mid-point of his range of returns on equity to the  
14 upper limit, or from 9.17% return on equity to 9.34% return  
15 on equity, or 17 basis points (Allen direct testimony, p.  
16 16, lns. 9-17).

17 Even with this adjustment, Mr. Allen's return on equity  
18 recommendation is significantly "out of line" with the  
19 findings of other commissions.

20 Q. Did the Staff witness make any such adjustment for the  
21 artificially low equity ratio he is recommending for MGE?

22 A. No. The Staff witness apparently made no such adjustment  
23 nor in any way recognized the huge difference in financial  
24 risk associated with the artificially contrived and  
25 arbitrarily low common equity ratio he recommends for MGE in  
26 comparison to the equity ratio of the comparative group.

5

14

13

2.

2.

1 the return demanded by investors is lower. This concept is  
2 not subject to debate and it is not controversial. This is  
3 absolutely fundamental to financial analysis.

4 Q. What are the risks caused by the capital structure?

5 A. The capital structure specifically is associated with  
6 financial risk. In the analysis of total investor risk,  
7 there are two types of risk, financial risk and business  
8 risk. Financial risk refers to the amount of risk created  
9 by adding leverage or debt to the capital structure of the  
10 company. The more debt or leverage added to the capital  
11 structure, the greater the financial risk. Financing with  
12 100% equity means there is no financial risk. As debt is  
13 added to the capital structure, financial risk is created  
14 and increases with the percentage of debt.

15 Q. What about business risk?

16 A. Business risk is entirely different than financial risk.  
17 Business risk is the risk associated with the operation of  
18 the entity. It is risk which rises up from the operation of  
19 the assets and it is related to weather, customer mix, the  
20 fact that revenues - for any number of reasons - may be  
21 lower than planned, returns may be different than expected,  
22 and overall operating results may be different than  
23 reasonably anticipated. Business risk also encompasses the  
24 risk of regulation, the risk of service obligations and the  
25 risk of general legal liability. These business risks are  
26 substantially unrelated to financial risk but add to the

1 total risk of the company. Total risk or shareholder risk  
2 is the sum of business risk and financial risk.

3 Capital Structure proposed by the Staff and Public Counsel is  
4 Unusual and Arbitrary  
5

6 Q. What capital structure did the Staff and Public Counsel  
7 witnesses use in their calculations of rate of return for  
8 MGE?

9 A. Both used the consolidated capital structure of Southern  
10 Union, including the impact of its Panhandle Eastern  
11 Pipeline Company ("Panhandle Eastern") subsidiary.

12 Q. What equity ratio did the Staff witness use in his  
13 calculation of rate of return?

14 A. As shown on Schedule 25 to Mr. Murray's testimony, the  
15 equity ratio is 25.38%.

16 Q. What was the equity ratio used by the Public Counsel witness  
17 in his calculation of rate of return?

18 A. The equity ratio was 25.98%.

19 Q. Is the consolidated capital structure the proper capital  
20 structure to use in calculating the rate of return for MGE?

21 A. Absolutely not.

22 Q. What is the proper capital structure to be used in this  
23 analysis?

24 A. The proper capital structure is the stand alone capital  
25 structure of Southern Union after removing short-term debt  
26 and the impact of its Panhandle Eastern subsidiary.

27 Q. Why?

1 A. There are three overriding reasons. One is specific to the  
2 circumstances of MGE. The second is financial and practical  
3 and a matter of the proper application of finance theory.  
4 The third is simply the application of basic reasonableness  
5 analysis.

6 Q. Please explain.

7 A. MGE is a division of Southern Union. Southern Union is a  
8 New York Stock Exchange publicly traded company which, until  
9 it acquired Panhandle Eastern, was primarily a natural gas  
10 distribution company with several individual divisions  
11 providing natural gas distribution service in multiple  
12 states and jurisdictions.

13 In 2003, Southern Union entered into an agreement to  
14 acquire Panhandle Eastern. To make that acquisition,  
15 Southern Union applied to the Commission for approval. To  
16 obtain that approval, Southern Union entered into a  
17 stipulation and agreement with the Staff, Public Counsel and  
18 other parties which was subsequently approved and so ordered  
19 by the Commission. This stipulation and agreement contained  
20 a number of conditions which were required by the Staff,  
21 Public Counsel and other parties and were designed to  
22 insulate MGE from the impact of Panhandle Eastern's  
23 operations.

24 Q. What do you mean by the use of the term "insulate"?

25 A. As is plain from reading the stipulation and agreement,  
26 "insulation" relates to isolating financially,  
27 operationally and in every other possible way a subsidiary

1 from other entities within the corporation, including the  
2 parent corporation. An essential ingredient of this  
3 "insulation" is that the parent corporation not guarantee  
4 or recourse the subsidiary's debt, or stand behind the  
5 subsidiary in any financial matter.

6 Q. Please continue.

7 A. The stipulation and agreement required the insulation of the  
8 MGE operation from Panhandle Eastern. It expressly  
9 prohibited funds flowing from Southern Union, the parent,  
10 into its Panhandle Eastern subsidiary.

11 Q. How have the Staff and Public Counsel applied that  
12 stipulation and agreement in this case?

13 A. The Staff and Public Counsel's use of the consolidated  
14 capital structure completely violates this fundamental tenet  
15 of the stipulation and agreement. It brings the Southern  
16 Union distribution properties, including MGE, together with  
17 the pipeline into a single entity.

18 Q. Why did the Staff and Public Counsel witnesses do this?

19 A. The Staff and Public Counsel witnesses do so in this case,  
20 in my opinion, to take advantage of a lower equity ratio and  
21 Panhandle Eastern's lower cost of debt.

22 Q. How do you respond?

23 A. For the Staff and Public Counsel to demand insulation of MGE  
24 from Panhandle Eastern prior to the acquisition and then  
25 little more than a year later to propose that rates be set  
26 for MGE using a consolidated capital structure, including  
27 the impact of Panhandle Eastern, is the height of

1 inconsistency and arbitrariness that should not be  
2 sanctioned by the Commission.

3 Q. Did the Panhandle Eastern acquisition make Southern Union's  
4 consolidated capital structure unusual and temporarily  
5 distorted?

6 A. Yes. The acquisition made the consolidated capital  
7 structure appear to have a lower equity ratio for all of the  
8 investments of Southern Union rather than only for the  
9 pipeline investment. The acquisition of Panhandle Eastern  
10 was a major event for Southern Union. It has caused the  
11 equity ratio on a consolidated basis to be lower than had  
12 been the case prior to the acquisition. Even the Public  
13 Counsel witness admits that the current capital structure is  
14 unusual.

15 This anomalous capital structure will be changed and  
16 Southern Union is working diligently to cause the equity  
17 ratio to return to a normal range. However, a normal range  
18 for the consolidated company may not be a normal capital  
19 structure for the distribution properties.

20 Q. Why is that?

21 A. The consolidated capital structure is an accounting artifact  
22 created by adding together the individual capital structures  
23 of the individual entities in Southern Union. Thus, the  
24 consolidated capital structure would be a proper fit for the  
25 distribution properties only by accident.

26 Q. Is the consolidated capital structure in any way appropriate  
27 for the determination of rate of return in this proceeding?

1 A. It is not because, in addition to the two factors just  
2 discussed, attributing the consolidated capital structure  
3 including Panhandle Eastern to MGE fails to pass a basic  
4 reasonableness test when compared to capital structures  
5 maintained, on average, by other companies within the  
6 distribution industry and when compared to Standard & Poor's  
7 ("S&P") utility financial target ratios of total debt to  
8 total capital. Southern Union's consolidated capital  
9 structure ratios at December 31, 2003 are not consistent  
10 with S&P's financial targets for a utility with bonds in the  
11 BBB bond rating category and which is assigned a business  
12 position of "4", such as Southern Union. S&P's Utility  
13 Group Financial Target benchmark ratios, revised June 21,  
14 1999, indicate that the total debt to total capital ratio  
15 required by S&P of a public utility with bonds rated in the  
16 BBB bond rating category and a business position of "4"  
17 ranges from 49.5% to 57%, implying a total equity to total  
18 capital ratio of 43.0% to 50.5%. Mr. Murray's recommended  
19 capital structure contains a total debt ratio of 68.45% and  
20 a total equity ratio of 31.55% which fall far above and far  
21 below S&P's ranges of total debt to total capital and  
22 implied total equity to total capital ratios for public  
23 utilities, such as Southern Union, with bonds rated in the  
24 BBB bond rating category and which are assigned a business  
25 position of "4".

1 Q. Is the capital structure recommended by Mr. Murray  
2 representative of the anticipated capital structure of the  
3 company in question and investor expectations of same?

4 A. No. In an April 6, 2004, research summary for Southern  
5 Union, S&P, which is investor influencing, expects that  
6 Southern Union will significantly decrease the leverage in  
7 its capital structure, recognizing that its current level of  
8 debt is not appropriate for the BBB bond rating. S&P   
9 states: "By the end of 2005, Standard & Poor's expects that ...  
10 the total debt to total capitalization ratio will be  
11 appropriate for the 'BBB' rating target benchmark of 56%.  
12 [Moreover,] in 2006, the conversion of \$125 million of debt to  
13 equity will lower that ratio to around 50%."

14 Q. Is there another MGE witness who will discuss the capital  
15 structure and explain how, consistent with generally  
16 accepted accounting principles, to properly exclude the  
17 impact of Panhandle Eastern from Southern Union's  
18 capitalization?

19 A. Yes, Mr. John Gillen.

20 Q. When you said that the capital structure was proposed by the  
21 Staff and Public Counsel was designed to reduce the equity  
22 ratio, what specifically did you mean?

23 A. The equity ratio of the consolidated capital structure is  
24 lower than the equity ratio of the capital involved in  
25 supporting the natural gas distribution properties of MGE.  
26 This is primarily because the consolidated capital

1 structure includes approximately \$1.2 billion in Panhandle  
2 Eastern long term debt.

3 Q. What are the specific steps that Southern Union has taken to  
4 improve its equity ratio?

5 A. Southern Union pays no common stock dividend. This means  
6 that 100% of the earnings of Southern Union are retained by  
7 Southern Union and are available to repay indebtedness and  
8 improve the equity ratio.

9 Q. What other steps has Southern Union taken?

10 A. Southern Union has publicly announced that it will achieve a  
11 55% debt ratio as quickly as possible. This most likely  
12 will involve a further issuance of common equity. In fact,  
13 Southern Union currently has an outstanding petition with  
14 the Massachusetts Department of Telecommunications and  
15 Energy seeking approval to issue up to \$130 million of  
16 common equity. Approval is expected during the week of May  
17 24, 2004. Southern Union has already received approval to  
18 issue up to \$150 million of common equity from the  
19 Pennsylvania Public Utility Commission, the only other  
20 regulatory body from which approval is required. It should  
21 also be noted that none of the proceeds from Southern  
22 Union's planned common equity offering will be used to  
23 invest in Panhandle Eastern, which is consistent with the  
24 terms and conditions of the aforementioned stipulation and  
25 agreement among Southern Union, the Staff, Public Counsel  
26 and other parties.

1 In addition, Southern Union issued a hybrid security in  
2 2003, that currently appears in its long term debt balance  
3 but will convert to common equity in 2006. This will also  
4 contribute to a higher equity ratio.

5 Q. Mr. Dunn, what are the capital structures proposed by the  
6 Staff and Public Counsel witnesses?

7 A. The capital structures proposed by the Staff and Public  
8 Counsel witnesses are as follows:

<u>Component</u>	<u>Recommended Capital Ratios</u>	
	<u>Staff</u>	<u>Public Counsel</u>
Common Stock Equity	25.38%	25.98%
Preferred Stock	6.17	6.14
Long Term Debt	61.10	59.42
Short Term Debt	<u>7.35</u>	<u>7.35</u>
Total	<u>100.00%</u>	<u>100.00%</u>

18  
19 Q. What do you believe is the appropriate capital structure for  
20 MGE in this case?

21 A. The appropriate capital structure for MGE in this case, as I  
22 proposed in my direct testimony, is the use of the Southern  
23 Union capital structure excluding the impact of Panhandle  
24 Eastern. This is consistent with the Commission's Order  
25 approving the Panhandle Eastern acquisition. At June 30,  
26 2003, that capital structure was simply the consolidated  
27 capital structure reduced by the Panhandle Eastern long term  
28 debt. I also made adjustments to the capital structure for  
29 a new issue of preferred stock. Since that time, Panhandle  
30 Eastern has produced approximately \$49 million in retained  
31 earnings. Those retained earnings are a part of the  
32 Panhandle capital structure and should be eliminated from

the consolidated capital structure at December 31, 2003. A similar adjustment should be made at the true up date for the then accrued and recorded pipeline retained earnings. As was the case with the capital structure at June 30, 2003, the Panhandle Eastern debt should be eliminated from the consolidated capital structure in calculating the capital ratios for the MGE distribution properties at the true up date. As shown in the rebuttal testimony of MGE witness John Gillen, removing the impact of Panhandle Eastern from the consolidated capital structure-in a manner consistent with generally accepted accounting principles - results in a capital structure as follows:

Rate of Return December 31, 2003				
	Amount (000)	Ratio	Cost	Weighted Cost
Common Equity	\$900,247	42.1%	12.00%	5.05%
Preferred Stock	230,000	10.7	7.860	.84
Long Term Debt	<u>1,008,635</u>	<u>47.2</u>	<u>7.2895</u>	<u>3.44</u>
Total	\$2,138,882	100.0%		9.33%

This is the appropriate capital and rate of return structure to use to set rates for MGE in this case.

**The Consolidated Capital Structure is Wrong in Any Event**

Q. You said there was a second reason why the consolidated capital structure should not be used in this proceeding. What is that reason?

1 A. Southern Union is a complicated company with different  
2 capital demands by different divisions and subsidiaries. It  
3 is comprised of two major business activities. The first is  
4 the distribution business, which in turn is comprised of a  
5 series of divisions operating in different states and  
6 jurisdictions. The second major business of Southern Union,  
7 the Panhandle Eastern pipeline operation, is entirely  
8 different. The Panhandle Eastern operations have different  
9 risks and, consequently, different capital mix requirements.  
10 The consolidated capital structure approach assumes that  
11 those responsible for financial decisions at Southern Union  
12 do not use contemporary financial theories and do not  
13 approach the matter seriously, a view which is beyond a  
14 doubt inappropriate and incorrect.

15 Q. Please explain.

16 A. It is simply wrong to say that companies do not allocate  
17 different types of capital to their various enterprises,  
18 divisions, subsidiaries and investments based upon  
19 management's appraisal of the risk of the various entities.  
20 In reality, companies do make this allocation, which results  
21 in different capital structures and different capital costs  
22 for different activities. As a consequence of the  
23 allocation, each of the activities of a complicated company  
24 would have a unique and specific operation for its capital  
25 structure.

26 Q. What does all of this mean for this case?

1 A. In this case, Southern Union management allocates capital to  
2 MGE and makes its investment decisions for MGE based on  
3 Missouri risk and opportunity. Southern Union makes similar  
4 decisions for its other distribution operations and its  
5 pipeline operations based on their risks and opportunities.  
6 The risks and opportunities are clearly different. To say  
7 that all entities are financed with simply the average  
8 capital mix of the parent company is inaccurate, and in no  
9 way reflects the reality of the company.

10 Q. Would the allocation of different capital mixes to the  
11 various distribution operations and to the Panhandle Eastern  
12 entities be consistent with the current theory of finance?

13 A. Yes it would.

14 Q. Can you provide a reference to an accepted financial text  
15 that demonstrates this process?

16 A. Yes. In the text book *Managerial Finance*, Lawrence J.  
17 Gittman, Michael D. Joehnk and George E. Pinches include the  
18 following statement:

19 "Because of the vast differences in business  
20 and financial risk among various lines of  
21 business and because of the growth of  
22 conglomerates and other diversified firms,  
23 many companies have begun to use risk  
24 adjusted divisional costs of capital. By  
25 division, we mean some sub-unit of the firm  
26 whether it is an actual division, a  
27 subsidiary, a project or a line of business.  
28 If the capital expenditure projects  
29 undertaken by the division are essentially  
30 similar with respect to risk (but differ in  
31 general risk level from projects of other  
32 divisions), the use of divisional screening  
33 rates which are the division-specific MCCs  
34 (marginal costs of capital) should be used.

1 Those divisions with greater risk than that  
2 of the firm as a whole will have higher MCCs,  
3 whereas those with below average risk will  
4 have lower costs of capital than the firm-  
5 wide MCC.

6  
7 The concepts discussed earlier in the chapter  
8 apply as well to divisional screening rates;  
9 that is, we must concern ourselves with the  
10 appropriate target capital structure for each  
11 division, and then calculate the explicit  
12 costs for each source of financing. The  
13 explicit cost of debt and preferred stock  
14 should be adjusted from those for the firm as  
15 a whole, but typically they are not.  
16 However, the cost of common equity, which  
17 reflects economic conditions in the exposure  
18 to business risk for a firm with no debt or  
19 preferred stock must be determined for each  
20 division. In calculating divisional costs of  
21 capital, the important elements are the  
22 division's target capital structure  
23 (reflecting primarily financial risk) and its  
24 cost of equity capital (reflecting primarily  
25 business risk." *Managerial Finance*,  
26 Lawrence J. Gittman, Michael D. Joehnk and  
27 George E. Pinches, Harper and Lowe  
28 Publishers, New York 1985. (Emphasis  
29 supplied.)  
30

31 Clearly, this is not a new concept since it appears in  
32 an introductory text book in 1985.

33 Q. Are there other academic references that support this  
34 concept?

35 A. Yes. Roger A. Morin, in his book Regulatory Finance  
36 Utilities Cost of Capital, states a widely accepted  
37 principle of finance which parallels that which was stated  
38 by Professor Gittman. At page 344, Dr. Morin says:

39 Incidentally, Figure 14-4 bears a  
40 crucial message: The cost of capital for  
41 a division investment project or  
42 specific asset investment depends on the  
43 riskiness of that investment and not the  
44 identity of the company undertaking the

1 project. The cost of capital depends on  
2 the use of funds and not the source of  
3 funds. This is because the cost of  
4 capital is fundamentally the opportunity  
5 cost of the industry. That is, the  
6 foregone return on comparable risk  
7 investments.  
8

9 Q. Are the theories described in these two books actually  
10 applied in the practice of finance?

11 A. Yes, they are. In the spring-summer 1998 issue of the  
12 Journal of Financial Practice and Education ("FPE"), a  
13 survey is reported in an article by Robert F. Bruner, Keith  
14 M. Eades, Robert S. Harris, and Robert C. Higgins on "Best  
15 Practices in Estimating the Cost of Capital: Survey and  
16 Synthesis." In this article, the authors report on a  
17 survey which they conducted concerning the cost of capital  
18 of 27 highly regarded corporations, 10 leading financial  
19 advisors, and 7 best-selling text and trade books. One of  
20 the survey questions bears directly on the issue of capital  
21 structure and the determination of which capital structure  
22 is appropriate.

23 Q. What was that survey question?

24 A. The authors asked the financial advisors and reviewed the  
25 textbooks trade books to determine an answer to the  
26 following question:

27 In valuing a multi-divisional company,  
28 do you aggregate the values of the individual  
29 divisions or just value the firm as a whole?  
30 If you value each division separately, do you  
31 use a different cost of capital for each one?  
32

33 Q. What was the response to this survey question?

1 A. Of the financial advisors surveyed, 100 percent indicated  
2 that they valued the different parts of a corporation  
3 separately, and, that they used a different weighted average  
4 cost of capital for each of the valuations.

5 In addition, 100 percent of the textbooks/trade books  
6 reviewed by the authors indicated the use of a distinct  
7 weighted average cost of capital for each division was  
8 appropriate.

9 Q. What does this demonstrate?

10 A. It demonstrates that the consolidated capital structure is  
11 not used in either theoretical finance or the practice of  
12 finance.

13 Q. Is it possible that the consolidated capital structure is  
14 appropriate to determine the rate of return for MGE in this  
15 proceeding?

16 A. No. It is not even a possibility.

17 Q. Why not?

18 A. We know at this point exactly the mix of capital used by  
19 Southern Union to acquire Panhandle Eastern. That mix of  
20 capital is the capital which currently stands behind  
21 Southern Union's investment in Panhandle Eastern. It is  
22 reasonable to exclude that mix of capital from the  
23 consolidated capital structure and treat the residual  
24 Southern Union as the capital structure of the distribution  
25 entities, and the capital structure I have recommended  
26 follows this approach. This approach also complies with the  
27 order of the Commission in approving the acquisition of

1 Panhandle Eastern while the use of the consolidated capital  
2 structure, including the impact of Panhandle Eastern, does  
3 not.

4 Q. Have you followed this approach in your initial  
5 recommendation to the Commission in this case?

6 A. Yes I have. As I indicated, minor refinements have been  
7 made as a consequence of retained earnings in the pipeline  
8 operation, but the concept has not changed.

9 ACTUAL COST OF LONG TERM DEBT

10 Q. Mr. Dunn, how did the Staff witness calculate the cost of  
11 long term debt for MGE?

12 A. The Staff witness used the average cost of long term debt  
13 for the entire corporation, including the impact of  
14 Panhandle Eastern long term debt.

15 Q. How would you characterize this calculation?

16 A. It is not appropriate.

17 Q. Why not?

18 A. As indicated previously, Southern Union entered into a  
19 stipulation and agreement with the Staff, Public Counsel and  
20 other parties in connection with the acquisition of  
21 Panhandle Eastern by Southern Union in Case No. GM-2003-  
22 0238. That stipulation and agreement was subsequently  
23 approved by the Commission and currently is in force.

24 The main thrust of that stipulation and agreement is to  
25 insulate the Southern Union or MGE cost of service in  
26 Missouri from the impact of that acquisition. The Staff

1 approach violates both the spirit and the letter of that  
2 stipulation and agreement.

3 Q. Please explain.

4 A. Panhandle Eastern has approximately \$1.2 billion in long  
5 term debt. This long term debt was raised by Panhandle  
6 Eastern prior to its acquisition by Southern Union in 2003.  
7 In fact, some of the Panhandle Eastern long-term debt was  
8 raised as early as 1994. Those funds could not have been  
9 used in the development or financing of facilities to serve  
10 MGE's customers.

11 Furthermore, the insulation sought by the Staff, Public  
12 Counsel and other parties in the acquisition proceeding and  
13 ordered by the Commission means that MGE is to be insulated  
14 from the impact of Panhandle Eastern. The Staff, however,  
15 adds the Panhandle Eastern long term debt in the calculation  
16 of the imbedded cost of debt and in the determination of the  
17 capital structure of MGE for no purpose other than to reduce  
18 the equity ratio and to reduce the cost of debt. This of  
19 course decreases the overall cost of capital for MGE. I  
20 believe the Staff's action is arbitrary and capricious,  
21 contrived, transparent, and wrong.

22 Q. Where do these calculations appear in Mr. Murray's  
23 schedules?

24 A. Schedule 10 of Mr. Murray's direct testimony shows the  
25 calculation of the cost of long term debt.

26 Q. Please describe the calculation.

1 A. The Southern Union cost of long term debt is 7.17% as shown  
2 on the top half of the schedule. That cost is related to  
3 One Billion, Fifty-nine Million of long term debt. The  
4 additional One Billion, One Hundred Eighty-five Million of  
5 long term debt associated with Panhandle Eastern has an  
6 average cost of 5.698%. That cost, when combined with the  
7 Southern Union cost, reduces the Southern Union imbedded  
8 cost of debt from 7.17% to 6.38%.

9 Q. Is Panhandle Eastern a corporation?

10 A. Yes it is.

11 Q. Was the Panhandle Eastern debt raised by that corporation?

12 A. Yes it was.

13 Q. Is Panhandle Eastern debt rated separately by the rating  
14 agencies?

15 A. Yes it is.

16 Q. Has the Staff ever said that it would use the capital  
17 structure of the company for ratemaking purposes if the  
18 company raised its own long term debt?

19 A. Yes. In the past, the Staff has said that in its view an  
20 important criteria in deciding whether or not to use the  
21 "company only" capital structure rather than the  
22 consolidated capital structure is whether the company or  
23 division raised its own debt from the public. See for  
24 example the direct testimony of David Murray in Aquila,  
25 Inc., Case Nos. ER-2004-0034 and HR-2004-0024, page 20,  
26 lines 16-20, attached hereto as Rebuttal Schedule JCD-1.

27 Q. How does that apply here?

1 A. Panhandle Eastern raises its own long term debt, which is  
2 separately rated and non-recourse to Southern Union. That  
3 debt should be isolated from Southern Union's MGE  
4 distribution operations, together with the appropriate  
5 amount of Panhandle Eastern common equity. When that is  
6 done, a Southern Union only capital structure (with the  
7 impact of Panhandle Eastern removed) is the result, which is  
8 the only appropriate capital structure to use for purposes  
9 of this case.

10 SHORT TERM DEBT IN THE CAPITAL STRUCTURE

11 Q. Did Staff witness Murray include short term debt in the  
12 capital structure?

13 A. Yes he did.

14 Q. Did Public Counsel witness Allen include short term debt in  
15 the capital structure?

16 A. Yes he did.

17 Q. Is that appropriate?

18 A. It is not.

19 Q. Why not?

20 A. Short term debt is just what the name implies - short term.  
21 Southern Union typically uses short term debt to finance  
22 utility plant additions and other capital requirements for  
23 short periods of time until permanent, long term financing  
24 is put in place in conformity with the principle of finance  
25 which suggests that assets should be financed with  
26 obligations that have a maturity which is similar to the

1 life of the asset being financed. As such, it is  
2 inappropriate to include short-term debt balances in the  
3 capital structure for permanent rates.

4  
5 Furthermore, Southern Union, including MGE, utilized short-  
6 term debt over the past year to finance temporary working  
7 capital needs such as under-collected gas costs and high  
8 levels of customer receivables caused by increasing purchase  
9 gas costs. Southern Union has repaid a significant portion  
10 of its short-term debt over the past several months with (i)  
11 proceeds from the sale of its 7.55% preferred stock in  
12 October 2003, (ii) free cash flow generated as a result of  
13 the continuance of its stock dividend policy, which allows  
14 the Company to retain its earnings for such purposes, and  
15 (iii) proceeds from the collection of receivables and  
16 previously under-recovered gas costs. As of April 30, 2004,  
17 Southern Union had no outstanding short-term debt.

18  
19 REQUIRED RETURN ON EQUITY

20 Contrived and Mechanical DCF Calculations

21 Q. Your third major criticism was the fact that both the Staff  
22 and the Public Counsel witnesses used arbitrary, contrived  
23 and mechanistic DCF calculations. Please describe this  
24 criticism in greater detail.

25 A. For at least the last three testimonies sponsored by  
26 different members of the Staff in connection with the

1 determination of MGE's cost of capital, including this case,  
2 the Staff witness has processed a series of numbers through  
3 a set of schedules, with no apparent comprehension of the  
4 meaning of the numbers or the implications of the data.  
5 This processing of numbers is not an analytical  
6 determination of the return on equity for MGE. It is simply  
7 an arithmetic exercise which produces anomalies that are  
8 averaged and subsequently disguised in further averaging  
9 calculations.

10 Dividend Per Share Growth Should not be used in the DCF  
11 Calculations  
12

13 Q. Please explain.

14 A. One of the major problems associated with the mechanistic  
15 analysis that begins on Schedule 15 of Staff witness  
16 Murray's direct testimony is the fact that there has been a  
17 change in dividend policy in the utility industry. That  
18 change in dividend policy means that a somewhat different  
19 approach to the determination of the DCF return on equity is  
20 required. It appears that the Staff witness either so  
21 mechanistically calculates and processes the numbers that he  
22 does not recognize the problem with the data and the  
23 distortion the bad data causes in the end result, or he  
24 recognizes the problem and ignores it. It should also be  
25 noted that to a lesser degree, the same is true with respect  
26 to book value per share growth. As many companies work to  
27 clear extraneous items from their balance sheets charges are

1 made directly to book value which distorts the growth  
2 calculation.

3 Q. Please explain.

4 A. The historic policy of utility companies was to pay high  
5 dividends (as a percent of earnings) and increase the  
6 underlying dividends frequently, usually every year.  
7 Recently, utility companies in general and gas distribution  
8 companies in particular have been striving to improve equity  
9 ratios and decrease the need for repeated equity offerings  
10 by reducing the increases in dividends while improving the  
11 tax efficiency of their return to shareholders.  
12 Consequently, dividend payments per share have not been  
13 increasing as rapidly as either earnings per share or book  
14 value per share.

15 Since the unadjusted older form of the DCF model  
16 focused on dividend growth as the driving force behind the  
17 shareholders' return, some modification is required because  
18 dividends are not now growing apace with earnings.

19 Q. Is this obvious from Mr. Murray's schedules?

20 A. It is. For example, Schedule 15-1 to Mr. Murray's direct  
21 testimony contains a calculation of dividend per share  
22 growth and earnings per share growth for the period 1992  
23 through 2002. The dividend per share growth is 1.66% and  
24 the earnings per share growth is 4.38%, or two and one-half  
25 times as great. His Schedule 15-2 shows that the dividend  
26 growth has remained about the same in the five-year period

1 as in the ten-year period at 1.69%, but a corrected earnings  
2 per share growth rate is much higher.

3 Q. What do you mean ``corrected''?

4 A. The Staff witness calculates on his Schedule 15-2 earnings  
5 per share growth at 1.72%. This number is substantially  
6 influenced by two factors. The first factor is the fact  
7 that the data is terminated artificially in 2002, it is  
8 simply old data. Secondly, of the eight companies, three  
9 have negative growth in earnings per share, one in the  
10 amount of negative 9.23%. This negative growth should not  
11 be included in the calculations of average historic growth  
12 since it is not a factor that would influence a potential  
13 investor making a calculation of this type. Put simply,  
14 investors do not seek to invest in a company that has a  
15 negative growth future. In fact, even the Public Counsel  
16 witness has rejected including negative growth rates in the  
17 DCF calculation.

18 Q. Is there any further evidence that the dividend per share  
19 growth is much lower than the earnings per share growth?

20 A. Yes. The Staff witness has included three projected growth  
21 rates in earnings developed by professional analysts for his  
22 comparative group on his Schedule 16. Those three projected  
23 growth rates in earnings range from 4.81% to 5.75%. This  
24 compares to the dividend growth rate of 1.69% and 1.66%  
25 calculated on Mr. Murray's Schedules 15-1 and 15-2.

26 Clearly, the dividend growth rate is out of line and a  
27 proper analysis would seek the explanation as to why it is

1 out of line and adjust the calculations appropriately. The  
2 Staff witness has not done so and consequently he has  
3 grossly understated the cost of common equity.

4 Q. Do the assumptions of the DCF model have anything to say  
5 about this difference?

6 A. Yes. The DCF model assumes that earnings, dividends and  
7 book value grow in tandem. Clearly, that is no longer the  
8 case. Staff witness Murray's continuous use of dividends,  
9 when their growth rate is out of step with earnings and book  
10 value, is a poor analytic technique and, in this case,  
11 apparently is done for no reason other than to reduce the  
12 recommended return on equity.

13 Q. How much does the use of this historic data in Mr. Murray's  
14 calculations affect his growth calculation?

15 A. The projected growth rates, which are the most relevant  
16 growth rates, range from 4.8 to 5.75% on his Schedule 16.  
17 After including in that calculation the historic growth  
18 rates, the growth used in the DCF analysis is lowered to  
19 3.93%. The effect is between 1 and 1.75 percentage points.  
20 Adjusting Mr. Murray's DCF result for this change alone  
21 would produce an indicated return on equity of 9.52 to  
22 10.22.

23 Q. Why in the face of this information would Mr. Murray  
24 continue to include the historic dividend per share growth  
25 in his calculation?

26 A. Mr. Murray continues to include this dividend growth either  
27 because the calculation is an unthinking, mechanistic

1 processing of numbers, or because he intentionally desires  
2 to reduce the number to produce the lowest possible return  
3 on equity. The evidence is abundant that including  
4 dividends per share growth in the calculation, at least on  
5 the historic basis, is wrong. To do so obviously is the  
6 result of ignoring reality or attempting to produce a  
7 desired end result.

8 Age of Data

9 Q. What is your comment with respect to the age of the data?

10 A. Mr. Murray used 2002 as an end point for the growth rates in  
11 his analysis even though his direct testimony was not filed  
12 until April, 2004, after publication of the March 2004 issue  
13 of the Value Line Survey on the natural gas distribution  
14 industry which included 2003 data. He indicated in his  
15 deposition that even if there were significant differences  
16 as a result of updating his data, he would not make the  
17 adjustments for this case. (Deposition, p.89, ln.2.)

18 Q. Have you compared Mr. Murray's 2002 data to newer 2003 data  
19 available from the Value Line Investment Service?

20 A. Yes I have.

21 Q. And what is the result of that analysis?

22 A. The way Mr. Murray's schedules work is that on Schedule 15-  
23 1, he derives the ten-year dividends, earnings and book  
24 value per share growth, and on Schedule 15-2, he derives the  
25 five-year dividends, earnings and book value per share  
26 growth. Then on Schedule 15-3, he takes the three ten-year

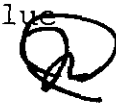

1 data points, adds them together and averages them, and the  
2 three five-year data points, again adds them together and  
3 averages them, and then averages those averages to produce a  
4 growth rate of 2.76%. That 2.76% is then carried forward to  
5 Schedule 16 and averaged with the analyst's forecasts.

6 Q. What would the result have been if he used new data?

7 A. The calculation which I have made shows that had he used the  
8 new data available to him at the time his testimony was  
9 filed, rather than the old data actually used, the growth  
10 rate which he would have included in the calculation on  
11 Schedule 16 is 3.85% rather than 2.76%. That derivation is  
12 as follows:

	Murray	Murray
	<u>Old Data</u>	<u>New Data</u>
<u>Growth</u>		
DPS		
5 yr.	1.69%	1.79%
10 yr.	1.66	1.72
EPS		
5 yr.	1.72%	7.69%
10 yr.	4.38	3.96
BYPs		
5 yr.	3.75%	4.45%
10 yr.	3.38	3.54
Average	<u>2.76%</u>	<u>3.85%</u>

27  
28  
29 Q. Mr. Dunn, you indicated that you believe that the dividend  
30 per share growth should not be included in this calculation  
31 under the current circumstances and policies being employed  
32 by natural gas distribution companies. What would have been  
33 the effect if the dividend per share growth is not included  
34 in the calculation?

1 A. Simply substituting the current data would have increased  
2 the result of the calculation by more than one percentage  
3 point. Similarly, eliminating the dividend per share growth  
4 - - which is clearly an anomaly - - results in an increase  
5 from the original 2.76% employed by Mr. Murray to ~~4.16%~~ <sup>3.31%</sup> --   
6 for an increase of 1.40 percentage points. In summary, if  
7 Mr. Murray used new data and did not include the dividends  
8 per share historic growths, he would have calculated a value  
9 line growth of ~~6.07%~~ <sup>4.97%</sup> rather than 2.76%. This is a huge   
10 difference. Reflecting this change in Mr. Murray's analysis  
11 would produce a DCF indicated return on equity of ~~11.09%~~ <sup>11.17%</sup>

12 Disregard of CAPM/Risk-Premium

13 Q. Are there any other examples of the improper application of  
14 a mechanistic calculation process to reach a desired result?

15 A. Yes. The Staff witness in his analysis has made three  
16 separate calculations of the required return on equity, a  
17 DCF calculation, a CAPM calculation, and a Risk Premium  
18 calculation. The results of the DCF calculation ranged from  
19 8.2% to 9.2%. The CAPM calculation result was 9.29%, and  
20 the Risk Premium calculation result was 10.41%.

21 There is a significant difference between the  
22 indication of the DCF model and the indication of the other  
23 two calculations. The Staff witness, however, made no  
24 comment or change as a consequence of this dramatic  
25 difference in results. It would appear that the Staff

1 witness had an end result in mind and was not in any way  
2 swayed by the facts related to the analysis.

3 Q. Why do you say this?

4 A. The Staff witness simply ignored the results of the other  
5 calculations and used the DCF as the sole basis for his  
6 recommendation. If the other analyses were of no value in  
7 the calculations or in the determination of the required  
8 return, they should not have been included in the testimony.  
9 Staff's failure to utilize these alternative analyses merely  
10 emphasizes that Mr. Murray's calculations are arbitrary,  
11 contrived and end-result oriented, as opposed to the best  
12 estimate of the return on equity.

13 Wrong Form of DCF Model

14 Q. How is the wrong form of the DCF model used in the Staff  
15 analysis?

16 A. On page 24, commencing at line 9 and carrying on for several  
17 pages, the DCF model is discussed in Mr. Murray's testimony.  
18 At line 17 of page 24, Mr. Murray states that he will use  
19 the continuous growth form of the DCF model. This  
20 continuous growth form assumes that the dividends are paid  
21 continuously rather than periodically. The use of this  
22 assumption causes the DCF result to be lower than it would  
23 have been had an appropriate form of the model been used.

24 Later in the testimony he uses the annual form of the  
25 model (P25L1-20), and finally in his calculations he uses a  
26 mix of data.

1 Q. Do you have a reference describing the different forms of  
2 the DCF model?

3 A. Yes, I do. In The Cost of Capital - Practitioner's Guide,  
4 by David C. Parcell, the various forms of the DCF model are  
5 shown commencing at page 8-7 and carrying through 8-17. I  
6 have included as Rebuttal Schedule JCD-2 those pages and the  
7 cover of the 1997 edition.

8 Problems with Comparable Group

9 Q. Are there any other problems with the data and calculations  
10 which appear on Mr. Murray's Schedules 15-1, 15-2 and 15-3?

11 A. Yes. I believe they demonstrate that Mr. Murray has not  
12 selected a comparable group.

13 Q. Please explain.

14 A. In order to develop an indication of an appropriate  
15 statistical standard by analyzing some data and using  
16 averages as the statistical standard, the data should have a  
17 central tendency. This means that the data should tend to  
18 cluster around a number, in this case, the average. Mr.  
19 Murray's data does not do that.

20 Q. Can you demonstrate that fact from the schedules?

21 A. Yes. Schedule 15-2 contains Mr. Murray's calculation of  
22 annual compound growth rates for the five-year period 1997  
23 through 2002. In the dividend per share column where his  
24 calculations have been made, you will note that the  
25 percentages vary from zero in two cases, to 5.75% in a third  
26 case. The average of the series - - which is supposed to be

1 the central tendency - - is 1.69% but the standard deviation  
2 is greater than the average at 1.73%.

3 Moving to the next column to the right, earnings per  
4 share growth, the results of the calculations vary from a  
5 minus 9.23% to a plus 7.28% and average 1.72%. Clearly  
6 there is no central tendency among this group of numbers as  
7 the standard deviation is 5.23%, or about three times the  
8 average.

9 Q. What do you conclude from this review?

10 A. The averages that Mr. Murray uses are not statistics from  
11 which valid conclusions can be drawn.

12 Equity Ratio Adjustment

13 Q. What is the problem related to the equity ratio adjustment?

14 A. As risk increases, investor demand for return increases, all  
15 other things equal. The theory of economic finance says  
16 that investors are rational and that they are risk averse.  
17 As investors' levels of risk increases, the required return  
18 on equity increases.

19 It is also well established that shareholder risk is  
20 comprised of two separate risks, business risk and financial  
21 risk. Finally, it is absolutely non-controversial to say  
22 that as the equity ratio decreases, all other things equal,  
23 the amount of financial risk increases and, therefore, the  
24 requirement for return on equity also increases.

25 Q. How does this relate to Mr. Murray's testimony?

1 A. Mr. Murray did an analysis of a "comparative group of  
2 companies which had an equity ratio of 49.68%" (Murray  
3 Schedule 22). His contrived capital structure for MGE has  
4 an equity ratio of only 25.38%. This substantial difference  
5 in the equity ratio between the comparative group and the  
6 capital structure attributed to MGE by Mr. Murray requires a  
7 substantial adjustment in the return on equity to compensate  
8 for the much higher financial risk associated with the lower  
9 equity ratio of his proposed capital structure. In other  
10 words, it is necessary to increase the return on equity from  
11 the results of his analysis based on his comparative group  
12 to a new and higher level that reflects the difference in  
13 risk between the MGE capital structure he has calculated and  
14 the capital structure of his comparative group.

15 Q. What is the magnitude of that adjustment?

16 A. Mr. Murray's recommended return on equity mid-point is  
17 9.02%. If that return were properly adjusted for the  
18 significant difference in leverage between his proposed  
19 capital structure and his comparative group, the correct  
20 return on equity would be 13.94%.

21 Q. Would increasing the return on equity from 9% to 13.94%  
22 result in an increase in the cost of capital because of the  
23 lower leverage?

24 A. No it would not. The cost of capital or rate of return  
25 would be exactly the same on a before tax basis for the  
26 9.02% return on the 49.68% equity ratio and the 13.94%

1 return on the 25.38% equity ratio. In other words, the  
2 before tax cost of capital is precisely the same.

3 Q. Do you believe that this is in conformity with the  
4 stipulation and agreement approved by the Commission in  
5 connection with the acquisition of Panhandle Eastern?

6 A. I do.

7 Economic Environment

8 Q. What use did Mr. Murray make of the economic data which he  
9 discusses in his testimony?

10 A. None, although there is a great deal of his testimony  
11 directed to general economic circumstances.

12 Q. Please explain.

13 A. Most of Mr. Murray's testimony and schedules relate to  
14 economic environment. Clearly, the economic environment is  
15 presently at a transition point with the next likely move in  
16 the cycle being up as opposed to down from an interest rate  
17 and capital cost perspective. This suggests that during the  
18 period the rates authorized in this proceeding will be in  
19 effect, capital costs will be higher than those indicated by  
20 an historic analysis such as Mr. Murray's. Nonetheless, Mr.  
21 Murray has not considered this factor nor has he adjusted  
22 his result to account for the likely change in the  
23 environment from the older data that he used in making his  
24 analysis to the probable new environment.

25 Failure to Adjust DCF Appropriately

1 Q. Did Mr. Murray leave out of his DCF analysis any  
2 adjustments?

3 A. Yes. There are two customary adjustments that should have  
4 been included in his analysis. One of those adjustments is  
5 for preoffering pressure and flotation expense, and the  
6 second adjustment is to annualize the dividend to the first  
7 full year of ownership after the date of the analysis.

8 Q. What is the adjustment for preoffering pressure and  
9 flotation expense?

10 A. Common stock, when sold to the public, has expenses  
11 associated with the sale which are not collected from the  
12 customers. It is appropriate and customary that those  
13 expenses be included in a calculation of the cost of common  
14 equity. Failure to do so means that the company cannot, if  
15 common stock is issued, earn the authorized return.

16 In addition to the expenses associated with the sale,  
17 there is often preoffering pressure related to the sale of  
18 new securities that results in a decline in the stock price.  
19 This pressure causes the realization of proceeds by the  
20 company to be less than that which would have been generated  
21 by the stock price before the offering was announced and the  
22 volume or supply of securities increased.

23 Essentially, preoffering pressure is a supply/demand  
24 phenomena. As the supply of the common stock increases at  
25 any point in time, an equilibrium market price will respond  
26 to that increase in supply by declining.

1 Q. Is it appropriate to make these two adjustments to the cost  
2 of common equity for this case?

3 A. Yes it is, because Southern Union has indicated that there  
4 will be a sale of common stock in the relatively near future  
5 in order to maintain its bond rating.

6 Q. Will MGE customers benefit from this offering?

7 A. Yes, they will.

8 Q. How will MGE customers benefit from this offering?

9 A. They will benefit in two ways. First, the bond rating of  
10 Southern Union will be preserved and because lower bond  
11 ratings lead to higher costs of debt, a savings will be  
12 realized. Second, the proceeds of the sale represent new  
13 capital available to Southern Union, some of which may be  
14 used to add facilities to MGE's infrastructure to provide  
15 service to its customers.

16 Q. Will Panhandle Eastern customers benefit from this offering?

17 A. No.

18 Q. Why not?

19 A. Because Southern Union under the terms of the approval  
20 granted by MPSC to acquire the Panhandle Eastern corporation  
21 is prohibited from investing new capital in Panhandle either  
22 directly or indirectly.

23 Q. What is the adjustment for growth in dividends?

24 A. The DCF model anticipates that during the first year of  
25 ownership, investors will expect to receive not the historic  
26 dividend but rather the historic dividend plus any increases  
27 in dividend which they anticipate will take place during the

1 course of the year. Mr. Murray has not adjusted for that  
2 circumstance in his continuous DCF model and consequently  
3 has understated the cost of common equity.

4 Mr. Murray's Selection of Companies

5 Q. Mr. Dunn, are there any problems with Mr. Murray's selection  
6 criteria for his so-called comparable companies?

7 A. Yes. Mr. Murray's selection criteria are laid out on  
8 Schedule 13 to his testimony. The criteria are as follows:

- 9 1. Publicly traded stock.
- 10 2. Distribution revenues greater than 90% of total  
11 revenues.
- 12 3. Information printed in Value Line.
- 13 4. Positive dividend per share annualized compound  
14 growth rate 1992-2002.
- 15 5. No Missouri operations.
- 16 6. Ten years of data available.
- 17 7. Total capitalization less than Five Billion  
18 Dollars.

19 The majority of these criteria, as Mr. Murray has  
20 previously admitted, are not true risk criteria. For  
21 example, the fact that the information is printed in Value  
22 Line is not a risk criteria. Furthermore, the first  
23 criteria, the fact that the stock is publicly traded, is  
24 redundant with the third criteria, the Value Line  
25 appearance. Value Line only reports on publicly traded  
26 stocks.

1           In addition, it is clear that having ten years of data  
2 available is not a risk criteria, but rather a criteria that  
3 has to do with analyst convenience. Also, there is no  
4 special risk criteria that I am aware of related to the fact  
5 that a company may have Missouri operations. MGE is a  
6 Missouri company and, if the DCF model is being used, it is  
7 appropriate to use Missouri companies if they are in fact  
8 comparable. The DCF model will eliminate any possibility of  
9 circularity.

10           Comparison of Public Counsel and Staff End Results

11 Q. Is there an end result problem with Mr. Murray's analysis?

12 A. Yes.

13 Q. Please explain.

14 A. I compared the DCF result produced by Mr. Murray with the  
15 DCF result produced by the Public Counsel's witness as a  
16 result of his analysis. The differences between the two end  
17 results for the same companies are striking.

18 Q. What is unusual about the fact that there are differences in  
19 the end result of the two analyses?

20 A. Both parties, the Public Counsel witness and the Staff  
21 witness, are trying to develop an estimate of the return on  
22 common equity for MGE. Both used many of the same  
23 "comparable" companies and both used data specific to  
24 those companies. Both claimed to have the same objective,  
25 i.e. analyze a risk similar group of companies to estimate  
26 the return on equity for MGE.

1 Q. What would this similarity of objective and process lead you  
2 to believe?

3 A. If a risk similar group of companies were selected, it is  
4 reasonable to expect that the return on equity for each of  
5 the companies in the group would be very similar to the  
6 return on equity for all of the companies, i.e. that the  
7 return on equity for each member of the group would be very  
8 tightly clustered since they are all expected to be similar  
9 in risk. Also each company return should be close to the  
10 average. Moreover, it is reasonable to expect that since  
11 both analysts had the same objective and both used similar  
12 procedures, their cost of equity would be similar and for  
13 the same company should be virtually identical. For  
14 example, both calculated a DCF return on equity requirement  
15 for AGL Resources. Under the circumstances, it is  
16 reasonable to expect both indications would be similar.

17 Q. Was that the result of the two separate analyses?

18 A. No.

19 Q. Please explain.

20 A. For example, both witnesses analyzed AGL Resources and  
21 estimated by way of the DCF model the required return on  
22 common equity for the company. It is reasonable to expect  
23 that the analysis of the same company using the same data,  
24 using the same time period and the same methodology for the  
25 same target company would produce a reasonably similar  
26 result. In fact, there is 29% difference in the two  
27 results, with the Staff indicated return on equity at 8.03%

1 and the Public Counsel indicated return on common equity at  
2 10.34%.

3 Q. Is the difference between the two results unique for AGL  
4 Resources?

5 A. No. All of the results are substantially different. In the  
6 attached Rebuttal Schedule JCD-3 I have compared the Staff  
7 DCF indicated return on common equity and the Public Counsel  
8 estimated equity using the DCF model, and calculated the  
9 percent difference between the two.

10 The reasonable correspondence or similarity in end  
11 result which one should expect is clearly not present.  
12 Since these differences are not explained or explainable, I  
13 believe both studies should be rejected. It is simply not  
14 reasonable for two analyst to make the same calculation with  
15 the same formula and the same data and produce radically  
16 different answers.

17 Data Problems in the Analysis

18 Q. What is the data problem that you refer to with respect to  
19 the Staff analysis?

20 A. Frankly, I am not sure if the data problem is one of the  
21 Staff's making or related to the Public Counsel's analysis.

22 Q. What is the nature of the problem?

23 A. An example of the problem is the equity ratio reported by  
24 the Staff witness for his comparative company group as  
25 compared to the equity ratio reported by the Public Counsel  
26 witness for its comparative group. Mr. Murray derives his

1 equity ratios on Schedule 22 to his testimony, whereas the  
2 Public Counsel witness derives his equity ratios on  
3 Schedules TA-2. In some cases, there is a significant  
4 difference between the equity ratio reported by the Staff  
5 witness and that reported by the Public Counsel witness.

6 Q. How substantial is the difference?

7 A. In the case of AGL Resources, for example, the difference  
8 amounts to almost 15 percentage points with the Staff  
9 witness reporting an equity ratio of 41.7% and the Public  
10 Counsel witness reporting an equity ratio of 27.0%.

11 Q. Have you compared all of the equity ratios reported by the  
12 Staff and the Public Counsel witnesses?

13 A. Yes I have. My Rebuttal Schedule JCD-4 compares the equity  
14 ratios from Mr. Murray's Schedule 22, with the equity ratios  
15 for the comparative companies from Mr. Allen's Schedule TA-  
16 2.

17 Q. Are all of the differences as extreme as the AGL equity  
18 ratio differences?

19 A. No. There are substantial differences such as AGL and South  
20 Jersey Resources and some reasonably close correspondence  
21 such as Northwest Natural where Staff witness Murray reports  
22 51.5 and Public Counsel witness Allen reports 48.0.

23 Q. What do you conclude from these differences?

24 A. I would conclude that one or the other is incorrect or that  
25 the data reported are not the same.

26 Q. Did you attempt to verify the AGL Resources data?

1 A. I did, and I was unable to confirm the 27 percent equity  
2 ratio produced by the Public Counsel witness calculations.  
3 The results of my calculations were more similar to the  
4 calculations of the Staff witness.

5 Q. What was the basis for your calculation of the AGL equity  
6 ratio?

7 A. I used data taken from the AGL 10Q as of December 31, 2002,  
8 and December 31, 2003.

9 Q. Does short term debt explain the difference?

10 A. It may explain part of the difference but not all of the  
11 difference.

12 Q. What is the cumulative effect of these differences?

13 A. The Staff calculated the comparative group equity ratio at  
14 almost 50% and the Public Counsel calculated the comparative  
15 group capital structure at 40%.

16 Business Risk Adjustment

17 Q. Please explain how both the Public Counsel and the Staff  
18 witnesses failed to adjust their recommendations for the  
19 business risk of MGE.

20 A. We have established that the financial risk of MGE or  
21 Southern Union is much greater than the financial risk of  
22 the comparative companies used by the Staff and Public  
23 Counsel witnesses. The business risk is also different and,  
24 in my opinion, it is higher for MGE than it is for the Staff  
25 and Public Counsel comparative companies. Neither the Staff  
26 nor the Public Counsel witnesses adjusted for that

1 difference in business risk and, as a consequence, neither  
2 has made a recommendation which is relevant for either  
3 Southern Union or MGE. I believe that the Staff and the  
4 Public Counsel witnesses both have incomplete analyses and  
5 those analyses, since they lack this required risk  
6 adjustment, should not be used by the Commission in reaching  
7 a decision as to the appropriate rate of return in this  
8 case.

9 COMMENTS ON THE PUBLIC COUNSEL TESTIMONY

10 Q. Have you reviewed the Public Counsel rate of return  
11 testimony in this proceeding?

12 A. Yes, I have.

13 Q. Do you have any comments with respect to that testimony?

14 A. Yes, I do. There are four major comments which I believe  
15 require discussion. In addition to these four comments, the  
16 testimony does suffer from the problems previously  
17 enumerated with respect to both the Staff testimony filed in  
18 this proceeding in connection with the use of the  
19 consolidated capital structure and the mechanistic analysis  
20 associated with the calculation of an estimated return on  
21 equity requirement and failure to include appropriate DCF  
22 adjustments. Specifically, however, the testimony of the  
23 Public Counsel witness has the following deficiencies:

- 24 • It includes dividend per share growth in the  
25 calculation even though the way the data is presented,

1 the dividend per share growth is clearly an anomaly  
2 which makes the inclusion arbitrary.

- 3 • It calculates the growth rate for the primary thrust  
4 of its analysis based entirely on a retention rate  
5 calculation which is both circular and could lead to a  
6 death spiral in indicated returns on equity.
- 7 • There is an unexplained adjustment in the rate of  
8 growth for four companies in the analysis.
- 9 • The Public Counsel witness used an inappropriate  
10 source for selection of companies and capital  
11 structure comparison.

12 Dividend Growth Rate Included in Analysis

13 Q. How did the Public Counsel witness incorporate dividend per  
14 share growth in his analysis?

15 A. In determining the growth rate for the comparable companies,  
16 the Public Counsel witness established three cases, a low  
17 growth case, a midpoint and a high growth case. For the low  
18 growth case, the witness averaged together a series of  
19 growth rates which included three individual dividend per  
20 share growth calculations. These averaged rates are  
21 summarized on page 13 beginning at line 10 of his testimony.  
22 It is clear from the tabular array of historic growth rates,  
23 projected growth rates, and the averages of those rates that  
24 the dividend per share growth rate is totally anomalous, and  
25 completely different from the other growth rates. Its  
26 inclusion in the calculation is entirely arbitrary and

1 wrong. It clearly does nothing other than significantly  
2 reduce the average and offset the true earnings per share  
3 growth.

4 Q. How does this differ from the Staff approach?

5 A. The primary difference is the fact that this tabular array  
6 clearly, and beyond any doubt, cries out for explanation and  
7 yet the Public Counsel witness, because of the mechanistic  
8 approach of processing the data through a series of  
9 schedules, disregards the anomaly and rolls it through the  
10 calculation thus arbitrarily reducing the indicated return  
11 on equity. Both did in fact include dividend growth which  
12 is inappropriate. Incidentally, the reason the matter is so  
13 clear from the Public Counsel's schedules is that the Public  
14 Counsel did not include negatives in the average growth rate  
15 calculation.

16 Q. How much difference is there between the dividend per share  
17 growth rate and the earnings per share growth rate?

18 A. From the table on page 13, the average earnings per share  
19 growth rate can be calculated at 5.32%. The dividend per  
20 share growth per share growth rate can be calculated from  
21 the data on the table at 1.46%. The earnings per share  
22 growth rate is 3.5 times the dividend per share growth rate  
23 and that substantial difference to a true analysis would  
24 cause either rejection or real efforts to explain and  
25 understand the difference. Since the difference is as I  
26 have indicated a result of the industry changing its  
27 dividend payout policies, these low numbers should be

1 excluded from the calculation because they serve no purpose  
2 other than to arbitrarily reduce the growth rate in the DCF  
3 calculation, thus arbitrarily reducing the indicated  
4 required return on common equity.

5 Use of the Sustainable Growth Rate

6 Q. What is the sustainable growth rate method?

7 A. The sustainable growth rate method is based on the notion  
8 that future growth in a company's earnings is dependent upon  
9 retained earnings and the rate earned on those retained  
10 earnings. If the retained earnings in the calculation are  
11 usually stated as a percentage and if the retained earnings  
12 are relatively low in the calculation, then the future  
13 growth derived from the calculation is likewise relatively  
14 low. It is widely understood in the analysis of cost of  
15 capital that the use of the sustainable growth rate  
16 methodology is both circular and can lead to a death spiral  
17 if a company has a bad year and that bad year is rolled  
18 through a sustainable growth rate calculation two or three  
19 times.

20 Q. How important is the sustainable growth rate calculation to  
21 the Public Counsel's determination of the required return on  
22 common equity?

23 A. The Public Counsel witness produced three separate estimates  
24 of growth. For the first or low expected growth rate, the  
25 witness used the overall average of all calculated growth  
26 rates for the company, including the incorrect dividend per

1 share growth rate. This means that the dividend per share  
2 growth rate was included in the calculation of the low  
3 expected growth rate at least three times. Next, the Public  
4 Counsel witness came up with a mid-point growth rate by  
5 using the sustainable or retention growth rate method.  
6 Finally, he developed a high range growth rate where he used  
7 the sustainable growth rate result again unless there was  
8 some reason to use a different rate.

#### 9 Unexplained Adjustments

10 Q. Did the Public Counsel witness use a different growth rate  
11 in any calculation?

12 A. Yes, he substituted his judgment for the calculations for  
13 four of the eight companies in his comparative group.

14 Q. What is the explanation for the substitution?

15 A. There is none given.

#### 16 Use of an Inappropriate Sources

17 Q. What source did the Public Counsel witness use for selection  
18 of companies and equity rates?

19 A. The C.W. Turner Reports.

20 Q. Do you believe that this is an appropriate source?

21 A. No.

22 Q. Why?

23 A. First, it is not recognized as a data source for this type  
24 of analysis. Second, all of the necessary data for the  
25 analysis was available in Value Line. In fact, the Public  
26 Counsel witness used Value Line for most of his data.

- 1 Q. Was the information taken from the Turner Reports available  
2 from Value Line?  
3 A. Yes.  
4 Q. Does this conclude your testimony at this time?  
5 A. Yes.

(Consolidated)**

*Jefferson City, Missouri  
December 2003*

Direct Testimony of  
David Murray

1 capital ratios. The resulting capital structure consists of 35.31 percent common stock equity,  
2 .38 percent short-term debt and 64.31 percent long-term debt.

3 The amount of long-term debt outstanding on December 31, 2002 includes current  
4 maturities due within one year. The amount of long-term debt in the capital structure is the  
5 amount of long-term debt indicated on the December 31, 2002 Balance Sheet provided by  
6 Aquila in response to Staff Data Request MPSC-222.

7 As of December 31, 2002, Aquila had \$300,963,000 of short-term debt outstanding  
8 with \$283,431,000 of Construction Work In Progress (CWIP) outstanding. Therefore, I  
9 included a short-term debt balance of \$17,532,000 in the capital structure, which is the  
10 difference between the amount of short-term debt outstanding and the CWIP outstanding.  
11 The difference between actual short-term debt outstanding and CWIP was used for the short-  
12 term debt balance because it is assumed that CWIP will eventually be funded by long-term  
13 debt.

14 Q. Why did you use Aquila's capital structure as of the test year, December 31,  
15 2002?

16 A. MPS and L&P are divisions of Aquila. Because the debt and equity are  
17 generated from the parent company, Aquila, MPS and L&P rely on Aquila to finance their  
18 investment in MPS and L&P assets. Because MPS and L&P do not issue their own debt or  
19 equity, Aquila's actual capital structure as of December 31, 2002 was used for MPS and  
20 L&P.

21 In addition, Aquila's consolidated capital structure as of the test year is not  
22 extraordinary for a comparable electric utility. According to Schedule 20, Aquila's year-end

AND REGULATORY FINANCIAL ANALYSTS**

**1997 EDITION**

**Author's Note: This manual has been prepared as an educational reference on cost of capital concepts. Its purpose is to describe a broad array of cost of capital models and techniques. No cost of equity model or other concept is recommended or emphasized, nor is any procedure for employing any model recommended. Furthermore, no opinions or preferences are expressed by either the author or the Society of Utility And Regulatory Financial Analysts.**

### Dividend Yield

Several functional forms of the DCF method have been developed. They differ mainly in the way the dividend yield is calculated.

#### Continuous Model

This method assumes dividends are paid continuously at the current dividend rate. Its form is:

$$(8.7) K = \frac{D_0}{P_0} + g$$

where: K = cost of equity

$D_0$  = annual dividends per share in period 0 (i.e., current DPS)

$P_0$  = current stock price

g = constant growth rate in DPS in future

#### Annual Compounding Model

This method differs from the continuous model since it recognizes that dividends are paid in a discrete manner rather than in a continuous manner and the expected dividend rate is utilized. This form is:

$$(8.8) K = \frac{D_1}{P_0} + g$$

where:  $K$  = cost of equity  
 $D_1$  = annual dividends per share in period 1  
 $P_0$  = current stock price  
 $g$  = constant growth rate in DPS in future

This is sometimes alternately be stated as:

$$(8.9) K = \frac{D_0(1+g)}{P_0} + g$$

or

$$(8.10) K = \frac{d_1 + d_2 + d_3(1+g) + d_4(1+g)}{P_0} + g$$

where:  $d_1$  = quarterly dividends (and the quarterly dividend is projected to increase by the value of  $g$  in the quarter when the utility normally increases the dividend rate - the third quarter in the example here).

It should also be noted that the interpretation of the  $D_1$  term is not universally accepted as a full year. Gordon, for example, has maintained that  $D_1$  is the next quarterly dividend on an annualized basis (Gordon, 1974, 81).

The interpretation of  $D_1$ , or  $D_0(1+g)$ , can take two alternative forms. First,  $D_1$  can be viewed as the dividends paid during the next period (Morin, 1984; Brealey and Myers, 1984; Reilly, 1985).

Second,  $D_1$  can be viewed as the dividend rate at the end of the next period (Linke and Zumwalt, 1984; Brigham, 1989; Bonbright, Danielsen and Kammerchen, 1988). Gordon summarized this issue by concluding "the (end of period  $D_1$ ) poses problems of implementation that are not worth the effort in view of the fact that (during period  $D_1$ ) and (end of period  $D_1$ ) typically differ by a very small amount" (Gordon, 1974, 81).

#### Quarterly Compounding Model

The annual compounding model can be further modified to recognize quarterly dividend payments. This form is:

$$(8.11) K = \frac{d_1(1+K)^{.75} + d_2(1+K)^{.50} + d_3(1+K)^{.25} + d_4}{P_0} + g$$

where:  $d_1$  = dividends per share paid in first quarter  
 $d_2$  = dividends per share paid in second quarter  
 $d_3$  = dividends per share paid in third quarter  
 $d_4$  = dividends per share paid in fourth quarter  
 $P_0$  = current stock price  
 $g$  = constant growth in DPS in future

Since "K" is in both sides of equation (8.11), it must be solved interactively.

Two alternative quarterly DCF models can be expressed as follows:

$$(8.12) \quad K = \frac{\sum_{q=1}^4 \frac{D_o(1+g)^q (1+K)^{1-(x+0.25(q-1))}}{P_o}}{P_o} + g$$

and

$$(8.13) \quad K = \left[ \frac{D_o(1+g)^{.25}}{P_o} + (1+g)^{.25} \right]^4 - 1 - \left[ 1 + \frac{D_o}{P_o} \right]^4 (1+g) - 1$$

Appendix 8.2 shows the derivation of these quarterly DCF formulas.

The quarterly DCF model can also be implemented by "compounding" the "g" factor, rather than the yield component. This will be described in the "Growth Rate" section of this chapter.

#### Semi-Annual Compounding Model

Another version of the DCF model represents a compromise between the annual compounding model and the continuous compounding model. This model is the semi-annual model and has also been referred to as the FERC model, since the Federal Energy Regulatory Commission utilized this version in its generic rate of return measure for electric utilities. This form is:

$$(8.14) K = \frac{D_0(1+0.5g)}{P_0} + g$$

where:  $D_0$  = dividends per share in period 0 (i.e., current DPS)

$P_0$  = current stock price

$g$  = constant growth rate in DPS in future

This DCF model recognizes the timing of dividend payments and dividend increases. If the investment is made between the time that a new dividend per share has been announced and the ex-dividend date, the expected yield will equal  $D_1/P_0$  (i.e., continuous compounding model). If the investment is made after four quarterly dividends have been paid at the current rate and before a dividend increase is announced, the expected yield will equal  $D_1/P_0$  or  $D_0(1+G)/P_0$  (i.e., annual compounding model). There are actually five possible expected annual dividends to be received within one year depending on the timing of the investment. They are expressed in terms of  $D_0$  as follows:

<u>Number</u>	<u>Expected Annual Dividend</u>
1	4 ( $D_0/4$ )
2	3 ( $D_0/4$ ) + [ $D_0(1-G)/4$ ]
3	2 ( $D_0/4$ ) + 2 [ $D_0(1+G)/4$ ]
4	( $D_0/4$ ) + 3 [ $D_0(1+G)/4$ ]
5	4 [ $D_0(1+G)/4$ ]

The sum of the five possible expected dividends is  $10 (D_0/4) + 10 [D_0(1+G)/4]$  or  $2.5 [D_0(2+G)]$ . The average expected annual dividend is equal to the sum of all possible annual dividends divided by five. The average expected annual dividend is  $.5 [D_0(2+G)]$  or  $D_0(1+.5G)$ .

This formula can also be justified when a DCF is performed on a group of comparison companies. At any point during a twelve-month period, some companies will increase dividends during the next few weeks, others at some time much later during the next year, and the remainder spread rather uniformly over the year. Therefore, for any one-year period, the investor can expect, on average, dividends to increase at the midpoint of the year. The implication is that the current dividend must be adjusted by one-half the annual growth rate to arrive at the expected dividend payment during the first year.

An alternative formulation of the semi-annual compounding model is:

$$(8.15) \quad K = \frac{D_0(1+n/4 \ g)}{P_0} + g$$

where:  $D_0$  = dividends per share in period 0  
 $P_0$  = current stock price  
 $g$  = constant growth rate in DPS in future

n = number of quarters since last dividend increase  
(assuming annual increases in DPS take place  
during same quarter).

This model specifically recognizes the timing of dividends, as well as the timing of dividend increases.

#### Comparison of Yields in Various Models

Each of these four models produce somewhat different yield estimates. Table 8.1 shows a set of hypothetical input values which can be used to show the yields from each model.

Table 8.1  
Input Values

<u>Variable</u>	<u>Value</u>
$D_0$	\$0.80
$d_1 = d_2 = d_3 = d_4$	\$0.20
$P_0$	\$10.00
$g$	5.00%

Use of these values results in the following yields:

#### Continuous Compounding Model

$$(8.7) \text{ Yield} = \frac{D_0}{P_0} = \frac{\$0.80}{\$10.00} = 8.00\%$$

#### Annual Compounding Model

$$(8.9) \text{ Yield} = \frac{D_o(1+g)}{P_o} = \frac{\$0.80(1.05)}{\$10.00} = 8.40\%$$

#### Quarterly Compounding Model

$$(8.11) \text{ Yield} = \frac{d_1(1+K)^{.75} + d_2(1+K)^{.50} + d_3(1+K)^{.25} + d_4}{P_o} =$$

$$\frac{.20(1+K)^{.75} + .20(1+K)^{.50} + .20(1+K)^{.25} + .20}{10} = 8.67\%$$

#### Semi-Annual Compounding Model

$$(8.14) \text{ Yield} = \frac{D_o(1+0.5g)}{P_o} = \frac{\$.80(1.025)}{\$10.00} = 8.20\%$$

#### Annual Versus Quarterly Models

A frequent DCF issue in rate proceedings concerns whether it is appropriate to utilize the annual or quarterly versions of the DCF model. Advocates of the quarterly model maintain that the existence of quarterly payments of dividends (and investor recognition of these payments) requires that the quarterly model be employed in order to properly match the "D" and "P" components of dividend yield (Cicchetti and Makholm, 1987; Linke and Zumwalt, 1984; 1987; Cargill and Wendel, 1994). Advocates of the annual

model maintain, on the other hand, that use of a quarterly model over-compensates investors because the ratemaking process (through the practice of monthly customer payments and use of average or year-end rate base) already recognizes this factor (Nyegaard, 1987; Rosenberg and Lafferty, 1988).

A third viewpoint is offered by Cicchetti, who maintains that the required return should be determined using a quarterly DCF model, but the effective rate of return should be adjusted to a nominal rate of return for use in determining revenue requirements (Cicchetti, 1989). This method is designed to recognize and balance the respective time value of money to investors (i.e., the quarterly receipt of dividends) and ratepayers (i.e., through the company's monthly accrual of earnings). A similar proposal is advocated by Siegel (1985) who maintains that quarterly DCF rates be determined and then discounted at the continuously compounded rate of return rather than the discrete, per period return.

#### Estimation of Yield Components

The previous analysis has identified three components which require input values. These are

- $D_0$  - current annual dividends per share
- $D_1$  - dividends per share in period 1
- $P_0$  - current stock price.

The first term -  $D_0$  - is straightforward and represents the current annualized level of dividends per share. For example, if the current dividend per share rate is \$0.20,  $D_0$  is \$0.80 (\$0.20 x 4, reflecting four quarterly payments).

The second term -  $D_1$  - can be determined in two alternative ways. First, as shown in equation (8.9),  $D_1$  can be estimated by increasing  $D_0$  by the growth rate, or  $D_1 = D_0(1+g)$ . Second, analysts' forecasts of dividends per share for the next period can be utilized for  $D_1$ . Sources such as Value Line and Salomon Brothers provide annual dividends per share estimates for most public utilities.

The third term -  $P_0$  - is technically the current (spot) price of a utility's stock. Two basic approaches are normally used to estimate  $P_0$ : use of the latest closing price, or (2) use of an average of recent prices. Advocates of the use of the latest spot price note that the spot price reflects all known information about the company and its stock, and thus that the spot price is most consistent with the efficient market hypothesis, which is a basic assumption of the DCF approach. Therefore, the latest closing price is theoretically the best one to use.

On the other hand, advocates of average prices note that stocks are subject to random fluctuations as buy or sell orders flow in, so the price at any moment can represent a temporary

disequilibrium. For this reason, they recommend the use of an average of recent prices.

#### Growth Rate

The growth rate component of the DCF equation -  $g$  - is usually the most crucial, and controversial, element in the use of this methodology. In estimating the appropriate growth rate, it is important to recognize two factors. First, the proper growth rate reflects the growth expectations of investors embodied in the price (i.e., yield component) of the company's stock. Analysts should recognize that individual investors have different expectations regarding growth and therefore no single indicator captures the growth expectations of all investors. Second, since the DCF model combines price (i.e., yield) and growth, the focus on growth expectations should target estimates of growth within a consistent time frame of the stock price contained in the yield component. Each of these factors relate to a "matching" of the yield and growth components of the DCF model.

An almost limitless array of techniques have been used in rate proceedings to estimate the constant growth rate component. Since the dividend discount model is technically concerned with growth in dividends, many methods are concerned directly with dividend growth. On the other hand, other methods examine factors other than dividend growth to estimate  $g$ . The objective of each of these
