I. THROUGHPUT DISINCENTIVE..... 1

II. IMPORTANT SCHEDULING CONSIDERATIONS ..... 8

III. DSM COST RECOVERY ..... 10

1 **REBUTTAL TESTIMONY**

2 **OF**

3 **WILLIAM R. DAVIS**

4  
5 **CASE NO. ER-2011-0028**

6 **Q. Please state your name and business address.**

7 A. My name is William R. Davis. My business address is One Ameren Plaza,  
8 1901 Chouteau Avenue, St. Louis, MO 63103.

9 **Q. Are you the same William R. Davis who filed direct testimony in this**  
10 **case?**

11 A. Yes, I am.

12 **Q. What is the purpose of your rebuttal testimony?**

13 A. The purpose of my rebuttal testimony is to further discuss the throughput  
14 disincentive, discuss important scheduling considerations regarding demand-side  
15 management (“DSM”) implementation, and rebut the direct testimony of Missouri Industrial  
16 Energy Consumers (“MIEC”) witness Maurice Brubaker and Missouri Public Service  
17 Commission Staff (“Staff”) witness John Rogers regarding DSM cost recovery.

18 **I. THROUGHPUT DISINCENTIVE**

19 **Q. Please define the term “throughput disincentive.”**

20 A. The throughput disincentive is a result of the traditional regulated utility  
21 business model in which the utility’s revenues are linked to its sales or “throughput,” creating  
22 a financial disincentive for the utility to engage in any activity that could reduce sales, like  
23 promoting energy efficiency programs.

1           **Q.     What are the driving factors of the throughput disincentive?**

2           A.     There are three main factors that drive the throughput disincentive. First is  
3 rate design. Revenues being collected through volumetric charges are the origin of the  
4 throughput disincentive. As the percentage of revenues collected through volumetric charges  
5 decreases, so does the throughput disincentive. The duration of time between rate cases is  
6 another driver of the throughput disincentive, since the negative financial impact of reduced  
7 kWh sales due to energy efficiency savings compounds quickly between rate cases. The  
8 third main factor that drives the throughput disincentive is the expansion rate of energy  
9 efficiency programs. As energy efficiency programs and their resultant energy savings grow  
10 rapidly, the effects between rate cases compound rapidly, creating greater financial  
11 disincentive.

12           **Q.     Is it possible to align utility financial incentives with helping customers**  
13 **use energy more efficiently without addressing the throughput disincentive?**

14           A.     No. The throughput disincentive is a fundamental barrier to the pursuit of  
15 energy efficiency. In testimony filed in Ameren Missouri's recent gas rate case, the  
16 Commission Staff testified that "The SFV [Straight Fixed Variable] rate design more closely  
17 aligns the Company's and customers' interests regarding energy conservation, and enables  
18 AmerenUE to expand its promotion of conservation without harming its shareholders  
19 because revenues from Residential and SGS customers do not depend on customer usage."<sup>1</sup>  
20 Staff appropriately recognized the inextricable link between sales volumes and aligning  
21 utility financial incentives to help customers use energy more efficiently.

---

<sup>1</sup> Case No. GR-2010-0363, Direct Testimony of Dr. Henry E. Warren, November 19, 2010, p. 15 ll. 5-8.

1           **Q.    What are lost revenues?**

2           A.    Lost revenues are a quantification of the throughput disincentive. Lost  
3 revenues are quantified as the reduction between rate cases in billed demand (kW) and  
4 energy (kWh) due to installed demand-side measures, multiplied by the fixed-cost margin  
5 rate.

6           **Q.    Is Ameren Missouri expecting load growth between this rate case and the**  
7 **next?**

8           A.    Yes.

9           **Q.    Wouldn't that load growth offset the lost revenues from energy efficiency**  
10 **programs?**

11          A.    Absolutely not. By implementing energy efficiency programs, the Company  
12 is knowingly causing financial harm to itself. This produces an unsustainable situation and  
13 creates intense downward pressure on the budgets for energy efficiency programs.

14          Load growth occurs in two ways: adding new customers and usage per customer  
15 growth. As shown in Ameren Missouri's latest Integrated Resource Plan ("IRP") filing, load  
16 growth is expected to be about 1.1% annually over the next 20 years. About 80% of that  
17 growth is customer growth while the remaining 20% of load growth is expected to come  
18 from usage per customer growth. It is also noteworthy that nearly all of that usage per  
19 customer growth is expected to come from the industrial class and was identified as a  
20 significant uncertainty in the load forecast.

21          There are additional costs associated with adding customers to the system, and the  
22 additional revenues from customer growth help offset those additional costs. Instituting

1 energy efficiency programs puts the full recovery of those costs at risk by reducing revenues  
2 collected from customers.

3 Use per customer growth also increases revenues from the time rates are set, but this  
4 is not a windfall to the Company. The additional revenues from customer usage growth can  
5 help offset part of rising costs, and reducing those revenues from our energy efficiency  
6 programs amplifies the negative effects of regulatory lag. For example, use per customer is  
7 expected to grow about 0.25%. However, when costs increase by more than 0.25% there will  
8 be a revenue shortfall.

9 Lost revenues are an opportunity cost. Simply stated, the Company would receive  
10 more revenues without implementing energy efficiency programs.

11 **Q. Couldn't revenues from hotter than normal weather be used to offset lost**  
12 **revenues?**

13 A. No. Normal weather is used as the expected value in the planning process, so  
14 there would be no business case to support planning for offsets to lost revenues. Again,  
15 regardless of weather, the opportunity cost still exists. In fact, given warmer than normal  
16 weather, the Company would be foregoing even higher revenues. Regardless, it would be  
17 unbalanced to offset lost revenues when weather is warmer than normal then allow no similar  
18 offset when weather is milder than normal.

19 **Q. Have you estimated the lost revenues incurred from the inception of**  
20 **Ameren Missouri's DSM programs through the implementation of rates from this case?**

21 A. Yes. I estimate that Ameren Missouri will have lost around \$15 million in  
22 revenue from 2009 through the effective date of rates from this case.

1           **Q.    Have you estimated the lost revenues that would occur if Ameren**  
2 **Missouri were to go two years without a rate case?**

3           A.    Yes. If Ameren Missouri were to continue spending \$25 million per year on  
4 energy efficiency over the next two years without a rate case, about \$53 million<sup>2</sup> of  
5 additional revenues would be lost.

6           **Q.    Are these levels of lost revenues a powerful incentive to limit spending on**  
7 **energy efficiency?**

8           A.    Absolutely. Lost revenues at that level over the next two years would reduce  
9 return on equity by as much as 30.7 basis points annually and reduce earnings per share by  
10 approximately 14 cents over the two year period. These are not insignificant impacts.

11           **Q.    Do the Evaluation, Measurement, and Validation (“EM&V”) results**  
12 **include the effects solely attributable to Ameren Missouri’s DSM programs?**

13           A.    Yes. The EM&V results contain two main components: the gross energy  
14 savings and a net-to-gross factor. Estimating gross energy savings is more like an accounting  
15 exercise where, for example, you count how many light bulbs you sell and multiply that by a  
16 savings per unit. The net-to-gross factor is a way to account for the behavioral aspects of the  
17 program. For instance, are customers using the product as expected, did customers engage in  
18 the program because of the incentive, or is the customer even an Ameren Missouri customer?  
19 These components of EM&V are specifically designed to make sure the savings attributed to  
20 the Company are only those that resulted because of the program and not from other factors  
21 like weather, the economy, or savings that would have occurred anyway.

---

<sup>2</sup> The MWh saved would likely be sold as off-system sales and so the Company would retain 5% of that revenue.

1           **Q.    Are the EM&V results used to calculate lost revenues?**

2           A.    Yes, historical savings come from the EM&V process and future savings are  
3 estimated by leveraging past EM&V experience.

4           **Q.    Is the Fixed Cost Recovery Mechanism you proposed in your direct**  
5 **testimony the only way to address the throughput disincentive?**

6           A.    No, it is not.

7           **Q.    Are you proposing an alternate approach?**

8           A.    Yes. An alternate approach to address the throughput incentive is to decrease  
9 the billing units used to set rates. This approach recognizes that the sales used to set rates do  
10 not reflect anticipated savings from energy efficiency programs.

11          **Q.    Please explain how this adjustment works.**

12          A.    I am proposing an adjustment to the test year sales used to set rates after all  
13 other rate design has been completed. This is advantageous because it allows the revenue  
14 requirement to be set and the rate design process to be followed as normal. Once that process  
15 is complete I would simply reduce the sales used to set rates based on expected savings from  
16 Ameren Missouri's energy efficiency programs.

17          **Q.    What level of adjustment are you proposing?**

18          A.    Based on continued expenditures of \$25 million annually, I propose the  
19 residential sales be reduced by 250,951 MWh. For the Small General Service, Large General  
20 Service, Small Primary Service, and Large Primary Service classes, I propose a total  
21 reduction of 227,678 MWh to be allocated based on the 2010 energy savings estimates. For  
22 classes with demand-related charges I propose those demand units be reduced by the same  
23 percentage as the energy.

1           **Q.    Is there a link between this billing unit adjustment and future DSM**  
2 **spending levels?**

3           A.    Yes. The \$25 million annual spending level is approximately the average  
4 level of expenditures over the 2008 IRP implementation plan (2009-2011) and is predicated  
5 upon the billing unit adjustment I am proposing.

6           **Q.    If the Company's estimate of DSM related impacts between cases turns**  
7 **out to be too high, is there a possibility that the Company could over-collect its fixed**  
8 **costs based on the adjustment you have proposed?**

9           A.    As with any cost or revenue element impacting the setting of rates, a  
10 difference in the actual level of that element from the amount used to set rates can produce  
11 over- or under-collections during the period when rates are in effect, all other things being  
12 equal. However, because my proposal seeks to use forward-looking information and also is a  
13 new concept for the Commission, the Company is willing to commit to building in a  
14 mechanism to prevent such an over-collection from occurring.

15           **Q.    What do you propose to ensure that the estimated load impacts built into**  
16 **rates in this case are not over-stated?**

17           A.    The Company would, in its next rate case, compare the adjustment to the final  
18 MWh savings result using its DSM evaluation for the time period that those rates are in  
19 effect. The Company would then make an adjustment to correct for any over collection  
20 related to this billing adjustment in order to keep customers whole if Ameren Missouri's  
21 energy efficiency programs don't obtain the level of MWh savings which is anticipated.

1                   **II.    IMPORTANT SCHEDULING CONSIDERATIONS**

2           **Q.    What is the current status of the Missouri Energy Efficiency Investment**  
3 **Act (“MEEIA”) rules?**

4           A.    The rules are not yet effective and likely will not be effective for several  
5 months. First, they will have to be published by the Secretary of State and then in the  
6 Missouri Code of State Regulations. The rules will not become effective until thirty days  
7 after publication in the Missouri Code of State Regulations.

8           **Q.    Are you familiar with the testimony of Mr. Rogers regarding the**  
9 **scheduling aspects of energy efficiency?**

10          A.    Yes. Mr. Rogers states that it is more appropriate to deal with the energy  
11 efficiency aspects of this rate case in a filing under MEEIA. He also provided a schedule to  
12 demonstrate how he believes events are aligned to support his conclusion.

13          **Q.    Do you agree with Mr. Rogers?**

14          A.    No. Mr. Rogers’ “optimal” schedule does not seem realistic. First, the  
15 schedule includes only 6 months for adjudication of Ameren Missouri’s 2011 Integrated  
16 Resource Plan filing, even though its 2008 filing took 12 months. Furthermore, the recent  
17 filings of the other Missouri investor owned utilities have taken about nine months on  
18 average.

19          The schedule presented in Mr. Rogers’ testimony also ignores realities associated  
20 with program implementation. It excludes any time associated with vendor contract  
21 development. It will take three to six months to renew existing contracts and six to nine  
22 months to develop contracts with new vendors.

1           Mr. Rogers also notes that Ameren Missouri's energy efficiency program tariffs are  
2 scheduled to expire September 30, 2011. This is true, but there is no reason that those  
3 programs couldn't be extended as a part of this rate case. Even with his theory of this  
4 alignment of timing, Mr. Rogers does not propose anything to address the throughput  
5 disincentive that would support the continuation much less the ramping up of those  
6 programs.

7           **Q. Are the MEEIA rules expected to solve the issues associated with**  
8 **implementing energy efficiency programs in Missouri?**

9           A. No. The approved rules address several contentious issues, such as changing  
10 rates outside of a rate case, which are likely to result in litigation. If a legal battle ensues, it  
11 is possible that any demand-side investment mechanism approved will face lengthy  
12 challenges in court and could ultimately be overturned. Furthermore, the definition of lost  
13 revenues and retrospective recovery of an incentive are not consistent with the alignment of  
14 utility financial incentives with helping customers use energy more efficiently. This will  
15 prevent the MEEIA rules from reducing barriers to cost-effective energy efficiency in  
16 Missouri, regardless of the possibility of legal challenges.

17           **Q. Is the timing of this rate case better aligned to support the continuation of**  
18 **Ameren Missouri's existing program without interruption?**

19           A. Yes, it is a much more realistic schedule given that the outcome of the rate  
20 case will be known by July 2011. Additionally many of the legal issues may be avoided (at  
21 least with respect to Ameren Missouri) if the Commission acts within this rate case and  
22 adopts a mechanism as the Company has proposed.

1 **III. DSM COST RECOVERY**

2 **Q. Are you familiar with the direct testimony of Mr. Brubaker regarding**  
3 **DSM cost recovery?**

4 A. Yes, I am. Mr. Brubaker concludes that Ameren Missouri's current method of  
5 cost recovery for DSM resources is superior to that for supply-side resources both in terms of  
6 cash flow considerations and earnings.

7 **Q. Do you agree with Mr. Brubaker's conclusions?**

8 A. Absolutely not.

9 **Q. Please elaborate on why you disagree.**

10 A. Mr. Brubaker contends that the current DSM cost recovery is more favorable  
11 to earnings since Ameren Missouri is allowed to continue to accrue carrying charges on the  
12 DSM expenditures until the time amortization begins, and that amortization does not begin  
13 until rates are changed in the next rate case. While this is a positive feature of the current  
14 cost recovery method, it ignores important differences between demand-side and supply-side  
15 resources. First, the development of significant demand-side resources requires continuous  
16 spending over a long period of time. Second, the Company can time a rate case filing to  
17 mitigate the rate lag caused by the delay between when a major supply-side project is placed  
18 in-service and when it would be reflected in rates. By timing the rate case filing around the  
19 in-service date, the Company can mimic the treatment demand-side resources currently  
20 receive. Attempting to file rate cases continuously to avoid the same kind of lag with  
21 demand-side resources is impractical. Further mitigation of the lag experienced with a large  
22 supply-side investment can be achieved through the use of construction accounting, as was  
23 approved for the Sioux scrubber.

1           **Q. Did you agree with Mr. Brubaker's assessment of cash flows being**  
2 **superior for DSM investments?**

3           A. No. As I mentioned in my direct testimony, DSM expenses are incurred as  
4 the utility engages in a variety of marketing strategies with the goal of altering customers'  
5 energy-related purchases and consumption behavior. In fact, DSM expenses are treated in a  
6 manner that is inferior to that applied to other expenses. Other expenses are built into rates  
7 dollar-for-dollar while, currently, DSM expenses are amortized and collected over a period of  
8 years. However, using a 3-year amortization is a reasonable way to mitigate the rate impacts  
9 associated with increases in the DSM expenditure level while not unduly extending recovery.

10           **Q. Mr. Brubaker also argues that using a ten-year amortization is more**  
11 **consistent with "matching benefits and costs." Is this valid?**

12           A. No. That logic could be inappropriately applied to many kinds of expenses.  
13 For example, it is a maintenance *expense* if Ameren Missouri paints a structure even though  
14 the paint lasts several years. That expense is booked entirely in the period in which it is  
15 incurred; it is not amortized over the expected life of the paint job. Expenses are not  
16 distinguished from capital expenditures merely by the duration of the benefits they produce.

17           **Q. Are there any other cash flow differences between a supply-side resource**  
18 **and demand-side resources?**

19           A. Yes. First, it is appropriate to compare a series of demand-side expenditures  
20 to a single generating investment since demand-side resources are mainly implemented to  
21 postpone that large supply-side resource. The cash flows for a large supply-side resource are  
22 negative during the few years of construction, and then positive for the remaining life of the  
23 asset as it is depreciated. In contrast, the development of significant demand-side resources

1 requires continuous spending over a long period of time. If the utility is capitalizing those  
2 expenditures, the cash flow will initially be negative. After many years DSM spending could  
3 level off. At that point the cash flows would be neutral. Since the spending is continuous,  
4 there is no period of positive cash flow and the unamortized regulatory asset balance does not  
5 decrease over time.

6 **Q. Are there other considerations when determining the appropriate cost**  
7 **recovery method for DSM?**

8 A. Yes. The recovery risk of DSM expenditures is considerably higher than that  
9 for a supply-side investment. When a traditional supply-side resource goes into service the  
10 output is tangible and easy to measure. With DSM, although the impacts are measured using  
11 the most reliable methods available, the load impacts may be disputed and are never known  
12 with certainty. Company witness Daniel Laurent fully explains that while Ameren Missouri  
13 has successfully implemented its Lighting and Appliance program, the Commission Staff has  
14 consistently voiced concerns and has advocated deferring recovery of those expenses not  
15 only in this rate case but also took that position in Ameren Missouri's last rate case.

16 As the assumed recovery period for prudent costs (i.e., the amortization period) is  
17 extended, the risk of recovery is also heightened. The use of a regulatory asset as the DSM  
18 cost recovery vehicle is a concern for Ameren Missouri. At a six-year amortization, an  
19 energy efficiency portfolio with expenditures as aggressive as those estimated for the  
20 Realistic Achievable Potential ("RAP") portfolio, described in Ameren Missouri's 2011 IRP,  
21 would produce an unamortized regulatory asset of \$659 million in 2030. Potential for  
22 inconsistent treatment of the regulatory asset heightens recovery risk and could lead the  
23 financial community to negatively adjust their views of the Company's expected financial

1 position. Such inconsistent treatment, and the associated negative financial impact, could be  
2 triggered by doubts raised about the effectiveness of DSM programs well after  
3 implementation and through no fault of the Company.

4 **Q. Please summarize your testimony and conclusions.**

5 A. For Ameren Missouri to keep its current energy efficiency programs going  
6 with an annual budget of \$25 million over the next two years, the Company's financial  
7 incentives need to be more closely aligned with helping customers use energy more  
8 efficiently. Waiting for the Company to file under MEEIA may not produce a materially  
9 different result and would, at a minimum, delay important decisions for the advancement of  
10 energy efficiency programs. Therefore, developing a supportive energy efficiency cost  
11 recovery framework in this rate case is a more constructive alternative to that process.  
12 Specifically I recommend that the Commission:

- 13 • Reduce the billing units used to calculate customer rates to reflect the anticipated  
14 effects of its energy efficiency programs. I propose the residential sales be reduced  
15 by 250,951 MWh. For the Small General Service, Large General Service, Small  
16 Primary Service, and Large Primary Service classes, I propose a total reduction of  
17 227,678 MWh to be allocated based on the 2010 energy savings estimates. For  
18 classes with demand related charges, I propose those demand units be reduced by the  
19 same percentage as the energy related charges.
- 20 • Include in rate base, with a three-year amortization period, the DSM expenditures  
21 subsequent to those included in Ameren Missouri's last rate case plus interest accrued  
22 at the Company's AFUDC rate.

23 **Q. Does this conclude your rebuttal testimony?**

Rebuttal Testimony of  
William R. Davis

1           A.     Yes, it does.

**BEFORE THE PUBLIC SERVICE COMMISSION  
OF THE STATE OF MISSOURI**

In the Matter of Union Electric Company    )  
d/b/a AmerenUE for Authority to File        )  
Tariffs Increasing Rates for Electric       )  
Service Provided to Customers in the       )  
Company's Missouri Service Area.            )

Case No. ER-2011-0028

**AFFIDAVIT OF WILLIAM R. DAVIS**

STATE OF MISSOURI    )  
  ) ss  
CITY OF ST. LOUIS    )

William R. Davis, being first duly sworn on his oath, states:

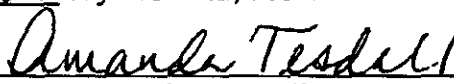

1. My name is William R. Davis. I work in the City of St. Louis, Missouri, and I am employed by Ameren Services Company as Senior Load Research Specialist.

2. Attached hereto and made a part hereof for all purposes is my Rebuttal Testimony on behalf of Union Electric Company d/b/a Ameren Missouri consisting of 14 pages, all of which have been prepared in written form for introduction into evidence in the above-referenced docket.

3. I hereby swear and affirm that my answers contained in the attached testimony to the questions therein propounded are true and correct.

  
\_\_\_\_\_  
William R. Davis

Subscribed and sworn to before me this 25 day of March, 2011.
