Affidavit of Maurice Brubaker

Maurice Brubaker, being first duly sworn, on his oath states:

1. My name is Maurice Brubaker. I am a consultant with Brubaker & Associates, Inc., having its principal place of business at 16690 Swingley Ridge Road, Suite 140, Chesterfield, Missouri 63017. We have been retained by the Missouri Industrial Energy Consumers and Midwest Energy Consumers' Group in this proceeding on their behalf.
2. Attached hereto and made a part hereof for all purposes are my direct testimony and schedules which were prepared in written form for introduction into evidence in Missouri Public Service Commission Case No. ER-2014-0370.
3. I hereby swear and affirm that the testimony and schedules are true and correct and that they show the matters and things that they purport to show.

Maurice Brubaker

Subscribed and sworn to before me this 15th day of April, 2015.

Case No. ER-2014-0370

Direct Testimony of Maurice Brubaker

1 **Q PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A Maurice Brubaker. My business address is 16690 Swingley Ridge Road, Suite 140,
3 Chesterfield, MO 63017.

4 **Q ARE YOU THE SAME MAURICE BRUBAKER WHO HAS PREVIOUSLY FILED**
5 **TESTIMONY IN THIS PROCEEDING?**

6 A Yes. I have previously filed direct testimony on revenue requirement issues
7 presented in this proceeding.

8 **Q ARE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE OUTLINED IN**
9 **YOUR PRIOR TESTIMONY?**

10 A Yes. This information is included in Appendix A to my revenue requirement direct
11 testimony filed April 2, 2015.

12 **Q ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?**

13 A This testimony is presented on behalf of the Missouri Industrial Energy Consumers
14 (“MIEC”) and Midwest Energy Consumers’ Group (“MECG”). These companies
15 purchase substantial amounts of electricity from Kansas City Power & Light Company

**Maurice Brubaker
Page 1**

1 ("KCPL") and the outcome of this proceeding will have an impact on their cost of
2 electricity.

3 **Q WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

4 A The purpose of my testimony is to present the results of a class cost of service study
5 for KCPL, to explain how the study should be used, to recommend an appropriate
6 allocation of any rate increase, and to make rate design recommendations.

7 **Q HOW IS YOUR TESTIMONY ORGANIZED?**

8 A First, I present an overview of cost of service principles and concepts. This includes
9 a description of how electricity is produced and distributed as well as a description of
10 the various functions that are involved; namely, generation, transmission and
11 distribution. This is followed by a discussion of the typical classification of these
12 functionalized costs into demand-related costs, energy-related costs and
13 customer-related costs.

14 With this as a background, I then explain the various factors which should be
15 considered in determining how to allocate these functionalized and classified costs
16 among customer classes.

17 Finally, I present the results of the detailed cost of service analysis for KCPL.
18 This cost study indicates how individual customer class revenues compare to the
19 costs incurred in providing service to them. This analysis and interpretation is then
20 followed by recommendations with respect to the alignment of class revenues with
21 class costs. I conclude by addressing rate design issues.

1 **Summary**

2 **Q PLEASE SUMMARIZE YOUR TESTIMONY AND RECOMMENDATIONS.**

3 **A** My testimony and recommendations may be summarized as follows:

- 4 1. Class cost of service is the starting point and most important guideline for
5 establishing the level of rates charged to customers.
- 6 2. KCPL exhibits significant summer peak demands as compared to demands in
7 other months.
- 8 3. There are two generally accepted methods for allocating generation and
9 transmission fixed costs that would apply to KCPL. These are the coincident
10 peak methodology and the average and excess (“A&E”) methodology.
- 11 4. The A&E methodology appropriately considers both class maximum demands
12 and class load factor, as well as diversity between class peaks and the system
13 peak.
- 14 5. In order to better reflect cost-causation, I have changed KCPL’s submitted cost of
15 service methodology by substituting the Average and Excess - 4 Non-Coincident
16 Peak (“A&E-4NCP”) method for KCPL’s seriously flawed Average and Peak
17 (“A&P”) method.
- 18 6. The results of my class cost of service study, incorporating the change in
19 methodology that I have applied, are summarized on Schedule MEB-COS-4.
20 Schedule MEB-COS-5 shows the adjustments required to move each class to its
21 cost of service on a revenue neutral basis at present rates.
- 22 7. A modest realignment of class revenues to move them closer to costs should be
23 implemented, as presented on Schedule MEB-COS-6.
- 24 8. Schedules MEB-COS-7 and MEB-COS-8 show my recommended adjustments to
25 the design of the Large Power Service (“LPS”) and Large General Service
26 (“LGS”) rates, respectively.
- 27 9. If the Commission approves a Fuel Adjustment Charge (“FAC”), the voltage level
28 distinctions (for purposes of recognizing losses) should be secondary, primary,
29 substation and transmission.

COST OF SERVICE PROCEDURES

Overview

Q PLEASE DESCRIBE THE COST ALLOCATION PROCESS.

A The objective of *cost allocation* is to determine what proportion of the utility's total revenue requirement should be recovered from each customer class. As an aid to this determination, cost of service studies are usually performed to determine the portions of the total costs that are incurred to serve each customer class. The cost of service study identifies the cost responsibility of the class and provides the foundation for revenue allocation and rate design. For many regulators, cost-based rates are an expressed goal. To better interpret cost allocation and cost of service studies, it is important to understand the production and delivery of electricity.

Electricity Fundamentals

Q IS ELECTRICITY SERVICE LIKE ANY OTHER GOODS OR SERVICES?

A No. Electricity is different from most other goods or services purchased by consumers. For example:

- It cannot be stored; must be delivered as produced;
- It must be delivered to the customer's home or place of business;
- The delivery occurs instantaneously when and in the amount needed by the customer; and
- Both the total quantity used (energy or kWh) by a customer and the rate of use (demand or kW) are important.

These unique characteristics differentiate electric utilities from other service-related industries.

The service provided by electric utilities is multi-dimensional. First, unlike most vital services, electricity must be delivered at the place of consumption – homes,

1 schools, businesses, factories – because this is where the lights, appliances,
2 machines, air conditioning, etc. are located. Thus, every utility must provide a path
3 through which electricity can be delivered regardless of the customer's **demand** and
4 **energy** requirements at any point in time.

5 Even at the same location, electricity may be used in a variety of applications.
6 Homeowners, for example, use electricity for lighting, air conditioning, perhaps
7 heating, and to operate various appliances. At any instant, several appliances may
8 be operating (e.g., lights, refrigerator, TV, air conditioning, etc.). Which appliances
9 are used and when reflects the second dimension of utility service – the rate of
10 electricity use or **demand**. The demand imposed by customers is an especially
11 important characteristic because the maximum demands determine how much
12 capacity the utility is obligated to provide.

13 Generating units, transmission lines and substations and distribution lines and
14 substations are rated according to the maximum demand that can safely be imposed
15 on them. (They are not rated according to average annual demand; that is, the
16 amount of energy consumed during the year divided by 8,760 hours.) On a hot
17 summer afternoon when customers demand 2,000 MW of electricity, the utility must
18 have at least 2,000 MW of generation, plus additional capacity to provide adequate
19 reserves, so that when a consumer flips the switch, the lights turn on, the machines
20 operate and air conditioning systems cool our homes, schools, offices, and factories.

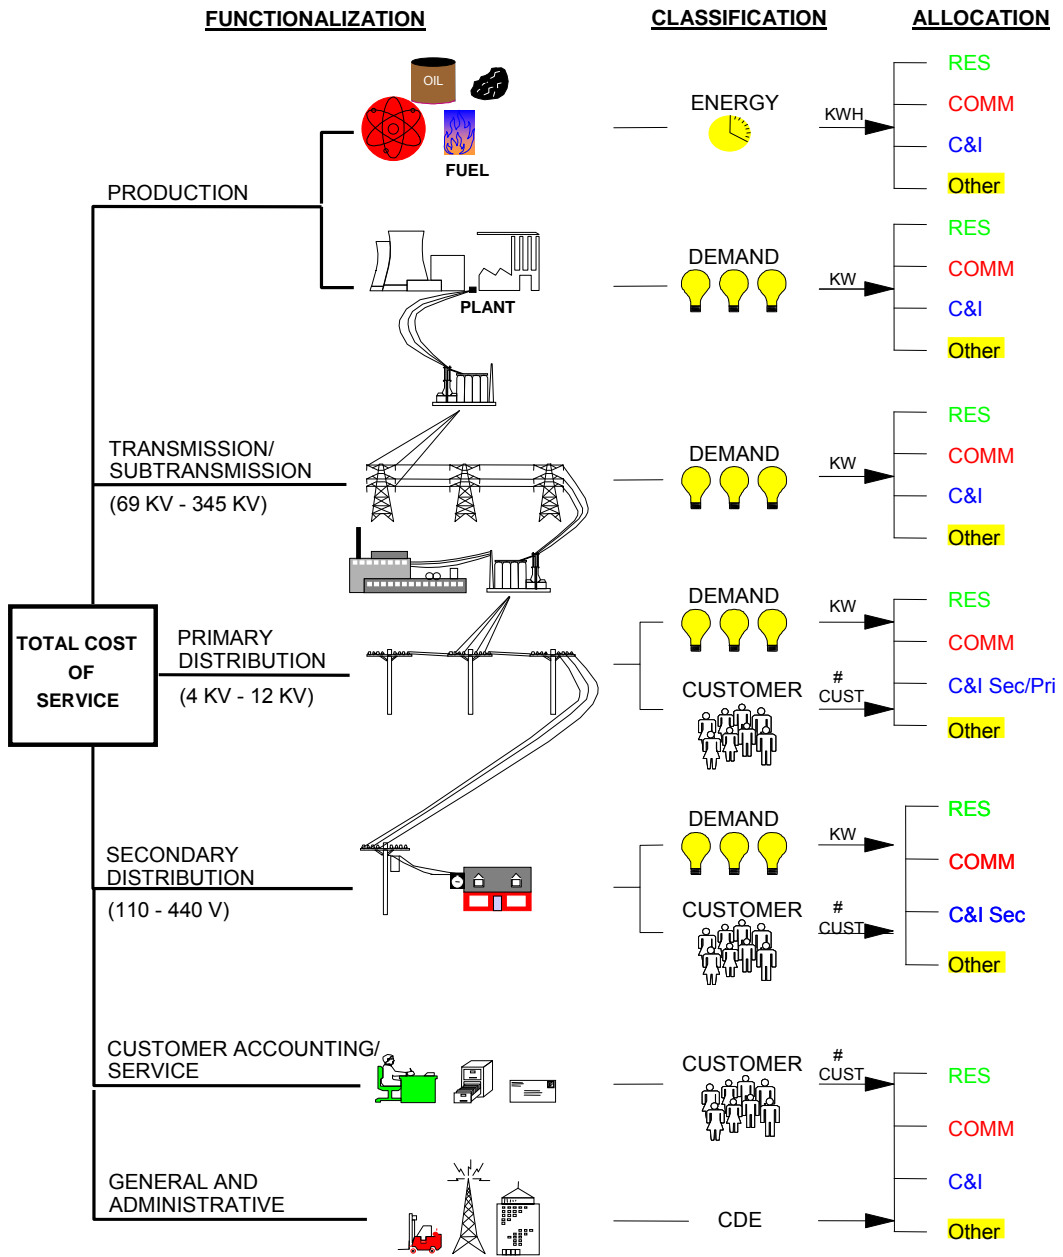

21 Satisfying customers' demand for electricity over time – providing **energy** – is
22 the third dimension of utility service. It is also the dimension with which many people
23 are most familiar, because people often think of electricity simply in terms of kWhs.
24 To see one reason why this isn't so, consider a more familiar commodity – tomatoes,
25 for example.

1 The tomatoes we buy at the supermarket for about \$2.00 a pound might
2 originally come from Florida where they are bought for about 30¢ a pound. In
3 addition to the cost of buying them at the point of production, there is the cost of
4 bringing them to the state of Missouri and distributing them in bulk to local
5 wholesalers. The cost of transportation, insurance, handling and warehousing must
6 be added to the original 30¢ a pound. Then they are distributed to neighborhood
7 stores, which adds more handling costs as well as the store's own costs of light, heat,
8 personnel and rent. Shoppers can then purchase as many or few tomatoes as they
9 desire at their convenience. In addition, there are losses from spoilage and damage
10 in handling. These "line losses" represent an additional cost which must be
11 recovered in the final price. What we are really paying for at the store is not only the
12 vegetable itself, but the service of having it available in convenient amounts and
13 locations. If we took the time and trouble (and expense) to go down to the wholesale
14 produce distributor, the price would be less. If we could arrange to buy them in bulk
15 in Florida, they would be even cheaper.

16 As illustrated in Figure 1, electric utilities are similar, except that in most cases
17 (including Missouri), a single company handles everything from production on down
18 through wholesale (bulk and area transmission) and retail (distribution to homes and
19 stores). The crucial difference is that, unlike producers and distributors of tomatoes,
20 electric utilities have an obligation to provide continuous reliable service. The
21 obligation is assumed in return for the exclusive right to serve all customers located
22 within its territorial franchise. In addition to satisfying the energy (or kWh)
23 requirements of its customers, the obligation to serve means that the utility must also
24 provide the necessary facilities to attach customers to the grid (so that service can be
25 used at the point where it is to be consumed) and these facilities must be responsive
26 to changes in the kilowatt demands whenever they occur.

Figure 1

PRODUCTION AND DELIVERY OF ELECTRICITY

A CLOSER LOOK AT THE COST OF SERVICE STUDY

1
2 **Q PLEASE EXPLAIN HOW A COST OF SERVICE STUDY IS PREPARED.**

3 A To the extent possible, the unique characteristics that differentiate electric utilities
4 from other service-related industries should be recognized in determining the cost of
5 providing service to each of the various customer classes. The basic procedure for
6 conducting a class cost of service study is simple. In an allocated cost of service
7 study, we identify the different types of costs (**functionalization**), determine their
8 primary causative factors (**classification**) and then apportion each item of cost
9 among the various rate classes (**allocation**). Adding up the individual pieces gives
10 the total cost for each customer class.

Functionalization

11
12 **Q PLEASE EXPLAIN FUNCTIONALIZATION.**

13 A Identifying the different levels of operation is a process referred to as
14 **functionalization**. The utility's investment and expenses are separated by function
15 (production, transmission, etc.). To a large extent, this is done in accordance with the
16 Uniform System of Accounts.

17 Referring to Figure 1, at the top level there is generation. The next level is the
18 extra high voltage transmission and subtransmission system (69,000 volts to 345,000
19 volts). Then the voltage is stepped down to primary voltage levels of distribution –
20 4,160 to 12,000 volts. Finally, the voltage is stepped down by pole transformers at
21 the "secondary" level to 110-440 volts used to serve homes, barbershops, light
22 manufacturing and the like. Additional investment and expenses are required to
23 serve customers at secondary voltages, compared to the cost of serving customers at
24 higher voltage.

1 Each additional transformation, thus, requires additional investment, additional
2 expenses and results in some additional electrical losses. To say that "a kilowatthour
3 is a kilowatthour" is like saying that "a tomato is a tomato." It's true in one sense, but
4 when you buy a kWh at home you're not only buying the energy itself but also the
5 service of having it delivered right to your doorstep in convenient form. Those who
6 buy at the bulk or wholesale level – like some of the Large Power Service customers
7 – pay less because some of the expenses to the utility are avoided. (Actually, the
8 expenses are borne by the customer who must invest in his own transformers and
9 other equipment, or pay separately for some services.)

10 **Classification**

11 **Q WHAT IS CLASSIFICATION?**

12 A Once the costs have been functionalized, the next step is to identify the primary
13 causative factor (or factors). This step is referred to as **classification**. Costs are
14 classified as demand-related, energy-related or customer-related.

15 Looking at the production function, the amount of production plant capacity
16 required is primarily determined by the peak rate of usage during the year. If the
17 utility anticipates a peak demand of 2,000 MW – it must install and/or contract for
18 enough generating capacity to meet that anticipated demand (plus some reserve to
19 compensate for variations in load and capacity that is temporarily unavailable).

20 There will be many hours during the day or during the year when not all of this
21 generating capacity will be needed. Nevertheless, it must be in place to meet the
22 peak demands on the system. Thus, production plant investment is usually classified
23 to demand. **Regardless of how production plant investment is classified, the**
24 **associated capital costs** (which include return on investment, depreciation, fixed

1 operation and maintenance (“O&M”) expenses, taxes and insurance) **are fixed**; that
2 is, **they do not vary with the amount of kWhs generated and sold**. These fixed
3 costs are determined by the amount of capacity (i.e., kilowatts) which the utility must
4 install to satisfy its obligation-to-serve requirement.

5 On the other hand, it is easy to see that the amount of fuel burned – and
6 therefore the amount of fuel expense – is closely related to the amount of energy
7 (number of kWhs) that customers use. Therefore, fuel expense is an energy-related
8 cost.

9 Most other O&M expenses are fixed and therefore are classified as
10 demand-related. Variable O&M expenses are classified as energy-related.
11 Demand-related and energy-related types of operating costs are not impacted by the
12 number of customers served.

13 Customer-related costs are the third major category. Obvious examples of
14 customer-related costs include the investment in meters and service drops (the line
15 from the pole to the customer's facility or house). Along with meter reading, posting
16 accounts and rendering bills, these "customer costs" may be several dollars per
17 customer, per month. Less obvious examples of customer-related costs may include
18 the investment in other distribution accounts.

19 A certain portion of the cost of the distribution system – poles, wires and
20 transformers – is required simply to attach customers to the system, regardless of
21 their demand or energy requirements. This minimum or "skeleton" distribution system
22 may also be considered a customer-related cost since it depends primarily on the
23 number of customers, rather than demand or energy usage.

24 Figure 2, as an example, shows the distribution network for a utility with two
25 customer classes, A and B. The physical distribution network necessary to attach
26 Class A is designed to serve 12 customers, each with a 10-kilowatt load, having a

1 total demand of 120 kW. This is the same total demand as is imposed by Class B,
2 which consists of a single customer. Clearly, a much more extensive distribution
3 system is required to attach the multitude of small customers (Class A), than to attach
4 the single larger customer (Class B), despite the fact that the total demand of each
5 customer class is the same.

6 Even though some additional customers can be attached without additional
7 investment in some areas of the system, it is obvious that attaching a large number of
8 customers requires investment in facilities, not only initially but on a continuing basis
9 as a result of the need for maintenance and repair.

10 To the extent that the distribution system components must be sized to
11 accommodate additional load beyond the minimum, the balance is a demand-related
12 cost. Thus, the distribution system is classified as both demand-related and
13 customer-related.

Figure 2
Classification of Distribution Investment

Demand vs. Energy Costs

Q WHAT IS THE DISTINCTION BETWEEN DEMAND-RELATED COSTS AND ENERGY-RELATED COSTS?

A The difference between demand-related and energy-related costs explains the fallacy of the argument that "a kilowatthour is a kilowatthour." For example, Figure 3 compares the electrical requirements of two customers, A and B, each using 100-watt light bulbs.

Customer A turns on all five of his/her 100-watt light bulbs for two hours. Customer B, by contrast, turns on two light bulbs for five hours. Both customers use the same amount of energy – 1,000 watthours or 1 kWh. However, Customer A utilized electric power at a higher rate, 500 watts per hour or 0.5 kW, than Customer B who demanded only 200 watts per hour or 0.2 kW.

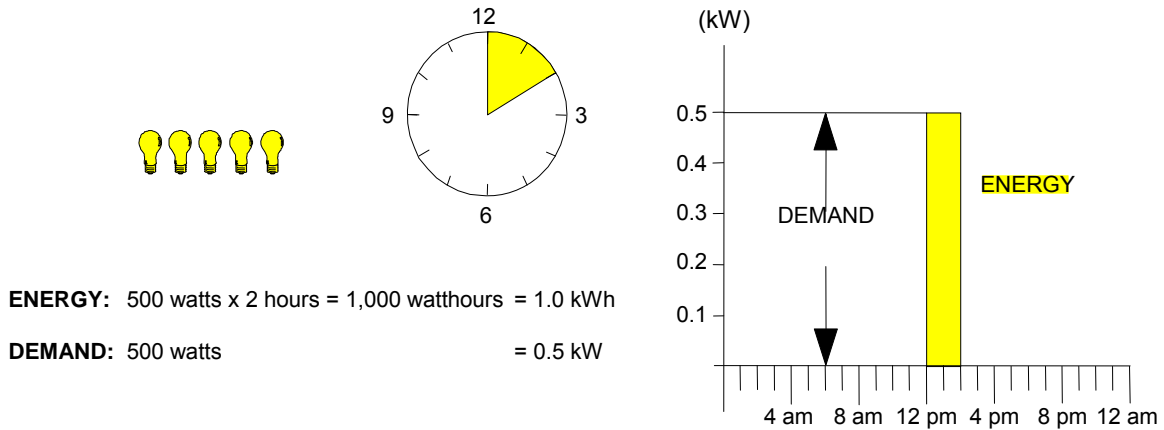

Although both customers had precisely the same kWh energy usage, Customer A's kW demand was 2.5 times Customer B's. Therefore, the utility must install 2.5 times as much generating capacity for Customer A as for Customer B. The cost of serving Customer A, therefore, is much higher.

Q DOES THIS HAVE ANYTHING TO DO WITH THE CONCEPT OF LOAD FACTOR?

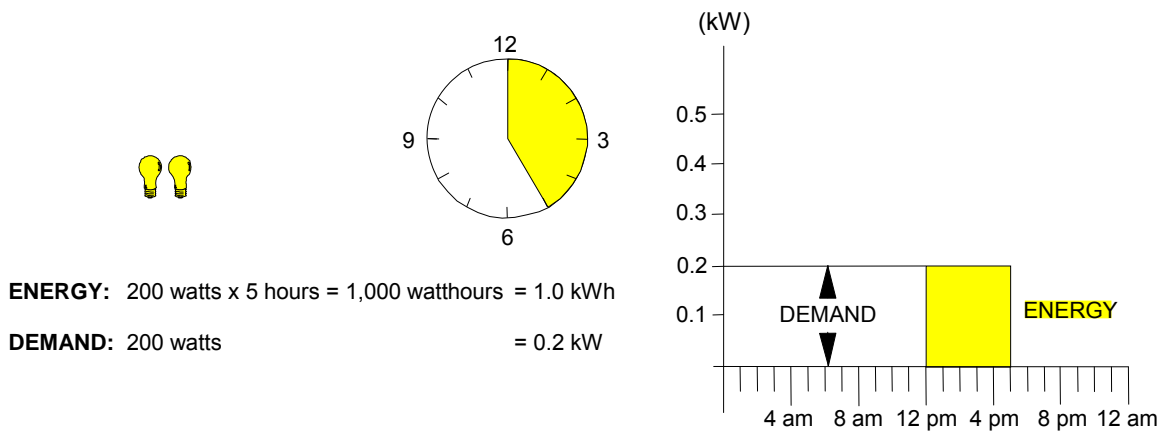

A Yes. Load factor is an expression of how uniformly a customer uses energy. In our example of the light bulbs, the load factor of Customer B would be higher than the load factor of Customer A because the use of electricity was spread over a longer period of time, and the number of kWhs used for each kilowatt of demand imposed on the system is much greater in the case of Customer B.

Figure 3 DEMAND VS. ENERGY

CUSTOMER A

CUSTOMER B

- 1 Mathematically, load factor is the average rate of use divided by the peak rate
- 2 of use. A customer with a higher load factor is less expensive to serve, on a per kWh
- 3 basis, than a customer with a low load factor, irrespective of size.

1 Consider also the analogy of a rental car which costs \$40/day and 20¢/mile. If
2 Customer A drives only 20 miles a day, the average cost will be \$2.20/mile. But for
3 Customer B, who drives 200 miles a day, spreading the daily rental charge over the
4 total mileage gives an average cost of 40¢/mile. For both customers, the fixed cost
5 rate (daily charge) and variable cost rate (mileage charge) are identical, but the
6 average total cost per mile will differ depending on how intensively the car is used.
7 Likewise, the average cost per kWh will depend on how intensively the generating
8 plant is used. A low load factor indicates that the capacity is idle much of the time; a
9 high load factor indicates a more steady rate of usage. Since industrial customers
10 generally have higher load factors than residential or commercial customers, they are
11 less costly to serve on a per-kWh basis. Again, we can say that "a kilowatthour is a
12 kilowatthour" as to energy content, but there may be a big difference in how much
13 generating plant investment is required to convert the raw fuel into electric energy.

14 **Allocation**

15 **Q WHAT IS ALLOCATION?**

16 A The final step in the cost of service analysis is the **allocation** of the costs to the
17 customer classes. Demand, energy and customer allocation factors are developed to
18 apportion the costs among the customer classes. Each factor measures the
19 customer class's contribution to the system total cost.

20 For example, we have already determined that the amount of fuel expense on
21 the system is a function of the energy required by customers. In order to allocate this
22 expense among classes, we must determine how much each class contributes to the
23 total kWh consumption and we must recognize the line losses associated with
24 transporting and distributing the kWh. These contributions, expressed in percentage

1 terms, are then multiplied by the expense to determine how much expense should be
2 attributed to each class. For demand-related costs, we construct an allocation factor
3 by looking at the important class demands.

4 **Utility System Characteristics**

5 **Q WHAT IS THE IMPORTANCE OF UTILITY SYSTEM LOAD CHARACTERISTICS?**

6 A Utility system load characteristics are an important factor in determining the specific
7 method which should be employed to allocate fixed or demand-related costs on a
8 utility system. The most important characteristic is the annual load pattern of the
9 utility. These characteristics for KCPL's Missouri jurisdiction are shown on Schedule
10 MEB-COS-1. For convenience, it is also shown here as Figure 4.

Figure 4

KANSAS CITY POWER & LIGHT COMPANY

**Analysis of KCP&L's (Missouri) Monthly Peak Demands
as a Percent of the Annual System Peak
For the Test Year Ended March 31, 2014**

1 This shows the monthly system peak demands for the test year used in the study.
2 The highlighted bar shows the month in which the highest peak occurred.

3 This analysis shows that summer peaks dominate the KCPL system. (This
4 same information is presented in tabular form on Schedule MEB-COS-2.) This clearly
5 shows that the system peak occurred in September, and was substantially higher
6 than the monthly peaks occurring in most other months. The peaks in June, July and
7 August were only 2.4%, 5.2%, and 0.7%, respectively, lower than the annual peak.

8 **Q WHAT CRITERIA SHOULD BE USED TO DETERMINE AN APPROPRIATE**
9 **METHOD FOR ALLOCATING PRODUCTION AND TRANSMISSION CAPACITY**
10 **COSTS AMONG THE VARIOUS CUSTOMER CLASSES?**

11 A The specific allocation method should be consistent with the principle of
12 cost-causation; that is, the allocation should reflect the contribution of each customer
13 class to the demands that caused the utility to incur capacity costs.

14 **Q WHAT FACTORS CAUSE ELECTRIC UTILITIES TO INCUR PRODUCTION AND**
15 **TRANSMISSION CAPACITY COSTS?**

16 A As discussed previously, production and transmission plant must be sized to meet the
17 maximum demand imposed on these facilities. Thus, an appropriate allocation
18 method should accurately reflect the characteristics of the loads served by the utility.
19 For example, if a utility has a high summer peak relative to the demands in other
20 seasons, then production and transmission capacity costs should be allocated
21 relative to each customer class's contribution to the summer peak demands. If a
22 utility has predominant peaks in both the summer and winter periods, then an
23 appropriate allocation method would be based on the demands imposed during both

1 the summer and winter peak periods. For a utility with a very high load factor and/or
2 a non-seasonal load pattern, then demands in all months may be important.

3 **Q WHAT DO THESE CONSIDERATIONS MEAN IN THE CONTEXT OF THE KCPL**
4 **SYSTEM?**

5 A As noted, the KCPL load pattern has predominant summer peaks. This means that
6 these demands should be the primary ones used in the allocation of generation and
7 transmission costs. Demands in other months are of much less significance, do not
8 compel the addition of generation capacity to serve them and should not be used in
9 determining the allocation of costs.

10 **Q WHAT SPECIFIC RECOMMENDATIONS DO YOU HAVE?**

11 A The two most predominantly used allocation methods in the industry are the
12 coincident peak method and the A&E demand method.

13 The coincident method utilizes the demands of customer classes occurring at
14 the time of the system peak or peaks selected for allocation. In the case of KCPL,
15 this would be one or more peaks occurring during the summer.

16 **Q WHAT IS THE A&E METHOD?**

17 A The A&E method is one of a family of methods which incorporates a consideration of
18 both the maximum rate of use (demand) and the duration of use (energy). As the
19 name implies, A&E makes a conceptual split of the system into an “average”
20 component and an “excess” component. The “average” demand is simply the total
21 kWh usage divided by the total number of hours in the year. This is the amount of
22 capacity that would be required to produce the energy if it were taken at the same

1 demand rate each hour. The system “excess” demand is the difference between the
2 system peak demand and the system average demand.

3 Under the A&E method, the average demand is allocated to classes in
4 proportion to their average demand (energy usage). The difference between the
5 system average demand and the system peak(s) is then allocated to customer
6 classes on the basis of a measure that represents their “peaking” or variability in
7 usage.¹

8 **Q WHAT DO YOU MEAN BY VARIABILITY IN USAGE?**

9 A As an example, Figure 5 shows two classes that have different monthly usage
10 patterns.

Figure 5
Load Patterns

11 Both classes use the same total amount of energy and, therefore, have the same
12 average demand. Class B, though, has a much greater maximum demand² than
13 Class A. The greater maximum demand imposes greater costs on the utility system.
14 This is because the utility must provide sufficient capacity to meet the projected

¹NARUC Electric Utility Cost Allocation Manual, 1992, page 81.

²During any specified time period (e.g., month, year), the maximum demand of a class, regardless of when it occurs, is called the non-coincident peak demand.

1 maximum demands of its customers. There may also be higher costs due to the
2 greater variability of usage of some classes. This variability requires that a utility
3 cycle its generating units in order to match output with demand on a real time basis.
4 The stress of cycling generating units up and down causes wear and tear on the
5 equipment, resulting in higher maintenance cost.

6 Thus, the excess component of the A&E method is an attempt to allocate the
7 additional capacity requirements of the system (measured by the system excess) in
8 proportion to the "peakiness" of the customer classes (measured by the class excess
9 demands).

10 **Q WHAT DEMAND ALLOCATION METHODOLOGY DO YOU RECOMMEND FOR**
11 **GENERATION AND TRANSMISSION?**

12 **A** First, in order to reflect cost-causation the methodology must give predominant weight
13 to loads occurring during the summer months. Loads during these months (the peak
14 loads) are the primary driver which has and continues to cause the utility to expand
15 its generation and transmission capacity, and therefore should be given predominant
16 weight in the allocation of capacity costs.

17 Either a coincident peak study, using the demands during the summer (peak)
18 months, or a version of an A&E cost of service study that uses class non-coincident
19 peak loads occurring during the summer, would be most appropriate to reflect these
20 characteristics. The results should be similar as long as only summer period peak
21 loads are used. I will make my recommendations based on the A&E method. It
22 considers the maximum class demands during the critical time periods, and is less
23 susceptible to variations in the absolute hour in which peaks occur – producing a
24 somewhat more stable result over time.

1 Based on test year load characteristics, I believe the most appropriate A&E
2 allocation would be using the two highest system peaks. However, the allocation
3 factors for all classes are very close to the A&E-4NCP allocation factors, and I have
4 chosen to use the 4NCP version that has previously been endorsed by the
5 Commission.

6 Schedule MEB-COS-3 shows the derivation of the A&E demand allocation
7 factor for generation using the four annual class non-coincident peaks, and page 1 of
8 my MEB-COS-Appendix shows the derivation of the A&E-2NCP allocation factor.

9 **Q REFERRING TO SCHEDULE MEB-COS-3, PLEASE EXPLAIN THE**
10 **DEVELOPMENT OF THE A&E ALLOCATION FACTOR.**

11 **A** Line 2 shows the average of the four non-coincident peaks for each class. Line 3
12 shows the annual amount of energy required by each class. Line 4 is the average
13 demand, in kilowatts, which is determined by dividing the annual energy in line 3 by
14 the number of hours (8,760) in a year. Line 5 shows the percentage relationship
15 between the average demand for each class and the total system.

16 The excess demand, shown on line 6, is equal to the non-coincident peak
17 demand shown on line 2 minus the average demand that is shown on line 4. Line 7
18 shows the excess demand percentage, which is a relationship among the excess
19 demand of each customer class and the total excess demand for all classes.

20 Finally, line 10 presents the composite A&E allocation factor. It is determined
21 by weighting the average demand responsibility of each class (which is the same as
22 each class's energy allocation factor) by the system load factor, and weighting the
23 excess demand factor by the quantity one minus the system load factor.

1 **Making the Cost of Service Study – Summary**

2 **Q PLEASE SUMMARIZE THE PROCESS AND THE RESULTS OF A COST OF**
3 **SERVICE ANALYSIS.**

4 A As previously discussed, the cost of service procedure involves three steps:

- 5 1. Functionalization – Identify the different functional "levels" of the system;
- 6 2. Classification – Determine, for each functional type, the primary cause or causes
7 (customer, demand or energy) of that cost being incurred; and
- 8 3. Allocation – Calculate the class proportional responsibilities for each type of cost
9 and spread the cost among classes.

10 **Q WHERE ARE YOUR COST OF SERVICE RESULTS PRESENTED?**

11 A The results are presented in Schedule MEB-COS-4, which reflects results at present
12 rates.

13 **Q REFERRING TO SCHEDULE MEB-COS-4, PLEASE EXPLAIN THE**
14 **ORGANIZATION AND WHAT IS SHOWN.**

15 A Schedule MEB-COS-4 is a summary of the key elements and the results of the class
16 cost of service study. The top section of the schedule shows the revenues, expenses
17 and operating income based on an A&E-4NCP cost of service study.

18 The next section shows the major elements of rate base, and the rate of return
19 at present rates for each customer class based on this cost of service study.

20 **Q DID KCPL SUBMIT A CLASS COST OF SERVICE STUDY?**

21 A Yes. KCPL submitted a class cost of service study. This study bases the allocation
22 of generation costs on a seriously flawed average and peak allocation method.
23 KCPL's method is not grounded in appropriate cost-causation principles, and should

1 not be accepted. I will address this proposed methodology in more detail in my
2 rebuttal testimony.

3 **Q HAVE YOU USED ITS STUDY?**

4 A I have used the study framework as a basis for preparing my cost of service study.
5 As explained below, I have developed a cost of service study using a different
6 allocation for generation fixed costs.

7 **Q HAVE YOU PREPARED ANY COST OF SERVICE STUDIES BESIDES THE**
8 **A&E-4NCP STUDY PRESENTED IN SCHEDULE MEB-COS-4?**

9 A Yes. I have prepared studies based on A&E-2NCP, and also 4CP methodologies.
10 The derivation of the generation capacity allocation factor and the results of each cost
11 of service study are presented in the Appendix to my schedules.

12 **Q HOW DID YOU USE KCPL'S COST OF SERVICE MODEL IN PRODUCING YOUR**
13 **CLASS COST OF SERVICE STUDY?**

14 A It was the starting point. The results of KCPL's allocation first were replicated by
15 utilizing the data contained in its cost of service model. Many of KCPL's allocation
16 factors and functionalizations and classifications have been utilized. The principal
17 area where I depart from KCPL and use a different approach were incorporated into
18 the allocations. They have previously been explained in this testimony.

1 **Adjustment of Class Revenues**

2 **Q WHAT SHOULD BE THE PRIMARY BASIS FOR ESTABLISHING CLASS**
3 **REVENUE REQUIREMENTS AND DESIGNING RATES?**

4 A Cost should be the primary factor used in both steps.

5 Just as cost of service is used to establish a utility's total revenue requirement,
6 it should also be the primary basis used to establish the revenues collected from each
7 customer class and to design rate schedules.

8 Factors such as simplicity, gradualism and ease of administration may also be
9 taken into account, but the basic starting point and guideline throughout the process
10 should be cost of service. To the extent practicable, rate schedules should be
11 structured and designed to reflect the important cost-causative features of the service
12 provided, and to collect the appropriate cost from the customers within each class or
13 rate schedule, based upon the individual load patterns exhibited by those customers.

14 Electric rates also play a role in economic development, both with respect to
15 job creation and job retention. This is particularly true in the case of industries where
16 electricity is one of the largest components of the cost of production.

17 **Q WHAT IS THE BASIS FOR YOUR RECOMMENDATION THAT COST BE USED AS**
18 **THE PRIMARY FACTOR FOR THESE PURPOSES?**

19 A The basic reasons for using cost as the primary factor are equity, conservation, and
20 engineering efficiency (cost-minimization).

21 **Q PLEASE EXPLAIN HOW EQUITY IS ACHIEVED BY BASING RATES ON COST.**

22 A When rates are based on cost, each customer pays what it costs the utility to provide
23 service to that customer; no more and no less. If rates are based on anything other

1 than cost factors, then some customers will pay the costs attributable to providing
2 service to other customers – which is inherently inequitable.

3 **Q HOW DO COST-BASED RATES FURTHER THE GOAL OF CONSERVATION?**

4 A Conservation occurs when wasteful, inefficient use is discouraged or minimized. Only
5 when rates are based on costs do customers receive a balanced price signal upon
6 which to make their electric consumption decisions. If rates are not based on costs,
7 then customers who are not paying their full costs may be misled into using
8 electricity inefficiently in response to the distorted rate design signals they receive.

9 **Q WILL COST-BASED RATES ASSIST IN THE DEVELOPMENT OF**
10 **COST-EFFECTIVE DEMAND-SIDE MANAGEMENT (“DSM”) PROGRAMS?**

11 A Yes. The success of DSM (both energy efficiency and demand response programs)
12 depends, to a large extent, on customer receptivity. There are many actions that can
13 be taken by consumers to reduce their electricity requirements. A major element in a
14 customer's decision-making process is the amount of reduction that can be achieved
15 in the electric bill as a result of DSM activities. If the bill received by a customer is
16 subsidized by other customers; that is, the bill is determined using rates which are
17 below cost, that customer will have less reason to engage in DSM activities than
18 when the bill reflects the actual cost of the electric service provided.

19 For example, assume that the relevant cost to produce and deliver energy is
20 8¢ per kWh. If a customer has an opportunity to install energy efficiency or DSM
21 equipment that would allow the customer to reduce energy use or demand, the
22 customer will be much more likely to make that investment if the price of electricity
23 equals the cost of electricity, i.e., 8¢ per kWh, than if the customer is receiving a
24 subsidized rate of 6¢ per kWh.

1 Q HOW DO COST-BASED RATES ACHIEVE THE COST-MINIMIZATION
2 OBJECTIVE?

3 A When the rates are designed so that the energy costs, demand costs and customer
4 costs are properly reflected in the energy, demand and customer components of the
5 rate schedules, respectively, customers are provided with the proper incentives to
6 minimize their costs, which will in turn minimize the costs to the utility.

7 If a utility attempts to extract a disproportionate share of revenues from a class
8 that has alternatives available (such as producing products at other locations where
9 costs are lower), then the utility will be faced with the situation where it must discount
10 the rates or lose the load, either in part or in total. To the extent that the load could
11 have been served more economically by the utility, then either the other customers of
12 the utility or the stockholders (or some combination of both) will be worse off than if
13 the rates were properly designed on the basis of cost.

14 From a rate design perspective, overpricing the energy portion of the rate and
15 underpricing the fixed components of the rate (such as customer and demand
16 charges) will result in a disproportionate share of revenues being collected from large
17 customers and high load factor customers. To the extent that these customers may
18 have lower cost alternatives than do the smaller or the low load factor customers, the
19 same problems noted above are created.

1 **REVENUE ALLOCATION**

2 **Q PLEASE REFER AGAIN TO SCHEDULE MEB-COS-4 AND SUMMARIZE THE**
3 **RESULTS OF YOUR CLASS COST OF SERVICE STUDY.**

4 **A** As indicated on line 0400 of Schedule MEB-COS-4, movement of all classes to cost
5 of service will require an increase to the Residential class and a decrease to all other
6 classes.

7 **Q WHAT ADJUSTMENTS TO REVENUES WOULD BE REQUIRED AT PRESENT**
8 **RATES TO MOVE ALL CLASSES TO COST OF SERVICE?**

9 **A** This is shown on Schedule MEB-COS-5. The first five columns summarize the
10 results of the cost of service study at present rates, and are taken from
11 Schedule MEB-COS-4. The remaining columns of Schedule MEB-COS-5 determine
12 the amount of increase or decrease, on a revenue neutral basis, required to move
13 each customer class to the average rate of return at current revenue levels. That is, it
14 shows the amount of increase or decrease required to have every class yield the
15 same rate of return, before considering any overall increase in revenues. Note that
16 the Residential class would require an increase of about \$46 million, or 11.2%, in
17 order to move to cost of service. All other classes would require a corresponding
18 decrease. The decreases range from about 8.3% for the Large General Service
19 class to 1.3% for the Lighting class.

20 **Q HOW DOES KCPL PROPOSE TO ADJUST REVENUES?**

21 **A** KCPL proposes essentially an equal percentage across-the-board increase.

1 **Q** **WOULD KCPL'S ALLOCATION MOVE CLASS RATES CLOSER TO COST OF**
2 **SERVICE?**

3 A No. KCPL's allocation would essentially maintain the status quo in which the
4 Residential class is below cost of service, and other classes are above cost of
5 service.

6 **Q** **DO YOU HAVE AN ALTERNATIVE RECOMMENDATION FOR ALLOCATION OF**
7 **KCPL'S REVENUE REQUIREMENT?**

8 A Yes. I will focus on adjustments to be made on a revenue neutral basis at present
9 rates. After having made my recommended revenue neutral adjustments at present
10 rates, any overall change in revenues allowed to KCPL can then be applied on an
11 equal percentage across-the-board basis to these adjusted class revenues.

12 **Q** **PLEASE EXPLAIN YOUR SPECIFIC PROPOSAL.**

13 A My specific proposal is shown on Schedule MEB-COS-6. Column 1 shows class
14 revenues at current rates. Column 2 shows my proposed cost of service adjustment.
15 This adjustment moves classes roughly 25% of the way toward cost of service. This
16 25% movement was selected because it makes a reasonable step in the right
17 direction without imposing too disruptive of a revenue increase on the Residential
18 class. An overall revenue-neutral increase of about 2.8% on the Residential class is
19 a relatively modest step, but at least it is a step in the right direction.

20 While some will want to talk about the impact on the Residential class of this
21 increase, it is also important not to lose sight of the fact that by not moving all the way
22 to cost of service, the other customer classes are continuing to bear more of the
23 burden of the revenue responsibility than they should. My recommendation of
24 moving 25% of the way toward cost of service, which limits the Residential class

1 revenue-neutral increase to 2.8% (as compared to the 11.2% increase required to
2 move all the way to cost of service) is relatively moderate, and must be considered in
3 light of the fact that other classes are being asked to continue to provide part of the
4 revenue responsibility that rightly should be shouldered by the Residential class.

5 **ANALYSIS OF LARGE CUSTOMER RATES**

6 **Q WHAT IS THE STRUCTURE OF THE TARIFFS APPLICABLE TO KCPL'S**
7 **LARGEST CUSTOMERS?**

8 A The LGS and LPS tariffs consist of a series of charges differentiated by voltage level.
9 There are separate charges for service at secondary voltage, service at primary
10 voltage, service at substation voltage, and service at transmission voltage. The rates
11 charged at the higher voltage levels are lower than the rates charged at the lower
12 voltage levels in order to recognize differences in cost of service.

13 At each voltage level, the rate consists of customer charges, facilities charges,
14 charges for reactive power, demand charges and energy charges. Demand charges
15 and energy charges also are seasonally differentiated, with summer charges being
16 applied during the four consecutive months beginning May 16 and ending
17 September 15.

18 **Q WHAT IS THE STRUCTURE OF THE DEMAND CHARGES?**

19 A In addition to being seasonally differentiated, the demand charges at each voltage
20 level consist of multiple block charges.

1 **Q WHAT IS THE STRUCTURE OF THE ENERGY CHARGES?**

2 A The energy charges are structured as three “hours use” blocks. The three blocks
3 consist of the first 180 hours use of the billing demand, the next 180 hours use of the
4 billing demand and the tail block is for consumption in excess of 360 hours use of the
5 billing demand.

6 These are what are known as hours use, or load factor based charges. The
7 rates decrease as the hours use increases to recognize the spreading of fixed costs
8 over more kilowatthours as the number of hours use, or load factor, increases. This
9 structure also recognizes that energy consumed in the high load factor block likely will
10 be off-peak or at times when energy costs are lower than during on-peak periods.

11 **Q PLEASE EXPLAIN HOW THE HOURS USE FUNCTION WORKS.**

12 A The number of kWh to be billed in each hours use block is determined by the
13 customer’s billing demand and the amount of kWh purchased.

14 A customer operating basically one shift (eight hours a day for five days a
15 week) would have usage in the range of 180 kWh per kW of billing demand.³ A
16 customer operating two shifts would utilize approximately twice that much energy,
17 and therefore use an additional 180 or so kWh per kW of demand, thereby filling up
18 both the first and second blocks.

19 Thus, it is reasonable to consider the first block as being primarily the daytime
20 on-peak hours, the second block for early morning, evening and/or weekend hours,
21 and the third block for additional use in weekend and nighttime hours. Given these
22 considerations, it is appropriate that the energy charges for the initial hours use
23 blocks be higher than for the third hours use block in order to collect more fixed costs
24 during the on-peak and shoulder periods.

³8 hours/day x 5 days per week x 4.33 weeks per month = 173 hours

1 **Q CAN YOU ILLUSTRATE WITH AN EXAMPLE OF HOW THE RATE WORKS?**

2 A Yes. Assume that a customer has a 1,000 kW billing demand, and uses 500,000
3 kWh in a month. This customer would be using 500 kWh per kW,⁴ or 500 kWh for
4 each kW of demand. To apply the rate, the 1,000 kW of demand would be multiplied
5 times 180 kWh per kW, which is the size of the first block, and would result in 180,000
6 kWh being priced out at the first block. The customer would also fully utilize the
7 second block, so 180,000 kWh would go in it as well and be priced at the second
8 block rate. The remaining 140,000 kWh⁵ would be billed in the third, or high load
9 factor block.

10 **Q WHAT IS THE LEVEL OF THE ENERGY CHARGES FOR THE HIGH LOAD**
11 **FACTOR (OVER 360 HOURS USE) BLOCK UNDER CURRENT TARIFFS?**

12 A The charges vary slightly by voltage level and by season, but range from
13 approximately 2.4¢/kWh to 2.6¢/kWh in LPS and from 3.1¢/kWh to 4.3¢/kWh for LGS.

14 **Q DO YOU AGREE WITH THE LEVEL OF THE OFF-PEAK ENERGY CHARGES IN**
15 **THE CURRENT TARIFFS?**

16 A No, I do not. I believe the high load factor block energy charges collect more fixed
17 costs than is appropriate.

18 **Q PLEASE EXPLAIN.**

19 A I have analyzed KCPL's current rate case filing and its claims for costs. KCPL's
20 calculated average variable costs (Schedule TMR-8) are less than 1.7¢/kWh. The
21 energy charges in the high load factor block of KCPL's current LGS and LPS tariffs

⁴500,000 ÷ 1,000 kW = 500 kWh/kW

⁵500,000 - 180,000 - 180,000 = 140,000 kWh

1 are substantially higher, as previously noted. Since KCPL proposes an essentially
2 equal percentage increase to collect its requested revenue increase, these
3 relationships would be perpetuated. Since the primary driver for this case is
4 increased fixed costs, this equal percentage on the total rate is particularly
5 inappropriate.

6 **Q WHAT DO YOU CONCLUDE FROM THIS REVIEW?**

7 A Based on the level of the average variable costs and also the avoided energy costs, it
8 is clear that the off-peak energy charges are collecting more costs than appropriate.

9 **Q WHAT SHOULD BE THE LEVEL OF THE OFF-PEAK ENERGY CHARGE?**

10 A Recognizing that most of the fixed costs should be collected from use during the
11 on-peak period and that consumption in the high load factor block occurs mostly
12 during evening and weekend periods when KCPL's energy costs would be lower than
13 they are during the on-peak periods, it is reasonable that the high load factor energy
14 block be at a level approximating the utility's average variable costs.

15 This structure would collect more costs through demand charges and provide
16 better price signals to customers. It would also be a more equitable rate because it
17 will charge high load factor and low load factor customers more appropriately. This
18 structure also would improve the stability of KCPL's earnings. Because customer
19 demands are generally more stable than their energy purchases, this rate design
20 would make KCPL's revenue collection and earnings less volatile.

1 **Q HOW DO YOU PROPOSE TO ADJUST THE LGS AND LPS RATES IN THIS**
2 **CASE?**

3 A In the interest of gradualism, my proposal is to maintain the energy charges for the
4 high load factor (over 360 hours use per month, or over a 50% load factor) block at
5 their current levels, increase the middle blocks (hours use from 181 to 360) by three
6 quarters of the average percentage increase, and to collect the balance of the
7 revenue requirement for the tariff by applying a uniform percentage increase to the
8 remaining charges in the tariff. This includes the customer charge, the reactive
9 demand charge, the facilities charges, the demand charges and the initial block
10 energy charges.

11 **Q HAVE YOU PREPARED AN ILLUSTRATION OF THIS RATE DESIGN?**

12 A Yes. This appears on Schedules MEB-COS-7 and MEB-COS-8 attached to my
13 testimony.

14 **Q PLEASE EXPLAIN SCHEDULE MEB-COS-7.**

15 A The first two pages contain a summary of the rate values for the LPS rate. The first
16 column is present rates, the second is KCPL's proposed rates and the third is my
17 proposal at the level of KCPL's proposed increase. The first column of the detail
18 sheets for this schedule (pages 3-8) shows the billing units for each block of each
19 voltage level of the LPS rate. The next two columns show the current rates and
20 resulting revenues by block. The middle two columns show KCPL's proposed rates
21 and the resulting revenues.

22 The final two columns show the rate based on KCPL's proposed increase to
23 the LPS class, but with my rate design proposal.

24 Schedule MEB-COS-8 shows the same information for the LGS rate.

1 **Q HOW WOULD THE RATES BE DESIGNED TO MATCH WHATEVER AMOUNT OF**
2 **INCREASE THE COMMISSION AWARDS TO KCPL IN THIS CASE?**

3 A First, the amount of additional revenue to be collected from the LPS and LGS tariffs
4 would be determined. The increase for the middle block energy charges would be
5 equal to the overall percentage increase times 75%. The high load factor energy
6 blocks would not change. The balance of the increased revenue from each tariff
7 would be collected by uniformly increasing all of the remaining charges in the tariff.

8 **Q IN ADDITION TO ITS PROPOSAL FOR AN EQUAL PERCENTAGE ACROSS-THE-**
9 **BOARD INCREASE, HAS KCPL PROPOSED ANY NEW RATES OR RATE**
10 **DESIGN?**

11 A No, it has not. It seems content to simply apply an equal percentage increase to all of
12 the charges. KCPL should be examining the tariff schedules and attempting to move
13 the rate elements closer to cost of service, to enhance the price signals given to
14 customers.

15 **Q IS THERE ANYTHING ELSE THAT KCPL SHOULD BE DOING?**

16 A Yes. KCPL should be working with its larger customers, especially those who have
17 unique load patterns and abilities to curtail load, to determine what rate or contract
18 features would be appropriate to meet the needs of these customers, which may be
19 different from what is contained in the standard tariffs.

20 **Q DO THESE CUSTOMERS OFFER BENEFITS TO KCPL AND ITS OTHER**
21 **RATEPAYERS?**

22 A Yes. In many cases, these customers have unique load characteristics which allow
23 KCPL to reduce its peak demand or to otherwise improve its overall load factor. For

1 instance, some large customers have significant abilities to interrupt load. By making
2 effective use of the interruptible nature of these customers, KCPL should be better
3 able to reduce its annual peak and thereby reduce its overall revenue requirement.
4 Other customers may offer other features. By providing tailored opportunities to
5 these customers, KCPL should be able to increase its overall load factor and reduce
6 its overall operating costs.

7 **ENERGY LOSSES**

8 **Q EARLIER IN YOUR TESTIMONY (PAGE 9) YOU MENTIONED ENERGY LOSSES**
9 **AND HOW THEY DIFFER ACROSS CUSTOMER CLASSES. HAVE YOU**
10 **PREPARED A SUMMARY OF ENERGY LOSSES BY RATE AND BY VOLTAGE**
11 **LEVEL?**

12 **A** Yes. They are summarized on Schedule MEB-COS-9. Column 1 shows energy
13 sales at the customer's meter and column 2 shows the amount of energy required to
14 be produced at the generator in order to overcome the losses incurred through the
15 system in order to deliver the energy to the meter shown in column 1. Column 3
16 shows the loss factor, which is determined by dividing the energy at the generator by
17 the energy at the meter. As shown on this schedule, and as summarized on lines 41
18 through 45, KCPL delivers energy to customers at four distinct voltage levels. They
19 are the secondary voltage level, the primary voltage level, the substation voltage level
20 and the transmission voltage level. Losses range from a high of 6.1288% at the
21 secondary voltage level down to 1.5651% at the transmission voltage level.

1 Q WERE THESE DIFFERENCES IN LOSSES TAKEN INTO ACCOUNT IN
2 PREPARING THE CLASS COST OF SERVICE STUDY?

3 A Yes.

4 Q KCPL HAS PROPOSED A FUEL ADJUSTMENT CHARGE (“FAC”) IN THIS CASE.
5 WHAT VOLTAGE LEVELS HAS IT PROPOSED TO DISTINGUISH IN THIS FAC?

6 A Only two. The secondary voltage level, and the primary voltage level.

7 Q WHERE ARE SUBSTATION AND TRANSMISSION LEVEL CUSTOMERS
8 ACCOUNTED FOR?

9 A They are accounted for in the primary voltage category in KCPL’s proposed FAC.

10 Q IS THIS APPROPRIATE?

11 A No. As can be seen from Schedule MEB-COS-9, lines 41 through 44, charging
12 substation customers the primary voltage level line loss factor would essentially
13 overcharge them by 50% for losses (3.7072% versus the correct 2.4828%); and
14 would overcharge transmission level customers by 140% for losses compared to what
15 they should be charged (3.7072% instead of the correct 1.5651%).

16 Q WHAT IS YOUR RECOMMENDATION?

17 A Should the Commission determine to allow KCPL to have an FAC, either in this case
18 or in a future case, KCPL should be required to track and charge customers
19 according to the four separate voltage levels at which delivery takes place, and not
20 the two levels it has proposed in this case.

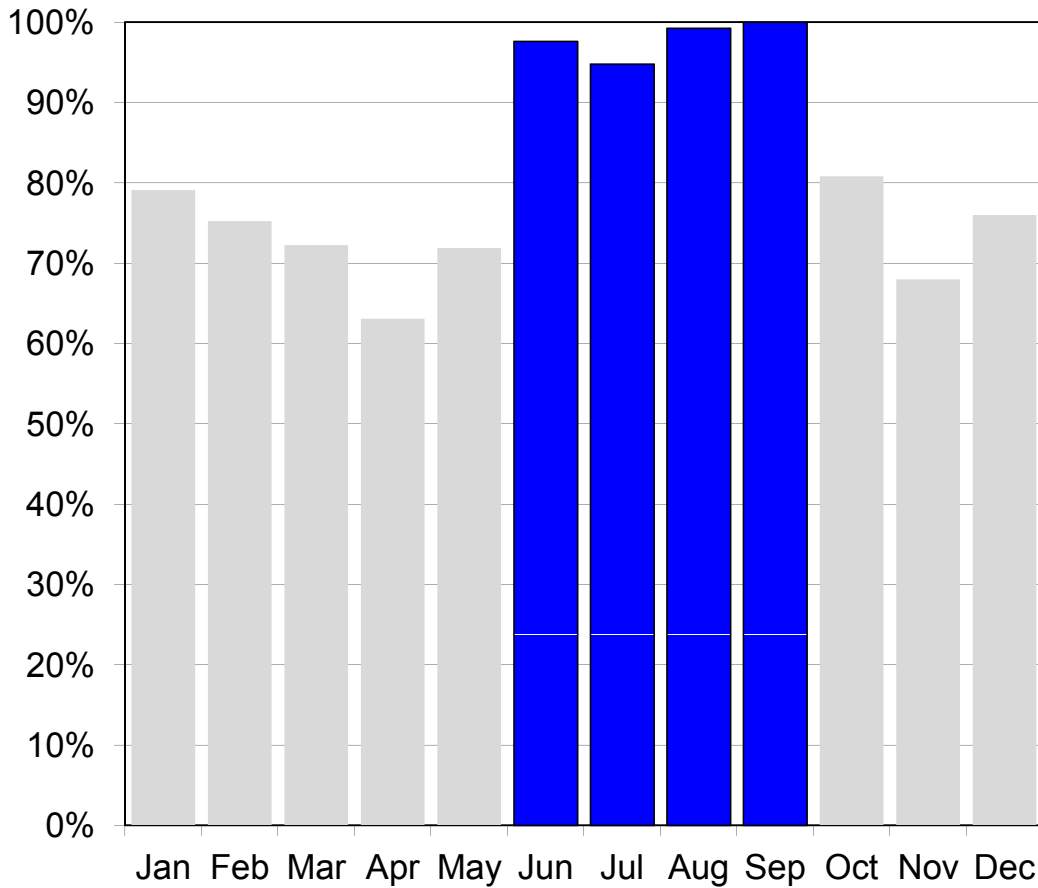

1 Q DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?

2 A Yes, it does.
