its Missouri service area )

Case No. ER-2004-0570

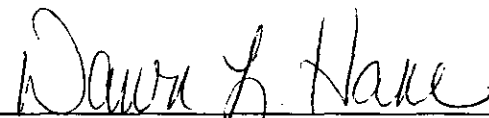

**AFFIDAVIT OF RICHARD J. CAMPBELL**

STATE OF MISSOURI     )  
                                  ) ss  
COUNTY OF COLE     )

Richard J. Campbell, of lawful age, on his oath states: that he has participated in the preparation of the following Direct Testimony in question and answer form, consisting of 11 pages of Direct Testimony to be presented in the above case, that the answers in the following Direct Testimony were given by him; that he has knowledge of the matters set forth in such answers; and that such matters are true to the best of his knowledge and belief.

  
Richard J. Campbell

Subscribed and sworn to before me this 16<sup>th</sup> day of September, 2004.

**DIRECT TESTIMONY**  
**OF**  
**RICHARD J. CAMPBELL**  
**EMPIRE DISTRICT ELECTRIC COMPANY**  
**CASE NO. ER-2004-0570**

Q. Please state your name and business address.

A. My name is Richard J. Campbell and my business address is Missouri Public Service Commission, P.O. Box 360, Jefferson City, MO 65102.

Q. What is your present position with the Missouri Public Service Commission (Commission)?

A. I am a Utility Regulatory Engineer I in the Engineering Analysis Section, Energy Department, Utility Operations Division.

Q. Would you please review your educational background and work experience.

A. In May of 1995, I received a Bachelor of Science Degree in Chemical Engineering from the University of Missouri in Columbia. In July of 1995, I began working for the Missouri Department of Natural Resource Air Pollution Control Program as an environmental engineer. I was employed with the Air Pollution Control Program from July 1995 until November 2001. I joined the Commission Staff (Staff) in November 2001. I am a registered Professional Engineer in the State of Missouri.

Q. Have you previously filed testimony before this Commission?

Direct Testimony of  
Richard Campbell

1           A.     Yes, please refer to Schedule 1 for a list of the cases that I have filed  
2 testimony in.

3           Q.     What is the purpose of your Direct Testimony?

4           A.     The purpose of my testimony is to recommend that the Commission adopt  
5 the weather and days adjustments to class usage for the weather sensitive rate classes of  
6 The Empire District Electric Company (EDE). These adjustments are listed in  
7 Schedule 2 by rate class. Staff witness Janice Pyatte calculated adjustments to revenues  
8 based on these weather adjustments to class usage. These adjustments to class usage  
9 were also included in the calculation of hourly generation requirements.

10           I also recommend that the Commission adopt the hourly net system load that I  
11 calculated. Staff witness Leon Bender used these hourly loads in estimating the  
12 normalized fuel and purchased power expenses for the test year. A monthly summary of  
13 the normalized net system load for EDE is shown in Schedule 3.

14 **NORMALIZATION OF USAGE**

15  
16           Q.     Why is it necessary to weather normalize electricity usage?

17           A.     Electricity use is very sensitive to weather conditions. Because of the high  
18 saturation of air conditioning and electric space heating in EDE's Missouri territory, the  
19 magnitude of EDE's load is directly related to daily temperatures. The weather during  
20 the test year differed from normal conditions. The average daily temperatures during the  
21 months of January, February, and March of the test year were cooler than normal,  
22 resulting in greater usage than normally would have occurred. The month of June and the  
23 first half of September were cooler than normal resulting in lower electricity usage. The  
24 month of August was warmer than normal resulting in higher electricity usage than what

Direct Testimony of  
Richard Campbell

1 would normally be expected. November and December of 2003 were also warmer on  
2 average than normal, which resulted in less heating use and lower total electricity usage.

3 Q. What method did you use to calculate the weather adjustments to class  
4 usage?

5 A. I used the Electric Power Research Institute (EPRI) Hourly Electric Load  
6 Model (HELM) to calculate the weather adjustments to class usage. In this model, the  
7 response to daily weather is first estimated for each of the rate classes from hourly load  
8 data. Weather normalized usage is then calculated for each month for each of the  
9 weather sensitive classes, based on the estimated response given normal weather  
10 variables (discussed later in this testimony). The weather adjustment to class usage is  
11 calculated as the difference between the weather normalized usage and the actual usage.

12 Q. How did you calculate the days adjustment?

13 A. HELM's output provides weather normalized usage on both a billing  
14 month and a calendar month basis. The difference between billing month and calendar  
15 month usage is referred to as the days adjustment.

16 Q. What are the inputs to this model?

17 A. There are four data inputs into the model – actual billing month class  
18 usage, hourly class load data, and actual and normal daily weather variables. The actual  
19 month class usage and the hourly class loads were supplied by EDE in response to Staff  
20 Data Request Nos. 16, 145, and 328. Staff witness George Chikhladze supplied the  
21 actual high and low temperatures for the test year and the history of high and low  
22 temperatures that I used to calculate daily normal weather, as described in the normal  
23 weather section of this testimony.

Direct Testimony of  
Richard Campbell

1           Q.     How did you determine which rate classes were weather sensitive and did  
2 you independently perform a weather impact analysis on hourly class load data to  
3 determine the appropriate weather response functions?

4           A.     Yes. EDE supplied hourly class load data for the time period dating  
5 January 1, 2002 through December 31, 2003. The hourly loads were plotted against  
6 mean daily temperature to ascertain the weather sensitivity of each class. The hourly  
7 loads from the classes that were found to be weather sensitive were then used to develop  
8 weather response functions in the HELM model.

9           Q.     Which classes were deemed to be weather sensitive?

10          A.     The rate classes that were deemed to be weather sensitive were the  
11 residential (RG), commercial (CB), space heating (SH), total electric building (TEB), and  
12 general power (GP) classes.

13          Q.     Were weather and days adjustments made to non-Missouri usage?

14          A.     Yes, non-Missouri usage was weather normalized and days adjustments  
15 were calculated using the same method used for Missouri usage. I combined all of the  
16 usage for each rate class that was weather sensitive from all of the non-Missouri  
17 jurisdictions by billing month, and billing cycle to calculate non-Missouri weather  
18 normalized usage.

19          Q.     Did you make any adjustments or corrections to the billing cycle usage  
20 data?

21          A.     Yes. The usage data provided by EDE, in response to Staff DR No. 16,  
22 was disaggregated by billing cycle. While reviewing this billing cycle data, I noticed that  
23 the usage in some billing cycles was negative, indicating billing corrections had occurred.

Direct Testimony of  
Richard Campbell

1 I was able to eliminate the negative usage by combining obvious incorrectly billed usage  
2 with the corresponding canceled usage and rebilled usage from the billing cycle data.

3 Q. Do any Missouri electric utilities use HELM?

4 A. Yes. Kansas City Power & Light Company (KCPL), Aquila, AmerenUE,  
5 and EDE have all used HELM to analyze loads in the past as part of their Missouri  
6 resource planning programs. KCPL and EDE have both used HELM to weather  
7 normalize billing month usage and hourly loads in recent rate design cases. EDE also  
8 used HELM to weather normalize usage in this case as well as its most recent prior rate  
9 case. In the AmerenUE complaint case, Case No. EC-2002-1, Staff adopted  
10 AmerenUE's weather normalized usage, which was normalized using HELM.

11 Q. Has Staff previously used HELM?

12 A. Yes, Staff has used HELM in rate cases involving EDE and Aquila.

13 Q. Which Staff witnesses relied on the adjustments to usage that you  
14 calculated?

15 A. Staff witness Janice Pyatte calculated the corresponding adjustments to  
16 Missouri retail revenues. The weather and days adjustments were also included in the  
17 adjustments provided by Ms. Pyatte to Staff witness Alan J. Bax for use in deriving the  
18 Staff's energy allocation factors.

19 These adjustments to class usage were also included in the hourly net system  
20 loads that I provided to Staff witness Leon Bender for use in the normalization of fuel  
21 costs.

22 **HOURLY NET SYSTEM LOADS**

23  
24 Q. What are hourly net system loads?

Direct Testimony of  
Richard Campbell

1           A.     Hourly net system loads are the hourly electric supply necessary to meet  
2 the energy demands of the company's customers and the company's own internal needs.  
3 It is net of (i.e., does not include) station use, which is the electricity requirement of the  
4 company's generating plants. The hourly loads used in my analysis of the test year  
5 January 2003 through December 2003 were provided to Staff in response to Data Request  
6 No. 15. I also used hourly load data submitted monthly by EDE in response to the  
7 Commission's rule 4 CSR 240-3.190 as a cross check to correct errors that were found in  
8 the data request response.

9           Q.     What method did Staff use to weather normalize net system hourly loads?

10          A.     The Staff's weather normalization procedure was developed by the  
11 Economic Analysis Department of the Commission in 1988. The process is described in  
12 detail in the document Weather Normalization of Electric Loads, Part A: Hourly Net  
13 System Loads (November 28, 1990), written by Dr. Michael Proctor, who at the time was  
14 Manager of the Economic Analysis Department.

15          Q.     Briefly summarize the process you use.

16          A.     In order to reflect normal weather, daily peak and average loads are  
17 adjusted independently, but using the same methodology. Independent adjustments are  
18 necessary because average loads respond differently to weather than peak loads.

19                 Daily average load is calculated as the daily energy divided by 24-hours and the  
20 daily peak is the maximum hourly load for the day. Separate regression models estimate  
21 both a base component, which is allowed to fluctuate across time, and a weather sensitive  
22 component, which measures the response to daily fluctuations in weather for daily  
23 average loads and peak loads. The regression parameters, along with the difference

Direct Testimony of  
Richard Campbell

1 between normal and actual cooling and heating measures, are used to calculate weather  
2 adjustments to both the average and peak loads for each day. The adjustments for each  
3 day are then added respectively to the actual average and peak loads for each day.

4 The starting point for allocating the weather normalized daily peak and average  
5 loads to the hours of the test year is the actual hourly loads. A unitized load curve is  
6 calculated for each day as a function of the actual peak and average loads for that day.  
7 The corresponding weather normalized daily peak and average loads, along with the  
8 unitized load curves, are used to calculate weather normalized hourly loads.

9 This process includes many checks and balances, which are included in the  
10 spreadsheets that are used. In addition, the analyst is required to examine the data at  
11 several points in the process.

12 Q. Has this method been used in other rate cases?

13 A. Yes, this method has been used in several cases before this Commission.  
14 Please refer to Schedule 4 for a list of these cases.

15 Q. What data was used in this process?

16 A. Actual hourly net system loads for the time period from October 1, 2002  
17 through March 31, 2004, were provided by EDE in response to Staff Data Request No.15.  
18 The actual daily weather variables were supplied to me by Staff witness  
19 George Chikhladze. I calculated the normal weather variables using a method developed  
20 by the Staff in 1991. The process is described later in this testimony.

21 Q. Were modifications made to the test year weather normalized hourly net  
22 system loads to account for Staff adjustments to test year usage?

Direct Testimony of  
Richard Campbell

1           A.     Yes. I adjusted the weather-normalized hourly net system loads to be  
2 consistent with the Staff's weather-normalized, annualized test year usage so that the  
3 estimated fuel expense would be consistent with the usage level Staff used in calculating  
4 revenues.

5           Q.     How were the hourly loads adjusted to account for the annual adjustments  
6 to usage?

7           A.     I added weather normalized wholesale usage and company usage to the  
8 Staff's weather normalized, annualized test year usage for both Missouri and  
9 non-Missouri. Then, I increased the adjusted annual usage by the loss factor supplied to  
10 me by Staff witness Alan Bax in order to include the additional amount of generation  
11 and/or purchased power necessary to serve this additional usage. A factor was applied to  
12 each hour of the weather normalized loads to produce an annual sum of the hourly net  
13 system loads that equals the adjusted test year usage, consistent with normalized  
14 revenues, plus losses. A monthly summary of the adjusted loads is shown on Schedule 3.

15          Q.     How was the weather adjustment for wholesale usage calculated?

16          A.     The weather adjustment for wholesale usage was calculated using the  
17 same methodology used to weather normalize the net system load. EDE supplied hourly  
18 wholesale load data for October 1, 2002 through March 31, 2004, in response to Staff  
19 Data Request No. 294.

20          Q.     Did any other staff witness use the weather normalized wholesale usage?

21          A.     No. However, Staff witness Alan J. Bax used the weather adjustment to  
22 wholesale usage in his calculation of the Staff's energy allocation factor.

23          Q.     Which Staff witness used your hourly normalized net system loads?

Direct Testimony of  
Richard Campbell

1           A.     Staff witness Leon Bender used the test year hourly normalized system  
2 loads in developing test year fuel and purchase power expense.

3 **NORMAL WEATHER VARIABLES**

4  
5           Q.     Who developed the methodology for calculating normal weather  
6 variables?

7           A.     Staff developed the methodology for calculating normal weather variables  
8 in 1991. This methodology is in the document Weather Normalization of Electric Loads,  
9 Demonstration: Calculation of Weather Normals, October 25, 1991.

10          Q.     Briefly explain how normal weather variables are calculated.

11          A.     The normal weather variables are used in both the normalization of class  
12 usage and hourly net system loads, and are calculated using Staff's ranking method and  
13 daily weather values for the time period January 1, 1971 through December 31, 2000.  
14 Staff's ranking method calculates daily normal temperature and degree days values for  
15 the test year. The primary objective of the Staff's method is to obtain calculated normal  
16 values that range from the temperature value that is "normally" the hottest to the  
17 temperature value that is "normally" the coldest because every year in Missouri normally  
18 has at least one very hot day and one very cold day.

19               The calculation of daily normal values begins by ranking the daily mean  
20 temperatures in each year of the historical period, 1971 through 2000 in this case. These  
21 temperatures are then averaged by rank, not by the day of the year. This results in the  
22 normal extreme being the average of the most extreme daily mean temperatures in each  
23 year of the historical period. Similarly, the second most extreme normal variable is the  
24 average of the second most extreme day of each year and so forth. A similar process is

Direct Testimony of  
Richard Campbell

1 used to calculate monthly rankings for each year in the historical period and a  
2 corresponding "normal" monthly ranking and temperature. The "normal" monthly  
3 temperatures and rankings are used to maintain the weather patterns present in the test  
4 year and the "normal" annual rankings and corresponding temperatures are used to  
5 determine magnitude of the normal weather variables for the test year.

6 Q. Why is the Staff's method of calculating normal weather variables  
7 appropriate?

8 A. Using ranked normals to calculate the weather adjustment to usage is  
9 appropriate because electricity use does not respond to temperature by a constant factor.  
10 Customer response to a change in temperature of one degree from 70 to 71 is very  
11 different from a change in temperature of one degree from 90 to 91. One of the  
12 properties of the Staff's method is that it minimizes the difference between actual and  
13 normal weather. This is very important in trying to capture the characteristic of customer  
14 response to weather. The ranking method of calculating normals allows for a more  
15 accurate estimate of changes in usage due to deviations from normal weather.

16 Using ranked normals is therefore important in estimating fuel and purchased  
17 power expense because these expenses are greatly impacted by daily weather extremes.  
18 Since every year has days with extreme temperatures, the daily normals should also  
19 contain extremes. The Staff's ranking method calculates normal extremes.

20 In addition, the Staff method of allocating weather normalized net system loads  
21 back to the hours of the test year uses the actual hourly load for that day. Daily load  
22 shapes are dependent upon the temperature for the day. The Staff's method for  
23 calculating normal weather values and distributing them to the days, minimizes the

Direct Testimony of  
Richard Campbell

1 difference between actual and normal weather. This minimization of weather  
2 adjustments is important to the accuracy of the load shape of the net system input for that  
3 day.

4 Q. Who supplied the history of daily temperatures used in your calculation of  
5 daily normals?

6 A. Staff witness George Chikhladze supplied the history of daily  
7 temperatures that I used in calculating the daily normal weather values.

8 Q. Does this conclude your Direct Testimony?

9 A. Yes, it does.
